The theory of the behavior of mineral grease when used as a bearing lubricant is essentially different from that of animal grease. The latter is applied under more or less pressure, but much reliance is placed on the fact that it softens under heat, and indeed runs like oil if the bearing is hot. Mineral grease, on the other hand, does not soften materially under like conditions, and therefore it must be fed to the bearing by steady pressure; preferably by a spring grease cup. As there is obviously a limit to the distance the grease cup will transmit its pressure along the shaft, it follows that the shaft should not extend more than 3 or 4 inches either way from the grease cup, unless it receives an additional supply of lubricant from another grease cup, or from oil, as is the case with some gear shaft bearings. Whether a bearing be lubricated by grease or oil there should be opportunity at each end of the bearing for "stale" lubricant to escape. The same principle applies to a long shaft bearing fed with grease from cups located some inches apart. In other words, an outlet should be provided for the grease midway between the two cups as well as at the ends of the bearing.

Attaching Coil to Metal Dash.

When a heavy spark coil is to be attached to a metal dash, especially an aluminum dash, it is necessary to distribute the weight of the coil over as large an area as possible. If the coil were simply bolted through the dash by four bolts these bolts probably would work loose in the aluminum in time and enlarge the holes through which they passed. In addition, the overhanging weight of the coil would tend to bulge the aluminum around the nuts belonging to the upper bolts. To make a stiff and durable job, the bolts should go through vertical strips of hard wood not less than 1-4 inch thick and 1 1-2 inches wide. These strips should go on the front of the dash and serve to distribute the pressure of the nuts and washers over a considerable area of metal. It may be necessary to have the same strips extend above and below the coil and have additional bolts put through their ends. In that case, leather washers should be used in addition to the metal washers under the heads of the bolts.

End Play in Steering Gears.

A set screw is useless to take the end thrust of the steering worm or the worm gear, and it concentrates the pressure too much. In many steering gears, slackness due to wear is found to a much greater extent in the end play of the worm and segment than in the worm teeth themselves. The only way to make a durable job in taking up end play is to use hard steel washers or discs as large as possible, and provide passages for oil or grease to work across their surfaces. If it were not for the difficulty of cutting it to shape, the blade of an old saw would make excellent thrust washers for this purpose.

Induction in Spark Plug Cables.

Irregular firing, which persists in spite of the utmost care in insulating the circuit and making perfect connections, is sometimes traceable to mutual induction between the spark plug cables, when the latter are several feet long and run side by side close together. The sparks from such induced currents may be as much as 1-8-inch long, and when the mixture is just right it may be ignited by such a spark near the end of the suction stroke. Misfiring of this nature is infinitely more puzzling and demoralizing than that due to simple failure of the spark. It does not always occur when the plug cables run parallel, but appears to be more marked with battery than with magneto ignition, though this statement may need to be qualified. It is also more marked with certain mixtures than others. The remedy is simply to run the cables at least an inch apart. In this connection it may be remarked than when the current supply is small trouble may be experienced with long cables owing to their static electrical capacity, by virtue of which they must first be electrically charged before they will deliver a spark at the plug. A cable may be so large and long as to absorb the whole charge and deliver no spark at all. A third possible source of loss in efficiency is unnecessarily large or sharp pointed metal objects in the high tension circuit, such for example as large binding posts, wing nuts and stray ends of wire. A high tension charge tends to escape into the air from any sharp metal point in its circuit, and objects such as binding posts absorb the charge on their surface exactly as a long cable does.

Starting in Cold Weather.

A handy kink for starting in cold weather, which is less known than it deserves to be, is to warm the cylinders by squirting gasoline into them and firing it with a match at the compression cocks. A few drops of gasoline in each cylinder is all that is necessary, and the match is held to each open compression cock in turn. The resulting small explosion imparts just enough heat to the walls so that, after the crank has been turned twice to expel the burnt gases, fresh injections of gasoline will evaporate and ignite at once on turning the crank. Obviously, before resorting to this device, one should make sure that there is no stray gasoline vapor about, such as might be due to excessive and fruitless priming of the carbureter, as this would be quite apt to lead to unlooked for and somewhat disastrous consequences, and the driver who does not regard the presence of oil and gasoline splashed over the motor promiscuously had better taboo this expedient. Lubricating oil absorbs gasoline to a certain extent and is then more inflammable.

Starting in Snow or Soft Earth.

Certain materials, such as snow or soft earth, sink under the wheels when the car stands for some time, and it is difficult to climb the minute but steep gradient thus created. A steam car can very easily be extricated from such a position simply by see-sawing it back and forth, going a little further each time until the "grade" has been so eased off that it is easily surmounted. This trick is simple with a steam car because the throttle can be left open and the reversing lever rocked back and forth. With dexterity, however, a gasoline car having planetary drive, and suitable arrangement of control levers, could be manipulated in much the same way; and with a very easy gear change and gentle clutch it might even be possible with standard sliding gear transmission.

A Possible Cause of Carbureter Flooding.

A possible, but seldom thought of, cause of carbureter flooding is the float striking the top of the float chamber before the float valve closes. This might happen from defective design, from a drop of solder added to the top of the float to raise the gasoline level, or from some accidental cause such as wear of the float valve needle. If the float valve levers reach the limit of their movement before the float valve closes the same effect will be produced. The only sure test for this is to expose the top of the float or the float needle and feel of the needle to see whether or not it is seated. If it appears to be seated, feel of the float and the float levers to see if they have a little further movement.

A Hold-Up in France

By Francis Milfoun-

THERE are no police traps in France. But there are various kinds of *contraventions* to which you may be an unknowing party. French law presumes one guilty—whether it is for maiming of a murder or the scratching in the crazy chicken middle of the road—until he proves his innocence. The perhaps innocent victim has no chance if he gets the least rattled, or is not a good witness in his own behalf.

The automobilist who makes a *contravention* in France may not be aware of it for six weeks, when finally a local *commissaire* hunts him up and bands him a paper (and takes his receipt for it, too) saying that at a certain time, a month or more back, a hundred, two hundred, or five hundred kilometres from where you now are, you smashed into a rush bottom chair which some imbecile left in the road by the curb; the chair fell over into a basket of eggs; the eggs were broken and now it is a question of your proving that it wasn't you at all who did the thing, but an automobile bearing another number registered in a department away across France. These *facts* count for nothing in the present stage of the game; you must see it through.

Even to a cock-sure gendarme, 837 M looks amazingly like 384 W, even when it comes to making oath on it. And the proof is up to you to prove that your automobile was in the repair shop at the time awaiting a new valve seating, which the factory wanted two months to supply, it being an ancient model and they being so busy thinking up more changes in design, which they can spring on an unsuspecting purchaser next year and so cause more annoyance of the same kind. There is one factory in France which, with only eight models manufactured to date, carries a stock of something like a million *pièces de réchange*, and the writer knows of another who in half a dozen years has put out a score of models and never has a piece that will fit any but the latest in stock. For the moment we assume that your car was one of the former (the writer knows, he had one of the same breed once), but the *judge de paix* knows nothing of this, and a sixty-cent-a-day gendarme is to him more worthy of belief than you who pay as many dollars a year into the French exchequers as taxes, even though you are a foreigner.

Again, you may get hauled up on the spot—if, for instance, you butt into a donkey and its cart, turning about in the middle of the street at its master's call from the opposite curb. This is a repetition of an incident which once occurred to the writer. In fluent, if not grammatical French attention was called to all and sundry to the true fact (a photographic film was exposed, even in order to have a silent witness, one that would tell no more than it was asked to tell), but no good came of it. A gendarme strolled by, haled you off to his brigadier at the Gendarmerie, and a *procés verbal* followed as a matter of course.

No, there are no police traps in France, but you get badly stung every time you have anything to do with those high-salaried gendarmes nevertheless. The gendarme of the average country town in France, of five thousand or more inhabitants, has a jolly time of it every Sunday morning. He saunters out spick and span, as proud as a peacock, takes his stand on a busy corner, and watches out. He picks out some poor unfortunate automobilist who stops to ask his way and demands to see his *"papiers"* (you must have them on your person, always, in France). He would like to have a look at your *Certificat de Capacité* and the receipt for your last taxes, if you please. Of course, you do please, and if you have not forgotten them and left them in the trunk which you sent ahead by *petite vitesse* you show them to him. If you have them all, well and good; if you haven't, why, *procés verbal;* the mere fact of the confection of which will cost you a franc, even if you are proved not guilty. Red tape is costly in France as elsewhere once it begins to unwind.

If you are a stranger from abroad, stopping by the roadside to admire the scenery, perhaps to spend some of the money you have brought with you for gasoline or oil, or perhaps even food and drink—all for the benefit of the native shop and hotel keeper—the case for the gendarme is not far different. All automobilists look alike to him in great coat and goggles. When he actually discovers you are a stranger in a strange land, he thinks he can frighten you in earnest. He is not a grafter, though, the gendarme in France, there is that to his credit. He is not like the up-State constable in New York or the Kent and Surrey bobbies of Britain, but his brigadier sends him out periodically to make what captures he can, just so that the record book of the "Maréchal de Logis" shall not remain a beautiful blank. Promotion in the gendarmerie depends upon activity, not upon efficiency.

If the stranger automobilist in France has provided himself with his "Carte Rouge and his "Carte Gris" and has his *numero* well displayed he has nothing to fear. But he must not talk back to the white-braided man of the law; this of itself is a punishable offense. The gendarme in France is, in one respect, like his American and English brothers. He seldom if ever has had personal experience of automobiles, and he is no judge of speed. He can be educated by being given a ride once and again. The writer has done this in several instances in various parts of France, and it is the same old story over again. When you are doing about your prettiest without racking your motor to pieces he immediately wants to know if that is as fast as it can go, and he is as wrathful as you are at a donkey cart which gets out of the way only too slowly. He invariably says hens and chickens and geese and dogs and sheep (except when the latter are going from one pasture to another) have no rights on the road, and you can run over them if you like for all he cares. This is what he says when he is riding beside you, but professional dignity prompts him to take another view if some peasant takes exception to your having decimated a scrawny hen of which he is the owner. As for hold ups for speeding, there are very few of these in France; they exist here and there and for more or less temporary periods, but in general, so far as the open country is concerned, you may make what speed you like so long as you don't run into somebody or something. Then, look out, *procés verbal* this time sure!

PACKARD IN PARIS IN LARGER QUARTERS.

PARIS, Oct. 25.—Present quarters proving altogether inadequate for growing needs, the Packard Paris branch called in the removal men this week and transferred their establishment from the Cité de Pusy to 177 Boulevard Pereire, further in the automobile district and more easily accessible from the central part of the city. H. D. Wilson, the Paris agent of the Packard Motor Car Company, reports that the number of cars of their manufacture visiting Europe this year is larger than ever before.

Though requests for repairs are always light, it was considered necessary by reason of the number of callers for information and assistance to seek more suitable quarters. The only reason for founding the Paris house was to be of assistance to Packard tourists in Europe; thus at the new establishment a complete stock of parts is maintained in readiness for shipment at a moment's notice, and a repair shop is at the disposition of those who may need it. The increasing number of Packard cars which traverse the Atlantic each year and undertake trips of several months' duration through Europe substantiate the claims which are made for the company's product.

Autoing Conditions in Buenos Aires

By Sigmund Krausz

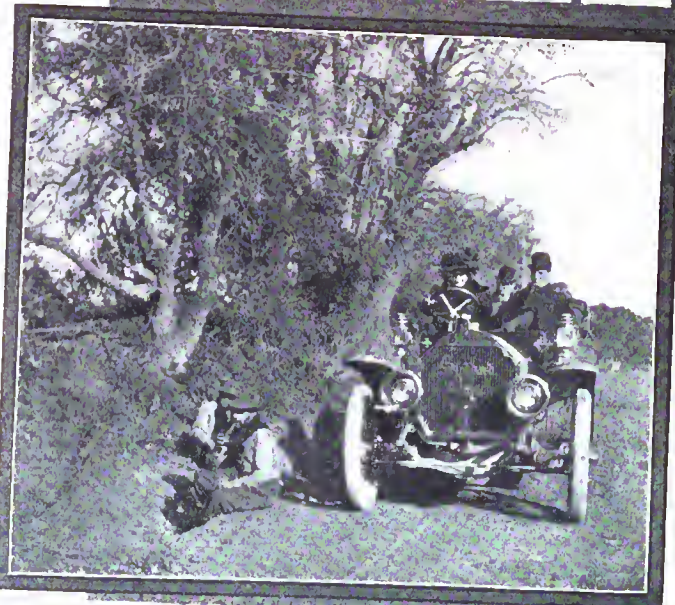
T takes patience and *savoir faire* to get an automobile out of the custom house in the capital of the Argentine Republic. Why it should be so is quite inexplicable, for there have arrived here a goodly number of automobiles. But everything down here seems to be arranged in a manner to benefit the "despatchandos," as the customs brokers are called, and the host of graft-seeking custom house employees who are in a position to be arbitrary. However, this condition is not different from that of the other South American countries I have visited so far, and one gets, by and by, used to the system.

Before speaking of automobile matters in general, I would like to advise other Americans coming down here, either for the purpose of establishing business connections or for pleasure autoing, to be even more careful in the matter of selecting garage accommodations than is necessary in Uruguay or Brazil. The city is full of dealers and chauffeurs interested in the proportion of foreign cars, and, unless you take the greatest precautions, the owner of an American automobile will soon find his automobile cutting the most extraordinary capers—if it remains in a condition to cut capers at all. I cannot make any direct accusations, but since the fact absolutely exists that American cars returned in first-class condition to garages after an afternoon's run have been found next morning "on the bum," and that if a repair is really needed it takes an eternity to have it done, one may draw his own conclusions.

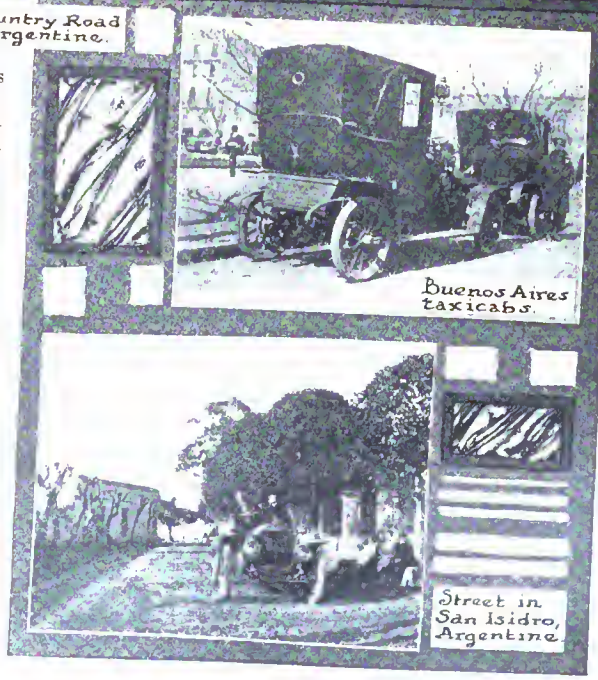
These facts were admitted to me by the owner of the garage where I keep my car, and I have made him—as a condition *sine qua non*—responsible for any inexplicable mishaps while the machine is in his place. Withal, I have also taken the precaution of hiring a compartment which can be locked, and am also careful enough to secure the safety of the motor by fastening on the hood by means of padlocks. Thanks to these precautions, my Stoddard-Dayton is performing in Buenos Aires with its usual reliability.

There is another thing to which I would like to call the attention of such American manufacturers who have a well-known car and wish to introduce it in the South American market, especially in Argentine. It is the matter of registering the name or trademark under which a car is sold. Without this precaution it may happen—as lately two American concerns have learned at their expense—that they see themselves in a position where they cannot sell their own product in Argentine without coming to an understanding with some blackmailer, who has registered either or both of them in his own name. There is a law that will protect the rightful owner of a name or trademark, unless he registers them before working. Since the cost is great, one may save a lot of trouble by the procedure. The protection is good for ten years and may be renewed.

Park of Palermo, Buenos Aires.



A Country Road in Argentine.



Buenos Aires taxicabs.

Street in San Isidro, Argentine.

Autoing the Rage in Argentina's Capital

Buenos Aires has seen within the last two or three years a remarkable growth of the auto fad, but the financial stringency of the last half year or so has put a considerable damper on the enthusiasm. There are at present, according to various estimates, from 1,000 to 3,000 automobiles in the city. The latter number is evidently much exaggerated, but it is quite safe to put the number down at about $1,500. Many of these, however,

are out of running on account of economic restrictions and the disgust of owners with the irresponsible and rascally class of chauffeurs which predominate. There are very few Argentinians who take the trouble to learn anything about the construction of their machines, or even to drive them, and, consequently, they are entirely at the mercy of any chauffeur who is in league with garages and repair shops. An Argentinian rarely buys a car for the love of sport, but simply for show. If his friend or neighbor has a fine car, he must, of course, if he can afford it, have a finer one. This is the reason why one sees such a large number of luxurious limousines and landaulets of the best makes in the streets, and they are, sometimes, of a horsepower entirely out of proportion with the requirements of the local topography.

The city is absolutely flat; the streets, though narrow, are well paved and touring in the country is, on account of the lack of roads or their abominable condition, largely out of question. These conditions may improve in time, but it will take considerable time, for *"manana"* is here the word, as well as in other parts of South America, even if not to the full sense of its meaning in Brazil.

Club Life and the Roads in the Vicinity.

There is an automobile club here, but it does not seem to be very active and confines its efforts principally to the promotion of social functions. The Touring Club of Buenos Aires, on the other hand, is somewhat more energetic in the way of furthering the question of road improvements. At the present time there are but few roads on which one may venture for some distance out of Buenos Aires, the best of these being the one leading to a resort called Tigre. It is of about 25 miles length, but the latter part of it, the stretch after San Fernando, is not exactly what one would call a good, or even a fair automobile road. Going in the Tigre direction one comes, after leaving Belgrano, over a five kilometer stretch of fine macadam road. This is a road specially constructed for the use of automobiles. It is about 20 feet wide, is fenced in with barbed wire, and is about the only place where one can speed with some safety.

There is talk just now of arranging a race, but unless it be a steeplechase or an endurance run, I cannot see where such an event could be held. Three horse race courses provide sufficiently for hyppic sport in the Argentine capital, but conditions for an automobile race of some importance are as yet in the embryo.

It is a pretty sight, especially of a Sunday, to see the long lines of fine autos out in the park of Palermo. There the fashionable world gives itself rendezvous, and while the private and livery carriages outnumber by far the autos, the latter are certainly there by the hundreds. The aspect reminds one forcibly of the Bois de Boulogne in Paris, and when the lines drive back to the city between 5 and 6 o'clock in the evening the Avenida Alvear is almost as crowded with vehicles as is the Avenue des Champs Elysées at a similar hour in summer. One may see then, in letting the automobiles pass review, all the famous makes of France, Italy, Germany and England, but very, very few of American origin. I am quite proud to say, however, that my 40-45 horsepower Stoddard-Dayton touring car caused quite a sensation among the connoisseurs during the corso in Palermo. They begin to call it here, "El diablo gris" (the gray devil), and it is opening the eyes of the natives to the possible merit of American cars.

The Street Sprinkling Man is Ever Present.

Speaking of the corso in Palermo, I must mention the nuisance of sprinkling the roads and streets that lead out there. I call it a nuisance because it is overdone. You may drive out at any hour of the day, by sunshine, cloudy weather, or even after a rain, and you will find the sprinkling fiend at work with hose wagon or even sprinkling can. No wonder all motor cars in Buenos Aires are fitted with "antiderapants." and it is a pity that the horses of the city cannot be equipped with a similar contrivance. For it is not only on the wide roads running to Palermo that the sprinkling fiend is busy. No, even the asphalt-paved narrow business streets are made almost impassable for draft animals by continuous watering, and on all sides one may see horses slip and fall down.

While I feel compelled to mention this asinine sprinkling nuisance, I am obliged at the same time to acknowledge with gratitude the good treatment I have received at the hands of the city authorities in relation to a driving license. On producing at the "intendente's" (mayor's) office my journalistic credentials, I was quickly granted a special license for 15 days, with the privilege of renewing it for a similar period as long as I stayed in the city. I was not even given a temporary number, and I have been driving about town unmolested by the police, who do not even seem to notice the lack of a number on the car.

The municipality has, however, taken lately some drastic measures relating to the driving of cars within the city limits. The chauffeur's examinations are to be more severe than hitherto, young men under eighteen are not allowed to drive cars of higher horsepower than eighteen, and among other things acetylene lamps are forbidden at night. I mean to say, the lighting of them. This measure I regard a good one, in view of the fact that the city is well lighted. The driving is regulated by arrows on the steet corners, pointing in the direction in which traffic is to move, and since there are but few streets in the city where vehicles can move in both directions, one has to know the town pretty well in order to avoid detours.

Plenty of Good Garages and a Taxicab Service.

There are a large number of livery garages here and several companies have auto taxicabs for hire on the streets. All these are of a collapsible landaulet type and of French manufacture. At this time of the year—it is winter now down here—they circulate with closed bodies. In this connection, I cannot refrain from mentioning the curious fact that horse-driven passenger vehicles for hire on the stands must be of the open kind. No hansoms, closed cabs or carriages are allowed, and no matter how the weather is—sometimes it gets deucedly cold here—the passenger has to face the biting pampero winds in an unprotected vehicle. There are no lap robes, either, furnished by the Buenos Aires cabby, who, by the way, is a far better man in his line than his chauffeur brother.

In order to secure adequate legislation, to improve the general character of chauffeur's and mechanic's service, and to promote the interests of dealers and garage proprietors, the "Sociedad Union Commercial de Automoviles" has lately been formed by a combination of importers, livery garage owners and accessory dealers, which promises to become an important factor in the automobile business of Buenos Aires. This association also has the sympathy and support of all private owners, and it is hoped that the object desired will be achieved. As it is, the business is certainly demoralized here and needs some energetic measures and unity of purpose to bring it back to normal state.

Ware Switzerland is the advice of A. A. Anderson, an American, who is taking the cure at Ragaz with his wife, gives his compatriots, and it seems that he really has cause to say the same. He set out with Mrs. Anderson for Zurich and thereby exceeded the terrible pace of six kilometers an hour, the limit set. This he does not deny, and, in fact, it would be difficult for anyone to keep within its bounds. At any rate, he was caught, and at Mels he had to deposit a sum of 100 francs. At Flums, after the wires had played, he was brought before the judge, and, after a long discussion, he had to pay a fine of 45 francs, the remainder of the sum being returned to him. It was while here that the incidents occurred of which Mr. Anderson so justly complains, for, during the many hours of waiting, both he and his wife were gravely insulted and even set upon by the population.

HOW THE INTERNATIONAL RULES WERE ADOPTED

PARIS, Oct. 25.—Next year's international racing cars must ıot exceed 130 millimeters (4.26 nches) bore for four cylinlers, and nust weigh not less than 900 kilos ,984 pounds). Six cylinder enines will be allowed a bore of 106 ıillimeters, and the same minimum eight of 900 kilos. Motors of the ıobron type, two pistons per cylıder, will be admitted. These desions being arrived at by the Inrnational Association of Recogzed Automobile Clubs, will be in gue for all the great speed consts of 1909, including the Grand ize of America, and, if Britain cides to hold another speed con-t, for that country also.

When the meeting opened with egates present from France, rmany, America, England, Belm, Italy, Switzerland, Spain, stria, Hungary, Portugal and pt, it was rapidly agreed to that method of regulation should be limitation of bore. England ıe held aloof declaring that er, and not bore should be limited. French delegates had ructions to insist on a maximum bore of 140 millimeters; , Germany and Belgium were known to be strongly in-d towards a mixiumum bore of 130 millimeters, on the nd that engines of this size would furnish an average speed o miles an hour, which was quite sufficient for the public. French objection to a very small bore appeared to be that greater the limitation the greater the departure from comial models, or from models giving experience for everyuse.

ere was a long fight before a common meeting ground could rived at, France finally abandoning its bore of 140 in favor o, but maintaining its minimum weight of 900 kilos. Ger- held for 130 bore and 1,000 kilos weight, and Italy tried concile all parties by 135 millimeters and 900 kilos. On a being taken the French proposition was adopted, Germany taly abstaining. America did not figure in the discussions, he ideas of France seemed most satisfactory to its delegates. der the new regulation, which will be the international law 909, no race—other than a local event—can be held with having other than 130 millimeters bore and a maximum t of 900 kilos empty. The cars will be lower powered hose of the present season, when the 155 millimeters rule force, but it is doubtful if they will be much slower. At na, last month, where a 130 millimeter race was held, the averaged 65 miles an hour with a bore of 120 and a of 1,200 kilos, while several faster, but less regular cars, d over 90 miles an hour on a straightaway. Speed, therevill be high, despite the drop from 155 to 130.

Tire Trouble Should Be Less.

eason of the lower minimum weight it may be expected re trouble will be considerably less than at any of the ng international races, where the cars have always been limit of their pneumatics. The question of rims and tires p for discussion at the conference, the Marquis de Dion ınce and Mervyn O'Gorman for England asking that disble rims should be forbidden, in order to force tire manus to improve their product. The bandishment of rims would, of course, entail the abandonment of dismountable wheels that England has been asking for during the past two years. René de Knyff was inclined to favor the ban on quick changing devices, but would not pronounce definitely until he had consulted his colleagues of the Commission Sportive. Finally it was decided to hold over the question until the next meeting, to be held November 30, during the Paris Solon.

Picturesque Setting of a French Race.

After hanging fire for two years the Gobron question was forced on the meeting and a decision arrived at in favor of multiple piston engines. Under the old Gordon Bennett rules the Gobron motor was, of course, admitted. When, for 1906, it was decided to limit bore the regulation was so worded that it was practically impossible for the Gobron engine, with two pistons per cylinder, to compete. Last year the same attitude was persisted in; this year, however, a strong stand was made, and the conference finally decided to allow the Gobron, with its two pistons per cylinder, to compete on the same footing as engines of the usual type. This decision finds general approval.

Small Cars Interested France Alone.

The voiturette regulations were quickly settled, this matter being of important interest to France alone. For single cylinder engines a maximum bore of 100 millimeters was maintained; two cylinders were given 80 millimeters, and four cylinders allowed 65 millimeters. Instead of 600 kilos minimum weight an increase was made to 800 kilos (1,763 pounds).

It had been decided by the International Road Congress to limit road signals to four only. The German club, therefore, brought forward a similar proposition and submitted the signals that it considered most suitable, these to be adopted as far as possble by all nations. In view of negotiations now carried on by the Touring Club of France and the Association Générale Automobile, the question was postponed until the November meeting. An attempt to arrive at a formula for touring cars was also postponed, and the British proposition to revive the Gordon Bennett conditions met with a firm refusal. Norway made application to be admitted into the international conference and was welcomed.

Chateau Country Is Favored.

An official decision regarding the Anjou course for next year's French Grand Prix may be expected this week. Indications are that the set of roads in the Château country will be adopted, but it is not yet known exactly how the course will be laid out. As the result of the reduction of bore a larger entry than usual is possible for the Grand Prix, and if, as is already proposed, the Automobile Club of France decides to reduce entry fees to $800 per car, $1,800 for a team of three, and to offer handsome cash prizes from 80 to 100 starters can be counted on. Such a number of cars would necessitate either a larger course or an elimination race. It will therefore be necessary to arrive at a definite conclusion regarding the race before selecting the roads. Chateauland would be a most inviting place to attract visitors from other countries.

THAT INTERNATIONAL ROADS CONGRESS.

Apparently there was one most unfortunate defect in the recent International Roads Congress instituted by the French Government and participated in by delegates from 29 countries, including the United States, France, Great Britain, and Germany, the four countries wherein the automobile has its greatest usage.

Talk there was aplenty, and much of it contained the oft-repeated charge that the automobile is "destroying the roads." There was no automobilist present to make suitable reply, and as far as the congress is concerned, the motor-driven vehicle stands more or less convicted as being guilty of destroying the highways. If travel over a given length of road is increased many fold by any type of vehicle, it is a simple case of addition that it will wear out that many times the sooner. It is a question of multiplied traffic that the roadmakers are called upon to answer, and it is their plain problem to bring the highways up to date and meet conditions that have arisen.

In this direction the Paris congress made slight, if any, progress, and the deductions of those present were confined to meager generalizations of practical value, at least for the moment, and until they develop into something more definite. The ideal road was the subject on which there seemed to be some differences of opinion, the adaptation of highways to modern conditions of locomotion remaining an unsolved problem as far as the first International Roads Congress is concerned. The effect of this new traffic was considerably enlarged upon, but as to the exact manner of providing something which would better withstand the greater use of the highways, the offerings were rather sparse and unsatisfactory, though it was generally recognized that something is absolutely demanded in the future, at least upon main traveled roads.

Before the next congress takes place it is reasonable to suppose that the roadmakers will have gained experience sufficient to enable them to recommend an up-to-date form of highway construction which will adequately meet the demands of motor-driven traffic, the growth of which is certain to be enormous within the next twelvemonth, for ultimately it will supplant all other forms of individual and commercial transport. That this will come at an earlier date than many believe is presaged by the gradually growing interest of the farmer and the sale of many cars to country dwellers.

In a touring article contained in this issue will be found some most interesting information concerning the increase of roads building in our Southern States, and explaining why it is bound to become even more general. Not as plentifully supplied with railroads as the Northern States, the South is finding the automobile a most available vehicle for abridging distances. But roads are a necessity, not a luxury.

* * *

PRICE OUTLOOK FOR SEASON OF 1909.

Predictions as to price reductions in the automobile field have been rife for a number of years past—in fact ever since the automobile became a practical machine, and every year since then the realization has been eagerly looked forward to by that portion of the public which has ambitions to enter the ranks, but is prevented from financial considerations. In the abstract, this demand has been for "a good four-cylinder machine at a medium price," and since it was first voiced—a time when there were few if any cars having a four-cylinder motor that listed under $3,000—the figure has gradually been receding. That is, up to last Summer, when the moment for the announcement of a shrinkage that can hardly be termed gradual, appears to have arrived.

Of course, the plans for the production of a machine embodying the usual standard features at a price far below what anything of the kind had ever been offered for hitherto, were in preparation for some time, and their culmination naturally precipitated the announcements of others who were preparing to enter the same field. Just what effect these cuts would have on the policy of makers specializing on low-priced cars was somewhat problematical at the time, but developments during the quarter intervening would seem to indicate that efforts to compete have been more along the line of an improved machine at the same, or a slightly lesser figure than formerly, rather than a wholesale cut merely to meet competition. This is a gratifying tendency that speaks volumes for the healthy condition of the industry, as any other course could only be detrimental, both to the participants and business generally. Prices for 1909 will not only be lower than ever before, but the automobile will likewise represent more for its cost than was ever before possible.

MOTOR PARKWAY RACING CLUB FORMING.

Preparations are under way for the formation of a racing club conduct contests on the Long Island Motor Parkway. The A. A.-A. C. A. peace agreement, it will be remembered, proed that future Vanderbilt Cup and Grand Prize races should run by such an organization.

Arrangements are being made by the Long Island Motor Parky officials for a series of sprint races over the cement stretch, be held Saturday, December 5.

Cars which competed in the Long Island Motor Parkway eepstakes (for cars selling above $4,001) on October 10, those the Vanderbilt Cup race, and cars which are to compete in Grand Prize race in Savannah on November 26, are eligible.

LOCOMOBILE WINS LOS ANGELES 24-HOUR.

Los Angeles, Cal., Nov. 2.—The first 24-hour race ever run the Pacific Coast proved a huge success, no one being injured l the contest being remarkable for the showing made by the es. Seven cars contested, and their total mileage was 3662 les at racing speed, yet only five tire changes were reported. e race was won by a Locomobile, driven by Murray Page, ich covered 921 miles, Page sticking to the wheel 21 hours. J. Leavitt, the 280-pound representative of the Locomobile e, drove the remaining 3 hours. Second to the Locomobile s the Franklin six, with 836 miles. The Studebaker had 628, l tbe Reo 474. The Chalmers-Detroit Bluebird, Pope-Hartford, l Sunset retired before the finish, the Sunset going through fence Sunday night.

A PAIR OF MAXWELL GLOBE GIRDLERS.

Mr. and Mrs. H. A. Hover, of Hover, Washington, reached w York last week, having completed in their 20-horsepower axwell touring car a run across the continent, the first stage what is planned to be the longest automobile journey ever dertaken by amateurs.

Since April 11 they have journeyed from Tiajuara, a small vile on the Pacific coast, in their 20-horsepower Maxwell touring . From that point they have crossed California, Washington, gon, Idaho, Wyoming, Colorado, Nebraska, Iowa, Illinois, iana, Ohio, and New York, and have visited Niagara Falls, ada, thus accomplishing what is believed to be the first feat crossing the United States from south to north and from east west in a vehicle of any kind driven over the public roads.

he travelers will shortly sail for Algiers with their car and d the approaching Winter in touring Algeria, Tunis, and pt, penetrating the Sahara Desert at least to Biskra. Crossto Italy in the Spring, the next three years will be devoted rossing every country in Europe, at least one way, with some ing in Western Siberia.

the Winter of 1911 the homeward trip will be begun by sing from Turkey into Palestine, where the car will be m to Jerusalem and back to the coast, then taken to India. a and Japan, the Philippines, Australia, New Zealand and aii, autoing in each as much as is feasible. From Hawaii will sail for San Francisco in the Winter of 1912, and they ct to have covered on their way more than 75,000 miles, of the journey in districts where an automobile has never seen.

FISK TIRES IN THE VANDERBILT.

r THE AUTOMOBILE.

our issue of October 29, under the title, "Story of the Tires," sire to correct the statement with reference to the Fisk n the Knox cars. The 50-horsepower car, driven by Denison, d only one tire on the left front, this change being necessary count of puncture, while the 40-horsepower car, driven by ue, changed two rear tires from non-skids to flat-treads, as rticle states, but these were the only changes made, and d no trouble with the front tires and finished on the same hat he started on.

THE FISK RUBBER COMPANY.
C. H. Gage.

opee Falls, Mass.

ABOUT A DASH FROM MICHIGAN TO MAINE.

Bangor, Me., Nov. 3.—With the arrival here of the appropriately dubbed "Jackson Mud Hen," which left Jackson, Mich., October 27, in charge of E. P. Blake and Charles G. Percival, there was brought to a close one of the most strenuous runs that the new light cars have recently been put to. The car is the new Jackson four-cylinder model listing at $1,600, or as the makers term it, their "dollar-a-pound-car." Mr. Blake is the owner of the car, as well as the eastern representative of the Jackson company, and in addition to affording a test of the car's endurance and speed, the autoists carried a message from Mayor Glasgow, of Jackson, Mich., to Mayor Woodman, of Bangor. The start from Jackson was made at most unpropitious time, making the trip right from Detroit, through Buffalo and Rochester, a plough through the mud, the amount plastered over the car upon its arrival at the last-named place earning it the above sobriquet. Up to that time, the only difficulties encountered had been lack of fuel, which always happened at inopportune times, a rural apothecary in Elyria being aroused at an early hour for a supply of alcohol, which was the only thing to be had.

While entering the garage at Rochester for a fresh supply of gasoline, a trolley car hit the machine, breaking its rear axle and fracturing two of J. S. McArthur's ribs. McArthur had been

E. P. Blake and Chas. G. Percival, Who Made the Run.

acting as mechanic on the trip, and was sent back from that point, Messrs. Blake and Percival alternating at the wheel from that point on. The remainder of the route lay via Albany and the Berkshires to Boston, where the tourists arrived Saturday last. One of the most remarkable things about the trip was the utter lack of tire trouble, in spite of the strenuous driving and bad roads, the Goodyear tire and rim equipment not even having been pumped on the journey to Rochester.

CONCERNING THE GENERAL MOTOR COMPANY

Detroit, Nov. 3.—Persistent rumors are being circulated in automobile circles to the effect that the long-talked of automobile combine, which J. P. Morgan is credited with promoting, and which would be equal in its field to the United States Steel Corporation, is about to become a reality, with several Michigan concerns figuring prominently in the deal.

Among the companies mentioned in this connection are the Buick Motor Company, of Flint, and the Oldsmobile Company, located at Lansing. It is known that representatives of J. Pierpont Morgan have been in Lansing for some time quietly investigating the affairs of the Oldsmobile Company. That their report was favorable is the assertion of those who profess to know. The Buick company is also said to have come in for consideration.

As outlined by those in touch with the situation, the plan is to take over a number of the leading plants throughout the country, devote each to the production of a single model, and exert an influence not unlike that now wielded by the United States Steel Corporation.

FALL ACTIVITIES OF THE AUTOMOBILE CLUBS

NEW ORLEANS NOW HAS AN A. A. A. CLUB.

NEW ORLEANS, LA., Oct. 26.—The Crescent City has at last awakened to the fact that she has all of the advantages, both natural and otherwise, of becoming the automobile center of the South and the automobile racing center of the whole country during the winter months. The success that Savannah has had in ber automobile ventures has stirred New Orleans enthusiasts into action, and as a result the New Orleans Automobile Club has been formed. A charter membership of fifty was secured, and the following are the officers: President, Thomas C. Campbell; vice-president, Theodore Grunewald; secretary-treasurer, Homer George; board of directors, Frederick I. Thompson, chairman, Ginder Abbott, W. P. Johnson, A. M. Cook, and H. A. Testard.

The meeting was most enthusiastic, and it was decided to affiliate immediately with the American Automobile Association. The two days' racing in November of course will be sanctioned by the A. A. A.

The aim of the club is chiefly for good roads. The club will soon take up the question of signboards and warnings for autoists and also the building of a new road for automobiling and a clubhouse. A vigorous campaign for members will begin at once, tbe club having as its aim a membership of one thousand. All persons interested in good roads, whether automobile owners or not, will be urged to join. The formation of the New Orleans Automobile Club is regarded as perhaps the biggest happening in Southern automobiledom in several years. There is no doubt of the club's success. Enthusiasm in the matter bas been so well worked up that the whole town is talking about it and practically all of the prominent business men are pledging support. Besides the campaign for good roads, the club will pull off first class races during the Winter months, for which a number of big racing cars have arrived.

The New Orleans club intends to follow up its track meeting with a 250-mile road race, the first of its kind ever pulled off in this section of the country.

President Thomas C. Campbell and three members of the racing committee recently made a tour of the good roads around the city, Mr. Campbell riding on the racing car of Arthur Redfern, which will be one of the entries in the races. Redfern drove his car on stretches at a sixty mile an hour gait and shot around turns without slackening speed to any extent. The club officials were highly elated over the demonstration.

VERMONT CLUB ELECTS NEW OFFICERS.

MONTPELIER, VT., Nov. 2.—At the annual meeting of the Automobile Club of Vermont held recently at the Pavilion hotel, Montpelier, the following officers were elected for the coming year: President, W. W. Brown, Springfield; first vice-president, A. C. Whiting, Burlington; second vice-president, James M. Boutwell, Montpelier; secretary and treasurer, Lester H. Greene, Montpelier; director, C. H. Slocum, Morrisville. The attendance was the largest in the history of the organization and every indication points to a most prosperous year.

WILLIMANTIC CLUB DOING GOOD WORK.

WILLIMANTIC, CONN., Nov. 2.—As winter draws near, when most of the cars will have to be housed for a while, the fifty members of the Willimantic Automobile Club feel that they have completed a very successful season. The club has accomplished much in the way of improvement in the road conditions of this vicinity, and the new road signs will be erected before the cold weather sets in. Plans are under way for procuring club rooms, which will help materially to keep the members together preparatory to an active good roads campaign in the spring.

BLISS PRESIDENT OF MASSACHUSETTS BODY.

BOSTON, Nov. 2.—A. E. Bliss, of the Malden Automobile Club, has been elected president of the Massachusetts State Automobile Association, succeeding Elliott C. Lee, of the Bay State Association. The annual meeting of the association was held at the rooms of the Bay State Association and there was a good representation of the constituent clubs. Besides the change in the presidency there is a change in the second office, A. D. Converse of the Winchendon club becoming vice-president in place of John P. Coughlin of Worcester. J. C. Kerrison of the Bay State Association was re-elected treasurer, and the selection of the secretary was left with the president and vice-president. Secretary James Fortescue of the Bay State Association, who has served the State association as secretary for two years, positively refused to continue in the office. A. D. Converse, the new vice-president, was appointed chairman of the Legislative committee, succeeding L. R. Speare, who declined to serve longer in that position. W. H. Chase of the Wachusett club of Fitchburg was reappointed chairman of the good roads committee, and John P. Coughlin was reappointed head of the sign board committee.

MARYLANDERS OBJECT TO SPECIAL TAX.

BALTIMORE, Nov. 2.—The Automobile Club of Maryland is determined to fight to a finish the proposed special tax recommended by Governor Crothers and the State automobile commission. At the club's last meeting the following resolution was unanimously adopted:

Resolved, That the members of the Automobile Club of Maryland are willing to pay their full proportion of taxes on their automobiles in the manner proscribed by the Constitution of Maryland, but stand unequivocally opposed to any special tax upon automobilists as a class to the exclusion of the owners of other vehicles, such proposed special tax being un-American in principle and in direct conflict with our State Constitution.

The question of levying the special tax for the purpose, as the Governor explained, of improving and maintaining good roads, has stirred up the members of the club to such an extent that a canvass of every automobile owner of the State is proposed to enlist his sympathy and support in fighting legislation affecting the interests of Maryland autoists. President Rowe advocated that before the end of the year every owner of an anto in Maryland should be seen personally and have him get his friends to work with the automobilists in getting proper laws to protect the automobile industry in this State, upon the ground that unjust taxes would surely drive the automobile and its benefits from the State.

MILWAUKEE WANTS TO BE IN NEXT TOUR.

MILWAUKEE, Nov. 4.—Milwaukee wants to be included in the route of the 1909 Glidden tour, and it wants this favor badly. So every member of the Milwaukee Automobile club, agents, manufacturers and owners, will petition the manufacturers through the A. A. A. to make Milwaukee a stopping point. Secretary James T. Drought, of the M. A. C., returned from New York with the news that the A. A. A. was favorably disposed toward the plan, but the manufacturers were not, and now every effort will be made to influence the latter.

At the annual meeting of the Milwaukee Automobile Club, Dr. Louis Fuldner, president; James T. Drought, secretary, and Lee A. Dearholt were re-elected directors. On Nov. 10 the club will meet again to consider the recommendation of increasing the board of directors from nine to fifteen. At this time the old officers will no doubt be re-elected, having given such splendid service for the last few years. The annual report sbowed the club to be in the most prosperous year of its six-year history. The treasury contains $1,500, not including $1,200 annual dues to be collected early in January.

THE 1909 RAMBLER SPARE WHEEL.

A unique feature of the 1909 Rambler line just announced by Thomas B. Jeffery & Company, which will attract a great deal of attention, is the Rambler spare wheel and inflated tire. All 1909 four-cylinder Ramblers are fitted for this equipment, which consists of a wheel complete, except the hub center, on which is carried a complete tire, inflated.

The wheel is secured to the hub center by six bolts. Removing the six nuts from these bolts, the wheel can be detached by means of special tools, a wheel puller and a socket wrench. Only three minutes are required to make the change.

This spare wheel is a regular wheel in every particular. It fits on either front or rear, and it is not necessary at the end of the trip to change it. In the event of tire trouble, the injured tire can be repaired, replaced on the original wheel, inflated, and that wheel is thereafter carried as a spare wheel. Besides being a handy provision against tire trouble, an extra wheel is always valuable in case of need.

Special brackets are provided to carry the wheel and tire, and an extra charge is made for the complete equipment. The illustrations tell the story quite conclusively.

Fig. 1—3 P.M.—The start—jacking up the car.

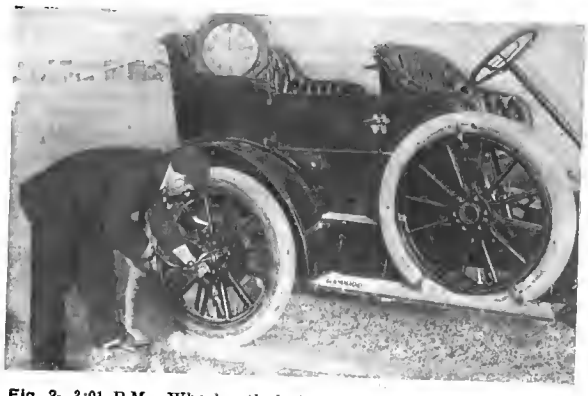

Fig. 2—3:01 P.M.—Wheel entirely loosened, ready to be taken off.

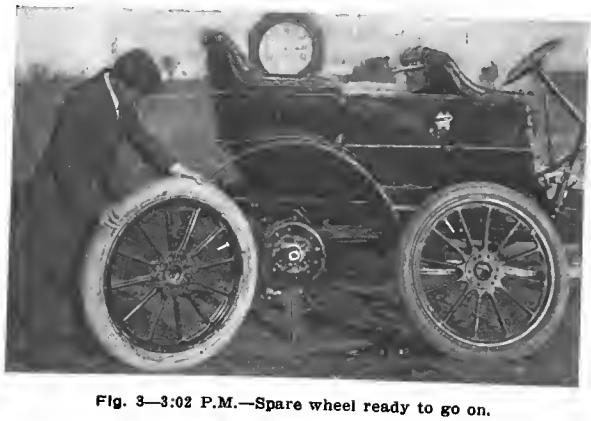

Fig. 3—3:02 P.M.—Spare wheel ready to go on.

Fig. 4—3:03 P.M.—Spare wheel with inflated tire in place.

DIAMOND TO HAVE RACING DEPARTMENT.

What may be regarded as the first practical step taken with a view to placing automobile racing in this country on the well-regulated basis, where tires and similar equipment are concerned, that has always distinguished the big establishments on the Continent, and which has doubtless been accountable in large measure for the success of foreign makers, has just been inaugurated by the Diamond Rubber Company, of Akron, O., in the shape of a racing department, which will be in charge of Joe Tracy, the well-known American driver. Speaking of this move on the company's part, one of the Diamond officials said:

"Mr. Tracy has been retained by us not only as consulting engineer on all racing equipment matters, but to have charge of a racing department we have organized which will be most complete in every respect. We are making no great predictions, but neither are we simply making a bid for increased publicity for our product. What we are doing is building up our organization so that we can take care of racing matters on a large scale. It is our present conviction that the automobile public demands the Vanderbilt and all similar big racing events."

Mr. Tracy will continue to retain his New York location, and states that he will be able to attend to other consulting commissions as in the past.

FIRE WILL NOT STOP DAYTON COMPANY.

DAYTON, O., Nov. 2.—In spite of the destructive fire which completely gutted the upper floors and badly drenched with water the lower portion of the building occupied by the Dayton Electrical Manufacturing Company on the night of October 21, the company found that enough of the undamaged stock was available for shipping to continue the business, except for the manufacturing end, just as though nothing had happened. This finished stock is sufficient to run for about six months, and in the meantime work on the new factory is being rushed to completion, so that by early Spring it will be possible to manufacture the 1910 stock.

"BEN" GOES HOME TO SELL CARS.

SYRACUSE, Nov. 2.—C. Arthur Benjamin is coming "home." He is going to sell Packard and E-M-F "30" cars, having just made Syracuse agency arrangements for these two makes. "Ben." is known from coast to coast, and he has sold automobiles of one kind or another since the beginning of the industry in this country. His latest connection was with the Aerocar Company, of Detroit. Benjamin has contracted for 150 E-M-F "30" cars, and already has disposed of one-third of them to sub-agents and has booked several retail orders in Syracuse and vicinity.

CONCERNING THE FUTURE OF THE AUTOMOBILE

By ALFRED REEVES, General Manager of the A. M. C. M. A.

"The Automobile's Future in America" is a big subject. The statistics of the past ten years are our main guidance for the future of this great industry. Many of the early figures are lacking, but it is safe for us to say that the automobile sales in 1903 were considerably less than $8,000,000, which has increased to over $105,000,000 in 1907, while this year's figures, when compiled, will show almost, if not about the same, despite the recent financial depression. During 1907 something like 52,000 cars were made and sold, and this year will supply about the same figures, although most of them are of the small type. It is estimated that the present capital of the automobile business is about $105,000,000, with an additional $36,000,000 in kindred trades, and $57,000,000 more in garages and retail salesrooms, making a total of $198,000,000. According to latest figures obtainable, there are 58,000 employees in the automobile factories in this country—about 29,000 employed indirectly in the making of parts, while there are 21,500 in the sales and garage establishments. This gives a total of more than 108,000 employees.

Number of Makers.—The records at the office of the American Motor Car Manufacturers' Association show that there are in this country 253 builders of automobiles, of which at least 123 are beyond the experimental stage, and are placing practical cars on the market. There are not less than 500 different trades involved in automobile manufacture, running from leather, varnish, broadcloth and buttons to steel, brass and rubber.

Although the importation of automobiles is fast decreasing, it is a fact that some $28,000,000 worth of foreign cars have been sold here. The trend is now going the other way, and the export trade of the American maker is increasing rapidly. It doesn't take very much of an imagination to figure that with our business methods, our unexcelled mechanics, our wonderful automatic machinery, and our perfect factory systems, America will continue its lead in motor car building, both here and abroad.

With 52,000 cars as a conservative estimate for this year it is safe to say that 175,000 automobiles have been sold here during the past eight years. They are big figures, but it is a big industry.

During the past year 13,980 cars have been registered in New York City alone, making a total registration since the law went into effect, of 63,338 cars. Above all, and of great interest to those about to enter the trade, is the fact that 9,386 new chauffeurs were registered during the current year. One cannot be a pessimist on the automobile's future in the face of such figures. What of the future of this greatest improved individual transportation of man? The past makes good reading and good history, but as matter-of-fact people we are interested in what confronts us.

Production for 1909.—Factory reports indicate a tremendous production in motor cars for next year, running from machines that range from $150 for the schoolboy to $11,000 cars for the luxury-loving and speed-fascinated millionaires. Four factories alone announce a total production of 36,000 cars, two of the leaders planning to turn out 12,000 cars each. Yet there is no reason to believe that next year will see an overproduction, provided good cars are made and sold at reasonable prices. The tremendous buying power of this country is evidenced in a score of ways, and particularly by the absorbing of motor cars during the past two years. Possibly next year's production will reach 75,000 cars. Yet we well know for the past five or six years a million buggies a year have been made and sold by the carriage people. Just what becomes of them no one has been able to say, but the buggy manufacturers continue to turn out these great quantities of horse-drawn vehicles. They are now turning their attention to motor vehicles, for the farmer is demanding the more modern type, for which he is quite ready to pay the price. One of the largest concerns of agricultural machinery plans to make 20,000 cars next year, yet this will hardly give them one apiece for their agents throughout the world.

THE AUTOMOBILE AS A WORLD-WIDE FACTOR

By E. P. CHALFANT, Assistant General Manager of A. L. A. M.

THE automobile, after all, is simply a manifestation of the forces of evolution that are working out the world's destiny, and its appearance is no more remarkable than was the advent of discoveries in other lines of endeavor.

A Vehicle of Commerce.—There can be no doubt now that the automobile is to play a permanent part in the affairs of mankind. If it had nothing else to recommend it but its time-saving and health-giving attributes, it would be a permanent institution. But it is as a vehicle of commerce that it is to figure more prominently in the future. Its commercial phases are practically unlimited. What the world wants are labor-saving devices, and the automobile is one. Manufacturing plants are hauling their product with motor cars in lieu of horses. They find the innovation an economical one from every standpoint.

Municipal Use.—Then, again, the automobile is to become a part of every well-regulated municipality. In many of the large cities of the country to-day motor cars are utilized with great success in the health and fire branches of the public service. They are found to be invaluable to hospitals, where a minute's delay sometimes means loss of life. The same can be said of the fire department, in which branch of the municipal government they have served to advantage. The Federal government, too, has become converted to their utility, and has installed motor cars in the post office service of the principal cities.

Miner and Farmer.—But it is not alone in the large cities that the labor and time-saving properties of the automobile are appreciated. In the isolated sections, far from the beaten paths, the miner and farmer have endorsed the horseless vehicle by using it. This apparent popularity of the automobile, however, is not confined to one section or nation. It is world-wide in its scope. It is as pronounced in the Orient as it is in America.

World-wide Good Roads Movement.—Automobilists in Japan are recognizing this fact, and good roads all over the Empire no doubt will soon be seen. The government should send several emissaries to Massachusetts, which State, I believe, has the finest roads in the world. That is another phase of the motor car that must not be overlooked. The good road movement is now world-wide. Its agitation was begun by the advent of the automobile, and the great benefits that are derived to-day by the construction of good roads must be credited to the motor car. In this country Ohio and Iowa possess the poorest roads. In certain seasons of the year the highways of the latter State are well-nigh impassable, the black loam apparently having no bottom.

But there is nothing unusual about this, as America, on the whole, is famous for hard road conditions. That is why the American manufacturer gives his product liberal clearance, and why the domestic car, typified in the product of the Licensed Association, is able to endure difficult going.

Manufactures.—The United States annually produces something like 80,000 automobiles, while Italy manufactures 25,000 and France 40,000. Germany is another producing nation, as is England, but the two first mentioned build the bulk.

Candidate for Indiana Governorship Made a Whirlwind Tour in Premier Pathfinder.

Auto Travel and the Steamers.—Not ıny years ago it was the custom of nericans going abroad to rent foreign rs on the other side, but witbin the past o or three years this has been changed such an extent that shipments of Ameri- ı cars for private use in the Spring and ir return in the Fall, have become an m of considerable importance with many the Transatlantic lines. Formerly, tour- s were content to land at Cherbourg, ıvre, Southampton or Bremen, but now ıny prefer a Mediterranean port, and the siness has increased to a point where e of the lines has decided to make ınges in the construction of its ısels in order to accommodate the gest enclosed cars between decks. is space has previously not been suffi- nt to permit of stowing the crates used closed cars and it will accordingly be reased nine inches on all the steamers of s line. This information comes from George N. Pierce Company, of Buffalo, Y., and reached it in the shape of a let- from the steamship company in ques- ı, owing to the fact that one-fourth to -third of the machines shipped for tour- purposes were Pierce-Arrows.

& J Tire Company Addition.—The & J Tire Company, Indianapolis, Ind., e broken ground for the erection of a te addition, the new building when com- ed giving the company about 50,000 ıre feet of additional floor space. When ed as to the possible effect of the reduc- in prices on the 1909 product, President C. Dowse made this statement: The n element that justified our reduc- the price of G & J tires for 1909 is reduction in our cost of production. s has been brought about by our im- ement in the methors of manufacture, ch has resulted in fewer replacements on guarantee, and increased factory capae- which has greatly reduced our overhead nse. We shall continue the coming sea- to use the same quality and quantity naterials as we have in the past, and put forth every effort to make the best on the market. Ours is the only rub- company in this country devoted ex- vely to the manufacture of pneumatie , and for that reason all our efforts oncentrated upon this one line."

eatest Wonder of the Age.—A cir- ! put out by the Heney Gas Engine Company, Ligonier, Ind., which proposes to exploit tbe automobile field, puts forth these claims: "The Greatest Wonder of the Age: Self-igniting; no batteries; no dynamo; no hot-tube; no spark plugs; no valves; no cams; no cogwheels; no weak sparks; no wires; no trouble starts in the rain, starts in the snow; nothing to adjust; no cams to set; no sparkers to set." And then the manufacturer logically ends by saying: "What more can you ask?" Nothing! On second thought, one might inquire, will there be any "back-kick"? One is inspired to ask the question by a casual statement in the circular informing of the ability of the engine to "mote" both ways. If the motor is strong-minded, and will positively go one way at a time, all right; otherwise, one's poor judgment is: "there is one point in the dark."

Trouble Among Auto-Buggy Makers.—The Success Auto-Buggy Manufacturing Company, of St. Louis, has brought suit in the United States Court at Indianapolis against two of the motor buggy builders of that State for what is claimed to be infringements of patents held by the Success company. The statement is made that these companies, namely the W. H. Kiblinger Company, of Auburn, Ind., and the Economy Motor-Buggy Company, of Fort Wayne, Ind., entered into an agreement with the plaintiff whereby they were to pay the Success company a royalty on each buggy manufactured by them, but that the defendants have failed to carry out this agreement. The proceedings are the result of defendants' refusal.

Prize Float at Syracuse Fair.—In the commercial float parade of the Ka-Noo-No Karnival, which is held annually in connection with the State Fair at Syracuse, the float entered by the New Process Raw Hide Company, of Syracuse, N. Y., won first prize in the machinery division. The central object of the float was a huge globe about five feet in diameter, made of raw hide and surrounded by a large gear ring at the center. Inside the globe were thirty incandescent lamps, and as the raw hide is translucent the effect at night was rather striking, made doubly so by the fact that the globe was revolved by gear and chain connection from the rear wheels of the wagon.

Chicago-Milwaukee "Great White Way."—The Chicago-Milwaukee Road and Real Estate Company, whicb plans to construct a $2,000,000 "Great White Way" from Milwaukee to Chicago, will give a dinner to Milwaukee business men this week to rouse their enthusiasm for the plan. H. D. Layman and J. F. Moeller, of Chicago, have been in Milwaukee for some days talking up the project. It is planned to place $54,000 of the $100,000 common stock in that city. There will be an additional issue of $2,000,000 preferred stock. The scheme is to build a boulevard 144 feet wide, whicb will be the finest motor and horse parkway in the world.

Hoosier'a Successful Trip East.—R. I. Love and party have just returned to their homes in Indianapolis, after completing a most successful trip of over 5,000 miles in a Premier Six. The route of the tour was East, most of the time being spent in and around the Adirondacks, where the road conditions were not of the best, but Mr. Love says that at no time were they inconvenienced by repairs, even escaping with the small number of four punctures. On the return trip the party covered 1,300 miles from Saranac Lake to Indianapolis in a week, having encountered good roads, with the exception of the strip between Toledo and Fort Wayne, where rains had made the going very heavy.

J. H. Neustadt Retires.—The announcement is made that J. H. Neustadt, founder of the Neustadt Automobile & Supply Company, of St. Louis, has disposed of his entire interest in the business and retired. In the reorganization which followed, the following officers were selected: President and treasurer, E. L. Epperson; vice-president, F. J. Tecklenburg, and secretary and general manager, H. W. Gray. Mr. Epperson has been associated in many ways with the automobile industry and other enterprises, while Mr. Gray is retained from the old organization. The Neustadt Company was one of the pioneers in the supply business and has become one of the largest in the country.

Southern Tier Motor Company Expanding.—The recently incorporated Southern Tier Motor Company, of Elmira, N. Y., has taken over the automobile business formerly conducted by the Elmira Arms Company's motor department and the Willys-Crew Motor Company. The new organization will occupy the garage which the latter company controlled. The company will have the agency for several lines of cars, although the Overland will be featured. Guy W. Shoemaker, the president of the firm, will give his entire attention to the trade in Elmira and vicinity, while the secretary, Harry K. Crandall, will look after the outside and road work.

Large Quantities of Oil for the Vanderbilt.—As an example of the immense amount of oil used in connection with a race like the Vanderbilt, A. W. Harris, of Providence, states that the nine cars which used Harris oil in that event took delivery of over 900 gallons, each car averaging 100 gallons apiece. Tbis may sound like a large figure for an event of such comparatively short duration, but it should be remembered that not only must a sufficient amount be provided for all emergencies, but that part of the oil is used by the camp tenders and during practice.

A. M. C. M. A. Hand Book Ready Soon.—The official hand book of the American Motor Car Manufacturers' Association, "Leading American Cars," which is published annually by this association, will be ready for distribution

at an early date, as the data is now in the hands of the printers. The mechanical details will be arranged according to price classification, with separate divisions for pleasure and commercial vehicles. Besides the mechanical details, interesting data will be given about 1909 models made by the members of the A. M. C. M. A.

Motorcar Company Elects Officers.—The Motorcar Company of Detroit, manufacturers of the Cartercar, has elected the following officers of the company for the coming year: President, F. T. Caughey, Detroit; vice-president, A. G. Nortb, Pontiac; secretary, H. R. Redford, Detroit; treasurer, H. G. Hamilton, Pontiac; general manager, R. A. Palmer, Detroit. This company has purchased the plant of the Pontiac Spring & Wagon Works at Pontiac, Mich., and will remove from Detroit.

First Entries for 1909 A. A. A. Tour.—Although the 1909 A. A. A. Tour for the Glidden Trophy is still nine months away, automobile manufacturers have commenced preparations for it. The first public evidence of this activity is the entry of three Molines in the runabout class, and W. H. Van Dervoort, of the Moline Automobile Company, East Moline, Ill., has requested of Chairman Hower that these three cars be given the first numbers in this class.

Anderson Increases Capital Stock.—The Anderson Carriage Company, Detroit, Mich., builders of the Detroit electric, recently passed resolutions increasing the capital stock of the company from $300,000 to $500,000. An output of 1,000 electric cars is the announced total for 1909. The concern also manufactures horse-drawn vehicles, of which it will make 15,000 for 1909.

Change in Lancia Price.—The Hol-Tan Company announces that on December 31, the day of the opening of the Palace show in New York, the price of the Lancia chassis will be advanced from the present price of $2,800 to $3,000. The change has been found necessary because of the increased demand for these cars following the good showing made in the different events in which they have participated.

Woodworth Treads Reduced in Price.—The Leather Tire Goods Company, Newton Upper Falls, Mass., announce a new price list for the Woodworth treads. The prices are substantially reduced, though the firm states that there has been no change whatever in the high quality of the product. A letter to the factory will quickly bring a copy of the reduced price list.

"Spit-Fire" Plugs Share in Victory.—Two cars which bave attracted attention lately by their fast work were equipped with Mosler "Spit-Fire" spark plugs, namely the winning Simplex in the last 24-hour race at Brighton Beach and tbe 12-cylinder Maxwell which did a mile in 31 seconds at Atlantic City.

New Facilities for the Oakland Company.—The work on the large additions to the Oakland plant at Pontiac, Mich., was commenced last week and the buildings will be rushed to completion as fast as possible in order to be available for the company's increasing business.

IN AND ABOUT THE AGENCIES.

Maxwell, Philadelphia.—The Maxwell-Briscoe Motor Company has leased the former Philadelphia branch house of the Rambler at 207-209 North Broad street, for the future home of the Maxwell. Incidentally the concern which will handle the car has undergone a change of name from the Kelsey Motor Car Company to the Longstreth Motor Car Company, with William C. Longstretb as general manager. There will be no change whatever, in the personnel of the company.

Rambler, Philadelphia.—A surprise in the nature of a shock struck Philadelphia's "Gasoline Row" last Thursday when it was announced that Thomas B. Jeffery & Company had decided to abandon Philadelphia as a contributing center and concentrate its Eastern business in New York City. The Tioga Automobile Company, at Broad and Tioga streets, George C. Brownlee, manager, has been appointed Pbiladelpbia Rambler agent.

Mitchell, Philadelphia.—Taking the former quarters of tbe Hills Motor Car Company and Noblit and Fassett, at the northwest corner of Broad and Cherry, and adding to it the rear balf of the Nichols Bazaar Stables, the Penn Motor Company has thrown them all into one, and after considerable alteration has one of the finest and best equipped salesrooms and garages on Philadelphia's "Gasoline Row."

Spencer Pump Distributers.—The manufacturers of the Spencer power air pump announce that the following distributing agencies have been established: American Motor Car Company, 187 Wisconsin street, Milwaukee, for the State of Wisconsin; George W. Edge, 3924 Olive street, St. Louis, for Missouri, and the Neustadt Automobile and Supply Company, 458 Golden Gate avenue, San Francisco, for that city and vicinity.

American Wind Shield in Europe.—The demand for the "Automatic" Wind Shield abroad has been sufficient to warrant C. A. Metzger, Inc., its makers, to have the shield manufactured in the leading countries of Europe. Emil Grossman, president of the National Sales Corporation, will be in charge of the wind shield exhibitions at the London and Paris shows, and will also make contracts for the manufacture of same.

Pope-Hartford, New Jersey.—The Pope-Hartford interests in Newark will hereafter be taken care of by E. P. Cooley, late of the Mitcbell Automobile Company of New Jersey. Several subagents have already been appointed in Northern New Jersey, among them being Victor A. Wiss & Brother, of Morristown, and the Garretson Auto Company, of Somerville.

KisselKar, Chicago.—Last week negotiations were closed whereby the Middle Western territory will be handled for the KisselKar by H. P. Branstetter, of the Branstetter Motor Company, 1337 Michigan avenue. The same quarters will be used, but the name changed to the Kissel Motor Car Company. Mr. Branstetter will immediately arrange for branch agencies in his territory.

Stoddard-Dayton and Reo, Santa Rosa, Cal.—Captain O. L. Houts and D. C. Prentice, of Santa Rosa, Cal., have formed a partnership and taken the agency for the Reo and Stoddard-Dayton cars for the coming year. F. J. Wiseman, well known as a Stoddard-Dayton driver, will be associated with them in the new venture.

Twentieth Century New Selling Agency.—The Twentieth Century Manufacturing Company, makers of lamps and generators, announce that the entire selling end of the business, so far as the automobile trade goes, will hereafter be in the bands of the Stevens-Britton-Maurel Company, of 1783 Broadway, New York City.

Richmond Roadster Distributing Branches.—The Wayne Works, Richmond, Ind., manufacturers of the Richmond cars, have made arrangements with the Racine Boat Mfg. Co. to act as the agents for the Richmond Roadster at all of that company's branches, located at New York, Boston, Philadelphia, Detroit, Chicago and Seattle.

Oldsmobile, Baltimore.—Tbe Oldsmobile will be taken care of in Baltimore for the coming year by the R. E. Leinbach Auto Company, 2312 Madison ave-

Annual Conferance of Wavsrley Salesmen and Officers.

The regular annual conference of salesmen and officers of the Waverley department of the Pope Motor Car Company has been an annual feature of the Indianapolis factory. The most successful one ever held, however, was the recent one, where the "New" and "Old" combined in united effort to dig out all of the points regarding this well-known electric carriage, which would be to ite benefit and theirs in pushing its sale. The above illustration shows the "New" and "Old" between the hours of conference. Reading from left to right, lower row: H. W. Goodman, Charles M. McAlpin, purchasing agent; Herbert H. Rice, vice-president and manager; Carl von Hake, treasurer; Wm. B. Cooley, president; Wibur C. Johnson, secretary; Roy A. Potts, sales manager. Top row from left to right: E. K. Shugert, R. T. Davie, P. W. Wigner, K. W. Brewer, H. W. Dickerman, E. R. Vincent, W. S. Gilbreath.

nue. This company is now planning to move into more commodious quarters in the vicinity of Ninth avenue.

Jackson, New York City.—The agency for the Jackson cars in this city formerly held by the George J. Scott Company, has been taken by C. W. Oathout at the same place, 1729 Broadway. Mr. Oathout has been Eastern sales manager for the Jackson Company for a year.

Apperson, St. Louis.—Elmer Apperson, of the Apperson Brothers Automobile Company, Kokomo, Ind., who was in St. Louis recently, made arrangements with the Capen Motor Car Company to represent the Apperson in St. Louis for 1909.

Regal - Detroit, Philadelphia. — The latest newcomer to Philadelphia's big automobile family on North Broad street is the Regal-Detroit, for which the Thomas M. Twining Company, at 326 North Broad street, recently acquired the local agency.

De Luxe, New York City.—The De Luxe Motor Car Company will be represented in New York City by H. R. Mallow, who has charge of the new branch just opened on Broadway.

Continental Tires, Cleveland.—Continental tires and demountable rims will be distributed in Cleveland by Charles E. Miller, 1829 Euclid avenue.

Franklin, Grand Rapids, Mich.—Adams & Hart, of 47 North Division street, Grand Rapids, have taken the agency for the Franklin car.

Autocar, Pittsburg.—Urling & Company, of Pittsburg, has taken the agency for the Autocar as well as the Corbin.

G & J Tires, Pittsburg.—The Iron City Tire Repair Company has taken the agency for the G & J tires.

PERSONAL TRADE MENTION.

Peter S. Steenstrup is one of the latest to succumb to the allurements of matrimony, and, furthermore, he is to become a resident of Detroit, having purchased a residence at No. 75 Calvert street in that city. Mr. Streenstrup is well-known as secretary of the Hyatt Roller Bearing Company, located at Harrison, N. J., but through the necessity of spending much of his time in the Middle West, he has decided to become a resident of Detroit, where he and Mrs. Steenstrup returned recently from their transcontinental wedding tour.

Peter S. Steenstrup.

William T. Taylor ("Billie"), who is at the head of the Philadelphia branch of the Olds Motor Works, will celebrate Thanksgiving Day by banqueting all the Oldsmobile agents and subagents in his territory at the Bellevue-Stratford. As his bailiwick includes Pennsylvania, New Jersey, Delaware, Virginia and the District of Columbia, "Billie's" guests will requlre several large-sized tables to serve them.

H. A. Githens, who for many years has been general traveling representative of the G & J Tire Company, has been advanced to the position of general sales manager. Mr. Githens is one of the best-known men connected with the industry, and his advancement is a just reward for conscientious services, according to the opinion of his many friends.

Emil Brossman, president of the Motor Car Equipment Company and the National Sales Corporation, sailed November 4 on the "Lusitania" to attend the Olympia show in London and the Grand Palais Salon in Paris. Mrs. Grossman accompanied him on the trip.

F. J. Lind, who is vice-president and general manager of the Maxwell-Briscoe-Pacific Company, agents for the Maxwell in San Francisco, has gone to Los Angeles, where he will take over the Maxwell interests formerly handled by the Maxwell-Briscoe-Willcox Co.

Charles M. Hall, for five years sales manager for the Badger Brass Manufacturing Co., makers of Solar lamps, at Kenosha, Wis., has resigned to become general manager of the American Lamp Co., at Detroit, Mich.

C. E. Smith, who has been with the Farmers' National Bank for a number of years, has left that institution and gone into the automobile business as the manager of the White Garage Company, Baltimore, Md.

J. H. Newmark, formerly of the Olds Motor Works, will be in charge of the newly formed publicity department of the Oakland Motor Car Company, of Pontiac, Mich.

George L. Breet, Jr., formerly with the White branch in Boston, has joined the sales department of the Algonquin Motor Company, Boston agents for the Oldsmobile.

George Fitzsimmons, formerly with the White Company in New York City, is now with H. J. Koehler in charge of the E-M-F sales department in New Jersey.

Harry De Groat has severed his connection with the Rambler Company, of Philadelphia, and in the future will be with the staff of the Studebaker Company.

M. J. O'Connor, who has been with the Pennsylvania Company in Cleveland as C. W. Moody's assistant, has gone to the Chicago branch.

C. A. Eastman, Pacific Coast sales manager for the White, is making an extensive inspection of the territory under his control.

OVERLAND DEVELOPMENTS.

INDIANAPOLIS, IND., Nov. 2.—With the sale of the majority of the capital stock of the Marion Motor Car Company, it is announced that the manufacture of the Marion will be discontinued after this season. J. N. Willys, president of the Overland Automobile Co., and E. B. Campbell have purchased 989 out of 1,000 shares of stock in the Marion company.

The Marion plant has been placed at the disposal of the Overland company, and is being used for the manufacture of Overland engines and part of the other mechanical equipment, the assembling being done at the Overland plant, in West Indianapolis.

In line with its plans to manufacture 2,000 cars next season, the Overland company is now building a substantial addition to its West Indianapolis plant, which will be completed within the next few weeks. Edward Sourbier, for some time with the Marion Car Co., will be general manager of the Marion plant at Fifteenth street and the Big Four tracks.

Carl G. Fisher's Auto-carrying Balloon.

AN AERONAUTIC AUTOMOBILE

Automobiling has always been closely associated with aeronautics, as the majority of enthusiasts in the latter field have been recruited from the former, but it has remained for Carl G. Fisher, of Indianapolis, to combine the two sports. Mr. Fisher, in addition to being an ardent navigator of the air, is the Indianapolis agent for the Stoddard-Dayton car, and, becoming tired of having to impress a farm wagon or other equally slow and uncomfortable method of transport to carry his party and the balloon from wherever the latter alighted, to the nearest railway station, he decided to take a car with him instead. In place of the usual basket, he substituted a Stoddard-Dayton 25-horsepower car, which was attached to the load ring of the balloon in the usual manner.

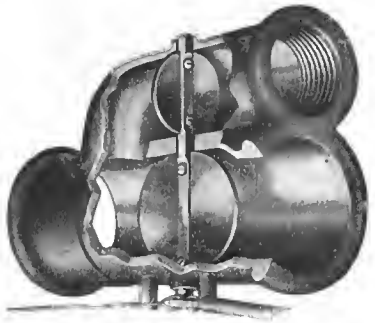
Last Friday, accompanied by Captain Brumbaugh, the well-known aeronaut, an ascension was made from Indianapolis. The plan was to make a 100-mile flight, landing just outside of Dayton, O., then load the gas bag on the deck of the automobile and proceed into the city. A westerly wind started the aeronauts in the desired direction, a few minutes after the big bag and its novel attachment were released at Indianapolis, and a landing was successfully made in a corn field near Dayton, just at dusk.

A Good Evidence of Busy Times.

INFORMATION TO AUTO USERS

Gabriel Products for 1909.—The products of the Gabriel Horn Mfg. Co., Cleveland, O., for 1909 show many improvements over former models.

As it is necessary to have a perfect working valve to operate an exhaust horn satisfactorily, the Gabriel company has perfected a valve that is guaranteed



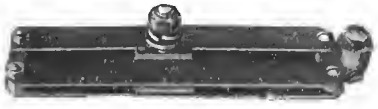
NEW GABRIEL CUT-OUT VALVE.

not to stick under any conditions. The instant the operating lever is moved, the disk in the main channel begins to close and the disk in the branch channel, placed at an angle of 90 degrees, starts to open. This gives immediate escape to the exhaust, causing the horn to respond, and prevents building up of back pressure. By removing the circular disk in the main channel of the valve, as shown in the illustration, a correct valve

THE 1909 GABRIEL HORN.

for the relief of the exhaust is secured; this gives a 1 1-4-inch escape opening in addition to the regular outlets; in other words, a perfect cut-out that relieves all back pressure caused by the muffler. When the valve is closed it does not allow any leaking of the exhaust or cause any noise. These valves are made up to fit all standard sizes of iron pipe or steel tubing ranging from 1 inch to 2 1-2 inches outside diameter.

While the outward appearance of the Gabriel Horn is the same as the 1908 product, the new model is superior in tone to any previous models. A little device has been perfected which makes it possible for the horn to produce a

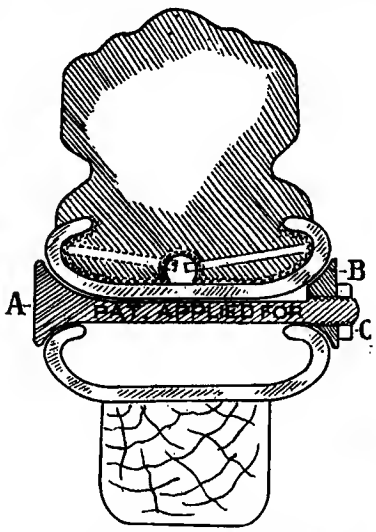


LATEST GABRIEL SHOCK ABSORBER.

sweet musical tone for city use; however, the pitch is such that the three notes can be caused to rise in unison, which makes a penetrating warning for country riding. The company will continue to furnish single-tube, three-note horns in four sizes to fit any size of motor.

The shock absorber manufactured by this company will in the new models have an increased bearing surface for attaching to the angle plate on the spring and a new method of fastening the stud to the friction pad by use of a 1-2 by 3-4 by 2 1-4 inch case-hardened block; this gives a 5-8 inch bearing on the stud, which allows it to turn, thereby taking care of the end motion the same as side links on a spring. These two features eliminate all noise or rattle and cause the absorber to be quiet in its action, and, owing to the use of a new friction material, the effectiveness and durability of the absorber is increased.

Swinehart Rim Attachment.—This attachment permits of equipping an automobile with Swinehart cushion tires without in the least disturbing the original rim equipment or changing the road clearance of the car. Pneumatic tires can be replaced by cushion tires in less than five minutes. With this attachment one or more cushion tires can be used in connection with pneumatics, on the same car, with excellent results, as the outside diameter of the wheels is not altered. It is a well-known fact that cushion tires are necessarily somewhat



SECTION SWINEHART RIM ATTACHMENT.

less in height than pneumatics, which formerly rendered the above impossible.

Swinehart cushion tires are fitted on light clincher rims at the factory, and are then shipped to car owners, together with bolts for attaching. Eight bolts are ordinarily required for each wheel. The nuts on these bolts need not be removed, simply loosened. The bolts are all placed on top of the rim on the wheel, and the tire and rim thrown into position. The bolts are then easily slipped around to their proper position, and tightened with a wrench, which securely clamps the rim and tire to the wheel.

One of the advantages of this attachment is its utilization as a spare wheel in case of injury to one or more pneumatics. A pneumatic tire can be replaced with Swinehart spare rim and tire in less than five minutes, and it is claimed that this spare wheel will run thousands of miles without any further attention. The Swinehart company claims this to be a most practical spare equipment, as it brings the strain directly over the bearings of the wheel on the same plane as with the original tire.

A Handy Dry Cell Holder.—The R. W. Magna Mfg. Co., Holyoke, Mass., are bringing out a new dry cell holder to be known on the market as the Magna quick change rigid battery holder. Amongst the claims for this equipment are the obvious features enabling one to replace a set of cells with-

out having to cope with the annoying details of loose end wires and other well-known troubles. The illustration indicates very clearly the absence of thumb screws and other small parts, likely to loosen, thus destroying the electrical contact; if indeed, they may not be lost. The principal of the wedge is employed in holding the cells in place, incidentally affording terminal connections as a combination feature, while the wiring is by way of permanent "bus bars" within the box. The whole idea is to provide batteries in which the electrical connections will remain good when made, and in which replacements can be affected quickly and without trouble.

The "Auto-Felt Boot."—The accompanying illustration shows the type of boot which A. H. Putnam & Company, Danvers, Mass., are manufacturing especially for use by automobile users in cold weather when

THE AUTO-FELT BOOT.

difficulty is sometimes found in keeping the feet warm. It is made with a felt top, foxed with leather, has a heavy felt lining, and is ten inches in height. The sole is a heavy, one-half double leather.

Graphlio Grease.—The Walter D. Carpenter Company, 39 Cortlandt street, New York City, has just brought out a new mixture to meet the demand for a non-fluid oil for automobile use. Graphlio grease is a mixture of pure neatsfoot oil of low cold test, free from stearine, and the Graphlio oil made by this company. This concern claims that the crystalline Graphlio, free from grit and dirt, in good grease, produces a mixture best fitted for all the uses of hard grease. The new preparation is furnished in five different consistencies.

Vol. XIX New York—Thursday, November 12, 1908—Chicago No. 20

The Automobile

The Vanderbilt Cup Winner "At Home"; the Trophy Which It Won Octobsr 24; ths Man Who Drovs It to Victory.

BRIDGEPORT, Conn., Nov. 9.—No Olympian chariot and charioteer was ever accorded a more royal welcome than Bridgeport accorded the Locomobile and George Robertson, victors in the Vanderbilt Cup race, on the occasion of their home-coming this week. The celebration was really a two-day affair, starting with a triumphal run from New York to the Connecticut city on Sunday, continuing with an afternoon of jubilant reception on Tuesday, and winding up that evening with a great banquet, at which the keynote was "local pride" over the fact that the first American car to win an international road race was "built in Bridgeport!" Of course Bridgeporters got excited.

The demonstration of enthusiasm and the wild hurrah of welcome and congratulation that marked the banquet was without dispute one of the most noteworthy evidences in the whole history of the sport in this country of how heartily Americans are ready to give encouragement to any triumph that marks the progress of the American automobile industry, and the success of American drivers in the handling of motor cars of home production in international speed competitions. As one speaker remarked: "Were every town to give its car the backing that Bridgeport does the Locomobile, there would be a corps of racing machines evolved that would furnish a topnotcher worthy of competitive comparison with the products of the world."

Illustrative of Bridgeport's universal co-operation in doing honor to the victors, it is to be noted that the banquet was promoted jointly by the Automobile Club of Bridgeport, the Bridgeport Board of Trade, the Manufacturers' Association, the Business Men's Association and the Press Club of Bridgeport. In the great dining-room of the new Stratfield Hotel were gathered 300 of Bridgeport's representative men, and still there were some that could not find seats at the tables. No such assemblage had ever before been gathered at a banquet in the city's history.

On a pedestal in front of the long guests' table stood the historic Vanderbilt cup itself. The sight of it seemed a constant inspiration to enthusiasm. In fact, it was a hurrah dinner from start to finish. The corks had not been popping many minutes before the banqueters broke forth in song. Two songs in particular proved highly popular and were shouted in chorus at every provocation, and the provocations were frequent. One was sung to the tune of "Harrigan" and ran as follows:

R-O-B-E-R-T-S-O-N spells Robertson,
Gee! but did you see the speed that's in him?
Devil a driver has a thing agin him.
Robertson, Robertson,
He's the king of the ring,
Not a thing can compare with Robertson.

The other had for its theme A. L. Riker, the designer of the car, and was a paraphrase on "Hallelulah":

There's a man we admire,
He's a man we all love,
In the ranks of designers
He's 'way up above.
Hallelulah! He's a corker!
Give him a cheer for the guest,
Hallelulah! Get up and holler
For our vice-president.

With 300 voices and an orchestra to accompany, the singing was indeed electrifying. It would have survived Niagara's roar.

The Hon. Stiles Judson, State attorney, who filled the post of toastmaster, was not only patriotically eloquent, but kept the fun going as well, always ready with clever repartee in response to the shots fired at him constantly from the tables. He had beautiful bouquets to hand out to Robertson, Riker and the Locomobile Company, and he did it most artistically.

Main Street in Bridgeport, Conn., with the Victor Receiving the Hearty Applause of the Multitude.

George E. Hill, speaking for Mayor Henry Lee in his absence, paid a glowing tribute to the mechanics that built the winning car.

Amzi L. Barber declared that he had started the Locomobile Company to give a job to his son-in-law, Davis, and that the presence of the Vanderbilt cup proved that he had made good. Mr. Barber quickly switched to a discussion of good roads, in the course of which he sketched their history and told of the accomplishments of Macadam and Telford. He advocated building a strip of asphalt in the center of all macadam roads, which, he said, would insure an imperishable and dustless highway. In conclusion, he declared himself in favor of the expense of roads building being divided equally among the government, the State, the county and the township, one-quarter each.

Then Judge E. K. Nicholson, on behalf of the Board of Trade, presented its engrossed resolutions of congratulations to the Locomobile Company.

S. T. Davis, Jr., in receiving them, said that the bringing of the cup to Bridgeport was primarily due to the sportsmanship and liberality of William K. Vanderbilt, Jr., and that his rules had made it possible to produce the speed machine that had evolved successful. Mr. Davis told how Dr. Thomas, of Chicago, had ordered the first racer and how that had led to the building of the two cars that had finally triumphed. He touched upon their failures and their successes on the path to the ultimate victory in the recent race. In conclusion, he said: "Racing is expensive, but it pays—when you win."

Next came the eloquent presentation by Thomas H. Macdonald of a silver shield to the designer of the winning car. Mr. Riker was brief and modest in his reply, attributing the success of the car to the material, workmanship and superintendence supplied by the company.

En Route "Home" Robertson Excited Interest Galore.

Then came George Robertson's turn at recognition. It took the form of a silver cup. In presenting it, Horace E. Jackson told of the famous men that Bridgeport had given the world of invention. The inventors of the Maxim and Hotchkiss guns and the Howe sewing machine were Bridgeporters. Wilson Marshall, who won the Kaiser's transatlantic yachting trophy, and Harry Porter, who is the Olympic champion at jumping, also hail from the Connecticut town. Robertson modestly thanked the donors and expressed the wish that next year the Locomobile Company would build three racers and send them over to France for the Grand Prix.

Frank G. Webb, vice-chairman of the Vanderbilt Cup Commission, extolled the sportsmanship of the donor of the cup and told how his appointment to the Racing Board by A. R. Pardington, and a subsequent conference, had resulted in the giving of the cup and the inauguration of the Vanderbilt races. He declared that the Locomobile's victory marked the end of the contests of great racing cars, and hoped that the Locomobile Company would be represented next year by a team of cars of 130 mm. cylinder measurement.

John C. Wetmore, who was the last of the regular speakers, suggested that the citizens of Bridgeport, embracing not only its business men but the school children as well, build at their own expense three Locomobiles and enter them for the next Grand Prix in France.

Many Prominent in the Trade at the Speaker's Table.

At the speaker's table the notables, of course, embraced S. T. Davis, Jr., the president of the Locomobile Company; A. L. Riker, its vice-president and designer; E. F. Russell, the superintendent; John A. Kingman, the advertising manager, and Driver Robertson and Mechanic Ethridge.

Other well-known celebrities in attendance were: Henry Hess, William Gray, Clarence Whitney, Howard E. Raymond, Harry Fisk, Alfred Reeves, William Hobbs, Cortland Cramp, J. H. McAlman, John F. Plummer, W. F. Fuller, Fred J. Wagner, Russell Field and William Culver.

The banquet had followed a most enthusiastic greeting in the afternoon by the city at large to Robertson and the Locomobile. Many factories were closed and all the public school children were let out to join in the welcome. At the ringing of the fire bell, sharp at 3 o'clock, George Robertson and his mechanic, Glen Ethridge, left the Locomobile factory in the victorious car, amid an ovation of hilarious cheering by the workmen in the Locomobile factory. Thousands packed the sidewalks along the line of parade and the police had hard work restraining over-

enthusiastic welcomers from rushing on the road and mobbing the heroes of the day with congratulations. The parade of the victorious outfit was an ovation from start to finish.

The run to Bridgeport on Sunday was a triumphal procession. Robertson started from the Locomobile headquarters in New York City, at Broadway and Seventy-sixth street, at 9:45 a. m., escorted by 10 Locomobile touring cars bearing enthusiasts. Stops were made at New Rochelle and Port Chester, where car and driver were greeted by crowds afoot and in automobiles. In fact, all along the route spectators had gathered to see the passing of the famous racing outfit. At Greenwich there was a halt for an hour at the Indian Harbor Yacht Club, where luncheon was served to the escorting caravan of New Yorkers and the contingent of Bridgeport automobilists that had come to greet the car and escort it to its home town. Just out of Greenwich on the homeward trip a ball broke in an engine bearing and necessitated the car being toured the rest of the way. Despite this inglorious form of entry to its native town, there was the most enthusiastic greeting awaiting it and its pilot by the thousands that had gathered to welcome them.

Formal Presentation of the Cup.

The formal presentation of the Vanderbilt cup to the Locomobile Company of America is scheduled to take place to-night at half-past eight o'clock at the Automobile Club of America.

An attractive program has been prepared. Besides the formal presentation of the Cup by Jefferson deMont Thompson, chairman of the Vanderbilt Cup Commission, and a limited number of speeches by men well known in the automobile world, there will be an informal social gathering in which moving pictures of this year's French Grand Prix, the Motor Parkway Sweepstakes, and the Vanderbilt Cup race, with several musical selections, and cigars and light refreshments will be features.

On this occasion many people will see the Vanderbilt trophy for the first time. Nearby will be the A. C. A. Gold Cup, which will be struggled for at Savannah on Thanksgiving Day. Five thousand invitations have been issued.

Exactly what will be the form of competition for the Vanderbilt Cup in 1909 is yet undecided. It may be a "national" contest for racing cars, but another suggestion would make it a fall event of the stock car chassis variety.

The Bicycle Cop Was Lenient to the Cup Winner.

N. A. A. M. PERFECTING TRAFFIC DEPARTMENT.

For the purpose of still further enhancing the importance of its traffic department, the National Association of Automobile Manufacturers, Inc., has arranged for a series of meetings of the traffic experts connected with the automobile factories. The department, under the arrangement recently made, now represents not only the National Association of Automobile Manufacturers, but the so-called licensed and unlicensed associations as well, embracing a membership of 93 members. Of these a great many, but not all, take full advantage of the facilities offered by the department, which attends to classification matters, checking of freight bills, the proper classification of goods shipped to and from the factories, the preparation of and all other attention to claims, etc.

Mr. Marvin, the manager of the traffic department, is at present in the West attending a meeting of one of the classification committees, and will, as soon as that meeting is over, hold meetings with the traffic managers in Cleveland, Indianapolis, Chicago and Detroit. Later on meetings will be held in Eastern cities, and it is not unlikely that general meetings will be held during the New York and Chicago shows. Arrangements are being tentatively made and meeting with approval.

Many of Bridgeport's Substantial Business Men Honored the Big Banquet with Their Presence and Enthusiasm.

ST. LOUIS HAS THREE DAYS OF VARIED RACING

ST. LOUIS, Nov. 7.—For the first time in its history St. Louis has had a three-day meet. Besides, it has had a hill-climb for the first time. The St. Louis Automobile Manufacturers' and Dealers' Association is responsible for getting the thing started, while E. A. Moross, a well-known manager of a brace of automobile actors, helped out with his really clever methods of racing on one-mile circular tracks. No one, despite several olose calls, was mortally injured, unless it be a man who struck the track hard while being discharged from a Moon car in the novelty race, and the chances are in his favor. All the events were sufficiently interesting to more than satisfy the 4,000 persons who went to the old Fair Grounds race track for the events on Saturday, and the most of 7,000 which turned out on Sunday.

Final and Steepest Grade of Solomon's Hill.

The hill-climb on Friday drew 500 automobiles 14 miles out on the Manchester road to Solomon's hill, where a course bad been measured off sixteenths of a mile in length up the grade that increases in steepness as it runs to the summit, making a circuitous turn on the way. By foot and by car nearly 5,000 people assembled to see the speeding, for St. Louis had never had a similar event before. One accident, which might have cost the driver his life, occurred in the early part of the sprinting. A Moon car, swinging up the hill at a 40-mile clip, hit the turn too fast, and, after several contortions, settled back with a collapsed rear wheel. Until the cloud of dust subsided thousands believed that something very serious had happened, and it was a miracle that Phillip Wells, the driver, was sitting at the wheel of his car with a smile on his face.

On account of some misunderstanding between the judges—Alden H. Little, James Hagermann, Jr., and E. Percy Noel—and the contest committee of the Manufacturers' and Dealers' Association, the percentages have not yet been calculated, so that it is not yet known how the cars finished in the climb. It is probable that the Stanley special car driven by Baldwin was the winner of the free-for-all, and that the next best percentage was made by the Apperson driven by McClain. Tuttle probably took second place among the gasoline cars with a Stoddard-Dayton.

At the Circular Track Meet.

The spirit of the two-day meeting at the Fair Grounds was proclaimed in red ink, so that every one might read: "Spectators are warned to keep off the track, in case of accident, as races will continue regardless of results to spectators, drivers, or cars." The first event was only fairly started before Tim Bohnsen, a competing motorcyclist, fell from his machine and rolled forty feet, to be picked up with a broken nose and other injuries. In the third event, a special race for Moon cars, William Igou, blinded by the dust, crashed through the outer fence, near where Oldfield killed two men four years ago. As if by a miracle, car and driver escaped without a scratch.

The early accidents did not appear to dampen the spirits of other entrants, including Baldwin, who again proved the star of the day. In spite of the turns being banked only for horse-racing, he tore around them at a gait that made some of the veterans of the game sit up and look interested. Clinging close to the outer edge of the track almost the entire distance, so that he covered more than a mile in his circuit, he trailed a great cloud of steam and dust behind bim. On the turns he seemed to shoot across diagonally, and when he had reached the straightaway of the far stretch, he shot abead faster and faster, while the crowd in the grand stand stood up and yelled. When his time of 54 4-5 seconds for his exhibition mile was announced the wise ones shook their heads, for they knew that no gasoline car present could better the new record for a single mile, although the steamer would have been outclassed in a much longer distance.

Christie Oldfield and Ollie Savin all tried to better the steamer's time, but failed. Christie went around in Oldfield's former record time of 59 seconds; Oldfield did the same, and Ollie Savin, driving Christie's "Dreadnought," made it in 1:07. Jack Taylor drove the 45-horse-power Stoddard-Dayton in 1:08, while Charles Soules did the distance in 1:01 5-5 with the Stearns "Red Devil."

The contests between the star drivers in heats of the Sweepstakes, the finals of which were run off Sunday, were close and interesting; but the feature race of the day proved to be the free-for-all handicap for three miles, with five cars running. It was won by Paul Caldwell, driving a six-cylinder Pierce Arrow.

Sunday's track racing was partly a repetition and a continuation of the day previous. There was one serious accident, during the novelty race, which otherwise would have been very amusing. The injured man was hurt about the head while being "discharged" from a Moon car, but will probably recover.

Summary of Solomon's Hill Climb.

CLASS A—MOTOR BUGGIES; WHEEL DIAMETER, 36 INCHES.

1.	Victor	Oliver	1:53
2.	Success	Siddway	2:11
3.	Eureka	Allen	2:12

CLASS B—TOURING CARS, ROADSTERS, TOURABOUTS.
Piston area under 50 square inches.

1.	Buick	McQuillen	1:04 4-5
2.	Chalmers-Detroit	Paine	1:05 2-5
3.	Jackson	Delaney	1:21 3-5

CLASS C—TOURING CARS, ROADSTERS, TOURABOUTS.
Piston diameter over 50 and under 65 square inches.

1.	Apperson	McLain	1:00 2-5
2.	Moon	Igou	1:03

CLASS D—TOURING CARS, ROADSTERS, TOURABOUTS.
Piston diameter over 65 and under 90 square inches.

1.	Stoddard-Dayton	Tuttle	:49
2.	Packard	Lewis	:54 4-5
3.	Stevens-Duryea	Blumcoe	:55 1-5

CLASS E—TOURING CARS, ROADSTERS, TOURABOUTS.
Piston area over 90 square inches.

1.	Apperson	McLain	:45
2.	Stearns	Oldfield	:46 2-5
3.	Stearns	Soules	:46 2-5

FREE-FOR-ALL.

1.	Staniey Special	Baldwin	:40 4-5
2.	Stanley	Baldwin	:43 1-5
3.	Stanley	Woodward	:45
4.	Apperson	McLain	:45 2-5
5.	Stanley	Cull	:45 2-5
6.	Stoddard-Dayton	Tuttle	:49
7.	Stearns	Oldfield	:49 2-5
8.	Pierce	Caldwell	:49 4-5

Savannah Making Final Preparations

SAVANNAH, GA., Nov. 10.—Savannah may be said to be on the last lap of its preparations for the Grand Prize race of Thanksgiving Day, and for the light car event of the day before. The greater number of foreign and American drivers are already located in their camps and are becoming acquainted with the picturesque course, which, banked and oiled, has been in condition for racing for several days. In fact, the track was ready for the race a week ago when the advance guard of the drivers arrived. Those who are here started Monday speeding their machines over the course. No requirement has been made of them except that they exercise caution when in the neighborhood of the city or the settlements. The road, however, runs from the city out towards the marshes and the sea, and in some cases is cut for miles through virgin forest with never a house near the track, so that except in few instances there is now on impediment to the drivers cutting their flyers loose whenever they choose. However, to give them every opportunity to learn the course under speed conditions, they will be given a guarded track for two hours a day for ten days before the races. The signs and banners are already up on the course, showing the turns and crossings, and giving the other information necessary to the driver. It is possible that the foreign signs may also be used.

It is the consensus of opinion that all American records will be broken on the course. The number of turns may preclude the breaking of Nazarro's world's record, though there are some of the visiting experts who will not even admit that. The more conservative estimates figure that the winner in the Grand Prize will travel the 400 miles at an average speed of between 68 and 70 miles an hour. Some of the laps they figure may be made at a speed of over 75 miles an hour. Miles of new straightaways have been constructed since the running of the stock car races in March, and turns have been in some cases entirely eliminated. At Isle of Hope the most dangerous series of turns has been done away with; in one case this has been accomplished by a detour through a private park three bad turns were eliminated and one sweeping banked turn substituted. While the number of turns even yet remaining takes away some of the speed of an undoubted remarkably fast course, they add a sporty element which appeals to those who think races of this kind should require the maximum skill from the winning driver, rather than a daredevil recklessness which only needs to cut it loose on a straightaway course. The straightaways with their perfect surface will cut off the seconds added at the turns. DePalma, who has the world's mile track record to his credit, and who has figured considerably in sprint racing, says there is no part of the Ormond-Daytona course which is better than the Ferguson avenue stretch of four miles between Beaulieu and Isle of Hope.

One of the Bridges Over the Course.

This is a part of the new roads which have been built especially for this race. Thousands have been spent in this road building.

The course for the light car race could not be better. It is a perfect 10-mile rectangle, with all turns scientifically banked, and as level as a billiard table almost. There is no reason why new world's records should not be set up in this race.

Savannah is determined to make an event of the races apart from the contests themselves. Two 20-round fights by well-known pugilists are scheduled for the nights of the two racing days. The following day will be devoted to an airship exhibition and other attractions. The great effort, however, is being concentrated on the successful conduct of the races. The military with almost twice the number used before will be on the job of policing the course. Martial law will prevail as before. Governor Smith, who gave the consent for the use of the troops for the March Stock Car races, has again agreed to proclaim martial law over the course for the two races and order the troops under the same commanders as before to keep the track clear for the racers. In this respect it may not be denied that Savannah has the best record of any other American city which has held road races.

The Savannah Automobile Club proposes to do itself proud in the accommodation of the visitors and the entertainment of its guests. An information bureau will be open at the Union Station to supply visitors with any information desired. The chief work of the office will be to direct applicants to places where they can be accommodated during their stay here. Tabulated information of every hotel, boarding house, and private residence which will receive visitors will be on hand, together with abundant help to make the work successful. The bureau will have telephone lines connected with the various places where visitors will be received so that tab may be kept on their capacity at all times. The club has gone into this feature with the same enthusiasm and the same thoroughness it has tackled the details of the races and will make just as great a success of it. It is an easy bet that accommodations will be provided for far more visitors than come, though the city expects a record-breaking crowd. It has been arranged to take care of many visitors in dozens of private and Pullman cars on sidings which have been laid adjacent to the grand stand. Special docking places have been arranged for chartered steamships which will come from New York, Philadelphia and Baltimore. Several are already scheduled.

A feature of the races will be the entertainment of the visiting newspaper men. Savannah has a record in the matter of entertaining newspaper men and proposes to keep it up. A recent delegation of visitors from newspaper row in New York is still remembered very pleasantly here, and the entertainment meted

out to them will be nothing to compare with the treatment accorded the visitors to the Grand Prize Race. The city started to get its hand in last week when the newspaper men from all over Georgia were invited here and wined and dined and taken over the course. Forty odd of these were in the city at the time and left loud in their praise of the course and promising large delegations from their respective cities to the races.

The arrangement with the Automobile Club of America is that the Savannah Club will have practically all the proceeds from the races. The local club in turn has decided that the proceeds shall be expended in advertising Savannah. They have determined that one of the ways they will expend this money is to give the visiting newspaper men a good time while here. Those who have been here know what this means. The others will have a right good time finding out.

It has been decided to start the light car race of Wednesday at 11 A. M. The Grand Prize event of the following day will start at 8.30 A. M. While these comfortable daylight starts may rob the contests of much of the picturesqueness attendant upon the break-o'-day beginning of the Vanderbilt race, it is fairly good guessing that those who do not care particularly to see the sun rise will be more comfortably satisfied with the later hours.

FROM THE NEW YORK END OF THE RACE.

New York, Nov. 8.—Of the fourteen foreign drivers engaged to pilot European cars in the Grand Prize Race on Thanksgiving Day, eleven have arrived. The *Kaiserin Augusta Victoria,* which got in on Saturday, had aboard Victor Hemery, Rene Hanriot, and Fritz Earle, the Benz trio; and *La Touraine* on Sunday brought Francois Szisz, of the Renault team. This quartette has joined the contingent already at Savannah, which is made up of Wagner and Nazarro, Fiat; Cagno and Piacenza, Itala; Hautvast and Rigal, Clement-Bayard, and Duray, Lorraine-Dietrich.

Rival importers have different stories to tell of the possibilities of the coming of a pair of Mercedes candidates, scheduled to be driven by Poege and Salzer.

There was some possibility early in the week, according to an A. C. A. press announcement, of there being two additional entries—one of a Buick, the 50-horsepower machine driven by Burman in the Lowell race, and the other a third Renault, a duplicate of this year's Grand Prize models, which had been shipped with the other two Renaults. It was said that Paul LaCroix would make the entry, provided that Renault Frères would furnish a driver. George Robertson in a cable to Mr. LaCroix made application for the mount. The Vanderbilt Cup winner also had a chance of a seat at the wheel of a Panhard now in this country, provided a sale of it was made to a prospective purchaser with Grand Prize aspirations. The Buick was announced on Tuesday as entered.

Leonard Zengle will supplant Cyrus Patschke as pilot of the Acme, the latter being deemed by the company's officials at present a bit too young for such responsibility.

W. Du Cros, of the Dunlop Tire Company, of London, has come over to look after the interests of his company in the race, the two Clement-Bayards and the Lorraine-Dietrich having already contracted for Dunlop equipment.

The Continental Caoutchouc Company has added to its Grand Prize offer of $4,000, split into $2,000 for first, $1,250 for second and $750 for third, another offer of $500 for Continental equipment in the light car race—$250 for first, $150 for second and $100 for third.

The latest addition to the prize list comes from the Bosch Magneto Company, which offers $500 to first, $250 to second and $100 to third, provided that the cars in question be equipped with Bosch magnetos.

According to a report from Pottstown, Pa., the six-cylinder Chadwick was recently timed on a four-mile course near Bristol and developed a speed of 111 miles per hour. The excellent showing of the Chadwick in the Vanderbilt will cause it to be most interestingly watched at Savannah, though its makers recognize that they are competing against specially built racers.

Information concerning the Lozier entry is to the effect that it is a regular stock model, with the exception of the motor, which has a 5 3-4 inch bore instead of the regular 5 1-4 inch; the stroke remaining at 5 1-4, the same as in the stock car. It is stated that private time trials on the road near the factory at Plattsburgh, N. Y., have been entirely satisfactory.

Fournier on His Way to America.

A cablegram from Henry Fournier, received Wednesday morning, gave the information that he is on the *Kron Prinsessen Cecilie,* which means that he will reach New York Tuesday next.

In the early days of automobiling in this country, one of the most prominent figures was this same Fournier, winner of the Paris-Bordeaux and Paris-Berlin races. His American performance of a mile in 51 4-5, driving a Mors on the Coney Island boulevard, remained as the American record until it was beaten by William K. Vanderbilt, Jr., with his mile of 39 4-5 on the Ormond-Daytona beach with a Mercedes.

Fournier is now an Itala pilot, having charge of the French representation for that Italian make. His garage is one of the largest in Paris and is much frequented by Americans. It is needless to say that Fournier can talk to them in their own language, which is a source of great satisfaction to a visitor in foreign parts.

Concerning the Light Car Race.

The three Oldsmobiles entered for the light car race have been withdrawn, F. L. Smith, vice-president of the Olds Motor Works, stating that it was found that they could not be prepared in time.

A third Chalmers-Detroit has been nominated by W. T. Bryson, the Savannah agent. It will be driven by Burns.

The Gregoire and the S. P. O., two of the European entries, are on *La Savoie,* due here next Saturday. The latter has 95.4 mm. more and 130 mm. stroke. Juhaz, an Hungarian-American, will be its pilot.

The Lancia light car racer is also on *La Savoie.* There arrived Wednesday, however, a standard Lancia runabout, which will also be shipped to Savannah. W. M. Hilliard and his crew left for the course on Tuesday, taking with them the Lancia which competed in the Sweepstakes, so that the Hol-Tan camp will have three cars at its disposal. Perhaps of the racing reputation of its builder much is expected of the Lancia.

The Work of Unloading the Foreign Racing Craft Upon Their Arrival at Savannah.

FORECAST OF WHAT FRENCH MAKERS WILL EXHIBIT

By W. F. BRADLEY.

PARIS, Nov. 5.—It will be a rather more modest Salon than usual that President Fallières will throw open to the public on the morning of November 28. After the ultra-voluptuous decennial, the organizers have decided on an economical exhibition, and though the show has no difficulty in holdings its unique position as a fashionable spectacular display, the light of the eleventh annual will be dim in comparison with that of the tenth show. The decision to hold an economical show meant the abandonment of the temporary building on the Esplanade des Invalides and the splitting up of the Salon into two distinct exhibitions, the first devoted to pleasure cars, the second to all commercial applications of the automobile.

Paris, with all its advantages, has no hall large enough for the housing of the most important trade exhibition of the country. It is true that the Galerie des Machines is empty, but the Salon organizers are artists who would as soon think of draping the Champs Elysées in black as housing their polished chassis in the monster steel and glass house on the Champ de Mars. Consequently pleasure cars will occupy their usual palatial hall November 28 to December 13, and eleven days later the doors of the same hall will be flung open to an exhibition of machine tools, gas engines, marine engines, stationary power plants, commercial vehicles—in fact, every branch of the automobile excepting the pleasure vehicle.

Clement Dirigible Sailing Over the Church of the Madeleine, Paris.

Decorations will be modest—comparatively. This, however, will not prevent the organizers spending more than any other body holding an auto show; but the difference between 1908 and previous years is that individual exhibitors, instead of being encouraged to adorn their stands with fine metal work, crystal, and gold paint, will be asked to refrain, and unlike previous years, will receive no special mention or award if they spend several thousand dollars on triumphal arches.

Feature Will Be Attention to Small Cars.

The distinctive feature of the Salon will be the attention paid by large firms to the production of small, low-powered, moderate-priced touring cars, runabouts and taximeter cabs. In previous years small firms and newcomers to the industry filled the small car class, the world-renowned firms being still too busy with rich customers to pay any attention to the man of moderate means. There are a large number of small firms and a few big ones that have tackled the problem of presenting a satisfactory two-passenger runabout with a single or two-cylinder engine at a maximum of $1,000. Several of them get as low as $800 for a one-lunger carrying a couple of passengers, but with two exceptions these are small, unknown firms.

The big houses are interested in the light touring car or runabout from $1,000 to $1,800 and, almost without exception have gone into this branch of the business with a set of cars which, although the most remarkable feature of the European industry, are altogether unknown to America, the heavy customs duty keeping them out.

Thus Renault has brought forth a two-cylinder 8-10-horsepower, two-passenger runabout. Such a move on the part of the Billancourt firm is not surprising, for while building a car de luxe, they have never neglected the small fry. The new model has an engine with two vertical cylinders in one casting measuring 75 by 120 bore and stroke, differing only in a few details from those in service all over the world on taxicabs. The only important change apart from dimensions is that in place of three-quarter elliptic springs at the rear semi-elliptics are used. The motor has the oil level regulator fitted for the first time on the large cars this year, and of course high-tension magneto. Anything short of a motor bicycle without a magneto is looked upon as a hybrid nowadays.

In addition to this little car and all their usual models with only detail modifications, Renault Frères will produce a couple of specially light models of 29-30 and 35-45-horsepower respectively intended for fast work with low-tire consumption. Excepting a rather more compact power plant a more inclined steering column, and a special gear box, the cars will be modeled after the usual series with all parts lightened. Comfortable closed bodies can be fitted, but they must be lighter than usual.

The aeronautical engine has undergone some changes since it was first brougbt out, but will now be presented in a definite form. Instead of a fan at each end of the sheet metal housing enclosing tbe motor, there is but one at the forward end, the current on being drawn in being deflected towards the engine hase, passing round all the exhaust pipes, the lubricator pipes, and finally on the exhaust box carried longitudinally under the engine base. The aerial propeller is mounted on the camshaft instead of the crankshaft, thus getting a slower speed without the necessity of speial gearing.

Brasier, Dietrich, C. G. V. (now Charron Limited), Panhard, and Berliet, all firms that have been conspicuous in the development of the powerful and costly type of car, have each brought out a little two-cylinder model, of not more than 12-horsepower, equipped with a runabout, touring car or taxicab body.

Details of One Concern's "Two."

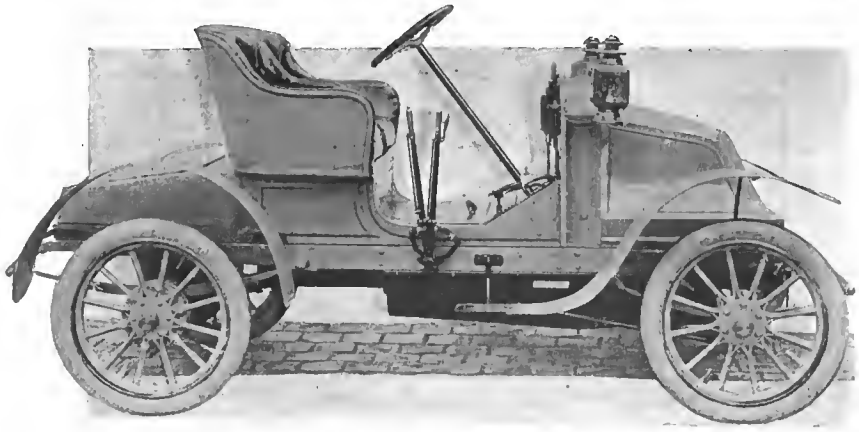
Brasier's "two" is practically a simplified and reduced model of his large cars, the engine being a vertical one of 102 by 120 millimeters, valves on one side, with Brasier carburettor, and Bosch bigh-tension magneto. Water circulation is by thermo-syphon, with fan behind the radiator, and lubrication by gear-driven pump. A leather-faced cone clutch transmits the power from the engine to the gear box, and connection to the rear wheels is by propeller shaft and live axle. Suspension, as in practically all these small models, is by three-quarter elliptics rear and semi-elliptics in front. In addition to this model there will be one on somewhat similar lines woth a four-cylinder engine in one casting, horsepower being about 15. Low-tension magneto on the Brasier, as on a very large number of important European makes, has had to give way to the high-tension type. As the high-tension installation is never accomplished by a reserve ignition, there must be distinctive advantages to account for this wholesale abandonment of the low-tension system.

Dietrich, who has always used chain drive and low-tension magneto, will next year have seven distinct models on three of which the drive will be by propeller shaft and the spark from a high-tension magneto.

Charron has entered thoroughly into the small car business with two rather original models, one having a couple of cylinders, the other four, both in a single casting. In each case bore and

stroke is 3.1 by 4.7, and on both models the radiator is placed on the dashboard, behind the engine, with circulation by thermo-syphon. Accessibility, interchangeability and simplicity have been very closely studied with remarkable results. The gear shifting lever passes direct into the three-speed box, running gear and road wheel brakes are interchangeable, as are also the inlet and outlet water pipes. Suspension is by three-quarter elliptics at the rear, and of course the armored wood frame has been abandoned. It is rumored that on the large models there will be a new device giving direct drive on all four speeds; no official confirmation of this can be obtained, however.

Panhard has a two-cylinder model in hand, but is not inclined to talk about it at present. The novelty of the pioneer firm, however, will be the adoption of the Knight silent engine, invented by Charles V. Knight, and built for several years by Knight & Kilbourne, of Chicago. Daimler, of England, has taken up the patents and will apply them to all 1909 models, while Minerva will do the same in Belgium. The Panhard firm refuses to divulge its intentions and even declares officially that it will have nothing new at the Salon. But as the Knight engine has been under test for the last six months, it is more than probable that the patent will be applied to at least some of the 1909 models. Fiat is declared to have the same patents under consideration for Italy.



Renault Two-cylinder Runabout, to Be Shown at the Paris Salon.

Berliet, who up to quite recently had nothing smaller than a 25-horsepower machine will have a two-cylinder shaft-driven car of 8-9-horsepower, a four-cylinder 15-horsepower model with shaft drive, and a 22-horsepower with the same characteristics. Low-tension magneto is abandoned for the hight-tension type, and a new system of force feed lubrication is adopted to all models with the exception of the 60-horsepower four-cylinder.

Itala Changes from Low to High Tension.

Itala also has changed over from low-tension to high-tension magneto on all models, including the four-cylinder 14-20-horsepower light chassis intended for a town vehicle or light touring car. Isotta-Fraschini will be in the light car business with a small four-cylinder having engine in one casting, and final drive by cardan shaft.

Darracq has a series that varies from a one-lunger voiturette selling at $700, complete with two-passenger body, to a six-cylinder extra long chassis at $3,200, Paris prices. The gear box on the rear axle, which is a feature of the taxicabs now in use in New York, is a thing of the past so far as Darracq is concerned. The new cabs will have their three-speed gear box mounted on the subframe, immediately behind the cone clutch and connected to it by a short shaft and universal joint. The clutch spring is within the forward end of the gear box, contained within a sleeve directly acted upon by the clutch pedal. Special provision has been provided against the leakage of grease out of the gear box. Lubrication has been improved by the adoption of a mechanically driven Dubrulle lubricator operated off the camshaft, in place of the pressure-fed lubricator at present employed. The changes of the cab chassis apply also to the smaller touring cars, with the exception that there is no universal joint between the clutch and the gear box. Three-quarter elliptic springs will be used for the rear suspension of all models, and the change speed lever under the steering wheel will be abandoned on all but the voiturettes.

Mercedes follows the general line of motor evolution by producing a shaft-driven model for 1909, the engine of which will be a four-cylinder of 3.5 by 4.7 bore and stroke. Ignition is by Eiseman high-tension magneto, valves are on opposite sides, and cooling is by honeycomb radiator. Four speeds are provided by the selective type of gearbox, with direct drive on the fourth. A couple of torque rods lead from the universal joint casing to points on the rear live axle near to the road wheels; the differential gear is in the same plane as the propeller shaft, the drive being by double bevel gear.

Six-cylinder models will be shown, but they will probably be less in numbers than at any previous exhibition. The six-cylinder engine never really caught on among Continental automobilists, and now that fashion has turned toward lighter and low-powered machines there is less demand than ever for more than four cylinders.

In brief the tendency of 1909 will be towards light four-cylinder touring cars, with bloc casting for the smaller models; high-tension ignition by magneto only for all but the largest cars; water circulation by thermo-syphon below 15-horsepower; gear-driven lubricators on all models; shaft drive on all but the largest models; suspension by three-quarter elliptics on all models.

Marine and Aero Motors.

At the industrial show special attention will be paid to the development of the marine motor, a large official stand has been secured with the object of pointing out to constructors the possibilities of business in the application of internal combustion motors to fishing boats and the various type of pleasure craft. It is not likely, however, that very much of interest will be shown on the stands.

In the aeronautical section there will doubtless be some interesting exhibits. Most of the leading constructors have devoted attention to the production of engines for aeroplane work.

Clement's Essay Into Aeronautics.

PARIS, Nov. 5.—Adolphe Clement, millionaire automobile constructor and head of the great factory on the banks of the Seine, has met with unusual success on his entry into aerial navigation. After several months' quiet serious work the mechanical portion of the world's finest airship was produced from the Clement-Bayard factory simultaneously with the completion of the balloon part at the Astra works. The two parts were connected, and as a trial trip the *Clement-Bayard* soared over Paris, making stoppages and performing evolutions at the most important centers, then passed over the owner's automobile factory and the one owned by his son-in-law, Ferdinand Charron. For the second outing a record journey of 160 miles was made in five hours. The *Clement-Bayard* is constructed on the same general lines as the *Ville de Paris*, and is without doubt one of the fastest airships in existence. The gas bag was made of material furnished by the Continental Tire Company, and is of two distinct portions. The power plant consists of a Clement-Bayard racing engine, with four cylinders, developing 120 horsepower, and driving a huge two bladed propeller at the forward end of the steel cage.

ABOUT AUTOMOBILE SPRING SUSPENSIONS*

By THOS. J. FAY, President Society of Automobile Engineers.

LIFE of a spring is forecast by the maker thereof, almost independently of the quality of the material. If the spring is limber and it is so placed as to indicate spring play, just at the point of reversals of camber, the life will be shortened. The superior grades of materials will stand this abuse for a comparatively long time, but the dynamic life of steel, like the life of every other animated thing, is limited. Inferior materials, advantageously situated, might last far longer than the superior products working at a disadvantage. The initial camber to give a spring for a given static camber, is a problem for the spring maker.

Figs. 8, 9 and 10 show three views of a given spring, under the conditions as follows:

(a) The spring under static load, indicating the static camber;
(b) straightened out under load;
(c) in reverse camber, in a testing machine, to the limit before permanent set.

It is worth while to study these three conditions in relation to springs, because they have to do with the life of the spring in service, and the easy riding qualities of the car due to spring action. It might be said in general that the greater the difference between the initial and the static camber, the more pronounced will be the easy riding qualities, and it might be said as well that the greater the initial camber and the greater the possible reverse camber, the better will be the life of the springs, especially if we take into account that the spring action in service will be limited

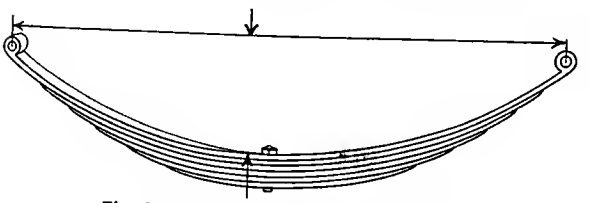


Fig. 8—(a) The spring under static load.

between the two points, as represented by the initial camber on the one hand and the condition (b), which means that the spring leaves will no more than straighten out in actual service. If the service conditions are such as to eliminate any reversal of camber, then it may be said the factor of safety will be represented by the amount of the reverse camber in a testing machine before permanent set.

If springs are limited in their applications to the conditions as before given, even though these conditions may be regarded as favorable, it may still be said of the springs that their life is limited. The life, in fact, under a fixed set of conditions, will depend entirely upon the kinetic ability of the materials used (dynamic qualities of the steel). This is a matter that has been exploited at some length in the press and on the marts of steel, but to almost no purpose, since, forsooth, springs do break and the breakages are not limited to the kind that are cheap and claimed to be non-dynamic in their character.

At the present time every particle of steel that goes into every automobile, regardless of price, is said to be of a dynamic character and toughened by a "special process" whether it is or not. It is rather to be feared then that this word "dynamic" has been relegated to a low estate. Notwithstanding the apparent tendency to class everything by way of steel that finds its way into cars as the very best obtainable, the fact remains that some of the material is truly good, and when it comes to the material for springs, which is the affair of the hour, kinetic qualities are those desired, if the life of the springs shall be long, provided the easy riding qualities are present in the spring suspension. This must be so,

*Continued from page 638 of The Automobile, November 5.

since, as before stated, easy riding qualities are present if the steel is subjected to a fiber strain not far from the elastic limit, and so it follows that steel flexed repeatedly and continuously, under conditions nearly approaching the elastic limit, will not last long unless it is of a character extremely kinetic.

The exact physical properties of the several grades of steel will be accorded a due measure of attention in connection with the part of this article specifically dealing with materials. For the

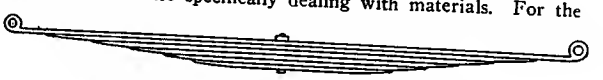

Fig. 9—(b) The spring straightened out under load.

present it will be well to consider one or two other points. For instance, a laminated spring of the flat plate variety must be so designed that each one of the leaves, regardless of their lengths, will be subjected to exactly the same fiber strain as its neighbor for the respective conditions of camber. This is rarely absolutely true, and the conditions here imposed are oftentimes violated, proof of which lies in the fact that plates will break out of the middle of a spring and the spring will work better without the broken plate than it ever did before. This merely illustrates the fact that the broken plate was doing nearly all the work and served for the most part as a mischief maker, merely because the broken plate was given a greater initial camber than the occasion demanded. Mathematically and in practice, if the spring plates are all of the same thickness they should all be bowed to the same radius, and if they are so bowed the fiber strain will be the same in all for every condition of camber to which they are all treated.

It is easy enough in practice to fix the initial camber for the various lengths of plates, if they are all of the same thickness, since they can all pass through the same bending roll, if they are all to be of the same radius. This is not to say that the best springs will come from the practice of making all of the leaves the one thickness, since it would be possible to get more work out of the springs were the leaves decreasing in thickness as they shorten. With decreasing thickness of leaves we may have increasing camber as they shorten, hence increasing pressure and greater work. It may not be generally understood, and it may be well to point out, that the efficiency of a spring is measured by its ability to transform energy. This was intimated in the entering chapter, but we can go a little farther and say that the spring action is even at the expense of the power of the motor,

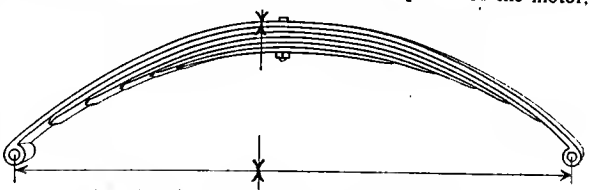

Fig. 10—(c) Reversal of camber to point of set.

and the more power the springs will absorb the easier will be the riding qualities of the springs. What is wanted in a spring is the ability to destroy the energy of the moving mass insofar as it can, by way of defeating easy riding qualities. We do not wish to have this energy destroyed instantly, but rather at an increasing rate for each increment of travel. We accomplish this more perfectly if the spring plates are made thin as they are made short.

There is no actual limit to any type of spring, from the mere point of view incidental to indifferent service; if, however, easy riding qualities are desired, or, if spring failures are to be eliminated, it is then that limitations of the types will have to be

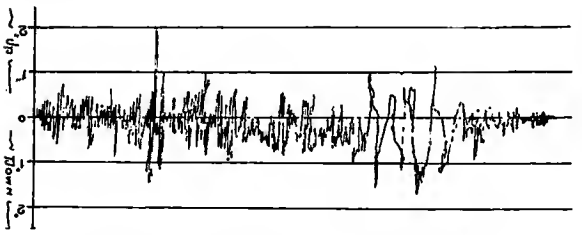

Fig. 11—Showing record of bumpometer test.

considered. Take, for instance, the helical spring, placed in such a way as to take care of the vertical bounce of the body, and it is plain to be seen the spring may snub the load within the required limits of travel, but the pendulum action will be at a high periodicity. Obviously, it would be disagreeable riding under such conditions, because the number of oscillations of the body would be very high indeed. It was found in practice that this very low priced and practically unbreakable type of spring could not be utilized, because it engendered extremely disagreeable motions.

The concord type of spring (used extensively in connection with the little Oldsmobile), known in the Far West as the "buckboard type," is probably the most easy riding spring extant. It has always been used in connection with short wheelbase vehicles, and its limitation is that due to wheelbase. The successful application of this type of spring has nearly always been in connection with vehicles of a wheelbase not exceeding 72 inches, and now that automobiles, even of the runabout type, are designed with the wheelbase considerably exceedingly 72 inches in nearly every case, this type has become almost obsolete.

In the cars of the time it is a question of laminated plate springs, full, three-quarter, or half elliptical, as the exigencies of the service would seem to demand. Designers split on these differences, and some designers resort to the scroll as a further means of engendering easy riding qualities. The author has had occasion to observe road performance in automobiles in connection with racing cars and as this road performance relates to the more important types of touring cars, these observations have invariably resulted in the conclusion that full elliptical (rear) springs, with a scroll top section and rather stiff lower section, would more nearly afford a level platform than might be obtained in any other way. Next to the full elliptical (top scroll) rear spring, it is possible that the three-quarter elliptical (scroll quarter) would afford more nearly the perfection desired. Unfortunately, these types of springs do not readily lend themselves to the design of cars, if a low center of gravity is sought, and certainly a low center of gravity is of the utmost importance.

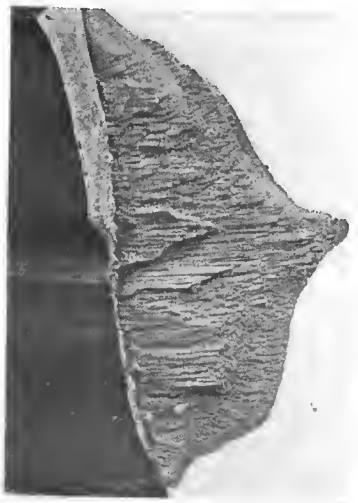

Fig. 12—Fracture of Krupp steel in a test, showing long fiber.

From the point of view of types of spring, the tendency may be to disregard the condition of service, and regard the type as dominant.. It is not absolutely necessary to resort to the use of full or three-quarter elliptical rear springs, because the application of skill will render it possible to obtain easy riding qualities with the half elliptical springs in the rear in connection with cars with a low center of gravity and devoid of over much top hamper. The question of where the weight is placed is quite as important as the result of the center of gravity. For instance, in limousine the resolved center of gravity can be low enough to escape criticism; even so, a considerable proportion of the weight can be concentrated high above the base line, and that proportion of the weight will be in evidence, by way of excessive "heel" when the car is doing a curve. Flywheels, for instance, have their weights concentrated at the rims, because the flywheel effect is the maximum under such conditions, but the center of gravity of a flywheel, if it is kinetically balanced, will be at axis of rotation. This same phenomenon can creep into body work, and it is plain that center of gravity is not all to be watched.

The spring performance will only be up to the springs as a matter of design, if the design of the car as a whole will render it possible to take advantage of the good qualities of springs. Under proper conditions the half elliptical type of spring will afford easy riding qualities, and a periodicity of the oscillations said to be agreeable by even the most fastidious. A modification of the half elliptical spring is that known as the platform type of spring, in which, in addition to the two half elliptical springs in the fore and aft plane, a third half elliptical member is placed in a lateral position, suspended from the after end of the two half elliptical members above referred to.

If top hamper causes lateral heeling in connection with the half elliptical springs, except in an ordinary way, this disagreeable property is far more noticeable in connection with the platform type of springs. The body is suspended to the lateral member of the platform members, and the spring action is therefore that which would engender lateral rolling if very much of the total weight is above the chassis frame. On the other hand, platform springs when properly designed and suitably placed, afford the very easy riding so much to be desired in connection with the road performance of automobiles.

Fig. 13—A secure spring clamp.

Up to the present time we have made no mention of the spring suspension at the front end of cars. At the front end the problem is different, because there the load is almost constant. If the motor is placed in the front the load will be scarcely varied at all, due to the presence or not of another person besides the chauffeur in the remaining front seat.. With the motor in front the chauffeur's position is so far back in the direction of the rear spring suspension that the difference of one person but little affects the weight actually resting upon the front springs. In front, then, it is very possible to take advantage of the half elliptical type of springs, since they lend themselves perfectly in every case, if only the weight is constant and the springs are designed taking that weight into account. In a very few cases the three-quarter elliptical springs have been used in front, and, while there is no great objection to the use of this type of spring under the conditions involving a constant load, there is a probable increase in cost to take into account, and *an expenditure can scarcely be justified in anything unless in connection therewith an advantage is afforded.*

There are types of springs that combine the regular functions, with special features, perpetuating the shock absorber idea. These springs will be illustrated in connection with shock absorbers, and since they are normal products from the spring point of view, they will not be given space here.

THINGS AN AMATEUR DRIVER SHOULD KNOW

By A. D. HARD, M. D.

IN the Middle States and in the Great Northwest, the number of automobile drivers who are owners of their cars is increasing very fast. The so called "middle class" are now buying automobiles with a rush, and the output of the manufacturers is an index of the nature of the market. The four-cylinder touring car of from 20 to 30-horsepower is in demand by people who will drive their own cars, and the sale of them will be immense. One of the great objections to the purchase of an automobile has been the prospective expense of a chauffeur.

The man who can easily write out his cheque for thousands in payment for a car that his wife asked him at the breakfast table to buy, expects to employ a chauffeur and does not care to become familiar with the mechanism of his car. But the man who has to worry some to get together the twelve hundred dollars or so with which to buy a car, must drive it himself, and must *know his car.*

Learn the Carbureter Thoroughly.

There are some very simple things involved in the structure of an automobile that are seldom considered or understood, and yet they are of prime importance to one who is to drive his own car. Carbureter construction and the reasons therefor are not often studied, and yet the carbureter is the heart of the automobile.

The large number of designs, all calculated to accomplish the same purpose, shows conclusively that the men who study this matter are not settled upon the best mechanism for feeding fuel to the combustion motor. We all know that we wish to get a uniform mixture at all speeds which will give the greatest power and least waste of energy in the form of heat that is possible. The driver should know how his carbureter is calculated to work to accomplish this purpose so that he may intelligently adjust it as may be required, and know what to do when it fails to work properly.

The in-rushing air produces a spray from the discharge nipple very much like that from a common atomizer used in medicine. The fine particles of gasoline are thus brought in contact with the air in a favorable way to be rapidly converted into vapor, and this vapor mixing with the air produces the explosive or combustive mixture.

If the Discharge is Too Free.

If the discharge of spray from the gasoline nozzle is too free, the particles will not be all vaporized, and will be deposited on the inner walls of the intake pipe as liquid gasoline, and the portion which enters the combustion chambers of the motor will be vaporized by contact with hot surfaces, and a too rich mixture will be formed to readily ignite or to give the best discharge of energy.

If it does ignite under these conditions, it only partially changes to an elastic gas having a much larger volume, because there is not enough oxygen at hand to furnish the carbon atoms with their required portion. The results will consist of lack of power, production of black carbon laden smoke, and fouling of the cylinders, all undesirable and easily avoided if we know how to meet the condition.

It is well that we should understand that all substances are composed of unit particles called molecules, and the relative nearness to each other of these molecules determines whether the substance is solid, liquid, or gaseous.

If a gas be compressed so that the molecules come in contact, the substance will no longer be a gas, but will take either a solid or liquid form.

If the molecules of a combustive gas be compressed until they are much nearer together than in the natural state, but not near enough to become a liquid, they ignite much more rapidly than before, because combustion heat can more readily pass from one molecule to another. Not only will they ignite quicker, but the liberation of energy will be greater in volume, and this is the reason we demand compression in the cylinders of a combustion motor.

One of the incidental features of this compression is greater facility for the ignition spark to follow other paths than the spark gap of the spark plug. This is an undesirable feature, and must be taken into consideration in securing perfect ignition of the combustion charge in the cylinder.

Trying the spark on the outside of the cylinder with no compression to influence it is not a correct exposition of its efficiency in producing desired results in the cylinder. It may spark beautifully when under observation, but when returned to the cylinder no perfect result may be attained.

The fault is usually due to the spark points of the plug being too far apart for anything but outside explosions. The points should be placed as close together as possible without being liable to fouling by small particles of carbon. Closeness of points not only favors production of sparks under compression, but it interposes less resistance to the current passing across the gap, and thus makes it less liable to follow some other track, with absence of the ignition spark.

Adjustment of the Vibrator.

The adjustment of the vibrator on the spark coil is always a matter of various ideas. The principle involved is that the primary current must be made and broken *completely* in rapid succession.

If it is so adjusted that when the points are apart there is still a flow of current from small particles between them, the indication is to *increase* the distance. If the points are in this close condition which favors a leak across the gap, the battery will be partially short circuited, and dry cells or storage battery will quickly loose their charge.

This is the explanation of much of the fault finding of those whose batteries quickly give out. They think that if the buzzer does not buzz they do not need to turn off the switch when the car is not in use. And, furthermore, the current is continuous to some extent when the car is in use, when it should be perfectly intermittent.

These three points of adjustment are of prime importance in knowing how to run an automobile. The fuel discharge from the carbureter nozzle, the points of the spark plug, and the points of the vibrator.

It is a mistake for a driver to ever try to correct an apparent fault in a coil. There are no reasons for a coil to refuse to work that can be remedied by an ordinary mechanic, except it be some outside connection. If the coil is so that a current will not pass through it, either the primary or secondary part, it is always due to burning out, and calls for a new coil at once.

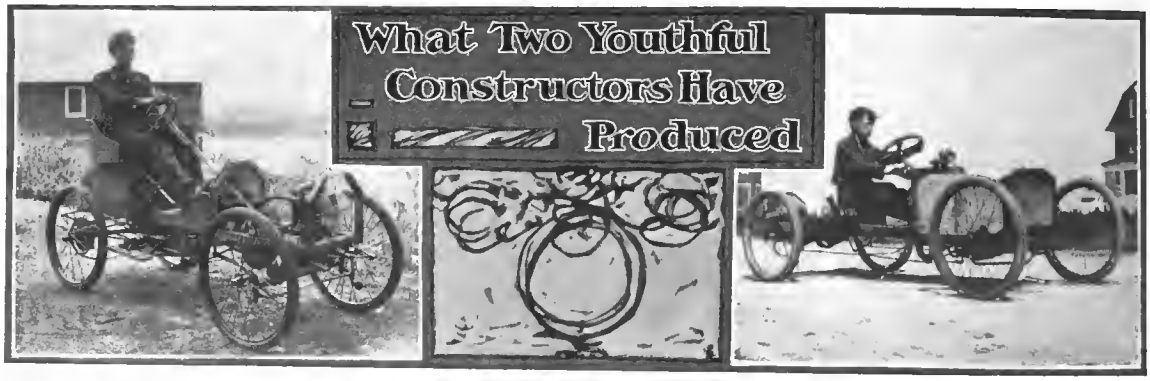
In the correction of all automobile faults, the greatest and most common error is in not properly locating the trouble before trying to correct it. Indiscriminate and misdirected changing usually gets farther away from the correct condition than at the beginning, and makes the job more difficult for even an expert.

When the Motor Gets Lazy

It is high time to look for the cause. It may be for no great reason, but lack of lubricating oil in the crankcase is a serious matter and oftentimes it is just this absence of oil that is at the seat of the trouble.

If the matter is not attended to on time and the motor stalls, it will be well to "crank" until the bearings cool down. If the bearings are allowed to "freeze" the trouble—for a road problem—will be beyond the ingenuity of the average autoist.

Sometimes it is kerosene oil—put into the cylinders—that seeps back into the crankcase, and kills the lubricating qualities of the crankcase lubricant. In such an event to drain off the oil and replace it with a fresh supply is the natural thing to do.



C. A. Byers in His Home-made Car.

H. L. Gray and the Steamer He Built.

WHAT A YOUNG CALIFORNIAN HAS BUILT.

Editor THE AUTOMOBILE:

[1,621.]—Bries Cowan, fifteen years of age, of Los Angeles, Cal., is probably ths youngest automobile manufacturer in ths world. At least, it is a safe wager that no other boy of his age, handicapped at the start by ths lack of mechanical training, as he was, has built, unassisted, an automobile that for speed, hill-climbing, and all other purposes is a greater marvel than ths one recently completed by this Los Angeles youth. He began working on the machine about eightsen months ago, at which time he was only a few months past fourtsen years of age. He had had no mechanical training of any kind, and, consequently, many discouragements were his first rewards. His persevering nature at length won, however, and with a real automobile of his own make, which he calls ths "California Midget," he is the envy of all the boys.

The "Midget" in general design somewhat resembles the large factory-made touring cars, although of miniature proportions. It is six feet in length and weighs about 300 pounds. It has an Aster engine of three-horsepower, and is capable of making a speed of from 25 to 30 miles per hour. It has a friction transmission and a double chain drive, is air-cooled, ths battery control is through an electric light switch, and ths differential operates successfully. It has a tread of three feet, and has external brakes on the rear wheels. It carries two gallons of gasoline and will run 25 miles on each gallon.

Only his spare time was devoted to the construction of ths "Midget." The entire machine, except the engine, including even ths wheels, is of the boy's workmanship. Ths materials and engine cost about $150, all of which was earned by ths youthful builder.

CHARLES ALMA BYERS.

Los Angeles, Cal.

TIMING TROUBLES WITH A 6-CYLINDER MOTOR

Editor THE AUTOMOBILE:

[1,622.]—As I am a reader of The Automobile and have a six-cylinder machine,

How do you time a six-cylinder motor when they fire 1-5, 3-6, 2-4?

Buffalo, N. Y. READER.

With the idea of being sufficiently explicit, attention will be called to the mean average valve timings as set down in the translation by C. B. Hayward (The Automobile, Nov. 5, 1908, page 649), as follows:

	Mean Av'gs.
Lead given the exhaust valve	46° 20′
Lag in closing inlet valve	25° 32′
Advance of the ignition	31° 15′
Lag in closing exhaust valve	5° 8′
Lag in opening inlet valve	12° 16′

Having in mind correct timing for the first cylinder incidentally fixing the range of the spark advance to give late firing and cranking, and the balance of the range (all possibles) to go for early ignition. With the first cylinder timed as to lost motion of tappets and ignition, crank to number five and go through the same operation; thence to number three and repeat the operation; likewise to number six, two, and four, respectively repeating the timing operation as you go along. In other words, proceed as in the order of firing, treating each cylinder as if it were a single cycle motor.

THE STEAM CAR OF NEW YORK CITY BOY.

Editor THE AUTOMOBILE:

[1,623.]—I enclose photograph and short description of a machine I constructed during my vacation, thinking ths same might prove of interest to some of your young readers.

Ths power plant consists of a 3 1-2-horsepower, two-cylinder, double-acting steam engine, with a bore of 2 1-2 inches and a stroke of 3 1-2 inches. This engine is supplied with steam by a 14-inch fire tube boiler heated by a burner, using either gasoline or kerosene. The boiler is placed under ths hood and between it and the dashboard is the water tank, which holds six gallons.

Ths engine is located under the seat in a horizontal position with the cylinders forward, and is connected to the rear axle by a short chain. The gasoline tank is in the rear and holds three gallons.

The frame is made of angle iron braced by truss rods. My front springs are three-quarter elliptic and my rear springs are one-quarter elliptic. The wheelbase is 78 inches, and the tread is 44 inches. The wheels are 28 by 1 1-2, wire wheels, the front ones being slightly dished. I use one-wheel drive to avoid the necessity of a differential. I carry between 150 and 200 pounds steam pressure. The gear ratio between my engine and my rear axle is 1 1-6 to 1, which makes it a fast little car.

I can make between 25 and 30 miles per hour. Even with this high gearing, it has sufficient power to carry three persons, and is a good hill-climber. I reverse by reversing my engine.

New York City. H. LIGGETT GRAY.

P. S.—I am fourteen years old.

THAT TROUBLE OF THE MAN FROM DULUTH.

Editor THE AUTOMOBILE:

[1,624.]—I believe the contributor of letter No. 1,601 from Duluth will find his difficulty in a short circuit; i.e., when No. 1 is firing, No. 2 is doing likewise, or something similar to that.

Worcester, Mass. P. W. WOOD, JR.

Editor THE AUTOMOBILE:

[1,625.]—In re letter No. 1,001, issue October 29, "Puzzling Knock When Climbing on ths High," "Subscriber's" trouble seems to be in improper carbureter adjustment for low piston speeds. Undoubtedly his trouble disappears when he drops back into second speed and the motor runs faster. If there is anything wrong with the transmission (i.e., everything from clutch to rear wheels), it probably is as noticeable in second speed as when driving "in ths high." Ths carbureter on "Subscriber's" car is probably adjusted properly for normal and high piston speeds and when he attempts to negotiate a grade on the high, and the motor slows down, ths partial vacuum caused by the downward stroke of the piston is insufficient to aspirate the necessary gasoline from the spray nozzle for a good mixture, causing the "very weak or about half as strong explosion" he mentions. Of what benefit is a wide-open throttle if the needle valve on the carbureter is not open enough?

Hope this will enable him to "value the car $200 higher."

New York City. D. C. H.

Editor THE AUTOMOBILE:

[1,626.]—Replying to my own letter, No. 1,601, I am pleased to state ths cause of this kick. It was caused, apparently, by a weak explosion. The car was equipped with Schebler D carbureter made for the car. After spending about $100 at everything else, the D carbureter was replaced with an E special, of the same make, as an experiment. Result: twenty more power, and will pull till dead without a miss. Why the D carbureter failed I know not.

Duluth, Minn. SUBSCRIBER.

LETTERS INTERESTING AND INSTRUCTIVE

ONE CARBURETER SHOULD DO THE WORK.

Editor THE AUTOMOBILE:

[1,627.]—I find your lettere eo very instructive that I write to eee if anyone can give me an idea ae to why my two-cylinder oppoeed Apperson engine will keep missing explosions after I have tried everything on earth to overcome it. Now, to be sure it was not the spark at fault, I went all over the wiring and changed it to almost new wire throughout, and so I am certain that it is not the wiring, the batteries, or spark. I put heavy rubber hoee over the secondary wire to make sure. I uee two Schebler carhureters and have taken them off and cleaned them thoroughly, and also took out the intake valves and put in new springs with the same tension. So this ought to he O. K. I have tried every adjustment possihle in the carhureters, even from a lean to a very rich mixture; even adjueted them singly, while only one cylinder was running; then let the two run, and tried all ways of adjueting.

The strange part of the deal is that each cylinder, running singly or alone while I hold down the other vihrator, will not miss at all, and at any speed. But just as eoon as I let up on the spring and allow both cylinders to fire, then it commences to miss, and will keep it up for an all day's run, hut will not miss as had when running on the road with throttle full open, hut still mieeee a good deal. The above usually would ehow lean mixture, hut in thie instance it eeems not to be the caee, ae I have tried it with a mixture

Mr. Lane in His Apperson Equipped with Two Carbursters.

so rich the water would holl in five or six miles and still ths engins would miss. Now, the above is a sticker for us all here, and I am very anxious to know what causes it. If anyone has ever had a like trouble, I wish they would give us their experience with it and ths cure. The very strange part of it is why each cylinder will run so good singly, and, then, as soon as hoth are turned on, they miss, and it does not seem to be one all the time missing, hut both seem to miss.

West Liherty, Ia. V. R. LANE.

The writer experienced the same kind of trouble and shook it off in the following manner:

(*a*) Removed a defective timer.

(*b*) Removed one carbureter and arranged the remaining carbureter below the motor and with equal length of intake piping to respective cylinders.

(*c*) Made sure of the battery.

(*d*) Replaced the coil with a good one, using a master vibrator.

Result: the performance is thoroughly good in every way.

COMPOSITION FOR COATING BRASS.

Editor THE AUTOMOBILE:

[1,628.]—Please let me know what the hest composition is for coating hrass to he put away for the winter. W. K. BAYLESS.

Lexington, Ky.

Lacquer would, of course, be fine; beeswax is good; cylinder (a pure mineral) oil might do. There is still one other way of preventing bright work from taking on a heavy black coat that is difficult to remove, besides destroying the highly polished surface. Saturate cheesecloth with clarified light mineral oil and wrap the parts in the same, or the cloth around the parts.

CHARACTERISTIC BEHAVIOR OF ELEMENTS.

Editor THE AUTOMOBILE:

[1,629.]—Will you kindly let me know the formuiæ for H and O for the hest combustion in an explosive engine? Can you give me any idea of how many pounds of water would he required to operate the average 20-horeepower gasoline engine giving 20 horsepower, if it were poeeihie to decompose water for this purpoee?

If it were possible to decompoee water by passing it through red hot pipee, what would happen to the H and O? Would they both come out fixed gases? Or would the O form an oxide with the iron and be consumed? What proportion of air would he neceesary to he mixed with the H to form an explosive mixture? Not taking into account the cost of decomposing the water, do you think it possihie to get the correct mixture for an engine in this way? At what degree of heat is H and O decomposed?

In hurning H in the open air would a hotter fire be the result, with air under pressure? If so, about what pressure? If hy hurning a pint of keroeene per hour it were possihie to completely vaporize one gallon of kerosene, ready for mixture with the air for an explosive mixture, and hy a neat little device which could he placed under the hood of an automobile alongside of the engine, do you coneider euch a device would help bring kerosene into use in explosive engines? Or are all manufacturers satisfied with gasoline, and the present system of vaporizing? H. T. E.

Nyack-on-Hudson, N. Y.

Confining a mixture to H and O, the product of combustion would be water, the formulæ for which is H_2O. The value of the second question is not apparent; water is in a state of finality, as respects the relations of the components. You would have to use coal and an electrolytic process to split the water into its components; you might better use the coal direct.

Water, in contact with a red hot pipe, makes steam. This steam, separated from any water, superimposes a superheated state. Superheated steam is not a permanent gas. Not considering the final effect of superheating steam from a point of view of the separation of the components, it is enough to say that a point is first arrived at under the conditions in which the steam ceases to be valuable for power purposes. In steam automobile practice, and in recognition of this fact, the pressure is kept below 600 pounds per square inch.

Obviously the components of water are hydrogen and oxygen. These elements, isolated, are in gas form, and in a state of finality; hence they are fixed gases. Oxygen will form with iron to produce iron oxide at a temperature and under conditions involving the iron compounds during the selective freezing period. You cannot, therefore, expect to form oxide of iron (excepting as a surface indication) at low temperatures. Hydrogen will burn with enough oxygen to form water, the formulæ for which are above given, and if the oxygen is to be taken from the air it must be in the ratio of H_2O. Water is not decomposed in practice unless by the electrolytic method. In the decomposition of water by the electrolytic method, reference may be had to the experiments by Lord Layleigh, briefly as follows: "Hence one ampere liberates .00001038 grams of hydrogen. The strength of the current, in electrolytic bath, for any value of the hydrogen, may be set down as follows:

$$I = \frac{\text{weight in grams of H. per sec.; liberated}}{.00001038}$$

and in the abstract

$$I = \frac{\text{weight of any element in grams, liberated per sec.;}}{.00001038 \times \text{chemical equivalent of that element}}$$

when I = the current in amperes."

The current in ampheres that would liberate 1 gram of hydrogen would simultaneously liberate 8 grams of oxygen. The actual power required in the process would depend upon the electromotive force of the "couple" involved. Taking into account the electromotive force (counter) then, determining the electromotive force necessary, in view of the resistanc of the circuit in ohms, the potential difference can be ascertained. With the potential difference in volts it will then be possible to deter-

mine as to the power required to liberate hydrogen and oxygen. The practical formulæ for the determination of these values would look as follows:

$$W = E\,I \qquad W = \text{energy in watts}$$

$$\text{H. P.} = \frac{E\,I}{746} \qquad E = \text{electromotive force in volts}$$

$$I = \text{current strength in amperes.}$$

You will observe from the information thus far given that your proposition entails some complexities, and is more of an undertaking than can be disposed of in a limited space. A sufficient insight is here given to enable you to intelligently drop the subject, or serve as a clue to further research.

In burning hydrogen a hotter fire would be the result of the mixture under pressure, because for a given mixture the greater the pressure the greater would be the quantity of the hydrogen present. Since hydrogen is a fuel under certain conditions, the more you have of it the more heat will be manifest as the result of its association.

Your last proposition savors of a long journey at the behest of an explosion. There is a great difference as between using liquid fuel, to be mixed with atmospheric air, and your proposition. Feeding vaporized kerosene into a train of atmospheric air en route to the combustion chamber portrays a hazard, since "popping" in the carbureter is sure to follow a mal-condition of the mixture.

Gasoline is a very satisfactory fuel. It is difficult to state the degree of satisfaction entailed; manufacturers will have to put up with it until they find something better.

NEWSPAPER MAIL TO MANILA IS UNCERTAIN.

Editor THE AUTOMOBILE:

[1,630.]—In your issue of April 2 last you have an article on "Successful Experiments with Dry Cells." The article is No. 1,288. It has been impossible for me to get your paper regularly, and the paper with this article referred to was one of those I failed to get. Will you please state the substance of the article in question.

In Letter No. 1,288 you express the wish to learn the experiences of others in relation to two-cycle motors "four-cycling." I installed a 2-horsepower, two-cycle engine in a boat, and upon running the same I judged from the exhaust indications that something was amiss. Further investigation led to the conclusion that the motor "four-cycled" up to the time when the cylinders became warm. After the cylinders warmed up the motor went back to its two-cycle relation. F. H. THOMPSON.

Manila, P. I.

Letter No. 1,288 seems to have been the fag end of a controversy. To rejuvenate dry cells, drill a hole in the sealing wax and spill a solution in through the hole, the same to be made of a one-quarter pound of salamoniac to a quart of water. Each cell will soak up a certain amount of the solution, and if the depolarizer is not neutralized or exhausted, provided the zinc is in sufficient presence, the cell so treated will be revived and serve further its useful purpose.

The experience you relate in relation to the four-cycling phenomenon in connection with a two-cycle motor, is not uncommon before the motor is warmed up in service. It is very likely the details of design have to do with this, since it is not unusual in some two-cycle motors to work code without four-cycling.

RESPECTIVE MERITS OF THE ANTI-FREEZERS.

Editor THE AUTOMOBILE:

[1,631.]—I am a subscriber of your very good magazine, and would say, if I am not in error, I have noticed two articles recently in same regarding anti-freezing solutions. One of these stated alcohol was better and the other recommended calcium chloride. Will you kindly state whether calcium chloride is injurious for this purpose, and if not, what proportion to use? C. A. HOFFMAN.

Ashland, O.

This is a subject that has been discussed on numerous occasions and from various points of view. None of the solutions are so perfect as to render it desirable to exclude water under favorable conditions of temperature. All the proposed mixtures will serve the intended purpose, and the drawbacks are insignificant in proportion to the benefits to be derived. Of calcium chloride there is this to be said: It must be chemically pure, and it must not approach in density up to the saturation limit, considering the boiling point of water, as the prevailing temperature. The greater the quantity of calcium chloride used the greater will be the damage, if the chemicals are not "chemically pure," and if electrolytic action does take place, even if the chemicals are pure, the remedy lies in using as little of it as possible. The chances are a 10 per cent. solution will serve under the most severe conditions likely to obtain in these latitudes, but it will not be practicable to go wholly by the tabular values, of freezing point, for degrees of saturation. The reason for this lies in the fact that water boils off, and as the water decreases the solution becomes more concentrated. Alcohol is treated in another article in this issue.

THE HIGHEST SPEED AT GRAND STAND.

Editor THE AUTOMOBILE:

[1,632.]—Could you tell me in "Letters Interesting and Instructive" about what was the highest speed attained while passing the grandstand in the last Vanderbilt Cup race?

Washington, D. C. H. T. CHITTENDEN.

No two observers will simultaneously reach the same conclusion in relation to the same matter, as it has oftentimes been found. The speed in front of the grandstand attained by the cars in the last Vanderbilt Cup race was variously estimated for different cars, all the way from 80 to 130 miles per hour. As a matter of fact, on hard level macadam road, 90 miles per hour comes close to the obtainable limit. The especially prepared roadbed in front of the grandstand is probably considerably faster than a hard macadam road, but how much faster it is difficult to say. In beach racing, as conducted at Ormond, it is generally considered that a given car will travel about six miles faster per hour than the same car could travel on a hard macadam road. It might be interesting to hear from some of the "stop watch sharps" who may have timed the cars in front of the grandstand.

BETTER "SWAP" CARS IN THIS CASE.

Editor THE AUTOMOBILE:

[1,633.]—As readers of your paper we would thank you for any information concerning two or three speed and reverse transmissions that could be placed in a "roadster" substituting the planetary system.

We would want a transmission that could be used without lengthening the wheelbase or making any other radical change. Our object in asking this is to do away with the noise and excessive grease caused by the planetary system. It would be quite satisfactory to have this answered in "Letters Interesting and Instructive." DESMOND-STEPHAN COMPANY.

Urbana, O.

It is a source of regret not to be able to safely advise users of cars to change the design whenever they find pleasure or anticipate profit in the plan. It is not a project likely to end satisfactorily, and it is, as a rule, better to "swap" cars with some one who wants what he does not possess. "The distant verdure ever looks the greenest."

HOW TO MIX AN ANTI-FREEZE SOLUTION.

Editor THE AUTOMOBILE:

[1,634.]—Could you advise us as to what proportion of glycerine, alcohol and water to be used as a zero fluid to the best advantage, and what degrees they will stand?

MONNIER AUTO & CYCLE SUPPLY COMPANY.

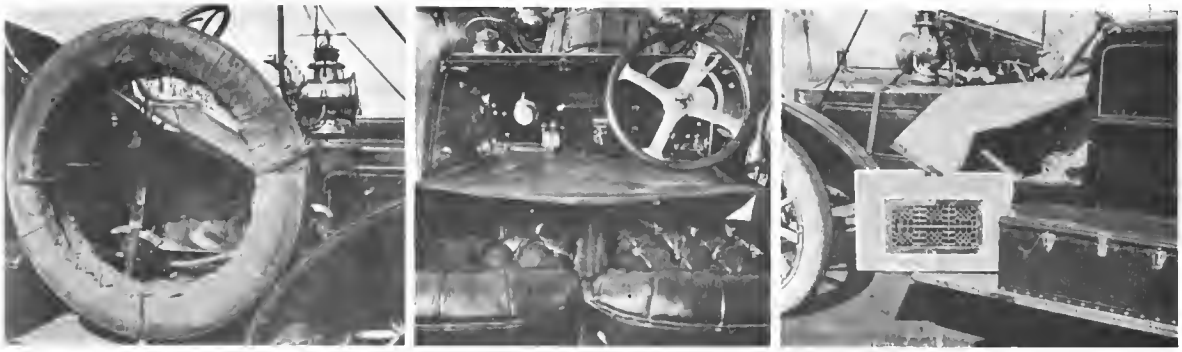
Detroit, Mich.

It is customary to use glycerine and water in equal proportions. This solution will serve well the purpose in these latitudes. Referring to alcohol, enough is to say it should be substituted in place of glycerine, retaining at much water as possible. It is the glycerine that is objectionable in that it attacks the rubber hose joints, and a fair remedy lies in using half water, as above stated, and equal proportions of glycerine and alcohol to make up the other half.

GRAPHITE AS A CYLINDER LUBRICANT.

Editor THE AUTOMOBILE:

[1,635.]—In the October 29 issue of your paper there appeared an interesting question, No. 1,603, concerning graphite as a cylinder



How Mr. Fowler, of Kansas City, Mo., Dispenses with s Lap Robs in Winter in His Packard.

ubricant. As answered by you, graphite is one of the best lubriants known for any purpose, provided it is of the bright variety the same as with oils), and it has been proven by authorities that lake graphite of tbe Ticonderoga variety gives much better results ecause of its natural lubricating qualities, and the fact that the lakes are capable of an infinite subdivision and are thin and tough.

The object of the graphite is to get right at the real cause of riction by eliminating it rather than forming a temporary cure, hat is, if one were to examine a metal surface (no metter how arefully polished) it would be seen to be filled with elevations and epressions, presenting the appearance of a nutmeg grater. Graphte fills in the iow spots and builds over all a thin, tough, veneerike coating of marveious smoothness and endurance.

It has also been found that friction is lower when graphite and il are used together, rather than when the graphite alone is used, s the oil serves as the carrying vehicle and helps to hold the lakes of graphite in place.

The objection cited that the graphite is likely to clog up the oil umps and leads is a good one, and would prevent it being used f there were no other way. Where splash lubrication is employed he graphite may be put into the crankcase in the proportions of scant teaspoonfui to a pint of oil, and where there are no side lates the graphite may be mixed with the oil and poured down the ent pipe.

Some introduce the graphite by removing one of the spark plugs nd squirting it tbrough the aperature by means of an ordinary ısect gun, which can be purchased at any drug store, or by means ' a quiii filled with graphite and rubber tube attached and the ntents blown into tbe cyiinder. Where graphite is used as indi:ted smoother running, higher compression and better regulation iii be quickly noticed; then, too, tbere is the assurance that if the l supply sbouid temporariiy fail there will be no bound pistons or ored cyiinders.

We prepare a speciai graphite for this use, known as Dixon's otor graphite, which is our celebrated Ticonderoga flake graphite, ound to an exceedingly fine powder but still retaining all the vantages of the flake formation.

JOSEPH DIXON CRUCIBLE COMPANY,
per L. H. SNYDER.

NE AUTOIST WHO LIKES TO BE COMFORTABLE.

itor THE AUTOMOBILE:

1,636.]—In the issue of The Automobile of October 22, the title of letter No. 1,592, "Do Autoists Like to Be Comfortable," attracted my attention. I, for one autoist, do like to be comfortable, and for that very reason I hed a simple device mads for my Packard that certainly improves my pleasure in it. I am enclosing you a few photographs of the device, and you are at liberty to publish them if you think they may be of use to any of your readers. The arrangement would, I believe, add to the pleasure of winter driving in any car.

Like many autoists who do much winter driving, I have oftsn felt the necessity of an improvement on the common bunglesome lap robe or "sack"—especially when driving in traffic and when handling the accelerator. A rubber or leather hood buttoned to the dash at the floor board and to the sides of the seats, soives ths robe problem. If the exhaust pipe leads under the floor, an ordinary furnace register-face set in ths board will admit a circulation of air around the pipe and up under the robe. The photos will clearly show the arrangsment of the robe and buttons and the iron grill.

Now, I have no patent to bring before the public, no device to be sold to car owners—I just had the idea carried out for my own comfort—and, being very enthusiastic about the pleasurable necessity, I write you in hopes that it may prove an addition to the pleasure and comfort of autoing in general.

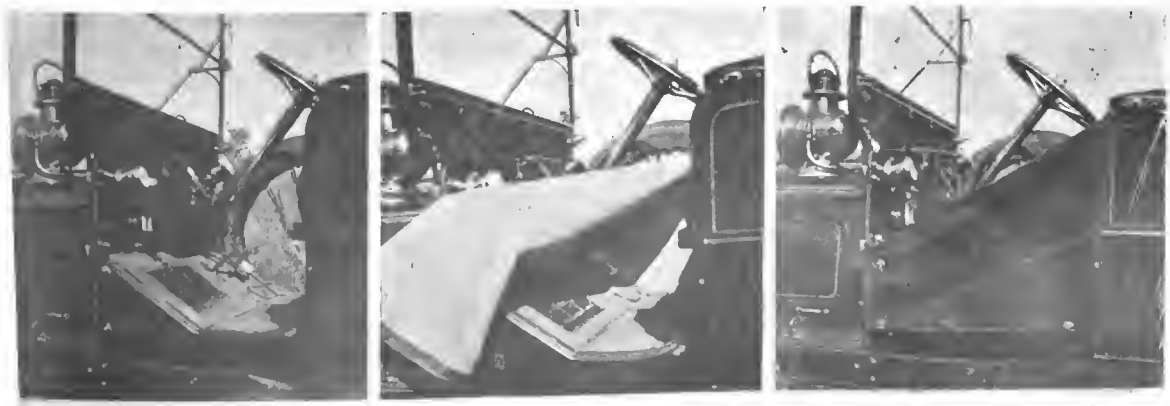
Kansas City, Mo. H. A. FOWLER.

REACHES AND REMOVES DIRT AND GREASE.

Editor THE AUTOMOBILE:

[1,637.]—I note letters of F. C. Snedecker (No. 1,587) and G. Ellsworth Meech (No. 1,610) on gasoline spray for cisaning tbe grease and dirt from auto machinery. I remember, as Mr. Meech does, that at one time someone advertised an air tank fitted with pump gauge, nozzle, etc., for cleaning by this method, but did not take much stock in it. But since Mr. Snedecker mentioned the subject, it set me to thinking I had around my premises a tank that was fitted up for brazing purposes that I could not make much of a success of in brazing. I removed the burners and put in place a length of rubber hose with fine nozzle, hois iess than No. 60 Stub gauge. It is certainly the best and quickest method of doing that kind of cleaning that I have tried. I think as Mr. Meech does, that with the addition of a little kerosene it would improvs matters. With this liquid, driven under pressure as it is, it will reach and remove dirt and grease in corners that is impossible to get at and other way. W. W. TRACEY.

Pittsfield, Mass.



Showing Rsgister Fitted in Floor. Leather Hood Partly Removed. Showing Hood Buttoned Down.

Philadelphia's Fire Chief and His Pierce-Arrow.

Ths chassis is a regular 4-cylndsr 24-horsepowsr Piercs-Arrow, built by the Georgs N. Pierce Company, of Buffalo, and a special body, consisting of two runabout seats and a box compartment in the rear containing hose and regular suppliss usually carried on chemical trucks, was constructed by ths Foss-Hughes Company.

MONTREAL MAY HAVE AUTO SPEEDWAY.

MONTREAL, QUE., Nov. 9.—Tbe Montreal City Council is to be asked to make provision for the construction of a speedway for automobiles on the property belonging to the corporation. The project is advocated by an alderman who, in speaking of the proposed innovation, said that his plan was to ask that the vacant land on both sides of the aqueduct be turned into two fine macadam roads. Tbe length of the aqueduct is something over five miles, extending from Point St. Charles to the lower Lachine road, above the Rapids. In order that the city could build the new conduit to Lachine, and also widen the old aqueduct from 40 to 140 feet, the corporation purchased more land on both sides of the aqueduct. After this is widened and the conduit is completed, there will still be 75 feet of vacant land on each side of the waterways. It is this vacant land that the alderman desires to see remodeled into two roadways.

The alderman admitted that in some forty years or so the city might need tbe land for an increased water supply, but in that event the automobile roads could be given up. The plea was put forth that there would be less fast driving in the streets of the city, if such a speedway is constructed. As the cost of macadamizing the two roads, no figures have as yet been made.

When the concrete covered conduit is completed parallel with the aqueduct it is proposed that before the water supply is turned on, there shall be an electric automobile trip through the subterranean passage, a distance of four miles.

PLAN SECOND-HAND EXCHANGE FOR TRADE.

At a meeting of the New York Automobile Trade Association, held last week, a plan was broached for the establishment by dealers of a "second-hand excbange." It was argued in support of the project that the handling of used cars received in exchange had become a great trouble and expense, necessitating, in the case of the large concerns, separate departments that required additional salesmen and took up much valuable floor and storage space. Attention was also called to the sacrifice attendant on disposing of cars to second-hand dealers and to the bigher prices the public was compelled to pay wben buying sucb cars.

It was suggested the dealers combine and form a stock company, rent a building in a more economical location than the Broadway district, and send their cars to the exchange to be sold at a fixed price, from which the exchange should deduct an established per cent commission. It has been further suggested that a monthly fee be charged for placing the car in the exchange to insure against loss from unsold or long unpurcbased cars. In this connection it was pointed out that as the excbange corporation benefited equally on all cars sold, there would be no object for any favoritism to any one make over another.

It is believed that the public by such a plan would be able to buy cars at a cheaper figure, be assured of a fixed price, and indisputably have a far larger range of selection.

PACKARD WINS A BIG CANADIAN TRACK RACE.

WINNIPEG, Manitoba, Nov. 3.—After being postponed three times on account of unfavorable weather conditions, the Winnipeg Automobile Club's annual race meet was held Saturday, October 24, and attracted a large gathering of people to the new one-mile track at Kirkfield Park. The cluh races were the first racing events to be held on this track, which has only recently been completed and is one of the fastest and best constructed tracks in Canada.

The chief event of the meeting was the 75-mile race for the Dunlop trophy, a handsome silver shield presented to the club by the Dunlop Tire Company for annual competition in either a road or track event. Seven contestants faced the starter out of the original nine entries made. E. Nicholson's Packard led throughout the race, being cleverly handled by his young chauffeur, O. W. Brown. McQuarrie on the McLaughlin Buick suffered from tire trouble in the thirty-second mile and lost six miles on the leader while making repairs. He, however, secured second place after a great struggle with Guest, who was driving John Galt's McLaughlin, the latter being third. When the third car crossed the line, P. C. Andrews, Stevens-Duryea, which was in fourth place, had completed 71 miles.

The Knox Cars that Form the Flying Squadron of the Springfield, Mass., Fire Department.

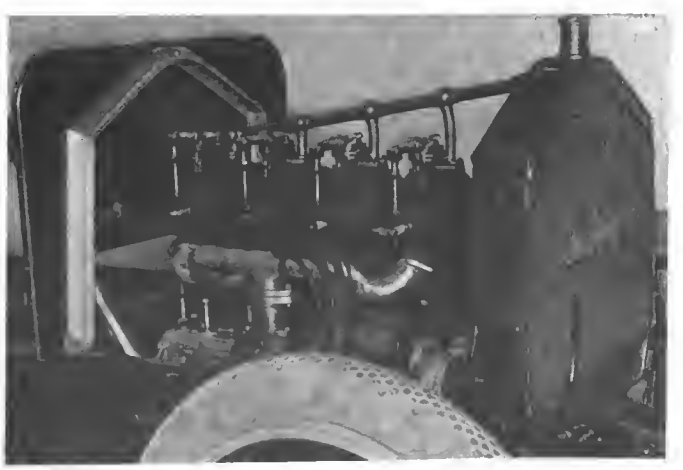
Great Western Cars for 1909

Model 20, 4-Cylinder 30-Horsepower Great Western Touring Car.

REE lines of the Great Western cars are being manufactured by the Model Automobile Company, of Peru, for the season of 1909. These models are styled Models 20, id 22. Model 20 is rated at 30 horsepower; Model 21 at rsepower, and Model 22 at 50 horsepower. Each model is act reproduction of the 50-horsepower seven-passenger car company has been building for the last three years, the ence being size and power.

e mechanical construction is identical in all, hence a deion in common will serve, outside of bore and stroke. Half c springs are used on the seven-passenger car and full c on rear and half in front on Model 20 and Model 21. models are made in either touring car or runabout at the price.

angement, Weight, Power and Dimensions.—The seven-ger 50-horsepower car's weight per horsepower is 58 2-5 s; the 40-horsepower weights 62½ pounds and the 30-ower weighs 62½ pounds in touring car and 63 1-3 pounds about per horsepower. The cylinder dimensions are: 20, 4 x 5-inch stroke and bore, respectively; Model 21, h bore, 5½-inch stroke; Model 22, 5-inch bore, 5½-inch Cylinders are cast separate. Any cylinder can be re- without disturbing any of the others. The pistons are d inside and out en annealed before e ground, thus giv- m equality of ex- exhaust valves are in the head and pletely surrounded ter. The intake re at the side, and to the cylinder as for the purpose of practically the en- rance in the cyl- The exhaust has stem, the top of cupped to receive ball against which kerarm works. done for the pur- eliminating noise uard against side-



Accessory Side of the New Four-Cylinder Motor.

wearing of the lifts. The intake valves are also equipped with ball ends for the same purpose as the exhaust. Cylinders are offset a half inch from center of crankshaft.

The crankcase is aluminum, in two pieces, with spacious handholes for connecting rod inspection and adjustment, and has five bearings for crankshaft. Right here a step is taken which will prove a factor in motor building. The crankcase proper does not take any of the strain of the power strokes of the piston; instead the studs which hold the cylinders to the crankcase go clear through and hold the manganese bronze bearing-caps of the crankshaft. The bottom half can be quickly removed without interfering with any bearing. Nickel babbitt, "die cast" bearings are used throughout.

The crankshaft is a solid one-piece drop forging, heat treated and ground to size, carefully balanced alone and with flywheel assembled. All valves are operated by a single camshaft. The gears for camshaft, pump and magneto drive are enclosed in a separate oil-tight case, which is divided in such a way that either the pump or magneto can be removed independently of each other or the balance of the gears.

A gear pump is used in conjunction with a flat tube radiator of ample size to insure proper cooling. The fan is mounted upon an adjustable bracket and is driven by 1-inch belt three and one-half times the engine speed.

Oiling, Ignition and Carburetion.—Ignition is by high tension magneto and battery, each system independent of the other. The magneto is located on the right forward supporting arm of the crankcase, just ahead of the carbureter. A Schebler "type P" automatic water-jacketed carbureter is used, located in center of the motor, on the right-hand side just below the inlet valve chambers. The oiler, with seven sight feeds, is mounted close to exhaust pipe, to keep oil flowing freely in cold

weather, and is driven by an eccentric and ratchet. The splash system is used in the crankcase.

The Transmission System.—A cone clutch is used with "raybestos" covering, with springs under covering to insure easy engagement. One of the features of the clutch is its manner of releasing, which is through a ball thrust bearing instead of a sliding yoke. The ball thrust is of split type, making it easy to remove. The thrust plates are hardened and ground. This type of clutch is simple, easily understood and quickly adjusted for wear. The connection between clutch and transmission is a double universal joint with sliding square for clutch release.

Clutch End of the Motor.

The gearset is of the selective type sliding gear, three speeds forward and reverse. Countershaft gears are keyed and forced on by hydraulic pressure, spaced by tubing separators. The reverse gear is forged integral with shaft, the gear on the opposite end being riveted in place. The drive shaft is round with four keys integral with the shaft. The spaces between are milled, hardened and lapped to size. The bearings are absolutely interchangeable. Bevel gear and differential casing have thread and nut adjustment for setting mesh of gear and pinion. Drive shaft with load is perfectly straight.

Rear axle is a heavy steel tubing, riveted and brazed, making it secure. Brake hangers of steel castings with dust flangers are used. Brakes are large and powerful internal expanding and external band on wheel hub drum; external bands lined with camel-hair fabric. These brakes hold both ways; operated by hand lever; external brakes are operated by foot lever 1⅜-inch nickel steel. Floating axle transmits power to hub clutch plates in rear wheel.

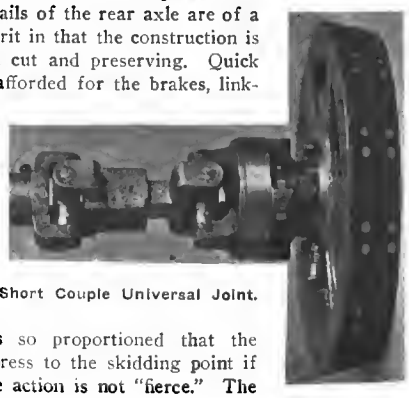
Front axle is I-beam type of solid one-piece forging. The center of front axle is the lowest point of the car. The pivot point of the steering knuckle is supported on hardened thrust bearings. Steering gear is of the worm and gear type, with eccentric bushings to adjust to worm and gear. All rods, levers and equalizers are underneath the cars between springs, leaving outside clean.

Specifications in the Main.—Frames cold pressed nickel steel, channel section with subframe and cross-sections.

In all cases the tread is 56 inches. The Model 20 car had 106-inch wheelbase; Model 21, 114 inches, and Model 22, 122 inches. The ground clearance is 10 inches, or better, in all cases, and the wheels are artillery type on ball bearings. Special attention has been given to the spring suspensions, with the idea of adopting the car to rough country roads. The easy riding qualities are further assured by the use of liberal sizes of tires.

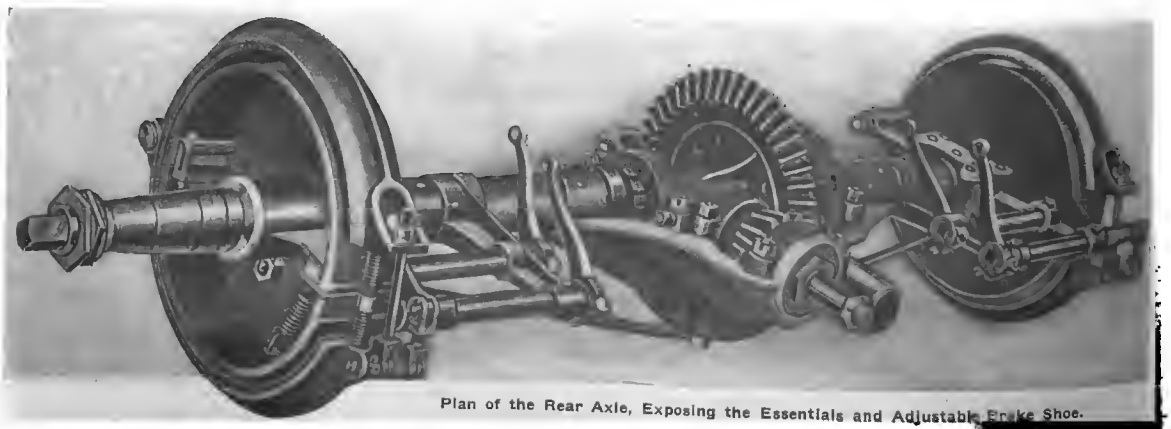
Some Protective Measures Shown.—Metal is used enclosing underpart of car; one side is hinged, while the other is clamped to the frame; thus the pan can be dropped very quickly, giving access to the underpart of car. Both front and rear fenders are designed for attractiveness and to insure greatest protection to car and its occupants. Much attention has been given to making the position of the driver comfortable, hence the space between the front and rear seat and dash is long and permits the driver to straighten out, and not be in a cramped position.

Some Notable General Features.—The details involving the clutch and the universal joints take on the appearance of a display of ingenuity in design, and there is a certain sturdiness in the construction that cannot be passed unnoticed. The details of the rear axle are of a high order of merit in that the construction is mechanical, clean cut and preserving. Quick adjustments are afforded for the brakes, linkage arms are provided with outboard bearings, and the brake shoes have liberal areas and are sufficiently rigid to assure uniform contact. The "motion" is so proportioned that the brakeshoes will press to the skidding point if necessary, but the action is not "fierce." The details in connection with the differential housing are very substantial indeed, bearing adequately supported, and the bevel drive is so arranged as to enable the workman to relate the gear and pinion in a manner to abort noise. The half time gears are separately and cleverly housed in, they are thus protected from foreign substances, and they may run in a grease pack for the double purpose of preventing noise on the one hand and engendering a long life on the other. The accessories under the bonnet may be quickly removed, are getatable in place, nor is it the least of the advantages, that ample provision has been made for oiling at every point.



Short Couple Universal Joint.

The leather face cone clutch is very carefully designed with a view to eliminating "spinning" effects. The coefficient of friction is held at a high point through the addition of cork inserts.



Plan of the Rear Axle, Exposing the Essentials and Adjustable Brake Shoe.

FRANCE PLANS TO HAVE AEROPLANE RACE

PARIS, Nov. 4.—There will be a flying race, the first the world has ever known, on the vast plains around Chartres, or on the open Champagne country around Rheims some time next fall. A prize of $20,000 will be offered to the pilot of the heavier-than-air flying machine capable of covering the greatest distance in the shortest possible time, under detail conditions yet to be announced. In instituting its aeroplane race the Aero Club of France declares that it is convinced that sky pilots have outgrown the preliminary period of circling round a field, and that in future the art must be practiced across country, from town to town. The definite selection of a course will be made later, but in any case it will be either over the Beauce plains to the west of Paris—the granary of France, or on the Champagne plains to the East—world-famed for its wines. No more suitable spot could be imagined, for the country is as flat as the proverbial billiard table, there are few villages, and practically no natural obstructions. Detail regulations regarding the race are being anxiously awaited by intending competitors.

Among French sky pilots the announcement of the aeroplane race is received with immense satisfaction, and already one dozen men are counted on as certain starters. Either Wilbur or Orville Wright, or both, will, it is believed, take part in the race, which will be open to all without restriction of nationality; Farman, Delagrange, Bleriot, Esnault-Pelterie, Kapferer, Gastambide-Mengin and Ferber are all looked upon as certain competitors.

A wave of aeronautical enthusiasm is sweeping over France, the desire to secure first place in aeral navigation being confined not merely to a group of enthusiasts, but being spread throughout the entire nation. Automobile constructors are keenly interested in the future of the aeroplane, as is shown by the fact that not only their engineers closely studying the aerial motor question, but the heads of the leading automobile firms are frequent spectators at the flights of Wright, Farman and others.

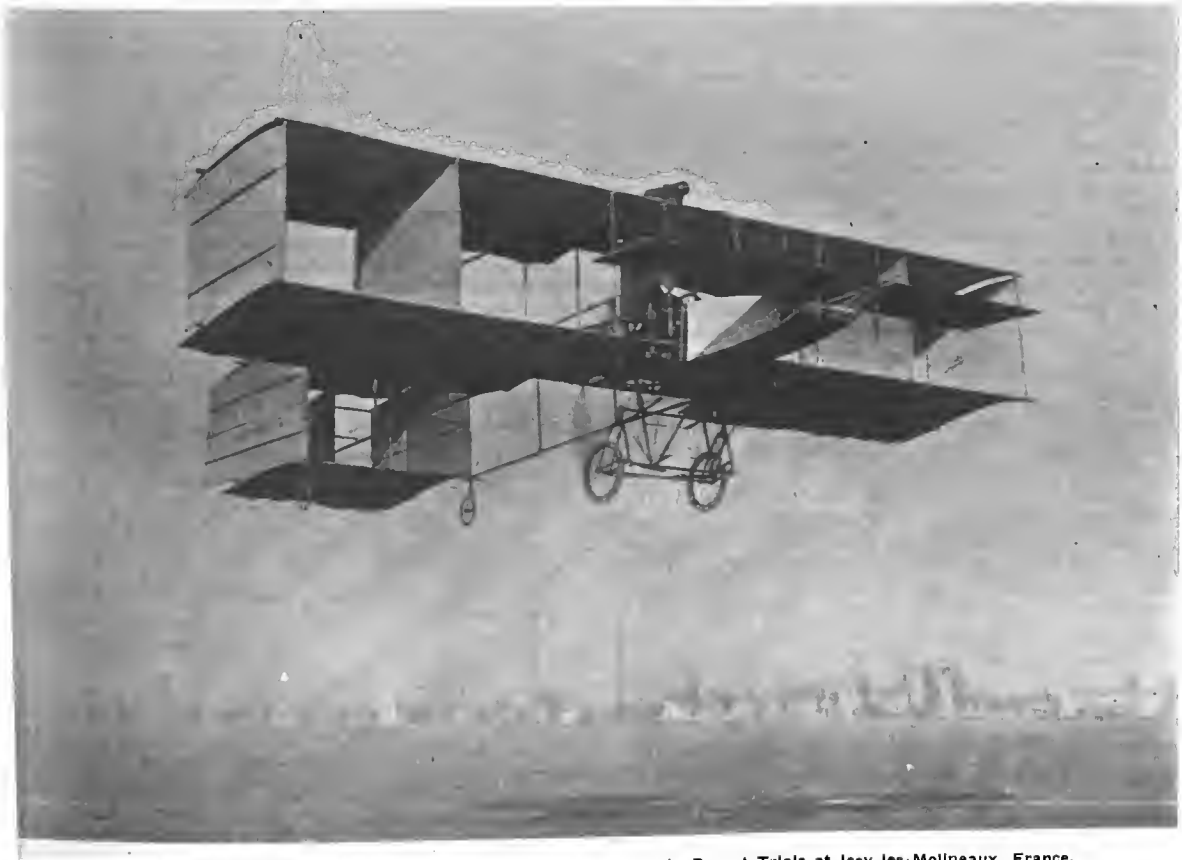
In addition to the Aero Club of France, the International Association of Recognized Automobile Clubs is occupying itself with aeroplane races. At the last meeting of this organization, held in Paris, it was unanimously decided to organize a flying machine race during the summer of 1910.

FRENCHMEN DO HONOR TO WILBUR WRIGHT.

PARIS, Nov. 5.—After being the subject of endless criticism and so little believed in that his name became synonymous with bluff, Wilbur Wright is the hero of the hour. He was the guest of honor this evening at the dinner of the Aero Club of France, at which M. Jean Barthou, the Minister of Public Works, presided, and who presented to Mr. Wright the Aero Club's gold medal and the special medal of the Acadamy of Sports. The 200 guests present included practically all the European experts and scientists interested in aviation.

FARMAN'S CROSS-COUNTRY AERO FLIGHT.

PARIS, Nov. 1.—Henry Farman has made the first cross-country aeroplane flight by a journey of about 17 miles from Chalons to Rheims. In order to clear obstructions he was obliged to rise to about 250 feet, and he accomplished the feat in 20 minutes, at an average speed of 45 miles per hour.



The Aeroplane of Leon Delagrange in Graceful Flight at One of the Recent Trials at Issy-les-Molineaux, France.

Comfort in Costume for the Woman in Autoing

AS so much of that satisfaction in the consciousness of being well-dressed which a sense of piety does not invariably bestow, is to be derived from automobiling attire, women who are ambitious to be quoted as among the modishly garbed, are devoting an immense amount of time—not to mention money—to their motoring toggery for the coming winter. Naturally the all-enveloping coat is of chief importance. This season there are innumerable models in middle weight worsteds, suited to a mild climate, as well as thick fabrics, almost as cold resisting as are the Swedish leathers and various pelts adapted to those northern regions in which winter arrives early and lingers late. Among the worsted coats are several new designs embracing the salient features of the Directoire period. These are the wide pointed revers which fasten over the fronts of the coat by means of cabachon buttons run through elongated button holes, and the high, turn-over collar which also is button trimmed. Many of these new models are of pelisse and redingote shape, but with sides slashed to the hips so that despite a scantiness of material below the waist line, there is no strain upon the lower portion of the garment when its wearer is seated. On these coats are placed the broad turn back Louis cuffs and the wide flaps covering the top of really serviceable deep pockets of leather which are let in just below the hips. The raised waist line which distinguishes so many ordinary coats and gowns appears in some of these redingotes in which the short effect is emphasized by means of a wide strap of material matching the revers and collar, that extends from the centre of the back to halfway across the front where it terminates with a huge button. In black, brown, green, taupe, smoke, wistaria, catawba, blue, wine, gray and tan broadcloth, these semi-fitting long wraps make ideal medium weight garments for motoring and are sufficiently dressy for general street use.

Double box plaits form the backs of an exceedingly smart model coat of Scotch cheviot which has a double breasted front and biased side forms. This cutting scheme places most of the fulness in the back and gives the long, flowing lines of the Empire without making the garment cumbersome—a fault which automobile tailors were just a bit slow to rectify.

Two-faced cloths are much in vogue at the moment for long coats of the ulster order, finished with mannish collars and revers showing the gayly plaided inner side of the material. The feature of such coats, however, is a double set of pockets, two of goodly dimensions upon the breast and a duplicate set of nearly twice their size over the hips. They are so set upon the garment that a plaid piped strap of the cloth, extending over the shoulders, borders the outer edges of both breast and hip pockets.

Chinchilla cloth, Irish frieze and various novelty weaves of rough surface and being extensively employed for the heavy coats designed to take the place of the fur and fur-lined garments to which some women object on the ground that it is impossible to exchange them for a wrap of pelt until the backbone of the winter has been broken and all furs are permanently discarded. Necessarily these very thick materials must be made up as scantily as is possible else they will prove too bulky for use save when the wearer of them is riding. The best model of all those recently brought from Paris is one having a back with a straight centre seam and sides which widen gradually from beneath the arms' eyes where they join fronts cut in precisely the same manner. This gives sufficient flare about the knees and feet, but not an inch of unnecessary weight. So narrow are the front and back forms across the shoulders that when the medium sized conventional coat sleeves are set plainly into the wide arms' eyes, their tops are almost concealed beneath a collar of moderate width.

Buttons are not a prominent feature of any of these rough fabric coats, for although quantities of them are employed, they are strictly utilitarian and fasten the slashed sides and back as well as close the fronts. Usually they are of moderate dimensions and of bone or metal precisely the shade of the cloth. On the contrary, the collars and sometimes the cuffs are surprisingly ornate. Sometimes they are of brilliantly hued leather or French kid and often they are of Oriental embroidery done on satin or of velvet with tinsel soutache braiding.

In addition to the rubberized English mohair, taffeta, satin or crêpe de Chine storm coat which accompanies every wise woman upon a motoring trip, there are various novel accessories designed

: shoulders, throat or head. One of these is the *ho* of oil silk or rubberized light weight fabric and ılar of about umbrella dimensions with a hole cut through which the head may be thrust. Another storm hood of materials similar to those employed *o* and large enough to be quickly drawn over the of ordinary size. Its features, however, is the im- ke those seen on old fashioned bonnets which falls collar and perfectly protects the throat.

fers of either wool or silk are of great convenience bilist whose coat is not double-breasted, as they wide and long that they entirely cover the chest he lack of sleeves add quite as much warmth as ne waist length sweater. Happily the worsted coat late months to a really serviceable size, the newest rs extending quite to the knees and being shaped tight street coats of the conventional tailored type. gh band collars covering the throat and their deep ctending half way over the hands, they promise so that fur coats seem unnecessarily burdensome. er has been a time when fur was so much to the obile circles. In addition to the aristocratic look- uskrat which so closely resembles seal as to deceive all but the initiated. The natural and sabled squirrel, the natural and dyed Russian pony and caracul, there are fetching looking garments in civit cat, leopard, coon and dog skin. While a majority of these coats are fifty inches long very smart affairs are of knee length, as some women prefer the three-quarters style in pelt as well as in the smooth and rough cloths that are fur-lined.

Gray, sabled and marked squirrel remain the favorite pelts for coat, hood and rug linings. Some of these intended for wraps come in such shape that they may readily be adapted to garments of any design so that, like the shawl collars of chinchilla, mink and linx, they may be shifted from a motoring to an evening wrap. The wee woman who likes to motor wears a sabled squirrel or white fox coat covering her skirt hem unless, like some of her elders, she has one of Swedish leather or French kid modelled after those of chinchilla cloth but lined brilliantly with kid-pale blue under white, red with French green and brown with cardinal.

Hats made of soft French felt, of Ottoman or of satin usually have the wind resisting depressed brim and the medium high crown, while those of leather kid or fur are on the turban or collapsible order, but hoods are rapidly coming to the fore as there is no danger of their blowing off and it is far easier to becomingly drape veils about them.

'S FOR WOMEN WHO CONTEMPLATE TOURING ABROAD

By BLANCHE McMANUS.

ratively recent vogue for the three-seated auto has tself and quite exploded the old adage that "three's y one of the 18-horsepower, or even 12-horsepower; rful for the kind of roads one ought to tour on— o bad for that in the region where you propose powerful machine won't make them any better, and go by train in the good old-fashioned and more

ed great cost of automobile touring is another ght to be exploded. Automobile touring, under l conditions is cheaper than any other form of one counts everything. A party of four women ndy and Brittany in a hired automobile for ten thing like $40 each, and another party of five n the Riviera, starting from Marseilles, for $100 party. How about that!

to the low-powered automobile, the writer once Alps in a *voiture légére,* built for two, with a only six—but they were full-grown French horse- Echelles, in Savoie; the Galiber; Lautret; Mont Simplon had no terrors. The three-seated auto- course, accommodate a chauffeur in the spider- you had much better fill it with a friend. He, e "the time of their lives" from such a viewpoint, who knows 12-horsepower is enough for the s in France, Italy and Germany, and in Algeria , if you think you would like something out of d the writer has done that, too, and found no Africa that a modest man's, or woman's auto- t scale.

three-seated automobile enables one to do away iced chauffeur, who drives your machine at the t suits himself, and to places whose hotels he m others of his kind, and who in general has a e byroads and the hotels of the country town.

obile touring abroad is largely confined to the untries, not ignoring Algeria and Tunisia, where the best where they exist at all. Most people that the countries bordering upon the great ke are blessed continually with a Summer cli- not. There is plenty of sunshine, but there nd there are cold seasons, which are not the e idea of orange blossoms and olive groves. The cold wind which comes up at sunset is nowhere more to be feared than on the French and Italian Rivieras, and the daily drop in temperature at this hour is something inconceivable to those who know it not. So when you take your long-dreamt-of automobile tour over the olive-covered slopes of the French Riviera, or along the vine bordered roads of sunny Italy, just remember that you will need the same warm clothing which is necessary while touring in many other countries.

One can do without furs, however; indeed, you should always leave that sealskin coat at home while traveling abroad, and then you won't be harassed getting it back through the customs again. Furs are not really needed, except in the Scandinavian peninsula and Russia, and those places have not yet been developed as automobile touring grounds. Furs, on an automobile, are only catch-alls for dirt and perhaps other things not so harmless. The woman automobilist will find good warm cloth garments to more than take their place.

The woman automobilist not infrequently prefers the English inn to the Continental hotel, principally because she finds carpeted microbe breeding and harboring floors there, a plethora of furniture and dimity curtains at the windows, good-sized wash-basins, and personal service from a bevy of neat capped maids who understand how to envelop the traveler with that air of importance and distinction, especially dear to a certain class of traveling Americans, who often never had so important a personage about them at home as a nigger cook.

While on the continent femininity of the same class professes to be appalled by the rather gaunt and bare—though undeniably cleanly—furnished rooms of the average country hotel. There bare floors of waxed tiles or wood seem chilly and uncomfortable, and the personnel who receives the traveler is apt to be less effusive over one's coming than in England; their's is a politeness tempered with a friendly independence, which one can but admire; they do not crawl or fawn about one, and you do not pay for inefficiency in the bill on leaving, either.

The advantages of the English inn are mostly superficial, however, and one soon learns to prefer bedrooms which seem rather to have gone through a process of elimination than an addition of useless lumbering accessories. The more efficient, though more independent continental *garçon* is worth half a dozen simpering mob-capped maidens when it comes to getting you installed in your rooms on arrival and getting your luggage down and strapped on the automobile on leaving.

CLUBS AID IN SUPPRESSION OF RECKLESS DRIVING

NEW YORK, Nov. 8.—Reports received at the headquarters of the American Automobile Association indicate that officers of many of the local automobile clubs which have placed their organizations on record as strongly opposed to speeding and reckless driving are not content with this action alone, but intend to place the responsibility where it rightfully belongs, upon the autoists of other States, who in many cases do not evidence any desire or inclination to observe the local speed laws. Many of the automobile clubs affiliated with the A. A. A. have during the past several months endeavored to break up the reckless driving and speeding through the principal thoroughfares, and the Automobile Club of Springfield (Mass.) has taken drastic action which will without doubt have a far-reaching effect.

At a recent meeting of the directors of the club, which is one of tbe largest and most influential in New England, it was decided to have suitable cards printed wbich will be displayed in all of the hotels and garages in Springfield and vicinity and leading through the popular routes into the adjoining States. These cards will call upon the automobilists to use the roads in a safe and sane manner, and if they fail to comply with the club's request, the directors have decided that there is but one alternative, that, the establishment of official club speed traps. The Springfield club is determined that the speed laws in the vicinity shall be properly observed, the club feeling morally responsible for the acts of the autoists from other States and they will not hesitate to establish traps if it is deemed necessary.

The club has taken this step upon their own inititative without waiting for specific complaints to be made, and in this connection have taken more radical action than the other clubs in New England which have been considering the best means of discouraging the continuous speeding over the splendid highways of that section.

It is only a few weeks ago that Secretary Elliott of the A. A. A. sent a warning against reckless driving to the officers of the 200 automobile clubs scattered throughout the United States, to the effect that drastic anti-automobile legislation would surely be enacted in many of the Eastern States, particularly Connecticut, if a stop was not put to the reckless driving over the roads of New England. There has already been some agitation regarding the Connecticut automobile statute, regarded as one of the modern motor vehicle laws in the country, being likely to be repealed, unless the autoists touring through the State cease speeding and thereby tend to diminish the number of accidents which have frequently occurred to the other users of the highways.

STATE ROAD TO DELAWARE WATER GAP.

SCRANTON, PA., Nov. 9.—At the annual election and banquet of the Scranton Automobile Association the papers read by the officers who had served in different capacities during the past year brought clearly before the minds of all the seventy odd members present the commendable work that has already been accomplished, or on the way of accomplishment, by the association. The retiring president, Dr. H. B. Ware, read a report on the growth of the association and the object which caused it to be organized, mentioning in detail some of the more important of these which have been attained: the changed attitude of the police and city authorities towards the reasonable use of the automobile, the work of educating the county overseers up to the point where they will be equally as desirous for good roads as the automobilist, and the proposed meeting between club members and the overseers to further this purpose.

The report of the chairman of the good roads committee, E. M. Clarke, was especially interesting as it dealt largely with the progress made in the proposed state road from Scranton over the Poconos to the Delaware Water Gap. He stated that if the association would bind itself to stand half of the expense falling upon the township through which the road passed, it would be an assured fact. This means about $6,000, which he said could be easily raised as he had already received pledges for liberal contributions.

The officers for the following year are: President, Thomas Sprague; vice-president, William H. Richmond; secretary-treasurer, Hugb B. Andrews. Dr. H. B. Ware, George Jermyn, and John Creining were elected to the board of governors to serve for three years.

ROCHESTER CLUB WANTS 1,000 MEMBERSHIP.

ROCHESTER, N. Y., Nov. 9.—The Rochester Automobile Club under its present administration is rapidly growing in membership, the total now being 531. The aim of President Henry G. Strong and Secretary Van Tuyle is 1,000 before the next annual meeting. Seventeen members were added at the recent meeting. The secretary's office is at the Hotel Seneca.

Recently there has been some reckless driving in and about Rochester, and as a result of a recent incident the club has sent broadcast the circular herewith reproduced. The club deems it advisable to apprehend, if possible, infringers of the speed law and the rights of pedestrians. The case in question was one of flagrant disregard of the latter, and its perpetrator should be made an example of.

$100 REWARD

Will be Paid by the

Rochester Automobile Club

for information leading to the arrest of the person driving the automobile which ran over JOSEPH HARTMAN on East Avenue, at six o'clock, Wednesday Evening, October 28, 1908.

Rochester Automobile Club

BERT VAN TUYLE, Secretary

Facsimile of Notice Issued by Rochester Automobile Club.

CLUB ACTIVITIES IN AND ABOUT PHILADELPHIA.

PHILADELPHIA, Nov. 9.—Club activity in the Quarker City is on the increase. That solid old organization, the Automobile Club of Philadelphia, having just gotten its one annual competitive stunt—the Brazier Cup contest—off its hands, is now busily engaged considering ways and means of building a centrally located and handsomely equipped clubhouse and garage to accommodate its rapidly growing membership. Tbe committee having the matter in charge has met with such success in seeking subscriptions to the proposed bond issue to float the scheme, that it has been decided to enlarge its original plans and endeavor to secure at once the entire sum that must be guaranteed before any conclusion of the matter is possible. It is authoritatively stated that the opening of next Spring will see the bopes of the

committee well on the way toward fulfillment. The club is still adding substantially to its rolls at every meeting, no less than 26 being admitted at last Monday's gathering of the Board of Governors. The committee on routes, maps and signs—which, by the way, is doing such excellent work that it is being set up as a model by clubs in others sections of the country—is almost ready with a complete revision of its road map of Philadelphia and vicinity, which will be issued from the press shortly, together with an additional book of routes. Each month this committee erects, or causes to be erected, at least a score or two of mileage, direction, and warning signs, and its work is in evidence no matter what direction the automobile traveler may take in coming into or leaving the city. This feature of the club's activities has been most potent in attracting those automobilists who realize the value of such work, and has been responsible for the addition of a large proportion of the new membership.

Up in Germantown the same old story of outgrowing the facilities afforded by the twice-enlarged clubhouse are heard, and now, in order to find room for a portion of those who are growing restive at being compelled to decorate the long waiting list for such a length of time, the officials of the club have decided to enlarge its quarters, and work will be begun on a handsome addition in the near future.

Tbe Quaker City Motor Club, having recovered from tbe jubilation following its successful management of the 200-mile Founders' Week race in Fairmount Park, is taking tbe first steps toward opening the 1909 season. To-morrow a bunch of "pathfinders" will leave town to select hard routes to and from Wilkes-Barre, which has been decided upon as the outward mark from its annual two-day New Year's run, January 1-2 next. The remembrances of the too-numerous ties and tbe subsequent runovers are still fresh in the minds of the contest committeemen, and the "pathfinders" have been ordered to select routes sufficiently difficult to keep the number of clean-score cars within a reasonable limit. MacDonald & Campbell, donors of the first prize cup, have announced that this year they will allow that emblem to go for "keeps" to the winning car, despite the fact that the original deed of gift called for a three-time win in order to secure permanent possession of the cnp.

The Quakers have chartered the steamship *Grecian*, sailing November 22, for the round trip to the Savannah races.

Across the Delaware, the erstwhile Camden Automobile Association has been reorganized as the Camden Motor Club, and is preparing to take active part in bringing about a much needed improvement in Camden county's roads. Dr. H. H. Grace is president of the reorganized club, with W. L. Hurley vice-president, and George E. Rhedemeyer, Merchantville, N. J., secretary and treasurer.

WILKES-BARRE CLUB HAS WON ITS FIGHT.

WILKES-BARRE, PA., Nov. 9.—The Wilkes-Barre Automobile Club bas succeeded in its fight to have the bridges across the Susquehanna from Wilkes-Barre to the west side and one from Pittston to West Pittston, declared free bridges. The members of the club circulated a number of petitions which were presented to the grand jury along with evidence resulting in the recommendation tbat these bridges be purchased by the county and thrown open to all without cost. This will not only save the members of the club a great deal of annoyance, but also all drivers of automobiles who travel through that section of Pennsylvania.

The sign post committee of the club is now busily engaged in carrying out its work of erecting direction and danger signs on all the main traveled roads in this vicinity with the hope that this beginning will be completed within the next few weeks.

On Saturday of last week the good roads advocates of the Wilkes-Barre Automobile Club secured the indictment of Mayor Lewis P. Kniffen and thirty members of the common council, for maintaining a nuisance in failing to have the streets of the city properly repaired. District Attorney Abram Salsburg laid the case before the grand jury and will call the accused for trial.

SCRANTON CLUB TO RAISE ROAD MONEY.

SCRANTON, PA., Nov. 9.—The plans for the State road over the Pocono Mountain towards Stroudsburg are taking such a definite form that there seems to be no doubt about the road's final completion. The supervisors of the different townships, and officers of the Scranton Automobile Association have at last gotten together and work will be started this week by members of the club to raise the $6,000 which they have promised as a body towards the construction of this new highway. Now that the farmers in the townships know exactly what the Automobile Association will do in the way of raising money, the petitions will be filed with State Higbway Department immediately. The work of collecting the club contributions will be in the hands of E. M. Clarke, of the firm of Clarke Brothers, and Solicitor H. B. Andrews, of the Automobile Association.

VIRGINIANS ELECT NEW OFFICERS FOR 1909.

NORFOLK, VA., Nov. 9.—At a recent meeting of the Tidewater Automobile Association of tbis city the association elected officers for the coming year and afterwards adjourned to the Lorraine hotel where a banquet was served in honor of the third successful year of the organization. The slogan of the meeting was not only good roads for the country, but the city as well, where many of the streets have been allowed to exist in a state not even fit for country roads even. The following officers were chosen for the coming year: President, W. M. Whaley; first vice-president, C. H. Bull; second vice-president, J. M. Gibbs; secretary and treasurer, C. L. Young. The directors elected were: F. O. Smith, S. W. Pannill, S. W. Harris and D. P. Paul, who, with the officers, include the board.

ATLANTA AUTOMOBILE CLUB ORGANIZED.

ATLANTA, GA., Nov. 9.—Over sixty automobile owners of Atlanta have organized the Atlanta Automobile Club and elected the following officers: President, Edward H. Inman; vice-president, Charles H. Ryan; secretary-treasurer, W. G. Humphrey. Executive committee: Beaumont Davidson, R. F. Maddox, J. D. Rhodes, Asa Chandler, Jr., Frank S. Ellis, and R. R. Arnold, Jr. More than $6,000 has already been subscribed for the purpose of erecting a club house and President Inman will appoint a committee to have full charge of this work with the hope that suitable quarters for the club will be built at an early date.

KOKOMO INDIANIANS ORGANIZE A CLUB.

KOKOMO, IND., Nov. 9.—Automobile owners of this place and vicinity have organized the Kokomo Automobile Club with an initial membersbip of over 100. Articles of incorporation have been filed and plans are on foot for securing club rooms in a suitable location. At the first meeting all the members were enthusiastic for a campaign in conjunction with the other clubs in the State, for the advancement of the good roads movement.

SAWYER NOW MASSACHUSETTS SECRETARY.

BOSTON, Nov. 9.—At an adjourned meeting of the directors of the Massachusetts State automobile association Herbert M. Sawyer of tbe Worcester Automobile Club was elected secretary to succeed James Fortescue, who refused a renomination to the office. Mr. Sawyer has been prominent in the affairs of the Worcester club, was last year secretary of the Worcester Board of trade and has a reputation as a hustler.

ANOTHER CLUB FOR PENNSYLVANIA.

KITTANNING, PA., Nov. 9.—The automobile owners of Kittanning have at last organized and the membership at present numbers about thirty, with prospects of a constantly increasing roll. J. H. Painter has been elected president and W. Moorhead, secretary and treasurer. The club proposes not only to work in the interests of better roads, but to provide better garage and repair facilities for Kittanning.

MUST BE REFORM FROM THE INSIDE.

It has become a necessitated case of reform from the inside in many localities where visiting autoists are numerous and negligent in observance of the rights of the other users of the road.

Members of legislative committees of various State bodies of the American Automobile Association each year have found it harder to answer successfully the charge of the lawmakers that an increasing number of autoists, when away from home, act in a manner of which they would not be guilty in their own localities. It is a situation where it looks very much as though the needs required a law-abiding autoist to catch a law-breaking autoist, and this idea is likely to spread quite generally and effectively in the next few months.

One club has met the issue squarely and without equivocation. On one of the most traveled main routes lies Springfield, Mass., and the abuse of the roads in its environs has gone beyond further acquiescence by the local automobile club, which announces that it will aid energetically in the punishment of those "tourists" who leave in their trail a cloud of dust and an assortment of mangled poultry and dogs, with the occasional inevitable catastrophies of greater magnitude. These roughs of the road must be brought to the bar of justice, and unless a plan is evolved whereby it is accomplished, the demand for more stringent laws will be unsuccessfully met by those autoists who labor generously every Winter at State capitals in the effort to obtain reasonable statutes.

If it is an established fact that the autoists themselves are lending efficient aid in apprehending these offenders, it will lessen in vast degree legislative prejudices, which are slowly giving away and would be dissipated more quickly were it not for the unjustifiable use of the highways by the inconsiderate few. These speed-crazed beings have miles of open country, and they should be hammered, if must be, into a sense of decency in places where the rights of others call for recognition.

* * *

ALMOST IMPERCEPTIBLE REFINEMENTS.

The time was when autoists were curious to know why ambitious types of automobiles ran into money. They could not see the equivalent in their cursory examination of the cars. They did admit the good performance, and they were persuaded to pay the price.

The most recent slant of this character lies in the desire for enlightenment along lines involving the 1909 cars. Why are they so much better, when the price is so much lower? It is like everything human; experience teaches economies, processes bow to refinements, and duplications of efforts eliminate themselves in time.

There is a great difference between doing things as a matter of course, and groping around in the dark, hoping thereby to stumble upon the missing link. In every art, science and industry a certain amount of groping must precede a definite measure of success. Fortunately, groping is the task of intelligence, but while the process goes on the cost floats up. Fortunately, ignorance might forego the finish, and the cost would never fall to the tune of soaring quality.

The reasons why the costs can be lower, and the quality become superior, are deep seated and scattered. They lie in the definite aims, the swelling volume of trade, and automatic co-operation on the part of the vendors of materials, the designers of automobiles, and the artisan, who weld the aggregation into the splendid finished products that greet the sober, earnest thinkers, who must support an industry to render it a complete success.

* * *

IN THE CONTROL OF COMPETITIONS.

Automobile competitions of the big sort are expensive. This expense is now borne, except in rare instances, by the manufacturers. It would appear logical that the man who pays the bills should have considerable voice in the premises; in the past, in this country, he has been a necessary yet modest factor. It is a good guess that his attitude will change shortly, and there are indications that the future will tell its own story in this regard.

That the methods of conduct and caliber of entrants will not deteriorate, is assured in advance, and, furthermore, the public will be interested to the same extent when patrons realize that the business element will not be allowed to intrude itself in a detrimental manner. That this can be accomplished, is evident from the results in France, where the makers have much to say as to what they will compete in and how and when.

LAW SAFE IF OFFENDERS ARE PUNISHED.

HARTFORD, CONN., Nov. 8.—Never since its inception has a more enthusiastic meeting of the Automobile Club of Hartford been held than that of Friday noon last. About a hundred of tbe members congregated at the Allyn House, completely filling the clubrooms. Many prominent citizens were present, including United States Senator Morgan G. Bulkeley, Mayor E. W. Hooker, City Engineer F. L. Ford, Colonel George Pope, and J. Gilbert Calhoun. Delegates from the various clubs comprising tbe Connecticut Automobile Association were present as the guests of the Automobile Club of Hartford.

After lunch the gathering listened to a very neat speech by Senator Bulkeley, who stated in connection with violations of the State automobile law that that measure was still good, even if it had been abused. It was the senatôr's opinion that bringing the offenders to book would alleviate present conditions.

Colonel George Pope, a member of the legislative committee which did a lot of hard work in the interest of the present liberal law, was the next speaker. Colonel Pope expressed the view that there was nothing to fear in the fortbcoming legislative body as regards a possible abrogation of the present law. "What we really need is not to repeal the law, but to enforce it."

Walter S. Schutz, attorney for the Automobile Club, spoke particularly of the money realized from licenses which should be expended for road repairs. Mr. Schutz struck a keynote when he remarked that one thing badly needed was a bridge across the Connecticut River at Lyme and Saybrook.

At the conclusion of the lunch a mammoth bunch of flowers was sent to Louis Elmer, the local Ford agent, who is seriously ill at the Hartford Hospital.

Following the lunch there was a business meeting of tbe Connecticut Automobile Association. J. D. Anderson was unanimously elected a director to the State body, vice G. K. Dustin, resigned. C. H. Gillette was elected secretary of the State association to fill the unexpired term of G. K. Dustin, resigned, and J. M. Brooks, of the Litchfield club, was elected treasurer.

The matter of compelling all wheeled vehicles to display a light at night was discussed. Such a measure was asked for in the last Legislature, but the farmer vote downed it. However, it will be tried again this season, and it is hoped that it will be passed successfully.

NEW JERSEY AUTOISTS ARE ORGANIZING.

NEW BRUNSWICK, N. J., Nov. 9.—The activities of W. C. Crosby, acting president of the Associated Automobile Clubs of New Jersey, and H. A. Bonnell, its secretary, have resulted here in the formation of the Middlesex County Automobile Club, the second meeting of which was held to-night. While L. A. Voorhees is the choice for president, Frederick Schussler for treasurer, and A. W. Clark for secretary, it was decide dto postpone the actual selection of officers until the nominating committee presents additional names for vice-presidents to represent the club in various sections of Middlesex county.

Those present at the meeting to-night also included: F. H. Elliott, secretary of the A. A. A.; J. V. Z. Anthony, president, and J. H. Edwards, ex-president, of the Automobile Club of Hudson County; Jacob Mason, vice-president of the New Jersey Automobile Trade Association; and Dr. J. R. English and Joseph Wood, ex-presidents of the New Jersey Automobile and Motor Club.

OLDS MANAGER DENIES COMBINATION STORY.

LANSING, MICH., Nov. 5.—Frederick L. Smith, general manager of the Olds Motor Company, denies that the company contemplates combining with other concerns under J. Pierpont Morgan.

"There is no foundation for the story," said he. "The Olds Motor works is on a firm financial basis, and is enjoying the best business in the history of the concern. The idea of selling the interests or joining with any combination has never been entertained."

FORD CAPITAL INCREASED TO $2,000,000.

LANSING, MICH., Nov. 5.—Papers were filed with the Secretary of State to-day for an increase of the capital stock of the Ford Motor Company, Detroit, from $150,000 to $2,000,000.

WHITE STEAMER WINS THE DESERT RACE.

PHŒNIX, ARIZ., Nov. 10.—The White steamer won the race from Los Angeles to Phœnix. The White arrived at 6.33, the KisselKar at 7.41; the Elmore at 8.45; the Franklin at 9.50 P. M., Pacific time.

Tbe Franklin had several bours' lead in California, but went astray on the desert, and the driver slept four hours until daylight, fearing to make a bad matter worse with a false start.

President Bullard of the Automobile Club says the White won, the Elmore second, KisselKar third, and Franklin fourth, but no official determination will be made until the arrival of mailed reports, showing the time deducted at the time the Colorado River was crossed.

RAILROADS GRANT REDUCED RATES TO A. A. A.

During the coming show season the American Automobile Association is to hold special meetings, the first series being scheduled to take place January 4 to 7, or during the week of the first show to be held at the Palace under the auspices of the American Motor Car Manufacturers' Association, and which will open New Year's eve. The second series of meetings will be held January 19 to 23 inclusive, during the week of the show at the Garden under the auspices of the Association of Licensed Automobile Manufacturers, which opens January 16 and continues for one week. At the request of the A. A. A., the Trunk Line Association has granted a special reduction of a fare and three-fifths for the round trip to members of the three A's desiring to attend either of these meetings. For the former, tickets can be purchased from December 31 to January 5, good returning up to and including January 11, while for the second meeting tickets must be purchased January 15 and 21, and will be good up to and including January 27 for return. Only members of the clubs affiliated with the American Automobile Association, or individual members of the latter, are entitled to the reduction. Autoists who are already members of the A. A. A. may file applications witb tbe secretary, Frederick H. Elliott, at national headquarters, 437 Fifth avenue, New York, where the meetings are to be held.

MORE EUROPEAN BUYERS OF KNIGHT PATENTS.

PARIS, Nov. 5.—It has now been ascertained that the Knight silent engine will be adopted on some of the Panhard-Levassor models next season. Though it has been known that Panhard has been testing the motor for the past few months, the officials of the company persistently denied any knowledge of it, and only a few days ago declared that they would have nothing new for the coming season. As chassis fitted with the Knight engine have been seen on the road in the hands of testers, it became impossible to deny that it was being studied at the Panhard factory, and this week official announcement was made that the patents had been brought.

It is not yet known on how many models the new engine will be fitted, or what modifications on Knight's original patent have been made. Each of the firms buying the patents is free to make whatever changes it may consider necessary, and it is certain that Panhard, like the others, will adopt certain modifications.

According to rumor, the Knight patents have been taken up in Germany by the Mercedes company and in Italy by the Fiat firm. No official confirmation of this can, however, be obtained. All that is certain is that in England Daimler will apply the Knight principles to all 1909 models, that Minerva will do the same in Belgium, and that Panhard will use it to some extent in France.

CHICAGO'S LIST OF EXHIBITORS BREAKS THE RECORD

NINETY-TWO makers of pleasure vehicles are already entered to exhibit at the Chicago show, with several still remaining on the waiting list. The high water mark in the previous show was ninety. The prospects of the big western exhibition, scheduled for February 6-13, are that in point of size it will exceed any previous automobile show ever held here or abroad. All spaces allotted up to date have been accepted.

The exhibitors, as will be seen on reference to the list, include practically every manufacturer of note, and, in addition, several who have not previously exhibited. As usual the Chicago list contains the names of several makers who will exhibit at no other show. There will be 12 automobile exhibits in the basement of the Coliseum Annex, the names of which are not included in the accompanying list, but will be announced later.

FIRST REGIMENT ARMORY.

Kissel Motor Car Co., Hartford, Wis.
Speedwell Motor Car Co., Dayton, Ohio.
Buckeye Mfg. Co., Anderson, Ind.
Jackson Automobile Co., Jackson, Mich.
Columbus Buggy Co., Columbus, Ohio.
Moon Motor Car Co., St. Louis, Mo.
Atlas Motor Car Co., Springfield, Mass.
Dorris Motor Car Co., St. Louis, Mo.
Overland Auto Co., Indianapolis, Ind.
Motorcar Co., Detroit, Mich.
Pope Motor Car Co. (Waverley), Indianapolis, Ind.
W. H. Kiblinger Co., Auburn, Ind.
Mora Motor Car Co., Newark, N. J.
Nordyke & Marmon Co., Indianapolis, Ind.
Moline Automobile Co., E. Moline, Ill.
Auburn Automobile Co., Auburn, Ind.
Anderson Carriage Mfg. Co., Anderson, Ind.
Chicago Coach and Carriage Co., Chicago, Ill.
Rapid Motor Vehicle Co., Pontiac, Mich.
Black Mfg. Co., Chicago, Ill.
Meteor Motor Car Co., Bettendorf, Ia.
Streator Motor Car Co., Streator, Ill.
Staver Carriage Co., Chicago, Ill.
Anderson Carriage Co., Detroit, Mich.
Model Automobile Co., Peru, Ind.
J. V. Lindsley & Co., Dowagiac, Mich.
Fort Pitt Motor Mfg. Co., New Kensington, Pa.
Wayne Works, Richmond, Ind.
Gaeth Automobile Co., Cleveland, Ohio.
Berliet Import Co., Chicago, Ill.
Rauch & Lang Carriage Co., Cleveland, Ohio.
C. P. Kimball & Co., Chicago, Ill.

MOTOR CYCLE SECTION—ANNEX SECOND FLOOR.

Minneapolis Motor Cycle Co., Minneapolis, Minn.
The Pierce Cycle Co., Buffalo, N. Y.
Merkel-Light Motor Co., Pottstown, Pa.
Reading Standard Co., Reading Pa.
New Era Gas Engine Co., Dayton, Ohio.
Bicycling World, New York.
Magnet Motor Co., Chicago, Ill.
Motorcycle Illustrated, New York.
Hendee Mfg. Co., Springfield, Mass.
Harley-Davideon Motor Co., Chicago, Ill.
Excelsior Motor Mfg. Co., Chicago, Ill.
Wagner Motor Cycle Co., St. Paul, Minn.
Consolidated Mfg. Co., Toledo, Ohio.
Ovington Motor Co., New York.
Aurora Automatic Machinery Co., Aurora, Ill.
Thiem Mfg. Co., Minneapolis, Minn.
Auto-Bi Co., Buffalo, N. Y.
American Motor Co., Brockton, Mass.
N. S. U. Motor Co., New York.
The Hornecker Motor Mfg. Co. Geneseo, Ill.
Armac Motor Co., Chicago, Ill.

COLISEUM MAIN FLOOR.

Winton Motor Carriage Co., Cleveland, Ohio.
Pope Mfg. Co., Hartford, Conn.
E. R. Thomas Motor Co., Buffalo, N. Y.
Stevens-Duryea Co., Chicopee Falls, Mass.
Peerless Motor Car Co., Cleveland, O.

Last year's attempt to organize a motor-cycle department was only partially successful. Manufacturers delayed their applications to such an extent that it was necessary to allot the space intended for them to other applicants and several motor-cycle exhibits were, in consequence, forced into the basement and Armory gallery. This year the responses were numerous and prompt, so that practically all of the motor-cycle exhibits will be found grouped on the second floor of the Annex. In 1907 there were 11 exhibitors of motor cycles. In 1909 there will be 21.

Accessory manufacturers will occupy the galleries of the Coliseum and Armory, the second floor of the Coliseum Annex and a part of the basement. There have been a greater number of allotments than ever before. A complete list will be ready about a week hence.

Elmore Mfg. Co., Clyde, Ohio.
Woode Motor Vehicle Co., Chicago, Ill.
Thomas B. Jeffery & Co., Kenosha, Wis.
Babcock Electric Carriage Co., Buffalo, N. Y.
Baker Motor Vehicle Co., Cleveland, O.
F. B. Stearns Co., Cleveland, O.
Reo Motor Car Co., Lansing, Mich.
Packard Motor Car Co., Detroit, Mich.
Everitt-Metzger-Flanders Co., Detroit, Mich.
Premier Motor Mfg. Co., Indianapolis, Ind.
Studebaker Automobile Co., South Bend, Ind.
National Motor Vehicle Co., Indianapolis, Ind.
Haynes Automobile Co., Kokomo, Ind.
The White Company, Cleveland, O.
Dayton Motor Car Co., Dayton, O.
Cadillac Motor Car Co., Detroit, Mich.
Maxwell-Briscoe Motor Co., Tarrytown, N. Y.
Locomobile Co. of America, Bridgeport, Conn.
H. H. Franklin Mfg. Co., Syracuse, N. Y.

SPECIAL NIGHTS FOR THE PALACE SHOW.

The wants of the inner man are to be well looked after at the coming show at Grand Central Palace. The restaurant will be in the second gallery and will occupy a much larger space than formerly. It will represent an up-to-date German grotto with mosaic flooring and roof covered by vines.

The annual A. M. C. M. A. luncheon will take place Tuesday, January 5, at the Hotel Manhattan, which has been chosen as headquarters for the association during show week.

Special nights as usual will be set apart for various classes. Following a private view of the show on the afternoon of December 31, will come a gala New Year's Eve night. The other special nights will be: Friday, army and navy; Saturday, students; Monday, engineers; Tuesday, society; Wednesday, merchants; Thursday, municipal.

AMERICAN IDEAS IN CONSTRUCTION AND EXPOSITION

By CHARLES CLIFTON, President of A. L. A. M.

A MOST significant note in the changing day is the sound of the automobile horn. The automobile industry, after a growth of unparalleled rapidity, has been among the first to recover from recent financial conditions. Tbis can be explained by the popular economic demand for self-propelled machines, and the ability shown by the leading manufacturers in the tight-money market. The legitimate automobile manufacturer is typified in an essentially modern man; progressive, or he would not be in the business; alert and full of nervous energy, if he shall succeed and survive. As in the mechanical development of their automobiles, in all their complexity and unknown quantities and ramified interests and industries, the Association of Licensed Automobile Manufacturers has done in several lines, work which is substantially of educational character.

In the preparation of the "Hand Book of Gasoline Automobiles," now in its sixth edition, good use in terms applying to the elements of an automobile is determined. And matter is included in or excluded from the Hand Book *pari passu* as it is really required by the public for its proper information, or calculated to lead to consideration of important points, always short of confusing the well-informed man in his adequate examination of tbe state of the market.

Standardization.—The work of the Mechanical Branch in frequently breaking virgin ground in automobile engineering, in original research connected with raw and finished material, in the establishment and intelligent use of mechanical and material standards, is well known; the evidence being the magnificent American cars and chassis exhibited at Madison Square Garden shows, and the eminently satisfactory service of the cars for years in the hands of private owners and in contests of nearly all kinds.

The great element of progress in the nineteenth century has been the recognition of the value of scientific gneralizations in every department of human conduct. Our science has become sounder, our understanding of its applications clearer; and the public has recognized that scientific conduct of a business means tbe substitution of universal experience, learned with difficulty and applied with toil, for the narrower range of individual experience which was at the disposal of the so-called practical men of fifty or one hundred years ago. Of this change the engineer is the representative and leader.

Standardization does not mean that cars will all be the same but bear different names. Given identically the same materials, the same designs, and the same class of skilled workman, the different factories will turn out cars of differing merit, regardless of the extent to which standardization may be carried deliberately or unconciously.

Digest of Periodicals.—The multitude of periodicals published, automobile, engineering, and allied, has recently been called a deluge. Realizing that the art and science of the automobile, as expressed in its technical literature, were developing faster than busy engineers could compass them, the leading association of manufacturers established some years ago a technical library department containing the best books and domestic and foreign periodicals, and regularly issued to its members a digest indicating what was new or worthy in automobile design and construction, including what might be of value as suggestive on account of immediate or future practical bearing.

It has become almost a truism that no other invention has in so short a time excited such a powerful influence upon mechanical engineering and its allied arts and sciences, or interested such a number of experts in its service, as the automobile. The nearest, perhaps, is the electric trolley system in the years of its first rapid development, but this involved quantity rather than quality and variety of work. The automobile industry has called upon all branches of engineering, mechanical, electrical, metallurgical—to surpass at a moment's notice the highest point of achievement reached by long years of growth. It "hustled the steel-maker." In view of the highly advanced state of mechanical engineering in all its branches a dozen years ago, it would seem tbat the automobile builder might have been satisfied with facilities so far in advance of those enjoyed by pioneers in earlier arts, but such has not been the case. Year by year his demands have become more insistent for finer materials and better tools. While for several years the American industry rested within the lines of the best general engineering practice, it some time ago took the master hand and rapidly forced the extension of all branches of metallurgy and machine work. One by one the leading material and tools makers awakened to the fact that the best the open market offered was not good enough for the American automobile. Laboratories were fixed up in the different shops for testing all materials, with a rigid system of rejection for falling below specification. About 1905 the Association of Licensed Automobile Manufactures inaugurated this work.

Mechanical Branch.—The engineers and mechanical heads of the principal automobile makers, composing the Mechanical Branch, have been quick to draw to their logical and accurate conclusion the data on various engineering subjects jointly and severally submitted and discussed at their periodical meetings. Many of the members of the Licensed Association have elaborate laboratories of their own for determining chemical and physical properties of materials.

Numerous A. L. A. M. standards have been made public. The work the Mechanical Branch has been carrying on is in large part for the benefit of the whole industry and so freely given. The proceedings of the body constitute three large thoroughly edited and indexed volumes.

Road Racing.—So much is an outline of how the machines are designed and built. Another phase of the industry is road racing, which within reasonable limits is good for all concerned. Its results are beneficial to the maker, in that it brings out weak points in design and construction that can be corrected easily. Incidentally it is a spectacular and inexpensive form of amusement for hundreds of thousands of people.

Ninth National Automobile Show.—But as a yearly event the converging point of past and future items of interest, the show in the thing the result of the foresight, ingenuity and labor of the factories during the past year. And yet the preparation and conduct of the show itself is alone a world of work and detail. For many months the modus operandi of the Ninth Annual Automobile Show which will open at Madison Square Garden on the third Saturday of January has been under way. The volume of labor and responsibility entailed on the Show Committee and its secretary is difficult to realize. The culminating success does not disclose what has passed to bring it to fruition. A clear conception and knowledge of the art and trade are necessary.

Madison Square Garden is made a complete city in itself. For example, a telephone system larger than used in any city of the second class is especially installed. Mail is received daily.

The show is the biggest trade exposition held in New York, as to variety and number of exhibits, the number of square feet of floor space utilized, value of goods shown, number of attendants required in conducting the show as a whole and its exhibits separately. Over three thousand employees and attendants are regularly on hand. The captains of the industry are there.

In the preliminary stages, engineers measure up the building to make use of all available area for exhibition purposes, considering the comfort and safety of the public as to passageways and regular and emergency exits.

Then the architect studies the building, to get from artistic standpoints, a harmonious decorative scheme, in keeping with the

floor plans of the engineers; lending itself to the practical side of a trade exhibition.

Now follow the constructing builders, to overhaul the building, to bring about the required result. Henceforth the work of preparation divides itself into two great divisions, one of which involves the almost endless communications with the trade regarding space, the preparation of thoroughly indexed rules for the conduct of the show, just to the large and small exhibitors and the management.

Above all a higher standard is maintained. Exhibits which could reasonably be considered freakish or of negligible interest, or irrelevant to the needs of the motorist, are prohibited.

The A. L. A. M. Show Committee has not only maintained the highest standard in the art of show preparation and conduct, but has been the pioneer in many methods now generally accepted in this country as matters of course. Conspicuous among these is the plan of having uniform decoration for all exhibits, obviously necessary for the desired effect of suitable background and setting for the introduction of the new automobile models. Automobile shows abroad have never reached this stage of development.

The other great division of work in making the show is that of the architect and decorator, who have just searched the world over for what is appropriate and best and newest in art. An astonishing number of different kinds of workmen are employed by them, artists, carpenters, drapers, carpet-layers, plaster workers, modelers, sculptors, electricians, telephone gangs, linemen wiremen, cabinet makers, scene painters, plain and fancy iron-workers, sign painters, steeple jacks, riggers, laborers, freight handlers. Labor is certainly represented in its varied forms.

The scene of the show nearing completion for opening is one of the most interesting and thrilling events it falls to the lot of the average man to see. Great hurry, together with exactitude and high-class work; great crowds of workmen; numerous foremen and superintendents directing and driving the men; designers and contractors whose increased reputations are involved, work ceaselessly for days without sleep. Wit, humor, camaraderie, permeate the whole.

After the show is installed and opened the complete city, under the A. L. A. M. management, is evident, divided into the business and financial sides.

Complete in and out freight and express offices are in working order. Over ten thousand pieces of mail are received daily. The telegraph ticks. The telephones at their busiest time handle more calls than the Syracuse telephone system at its busiest time. A complete day and night police force, uniformed and plain-clothes men, properly officered, patrols the Garden. Ticket-sellers, takers, checkers, counters, porters, cleaners, electricians, wiremen are busy. Decorators constantly keep their work in shape. Carpenters and carpet layers are always at hand.

Band and orchestres attend. Cafés, restaurants and rathskellers are in operation.

The most remarkable feature of all in some ways, is the demolition of the show. What have taken hundreds of people months to get ready in advance, materials, several million dollar's worth of exhibits, are, beginning at eleven o'clock the last night, within the following fifteen hours, packed and shipped from the Garden; the entire exhibit, probably one hundred car-loads of freight, removed, the structure work taken down and the building put in its original condition.

But the object has been accomplished. The A. L. A. M. yearly models have as a whole been suitably submitted to the public.

STATISTICS REVEAL STEADY GROWTH OF THE INDUSTRY

As a commentary on the growth of the automobile industry and the increase of business in standard high-grade cars, some statistics compiled by M. L. Downs, secretary of the show committee of the Association of Licensed Automobile Manufacturers, have an especial interest. According to the actual figures, the number of exhibitors at the national show in Madison Square Garden has increased 100 per cent. since 1905. In the same period the amount of floor space utilized for this show in Madison Square Garden has increased 40 per cent. This increase in floor space has been cumulative, a little being gained each year through ingenious engineering.

At the next show, January 16-23, there will be about 5,000 feet more space available than there were last year. This additional room has been gained this time chiefly by manipulating the plans of the elevated platform and what was last year the mezzanine floor. Last year there was a mezzanine gallery at the rear of and about four feet above the elevated platform that is built over the boxes. At the coming show there will be no change of level, but the boxes and other seats will be floored over evenly, and there will be a ten-foot passageway between the vehicle exhibits at the front of the platform and the display of accessories at the back of it. The platform will overhang the main floor as before.

The gain in the number of exhibitors represents not so much an increase in the ranks of the manufacturers of licensed cars as it does new exhibits of accessories. There will be more than three hundred exhibitors in the Garden this year, which will exceed all former records.

At the shows in the Garden it has been a problem always how to arrange the signs at the various spaces so that they shall present the minimum of interference with the artistic presentment of the whole. Uniformity in the board signs bearing the names of the makers was first achieved, but even then they were a jarring note in the decorative harmony, and ingenuity was exercised to devise some plan wherehy these necessary guideboards might be made a part of the decorative scheme. The satisfactory method seems to have been found now. This has been accomplished by devising an ornamental lamp-post to be placed at each exhibitor's space, the exhibitor's name appearing on the glass panels of the lamp. This feature, it is expected, will work a remarkable change in the general aspect of the whole show from an artistic viewpoint. A suitable setting is as essential to the success of an industrial show as to any other exhibition.

PITTSBURG SHOW THE LAST OF MARCH.

Pittsburg, Nov. 9.—The next annual show to be held under the auspices of the Automobile Dealer's Association will open in Duquesne Garden, Saturday evening, March 27, 1909, and carry through to the following Saturday. Under the leadership of its president, W. N. Murray of the Standard Automobile Company, the association is making preparations to far excel anything that has heretofore been seen in Pittsburg in the show line. The other officers of the association are: Vice-president, A. L. Banker, of Banker Brothers Company; treasurer, George T. Moore; secretary, Charles F. McLaughlin.

NEXT GRAND PRIX IN CHATEAULAND.

PARIS, Oct. 31.—Chateauland is practically decided upon as the scene of the next Grand Prix. This week a deputation from the town of Angers waited on the Racing Board, gave particulars of their local organization, the progress made towards the collection of the $20,000 subvention, and asked for a definite answer. Though no official decision was given, it is understood that after a final visit to the course by the members of the Racing Board the Angers triangle will be accepted.

Already a large plot of land has been picked out for grandstands at St. Germain des Pres, about twelve miles from the town of Angers. As the stands will be on the outside of the course and the gasoline station on the inside, it will be possible to arrive at headquarters at any time during the race. A good road from Angers reaches the grandstands by following the banks of the River Loire.

Although 185 miles from Paris, in a southwesterly direction, the general situation of the Angers course is so favorable that spectators are expected to be almost as numerous as at Dieppe. Saumur is only 25 miles to the east along the beautiful Loire Valley; Tours is about 65 miles away; Blois is not more than 95 miles away; Le Mans is about 50 miles to the north, and all round are small towns capable of providing excellent accommodation for tourists. The course selected is roughly triangular shaped, two sides being straight and the third rather winding, the total distance round being 46.1 miles. It is believed that with such a length not more than 74 cars should be allowed—one car per kilometer. If, as is quite possible under the reduced core regulations, this number should be exceeded, the club would limit the entries to two per firm.

Owing to troops now serving but two years with the colors, it will be impossible next year to protect the Grand Prix course by military, as on previous occasions. It has been decided, therefore, to employ gendarmes, mounted and on foot, for the most crowded portions of the course, to swear in the greater portion of the 600 road menders of the department, to employ a large number of policemen, and to put club officials at various points round the course.

RAISING THE LIMIT FOR THE BRIARCLIFF.

The committee of New York tradesmen and entrants, to whom the deed of gift for the running of the Briarcliff race was intrusted, has been discussing the weight and cylinder limits for next year's race. It is said to favor 5 1-2 inch cylinders, equivalent to 94.9 square inches for four cylinders, and 2,500 or 2,600 pounds weight limit. This means greater cylinder volume and lighter than the international limits this year and also the limits decided upon for next year. It is argued that the race being intended as a test for high powered touring cars, these increased limits are desirable. If these limits "go," the committee will have to be careful not to advertise their race as an international contest, or they may get into trouble with the Automobile Club of America, under whose jurisdiction international contests in this country are now held, in accordance with the recent agreement between the club and the American Automobile Association.

LYNN WILL TRY AUTO MAIL COLLECTING.

LYNN, MASS., Nov. 9.—Collection of mail by automobile has been introduced in this city by Postmaster Craig, and it is believed that this is the only city in New England with this up-to-date means of handling mail. The postmaster experienced the difficulty in covering the city and making as many collections as were needed by men on foot or with horse-drawn vehicles, and he therefore went to Washington and conferred with the postal authorities. They approved of his plan, and Postmaster Craig has installed a Ford car fitted with a large mail box. With the car three collections a day are made, and only one man is required. Previously the work was done by two horses and wagons and two men.

Five 1909 De Luxes Sold to Residents of Marquette, Mich.

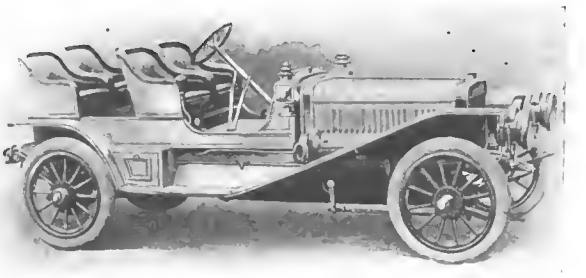
FRENCH MAKERS TO INQUIRE INTO ACCIDENTS.

PARIS, Nov. 5.—Daily newspapers get hold of so many automobile accidents that never occurred, and exaggerate those that did to such an extent that the Marquis de Dion will ask the A. C. F. to vote a special fund for the control of all reported mishaps. The movement was started by a blood-curdling story which got into all the European newspapers of a high-speed car running down a child in the presence of its father. The distracted parent picked up the body of his son, then fired revolver shots after the car, killing the driver and a beautiful girl sitting by his side. Without control the car sped on, mounted the footpath, overturned, and fatally injured another lady occupant of the vehicle.

On official injuiry being made the police authorities could only find one accident in the district named during a period of six months, on which occasion an automobile ran into a horse buggy, the people quarreled over the responsibility, one of the automobilists fired his pistol in the air, but no one was either injured or killed. An accident at the Port Maillot, Paris, in which a cyclist collided with an automobile and was killed was reported in the papers as being caused by the motor vehicle. The police report was to the effect that the cyclist met his death by imprudence, the automobile driver being blameless. Not a single paper publishing the original story would accept the correction, however. With the fund requested by the vice-president of the French Club all motor accidents would be inquired into, and where incorrectly reported correction would be demanded.

SMOKY EXHAUST EXAMINATION IN PARIS.

PARIS, Nov. 5.—So severe are the Paris police against smoky exhausts that the Automobile Club of France has been obliged to fix up an anti-smoke apparatus in its garage. It is a simple apparatus, consisting of a metal pipe leading into the chimneys of the building, provided with a flexible end fitting over the car's exhaust pipe, and an electric fan operating a ventilator. If it is discovered, on starting out, that an engine is smoky, it is immediately linked up to the piping and allowed to run until all the extra oil has been drawn off. It is proposed to fix similar apparatuses in all the city garages. Their use would be cheaper than being caught by the police and being summoned into the municipal courts for smoking.



1909 $3,000 Winton "Six" Roadster, of 48 Horsepower.

Grabowsky Delivery Wagon Utilized for Charitable Purposes.

A NEW IDEA IN COMMERCIAL CARS.

The Grabowsky Power Wagon Company, Detroit, Mich., will exploit a new delivery wagon, along lines somewhat at variance with customary methods. They will build a line of delivery automobiles, one of which is here illustrated.

Amongst other features, the idea of a demountable power plant is featured. The plan is to afford a ready means of "swapping" power plants in the event a mishap demands some such treatment.

The same company will equip maintenance stations in the various centers of trade, with a view to providing delivery service to all who may care to avail themselves of the same.

AUTOMOBILE SHOW FOR ST. LOUIS.

St. Louis, Oct. 26.—After many weeks of conflicting reports as to the probability of an automobile show for this city during the winter, the announcement is made that the Automobile Dealers and Manufacturers' Association has actually decided to hold an exhibition during the week of February 15 to 20 inclusive. More than twenty-five of the local dealers have signified their willingness to participate.

NO ENDURANCE RUN BY DETROIT DEALERS.

Detroit, Nov. 3.—There will be no endurance run under the auspices of the Detroit Automobile Dealers' Association this Fall.

Plans are already being formulated for the annual show under the auspices of the dealers' association, which will be held some time in December or January, and which promises to be on a more extensive scale than ever.

"Uncle Joe" Cannon Used Chalmers-Detroit in Home Electioneering.

WISCONSIN'S GOOD ROADS AMENDMENT.

Milwaukee, Wis., Nov. 9.—The so-called "Good Roads Amendment" to the State constitution of Wisconsin was overwhelmingly adopted at the general election, November 3, and the State is now required to give aid to highway improvement and construction work. This is the best news Wisconsin owners have had in a long time. The State geological survey has already started work on laying out an elaborate system of State highways, which, when completed, will form a chain of drives and courses throughout the State. Just before the election opponents of the amendment started a campaign story that the whole matter was a plot of automobile owners to get speedways at the expense of the people. The overwhelming vote showed the fallacy of the argument.

The first work under the new amendment is the five-mile boulevard from the city limits of Milwaukee, an extension of Grand Avenue to the county limits, which eventually will form a boulevard half-way across the State on nearly an air line to the capital, Madison. The distance is 85 miles. The cry of "plot" was raised by persons through whose property the road will eventually cut. Evidently it was not considered that such a thoroughfare would enhance the value of the property.

President Joseph Moon in the 1909 Moon Touring Car.

POPE REORGANIZATION ALMOST COMPLETED.

Hartford, Conn., Nov. 10.—Vice Chancellor Howell of Newark, N. J., to-day took under advisement until Thursday a petition filed by counsel for the receivers of the Pope Manufacturing Company asking for instructions regarding an offer of $1,500,000, made by a reorganization committee for the assets, less cash in the hands of the receivers August 1 last, of the Pope company. Should this sale be authorized, as there is every reason to believe that it will, the receivers will at once pay a final dividend of 25 per cent., making 100 per cent. in all, to holders of approved claims against the company.

The vice chancellor also made an order authorizing the sale by the receivers of the Pope company plant at Hagerstown, Md., from which all mechanical equipment has been removed, for $57,500, and of a bicycle factory at Elyria, Ohio, owned by the Federal Manufacturing Company, all of the stock of which is owned by the Pope company, for $35,000.

It was stated by receivers' counsel that the reorganization committee approved of both sales.

It appears that about 98 per cent. of the first preferred stockholders and over 90 per cent. of the second preferred stockholders have given their consent to the reorganization scheme and have deposited their respective stocks in accordance with its terms. The plan provides for the issue of the reorganized company of $800,000 of 6 per cent. notes secured by a first mortgage; $2,500,000 of 6 per cent. cumulative preferred stock, and $4,000,000 of common stock.

A Party of Tourists in a Premier in the Tennessee Mountains.

Cbalmers-Detroit Non-Stop Runs.—What was probably one of the most comprehensive strokes of newspaper automobile publicity yet attempted in the automobile world, was carried off in a highly successful manner on Election Day. In accordance with a carefully prearranged plan, no less than 100 of the new Chalmers-Detroit "30's" were started on a 200-mile non-stop run simultaneously, in different parts of the country. The event was dubbed the "Election Sweepstakes," and in every case official abservers were carried and the gasoline and oil consumption carefully noted. Every Chalmers-Detroit agent notified the home office by wire of the progress of his run, its starting and finishing time, as well as the weather conditions, and the fuel and oil consumption of his car. The telegrams were all in by midnight of Election Day, and an "extra" under date of "Detroit, Midnight Nov. 3," was immediately printed and sent out broadcast, marking the successful culmination of one of the most striking publicity "stunts." According to the results shown, the minimum fuel consumption was eight gallons, and the maximum 16. Every one of the bulletins, or "extras," which were printed in two colors, was sent out under a special delivery stamp, and was in the Detroit post-office at 1 A. M., November 4, so that in many cases Chalmers-Detroit dealers were in receipt of their bulletins the day after the non-stop run was held.

American Car in Sweden.—That an American car is the one best fitted to win the great winter reliability tour held in Sweden each year, is the opinion of Pantus Lindstrom, who is now in this country. Mr. Lindstrom, who is a mechanical engineer, is one of Sweden's best known sportsmen and has driven his own car in all of the winter reliability runs since the first one was held. He is now negotiating for a six-cylinder 60-horsepower Pierce Arrow, with the intention of entering it in the run on his return home. If he carries out his intention the car will be the first one of American make that has ever been entered in this event. Mr. Lindstrom's attention was first attracted to the Pierce Arrow in 1906 when a car of that make, driven by Percy Pierce, won a perfect score in the Herkomer tour in Germany. His determination to buy a Pierce became positive when it scored for both the Glidden and Hower trophies this year.

Locomotive to Show Independent.—Owning allegiance to neither of the big trade organizations, the American Locomotive Company, Providence, R. I., could be happy with either, "were t'other but away," and true to self-established precedent, will hold forth with neither this coming show season. As was the case last year, the American Locomotive car will be shown at the parlors of the Waldorf-Astoria and will have a three weeks' show all to itself, beginning with the opening of the A. M. C. M. A. gathering at the Palace on New Year's eve, and closing with tbe end of the Garden show on January 23. The cars will be shown in the parlors on the Thirty-third street side of the big hostelry.

Spokane's Latest Recruit.—Having watched with interest the success of Seattle's city government in employing automobiles for the use of the city engineer and the department of public works, the business men of Spokane have indorsed the wish of Engineer Ralston for a machine. The plan is at first to divide the use of the car between the city engineer and tbe board of public works. Heretofore he has been unable to visit more than one or two pieces of important work in a day outside the city, but by the use of an automobile he contends that he could see them all in the same time.

Pennsylvania as a Pathfinder.—In preparation for its annual run to Wilkes-Barre and return, January 1-2, the contest committee of the Quaker City Motor Club of Philadelphia used a Pennsylvania car on a two days' trip to Wilkes-Barre and picked out the route. Although the distance from Philadelphia is something like 125 miles, it is especially noteworthy as an endurance route because of the hilly country passed through, the famous Giant's Dispair Mountain being one of the climbs to be made in the course of the run.

Glidden's 50,000-Mile Tour.—Charles J. Glidden, of Boston, is planning to complete his world tour of 50,000 miles started in London in 1901, next year by drives in Spain, Portugal, Tunis, Algeria and Tripoli. He has already driven 46,528 miles in thirty-nine countries. He expects to resume his tour in Algeria next March and contemplates running the total up to 50,000 miles in 45 countries. He has decided to equip his car with Thomas shock absorbers, now being marketed by the Buffalo Specialty Company, Buffalo, N. Y.

Cutting Into Railroad Revenue.—Texas automobile owners are figuring that they are responsible for a considerable loss of revenue on the part of the railroads. At the State Fair at Dallas observations were made of the visiting cars, and it was found that touring parties were present from all parts of the State, a considerable percentage of them in Franklin cars. Believers in the automobile welcome this evidence of the growing popularity of the vehicle, freeing owners of machines, as it does, from the restrictions of railway time cards and reducing distance to a minimum.

Sympathy Not Wanted.—"There can be no doubt that we did have hard luck in the Vanderbilt race," said C. W. Matheson, of the Matheson Automobile Company, recently. "Chevrolet's car went out with a broken cylinder, and Ryall's car was put out of commission by fire. Both of these accidents seemed very strange, inasmuch as these cars had run in the preparatory spins absolutely without trouble. But I am not a candidate for sympathy, and we will do better in future events."

Stearns Prospects in the West.—The success attained by Sales Manager Charles B. Shanks, of the F. B. Stearns Company, on his Western trip has again caused the company to increase the working force both night and day and look for additional building facilities as well. Mr. Shanks reports that at no place did he have any trouble in placing an agency in the hands of people who were not enthusiastic about the prospects of selling all the cars they would be allotted.

More Taxicabs for Gotham.—The latest arrival in the taxicab field of New York City is the long-looked for service of the Hotel Knickerbocker, which made its start last week. The new concern is known as the Universal Taximeter Cab Company, and has for its officers the following: President, J. H. Stack; treasurer, J. H. Norton; secretary, J. F. Mulgrew. The chassis used by this company are made by the Argyll Motor Company, Scotland.

Business Is Better Already.—The best evidence of increased business activity is an increase of orders. The Baker Motor Vehicle Company reports that it has received orders for 16 cars in one day, for immediate shipment, and says that the election of Taft has resulted in telegraphic orders from its agents throughout the United States, demonstrating that many purchasers were waiting to learn the result of the election before placing their orders for cars.

Monogram Oil Scores Heavily.—The fact that the winners of four races out of five held at the opening of the Long Island Motor Parkway, October 10, coupled with the fact that the winner of the 200-mile race in Philadelphia, on the same day, and the winner of the Vanderbilt Cup race, October 24, used Monogram oil, is a source of extreme gratification to the makers, the Columbia Lubricants Company, of New York City.

American Roadster Victories in Texas.—Two leading events in the auto meet of the Texas State Fair, at Dallas, November 1, were won by an American Roadster, driven by Fred I. Tone—the 10-mile for cars of 50-horsepower and the 10-mile free-for-all. In the first event the American kept the lead all the way, finishing in 11:28¾, and the other event was also won with ease. In two trials at the mile, Tone drove in the times of 1:06 and 1:02½.

Another Newcomer.—The Motor Car Repair Company of New York City, which

has been in the repair business for some years, has branched out and joined the manufacturing forces. The new car is to be known as the Prodal, made in two types, a commercial and a pleasure car. The company has moved into its factory at 509-515 West Fifty-sixth street, where the additional space gives plenty of room for this new venture.

American Motor Company Changes Hands.—The entire stock and business of the American Motor Company, of Eau Claire, Wis., has been purchased by R. M. Burdick and C. W. Dandewalker. The factory site on Water street, where this company formerly mannfactured marine motors, is rapidly being equipped for the mannfacture of automobiles, which will be the main feature of the product from now on.

Reading, Pa., to Have Taxies.—Not only are the larger cities taking up the taxicab as a necessary convenience, but the smaller cities are fast joining in. The latest addition to the list is Reading, Pa., where the Reading Automobile Company has ordered six motor-cabs from the H. H. Franklin Manufacturing Company, equipped with the standard 18-horsepower air-cooled motor.

K-W Company Enlarging.—The K-W Ignition Company, 34 Power avenue, Cleveland, reports it has found business so successful during the past year that it has recently completed improvements which double the manufacturing space, and at present is busy installing new machinery. The new equipment includes facilities for manufacturing K-W coils and an impregnating plant.

Winton Sales Good for 1909 Cars.—Sales Manager Churchill, of the Winton Motor Carriage Company, feels well satisfied with the sales of Sixes which have been so far recorded. He is especially pleased by the increase in individual orders which the company has received, saying that the number of these is far ahead of the old record made in 1905 with the Model K.

Stearns Company Will Use Hele-Shaw Clutch.—The F. B. Stearns Company, of Cleveland, O., will use the Hele-Shaw clutches, manufactured by Merchant & Evans Company, of Philadelphia, Pa., on their new 25-horsepower shaft-drive car. Many European makers have used this clutch for some time past.

Bendix Company to Move Factory.—The Bendix Automobile Company, which has had its factory and offices in Chicago, has completed arrangements whereby it will move to Logansport, Ind., where the force is expected to be increased from 300 to 500 men.

IN AND ABOUT THE AGENCIES.

American Locomotive, Chicago.—The American Locomotive Company has just completed arrangements for a branch at Twelfth street and Michigan avenue, Chicago. The manager in charge is Benjamin C. Day, who, before joining the American Locomotive Company, was manager of the Winton branch in Chicago. Associated with Mr. Day in the selling department will be B. C. Hamilton, of Chicago, and R. L. Malkin, from the New York headquarters. Adell Starr, an expert from the factory, has been sent on to take charge of the repair work.

In speaking of the new branch and the reasons for its establishment, James Joyce, manager of the automobile department of the American Locomotive Company, has this to say: "Next to maintaining the distinctive quality of the Locomotive car, the company has been most concerned with its reputation for taking proper care of its customers. As Chicago is becoming yearly a more important metropolis, it has been deemed best for the Locomotive Company to establish its own branch in the city in order to give its customers of Chicago and the middle West the facilities and attention provided in New York."

Studebaker, Glens Falls, N. Y.—D. H. Colles has leased the new three-story brick garage on Warren street and will handle the entire Studebaker line of gasoline and electrics for 1909, covering the counties of Saratoga, Washington and Warren. Mr. Colles was formerly connected with Miller Bros. garage in Glens Falls.

Reo and Premier, Newark, N. J.—The Howe Motor Car Company, Newark, N. J., which has handled the Reo and Premier cars for the past year, has been purchased by M. F. O'Neill, who will continue the business under the name of the O'Neill Motor Car Company at the same location, 51 Bank street.

Great Western, Kansas City, Mo.—B. L. Corlew, who has for some time been carrying on an auto livery, has taken the agency for the Great Western car, manufactured by the Model Automobile Company, of Peru, Ind. Offices and salesrooms have been secured on Grand street.

Ex-Champion Corbett as an Autoist.

"Gentleman Jim," at one time king of the heavy-weight pugilists, in the Brush runabout, in front of the theater in a Minnesota town, where he was playing.

Locomobile, Cal.—R. J. Leavitt, the agent for the Locomobile in Southern California, has taken over the garage of the Success Automobile Company at Pico and Hill streets, which he will hereafter make his headquarters.

Pennsylvania Tires, Cleveland.—The Cleveland business of the Pennsylvania Rubber Company has been put in the hands of a local concern known as the Pennsylvania Rubber and Supply Company, which has J. C. McLean as manager.

Jackson, Los Angeles.—The A. E. Gump Automobile Company is making preparations to give up the retail agency of the Jackson cars in Los Angeles and will start in as the Pacific Coast distributers for that machine.

Empire Tires, Kansas City.—Hereafter the Stowe Implement Company will be the wholesale agent for the Empire Tire Company in this section while the Jackson Motor Company will continue to act as the retail agent for Kansas City.

Gray & Davis Lamps, Boston.—This well-known firm of lamp makers, with factory and main offices at Amesbury, Mass., has opened a branch in Boston at 747 Boylston street. G. W. Morrill has been appointed manager of same.

Matheson, Baltimore.—The Matheson Motor Car Company of Maryland, with offices at 1002 Morton street, will hereafter act as the distributing agents for the Matheson car in Maryland, Virginia, and District of Columbia.

Thomas Shock Absorber, Philadelphia.—The Penn Square Automobile Company, 1420-28 South Penn square, has been appointed Philadelphia agent by the manufacturers, the Buffalo Specialty Company, of Buffalo, N. Y.

Jackson, Council Bluffs, Ia.—The Jackson agency has been taken for Council Bluffs by Henry Sperling, who has for some time been the agent for the International Buggy Company and the Detroit Electric.

Genesee Garage Company, Syracuse, N. Y.—This concern has taken possession of its new salesrooms at 242 West Genesee street. The company is agent for the Peerless, Cadillac, and Pope-Hartford.

Perfection Springs, Boston.—The Perfection Spring Company, of Cleveland, has established a branch office in the Oliver Building, Boston, from which point the Eastern and export trade will be handled.

Cadillac, Washington and Idaho.—The Bringham-Fenn Motor Car Company, with temporary headquarters on Broadway, Seattle, has taken the selling agency for the Cadillac in Washington and part of Idaho.

Pfanstiehl Coils, Boston.—The Bi-Motor Equipment Company, 177 Portland street, Boston, has been appointed New England distributer for this well-known make of spark coils.

Regal, Nashville, Tenn.—J. O. Caldwell, Jr., formerly engaged in the automobile business in Boston, has located in Nashville, Tenn., where he has taken the agency for the Regal cars.

Pennsylvania, Wilmington, Del.—The Pennsylvania car will be represented in Wilmington, Del., by the Bradford Automobile Company, who also have the agency for the E-M-F.

Peerless, Trenton, N. J.—Peerless cars will be represented in Trenton, N. J., by Robert C. Manning, who has bought out the Trenton Auto Garage and Supply Company.

Stoddard-Dayton, Harrisburg, Pa.—The Cox Automobile Company, of Harrisburg, has secured the agency for the Stoddard-Dayton cars for the coming season.

Franklin, Reading, Pa.—The Reading Automobile Company, 26 South Fifth street, has taken the agency for the Franklin cars for the coming year.

Apperson, Los Angeles, Cal.—H. O. Harrison, at present agent for the Oldsmobile, has also secured the Apperson agency for the coming year.

Franklin, Pittsburg.—The Franklin car will be represented in Pittsburg by the Standard Automobile Company, of 5917 Baum street.

Franklin, Dayton, O.—The Peckham Carriage Company, St. Clair street, has made arrangements to handle the Franklin car for 1909.

Franklin, San Francisco.—The Consolidated Motor Car Company has been appointed agent for the Franklin car in San Francisco.

Dayton Airless Tires, Elmira, N. Y.—The Dayton "Airless Tires" will be represented in Elmira by O. J. Manley.

Selden, Newark, N. J.—The agency for the Selden car has been taken by the Auto Exchange, of this city.

Franklin, Milwaukee.—The Franklin will be handled in Milwaukee by W. F. Lange, Farrell avenue.

PERSONAL TRADE MENTION.

C. P. Rockwell, formerly assistant sales manager of Thomas B. Jeffery & Company, has been appointed manager of the New England branch of that company in Boston, succeeding V. A. Charles, who, it is expected, will become New England traveling sales representative. Mr. Rockwell is not a stranger in New England territory, as for sixteen years, before joining the Rambler interests, he was connected with the bicycle and automobile sales department of the Pope Manufacturing Company with headquarters at Hartford.

F. E. Castle, better known in trade circles as "Governor," has acquired an interest in the Atwood Manufacturing Company, of Amesbury, Mass., and this concern will hereafter be known as the Atwood-Castle Company. For the present Mr. Castle will continue to make his headquarters at Detroit. The new company has some extensive plans in view.

Marcus I. Brock, who for the second time became sales manager of the Autocar Company in the early part of this year, has just handed in his resignation to that company and it has been accepted to take effect November 30. Mr. Brock leaves with the good will of the company. He has well-formulated plans for the future, though not yet ready to announce them.

Howard E. Coffin, designer of the Chalmers-Detroit car, and chairman of the executive committee of the Mechanical Branch of the Licensed Association, recently sailed for England and will also visit France, Germany and Italy. He will make a report to the Mechanical Branch on any items of interest appearing at the foreign shows.

Eddie Bald, the old-time bicycle champion, and more recently of auto racing fame, has been appointed sales manager of the Mutual Motor Car Company, the Pittsburg agent for the Stearns cars. Mr. Bald was formerly sales manager of the Crescent Automobile Company, of Pittsburg.

F. A. Harris, secretary of the Brush Runabout Company, Detroit, Mich., started on Friday last on the annual trip to the Pacific coast. The company reports that its coast trade has assumed large proportions during the past year and is constantly increasing.

Louis J. Bergdoll, of the Bergdoll Motor Car Company, of Philadelphia, has moved his offices from the headquarters of the Bergdoll Company to the building of the Auto Accessories Company, at the corner of Broad and Vine streets.

George D. Wilcox is now connected with the Omar Motor Company, manufacturers of the Browniekar, Newark, N. Y. Mr. Wilcox was formerly sales manager of the Gearless Motor Car Company, of Rochester, N. Y.

William R. Barnes, formerly of the Hartford Rubber Works Company, has been appointed manager of the Philadelphia branch, to succeed Franklin Kesser, who has taken up other duties at the factory.

P. Tremont Rockett, formerly connected with the sales department of the Maxwell-Briscoe and Stoddard-Dayton Companies, has joined the selling forces of J. M. Quimby & Co., of Newark, N. J.

Willis B. Troy, who was prominent as a manager of racing teams in the old bicycle days, has been engaged by Sidney B. Bowman to look after the Clement-Bayard team in the coming Savannah race.

Lewis H. Kittredge, president of the Peerless Motor Car Company, and secretary and one of the most active and able members of the A. L. A. M., has just returned from a trip abroad.

H. C. Merrill, formerly connected with the Kansas City agency of the Moon car, has accepted a position with the factory as a traveling salesman.

F. A. Stock, formerly of the Auto Stock Company, has gone with the Standard Automobile Company, since this company has taken the agency for the Franklin machines.

A. Gremes, who has been connected with the Chicago office of the Warner Instrument Company, is now in charge of the company's Cleveland branch.

Henry Beegle, formerly with the National Casb Register Company, has gone with the Pittsburg branch of the Winton Motor Carriage Company.

James E. Iams, of the Iams Motor Company, Pittsburg, has gone with the Olds Motor Works branch, in that city.

APPERSONS INCORPORATE.

KOKOMO, IND., Nov. 9.—The announcement is made that Elmer Apperson, who has been doing business as Apperson Brothers' Automobile Company (not incorporated), has just incorporated under the laws of Indiana, retaining the old firm name. The authorized paid up capital is $400,000. This reorganization does not in any way affect the business of the company, as the management remains the same, with the following officers: President and general manager, Elmer Apperson; vice-president, Edgar L. Apperson; secretary-treasurer, Alton G. Seiberling. George H. Strout will continue as sales manager.

In connection with this new move it is interesting to note that Edgar and Elmer Apperson, as pioneers in the automobile industry, have been engaged in their manufacture since 1893.

BUSINESS DIFFICULTIES.

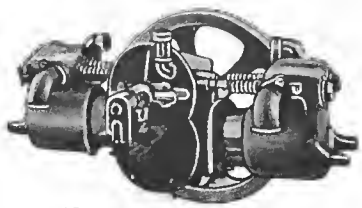
Rainier Motor Car Company.—November 3, the Rainier Motor Car Company, having salesrooms at Broadway and Fifty-fifth street, New York, and factory at Saginaw, Mich., was forced into involuntary bankruptcy by the petition of the attorneys for the following creditors: Pembroke C. Chrysler, J. J. Higgins, and the Hartford Suspension Company. The officers of the company are confident that a reorganization can be effected before long.

"It is simply a case of not having enough cash to get through the product we had planned for 1909," said Paul Lineberger, general manager of the company. "Our assets are far in excess of our liabilities, but during the financial stringency we have been unable to raise the cash to meet our material bills and our large payrolls. With better times at hand we are confident of being able to put through the reorganization we have in mind."

The liabilities of the company are $220,000, of which $50,000 is secured. The cars and material on hand in this city alone are reported to be assessed at $50,000. The company was incorporated in New York City, March 7, 1907, with capital of $1,000,000, made up of $800,000 common and $200,000 preferred stock.

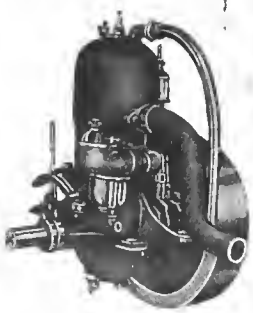
INFORMATION FOR AUTO USERS.

Single and Double Cylinder Motors.—Schaub & Son Machine Company, of 3064 Henshaw avenue, Cincinnati, O., are manufacturing two small motors at a moderate price for marine and automobile use. The



SCHAUB AUTOMOBILE MOTOR.

single cylinder engine is a light, 5-horsepower vertical motor of two-cycle design, built for use in small boats. The two-cylinder is a four-cycle engine of the doubl



SCHAUB MARINE MOTOR.

opposed design, with a 4-horsepower rating. Both motors are water cooled. The manufacturers claim that the full horsepower rating is developed and furnish them complete with pump, timer and carbureter.

English Valve Tester.—This little Instrument is designed to indicate the pressure in pneumatic tires. When a reading is desired, all that is necessary is to

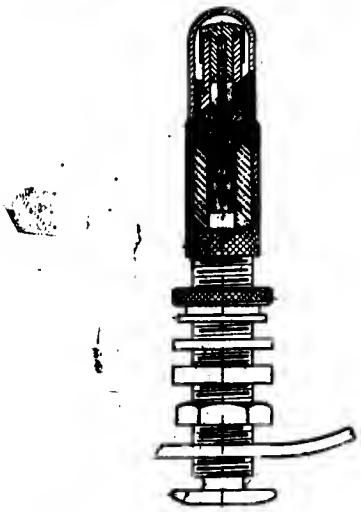
TESTER FOR TIRE PRESSURE.

place the tester over the valve and allow the air to blow through. The instrument is handled in this country by the Motor Car Equipment Company, 1727 Broadway, New York.

"Infallible" Metal Polish.—The U. S. metal polish made by G. W. Hoffman, of Indianapolis, with branches in New York, Chicago and San Francisco, has been used for about fifteen years, which should be a recommendation to those auto users who have had trouble in finding a polish for the bright work on their machine. This polish comes in the form of a paste in three ounce to one pound boxes.

INFORMATION TO AUTO USERS

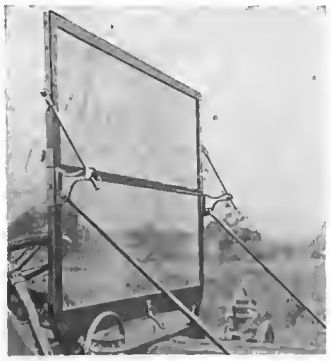
Edco Tire Valve.—Ch. Dien, manufacturers' agent, 35 West Forty-fourth street, New York City, is placing upon the market a tire valve, styled as above, a cross section of which is here given in the illustration. We are enabled to afford advanced information in relation



CROSS SECTION OF EDCO VALVE.

to this very excellent tire valve, notwithstanding the fact that, while letters patent are applied for, the matter is still pending. The vendors of this device need scarcely call attention to the importance of the niche it fills in connection with tires, nor will it be necessary for them to refer to the want they are endeavoring to satisfy. It is pleasant to note that this valve is not kept tight merely if a spring works. As a matter of fact, tightness is the product of direct pressure with no limit to the take-up.

Loring Wind Shield.—J. W. Loring & Son, 140 Union street, Worcester, Mass., have lately put upon the market a new wind shield which has been thoroughly



THE NEW LORING WIND SHIELD.

tested, and which they assert will not rattle nor work loose in any of the positions it may be placed in. The frame of the shield is of mahogany, and the trimmings are of solid brass. It may be adjusted to be held in place both in the upward and folded position by the two thumb screws on each side, which constitute the entire holding device.

New Charging Rheostat.—The Cutler-Hammer Manufacturing Company, of Milwaukee, Wis., offer a rheostat of which the accompanying illustration shows great compactness with the usual slate panel differing in one respect, i. e., the panel is in three sections. The top section includes a Weston volt-meter and the requisite terminal binding posts. The middle section holds a double pole knife switch, the rheostat contact segments, and operating levers,

1 2 3 4

CUTLER-HAMMER CHARGING RHEOSTAT.

while the bottom section is confined to the automatic protective devices. The functional arrangements of this set are explained by the makers as follows: (1) A low-current cut-out which automatically opens the circuit if the current drops to a predetermined minimum. This prevents the battery from discharging into the line should the line voltage drop below that of the battery. (2) A maximum voltage cut-out. This automatically opens the circuit when the battery voltage reaches the point at which the cut-out is set to operate. (3) A solenoid switch, the opening or closing of which "breaks" or "makes" the main line charging circuit. (4) An overload circuit breaker which automatically opens the circuit if the charging current rises to the point at which the breaker is set to operate. This insures the battery against being charged at an excessive rate, which is an extremely important matter, involving the life of batteries to a marked degree.

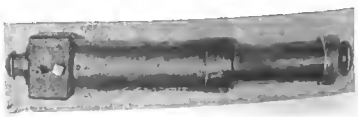
"U K O" Spark Plug.—As produced by the Utility Company, 636 West Forty-fourth street, New York City, this plug is of the mica genera, and among its points of merit it holds a feature of

THE U K O SPARK PLUG.

double insulation, platenoid wire node, two terminal nuts, and a solid brass head. The plugs are guaranteed by the makers and should be very acceptable to users desiring a simple, effective, and trim looking ignition accessory.

Cleanola for Polishing.—Since Cleanola was offered to automobile users more than a year ago, it has come into general use, as it has been found most efficient not only in polishing and preserving varnished surfaces of the car, but the top and leather cushions as well. The compound is manufactured from a secret formula by the Cleanola Company, Pittsburg, Pa., and the makers assert that there are positively no acids, alkalis or volatile oils used in its composition, and guarantee it to be absolutely harmless. The company offers to send either dealers or owners of cars a full size 25-cent package for trial on receipt of 10 cents to cover the cost of packing and mailing.

Hydro-Pneumatic Spring.—The Trojan Hydro-Pneumatic Spring Company, Watervliet, N. Y., are offering to the trade their Hydro-pneumatic Spring, in its improved and perfected form, as a leader for 1909. The illustration shows the device, and, as will be observed, it is symmetrical, strong, neat, and presents no obstructions to its ready application. The makers claim for the device that the springs have been made entirely fool proof, self-adjusting in every way, and great care has been taken



THE HYDRO-PNEUMATIC SPRING.

to manufacture a spring which not only has the best riding qualities, but also improves the looks of the car. Everything is enclosed in such manner as not to let the smallest particle of dust or mud penetrate the spring. There is nothing more to look after on the whole apparatus, once the springs are pumped up. On trucks, etc., considering solid tires, the springs make for easy riding, not unlike pneumatics, and as respects the springs, overloading is not a factor.

VOL. XIX NEW YORK—THURSDAY, NOVEMBER 19, 1908—CHICAGO No. 21

THE AUTOMOBILE

Next the Grand Prix on American Soil

SAVANNAH, GA., Nov. 19.—All is practically in readiness for the American edition of the Grand Prix of France, wherein will participate 14 cars of foreign manufacture and six of American make. The event is not unlike two races in one, for even the most enthusiastic American surcharged with patriotism does not hope for success against the six Italians, five Frenchmen, and three Germans, piloted by such experienced speed kings as Nazarro, Szisz, Hemery, Wagner, Fournier, Duray, and others scarcely less adept and daring. While it is true that the fat prize list has been a factor in securing such a notable array of foreigners, there also exists a desire on the part of France to avenge the German victory of July last at Dieppe and the Italian success of 1907. The tire companies, too, have an interest in the proceedings, and Michelin of France, Continental of Germany, and Dunlop of England are sharing a goodly part of the burden of this Grand Prix on American soil. So many elements enter into success or failure in an automobile road race that the best of form pickers can only guess as to the probable outcome. A wide range of opinion exists as to the winner. One man will fancy Hemery, the 1905 Vanderbilt winner, another Wagner, who scored in the 1906 big American race. But both of these drivers are now at the wheels of other cars, while their American successes were of the Darracq label. Strang, an American, with a foreign mount, is well liked because of his comparatively recent wins with an Italian-built racer. This time he figures as a Renault driver, one of his comrades being Szisz, the Grand Prix of France winner in 1906. Nazarro, with an uninterrupted series of victories in 1907, is of a quiet confidence-inspiring disposition. He will certainly bear watching. Fournier, the well-known Mors star of earlier days, is of the Italian contingent, with Cagno and Piacenza the other helmsmen of Italas. Hanriot and Erle, of the Benz team, and Rigal and Hautvast, the Clement pair, are not well known in this country. Duray, of the French aggregation, was born in San Francisco years ago, and ranks as one of the probable quantities. The second division of the race —which means the struggle of the American cars—will supply an interesting competition, especially involving the six-cylinder Chadwick and the four-cylinder Lozier, with the National and Acme "sixes" and the Simplex and Buick completing the American contenders. The small car race on the day before Thanksgiving will serve as a curtain raiser for the high speed

event. Seventeen little fellows, internationally divided, should supply some lively competition well worth the watching. It will be a source of regret that Herbert Lytle, one of the best of American drivers, will not be able to engage, as he is suffering from an attack of typhoid fever at his home in Toledo. Therefore, another one will have to be named for the Isotta car.

Concluding Arrangements for the Race.

Assignments to the replenishing and repair pits in front of the grandstand was made according to the results of the drawing for starting. The rules are such that all supplies, except tires, must be taken on from the pits in front of grandstand. Tires may be taken from one other station at the opposite end of the course. No one will be allowed to assist in repairs, adjustments, or replacements except the driver and mechanician of the car. This is the order of the start:

GRAND PRIZE RACE.

Place.	Car.	Driver.
1.	Clement	Regal
2.	Lozier	Michener
3.	Simplex	Seymour
4.	Buick	Burman
5.	Chadwick	Haupt
6.	Fiat	Nazarro
7.	Acme	Zengle
8.	Benzo	Hemery
9.	De Dietrich	Duray
10.	Renault	Szisz
11.	National	Harding
12.	Itala	Cagno
13.	Clement	Hautvast
14.	Fiat	Wagner
15.	Benz	Hanriot
16.	Renault	Strang
17.	Itala	Fournier
18.	Fiat	De Palma
19.	Benz	Erle
20.	Itala	Piacenza

SMALL CAR RACE.

Place.	Car.	Driver.
1.	S. P. O.	Juhasz
2.	Lancia	Hilliard
3.	Chalmers	Bergdoll
4.	American-Aristocrat	Manville
5.	Cameron	Cameron
6.	Isotta	
7.	Gregoire	Robertson
8.	Buick	Burman
9.	Maxwell	See
10.	Chalmers	Lorimer
11.	Buick	Hearne
12.	Maxwell	Costello
13.	Chalmers	Burna
14.	Buick	Easter
15.	Maxwell	Munwieler
17.	Maxwell	Kelsey

International signals are used on the course. Speed practice began Monday. One hundred and seventy-two flagmen, in addition to the special officers, guarded the course from 12 o'clock noon until 4 in the afternoon.

The light cars were on the ten-mile course from 12 to 1:30, and the Grand Prize racers had the course from 2 to 4 o'clock. In the light car practice Burman in a Buick skidded on the turn from the White Bluff road into the Montgomery crossroad and his machine went into a tree, smashing the right rear wheel and the running gear. It is doubted if the car can be gotten in shape for November 25. The company fortunately has an extra car in Savannah, which will be substituted for the damaged one. Burman was not thrown from the car by the impact with the tree, but received a severe shaking up. Grennan, who rides with him, was thrown thirty feet from the car, but escaped with a few scratches. Hilliard in the Lancia missed a turn going at high speed and went into a crowd watching the practice. His car was not injured, and no one was hurt, though there were narrow escapes. The light cars did not attempt any fast work on their first tryouts, but the Grand Prize racers made up for this when they took the course half an hour after the little fellows had left it. Duray in the De Dietrich on his first lap went the 25.13 miles in 22 minutes and 12 seconds, better than 69 miles an hour. Wagner was next best, with 23:20 and 23:50. Duray made another lap in 24:55. Nazzaro made a lap in 25:32. Rigal made laps in 23:36 and 27:51. Hanriot made 24:10 and 24:59. Szisz did a lap in 24:24 and another in 25:05. Hemery had laps in 24:58 and 25:04. Hautvast made a lap in 26:59.

The times in the first trials under racing conditions cause the experts to believe that the winner of the race will have to cover the 400 miles at the average rate of about 70 miles an hour to win. In the sprints on some of the longer stretches it is estimated that cars have gone faster than 100 miles an hour.

List of Officials Chosen.

The list of officials chosen for the Grand Prize race is imposing, not only in number, but in titular importance. At the top of the club's announcement of its choice stands the list of honorary referees. It is headed by the Hon. Hoke Smith, Governor of Georgia; the Hon. Joseph M. Brown, the Governor-elect, and Hon. George W. Tiedeman, Mayor of Savannah. Then come the names of the following gentlemen prominent in official list of the two promoting clubs with Jefferson de Mont Thompson, chairman of the A. A. A. Racing Board, added: Frank C. Battey, president Savannah Automobile Club; Harvey Granger, chairman course committee; R. J. Davant, chairman executive committee; E. H. Gary, president, Henry Sanderson, vice-president, Automobile Club of America.

An equally imposing array of judges of the State and local courts is named to act as honorary judges.

The real work of conducting the race will, however, fall upon Robert Lee Morrell, as referee; Fred J. Wagner, as starter; S. M. Butler, chief of timers; Harry T. Clinton, clerk of the course, and Tom Moore, press agent, assisted by W. J. Donlan, of the Savannah Chamber of Commerce. Harlan W. Whipple, A. R. Pardington and seventeen others are to serve as judges.

Ten have been appointed inspectors whose duty it will be to look out for possible fouling at the turns.

Major William B. Stephens will command the military. The following have been ordered to guard the course: Savannah Volunteer Guards, Georgia Hussars, German Volunteers, Irish Jasper Greens, Chatham Artillery, Oglethorpe Light Infantry, Emmet Rifles, Republican Blues and Savannah Cadets.

Attendance from North Will Be Substantial.

The attendance of a large crowd from New York seems assured from the reports of the steamship company and the various railroads and individual promoters of hotel trains and also of a throng of considerable proportions from several other Northern cities, special excursions being in progress of organization in Chicago, Boston and Cleveland. The Cleveland train load is being gathered by the local club.

On the *City of Savannah,* which has been chartered by the A. C. A., and sails Saturday, will go Judge Gary, its president, and other officials of the club. The overflow of sea-going racegoers that day will be carried by the *City of Columbus,* another ship of the Savannah Line. The boats sailing Tuesday and today carried considerable contingents of early invaders.

Big bookings are said to have been made on the Wall street special and the hotels to be run by the Pennsylvania and Baltimore & Ohio roads.

Cash Prizes Now Total $17,850.

In addition to the $8,000 in cash offered by the A. C. A. to the successful drivers, various equipment concerns have put up prizes, which amount to a large sum in the aggregate.

The Michelin Tire Company's prize list is a liberal one. It offers $2,000 to the winner, $1,000 to second, $500 to third, $300 to fourth and $200 to fifth in the Grand Prize race; and $500 to first, $300 to second and $200 to third in the light-car contest, an aggregate of $5,000 for the two races.

Big money is also being put up by the Continental people, who offer $2,000 to first, $1,250 to second and $750 to third in the Grand Prize; and $250 to first, $150 to second and $100 for third in the light-car race.

The Bosch Magneto Company is also out with an offer of cash prizes made up of $500 to first, $250 to second and $100 for third.

The total of these trade offerings is $9,850. The bestowal of the prizes is, of course, conditional upon the equipment of the respective donors being used on the successful cars.

FOURNIER GLAD TO VISIT AMERICA.

In the real pioneer days of automobiling in this country there was no more prominent and popular figure than Henry Fournier, the famous French cyclist, who naturally became a motorcyclist, and as naturally drifted into automobiling.

On Fournier's first American visit he brought with him a motor bicycle and a motor tricycle, and his startling performances on the 10-lap track in Madison Square Garden excited enthusiasm galore, for notbing like it had ever been seen before on this side.

Fournier of France.

His next visit came after he had won the Paris-Bordeaux and the Paris-Berlin automobile races. After incidentally tackling a "wildcat" engine at a blind railroad crossing on Long Island, in which the car was smashed to smithereens and several of its occupants sojourned for a time in a neighboring hospital, Fournier, who had miraculously escaped unscathed and had saved his own life and that of his fellow passengers by some quick manipulation of the steering wheel, took the honors in tbe first straightaway races ever held in America. His Coney Island boulevard mile of :51 4-5 remained unbroken until Charles Schmidt, who served as his mechanician in the Paris-Berlin, accomplished a mile at Ormond-Daytona in :46 2-5 with the *Packard Gray Wolf*.

Fournier is at the head of the Paris-Automobile, one of the largest garages in Paris, and his business duties prevented him from competition for several years, his reappearance coming in the last Grand Prix at Dieppe. His Itala is a powerful car, though it may be somewhat at a disadvantage on the sinuous course at Savannah.

"I am truly glad to visit America again," said the well-known Frenchman upon his arrival Tuesday on the *Kronprinsessin Cecilie*. "I would not care to predict as to my possible success at Savannah, though I hope to quickly become familiar with the course, and shall do my best to figure among the early finishers.

"While the demand in France for big cars has not been as great as before, the monster tourer has received considerable impetus from Michelin's latest innovation in the shape of *les roues jumelles*—a double rim and two tires of a slightly smaller size, instead of a single large tire—a device which greatly increases the life of the tires and does away with a great deal of tire trouble. Yes, oh yes, they were many, very many," be said, with regard to the number of American tourists *en automobile* to be seen in France during the past Summer. "More than ever, in spite of your hard times."

"The field for a good American car on the Continent is excellent," was M. Fournier's opinion on this subject, but he could not say whether he would take one back with him.

Another automobile celebrity to arrive by the North German liner is tbe Chevalier Garibaldi Colteletti, who comes as a delegate of the Automobile Club of Italy to look after the interests of the Italian entrants in the races at Savannab. When asked regarding the status of the Italian industry, he said it was only in a good way where the best known cars were concerned. "But with the exception of such small cars as bad achieved a good reputation, or were very prominently before the public, such as the Lancia and one or two others, none of the newer entrants in the field had been able to survive the bad spell."

STRICKER KILLED IN SOUTHERN RACE.

BIRMINGHAM, ALA., Nov. 17.—During the 24-hour automobile record race on the one-mile fair grounds track, which was poorly ligbted, Emile Stricker crashed into the fence and was killed instantly. Barrows, the mechanic, was seriously thougb not fatally injured. Stricker will be remembered as having been the driver of Robert Graves's Mercedes in the Vanderbilt race, and in the preliminary practice had a narrow escape.

Louis Strang, who was driving the alternate car in the record contest, wired Tuesday from Birmingham as follows:

"Stricker was driving tbe Renault car with me for a twenty-four-hour record. The car skidded completely around while traveling on the turn, and did not burst a tire, nor did the car hit the fence. The only explanation of the accident is that Stricker's long coat caught in the rear wheel, pulling him out of the car. The heavy coat was torn from his body and was taken from the rear wheel after the mishap. The car was found to be in running order and the tires intact after the accident."

FACTS ABOUT THE NATIONAL SIX

The National six-cylinder will enter the race as one of the three American "sixes" to compete for the Grand Prize. There are no foreign sixes entered for the competition. This car has cylinders 5 inches bore and stroke, respectively, and the motor will bave the distinction of being the only product in which both the cams and the crankshaft will run on ball bearings. This motor is the same as that used in tbe National car known as tbe "Big Six," and the makers thereof put forth the claim that the car complete is a regular stock product, using identical materials with the stock car.

National Six-cylinder Candidate for the Grand Prize at Savannah, to Be Driven by Hugh Hardin

Requirements of the 1909 Racing Rules

By Rene M. Petard

Typical Picturesque Setting of a French Hill Climb, This Scene Being Located at Gaillon.

NOW that the racing rules for another year have been settled by the International Association of Recognized Automobile Clubs, as was lately reported in these columns, European designers will at once start work on their new racers, and, judging from the latest reports and rumors, quite a few newcomers in the field are to be expected. In order to give the American public and makers an insight of the question which the distance has always made rather remote, even to those most interested, consideration will be given in the following to tbe influence which the new rules will have on the design and construction of the 1909 racing cars, together with an occasional reference to European methods of race preparation.

As was before stated, a large number of entries is expected in next year's big road races. On the other hand, it is doubtful, altbougb the question was brought up, wbether a longer course than usual will be selected, at least for the Frencb race, so that there is every chance of a crowded race in which there will be a large amount of passing, necessitating cars of quick accelerating power, and this will be one of the most important points to be considered and one which will materially affect the design.

Effect of Reduced Engine Size.

It is not to be expected that the reduction In engine size included in tbe rules will bring about a closer resemblance between the racing and the touring cars. In fact, the effect will altogether be different, and an *eclosion* of high specialized machines, wbich the unaverted mind certainly would term as freakish, is to be witnessed. A forecast of what will happen can easily be drawn from the history of the English Four-Inch race, which was expected to be a touring car event and turned out to be the competition so far held in which the most unconventional machines were presented.

The influence of the minimum weight limit will be small, as, considering the type and size of the mechanisms which will be used, there is very little reason to believe that any maker will produce a car below 900 kilos; at the same time it will be well to keep as close to this limit as other conditions, especially adherence, will permit. It might not be untimely to state as regards this special question that foreign makers have pretty nearly abandoned the old notion that weight within reasonable limits was a hindrance to speed. In fact, not a few French makers openly admit that their unsuccesses in late years have been largely due to excessive power in proportion to weight. Inspection of past results will evidence the fact that the successful cars of the past two years were all on the rather heavy side, while the preceding successes of Brasier and Renault had been victories of relatively low-powered cars.

Strokes of Ten Inches May Be Seen.

Next year will be a long stroke year, as was 1908, or rather more than was this year. Strokes of ten inches will probably be seen; these, however, present constructional difficulties which will probably prevent their general adoption. The writer favors 200 millimeters or approximately eight inches. This will make an already quite high engine, although not sufficiently so to bring any noticeable perturbations in the stability of the machine in negotiating curves, such as were evident in the Voiturette Grand Prize, wbere the torque reaction of the very high single-cylinder engines created considerable driving difficulties around corners. It was found that engines with crankshafts turning left handedly were easier to manage in the numerous left-hand turns. Considering the fact that most races are run counterclockwise, with a predomination of left-hand turns, this sense of rotation should be recommended for racing engines.

To draw full advantage of the long stroke, and to give the engine the necessary flexibility on the crowded course, piston speeds much above normal will have to be resorted to, and the most successful motors certainly will keep up to 2,500 to 2,800 revolutions per minute without any appreciable drop in the power curve, which conservative estimates place above 130-horsepower.

To attain these results the greatest care will have to be exercised in the laying out of the valves and piping, and in the timing of the motor, witb consideration to the laws of gas flow and inertia. The valves in a hemispherical cylinder head, which were a majority this year, will next year be the rule, and they will preferably be set at 45 degrees angle, as in the Clement 1908 racer. The writer favors flat-seated valves in such an engine as having a better seat at high speeds and requiring considerably less lift for a given port area. The lift, however, should be sufficient to allow for more than the strictly necessary opening, as flat valves create more wire-drawing effect on gases than do cone-seated ones.

In the design of the valve proper the fillet should be very large, so as to guide the gas to the edge without the creation of eddy-currents, and the portion of the valve head bearing on the seat should not be left to protrude at a bigher level than the head proper, as is done in ordinary flat valve practice to facilitate grinding, as this sets up a resistance to gas flow at the very

point where it is most harmful. The valves themselves should be very light, as well as the reciprocating parts in their actuating mechanism to avoid inertia effects and insure strict obedience to cam profile. The inlet valve should be at least a full three inches diameter. The exhaust valve, if single, should be at least equal, although the above considerations of shape are of less importance for its design, but the writer would favor a smaller valve or an equal one with less lift and a well-designed valve closed exbaust port at bottom of stroke.

The exbaust valve should preferably seat direct on tbe cylinder head without the use of a cage to insure a cool and undistorted seat, which would otherwise be feared considering the diameter. This would increase complication and reduce accessibility, but the cbances of a machine are so utterly spoilt by a valve breakage that it cannot well be raised as an objection.

If a caged-in construction has to be resorted to, the writer will recommend that used on the motor which Nazarro drove with the well-known success at Brooklands. In this high rotary speed motor a single inlet and two exhausts were provided, all overhead. A fork-shaped rocker arm actuated the exhaust pair from a single actuating rod. This construction permitted to use exhaust valves of relatively small diameter, reducing the risk of pitting and of seat warping to reasonable limits, as was proved by the results achieved in the race, which was one of the hardest tests an engine ever was put to.

Regarding the Actuating Mechanism.

As regards tbe actuating mechanism, the overhead camshaft is most tempting, but it tends to further increase the height of an already abnormal engine, so that it seems preferable to leave this part in its more usual location in the crankcase. For the rocker arm construction the writer would favor the single beam, long ago inaugurated on the Fiat racers and used eon the Stoddard-Dayton stock cars, flat-leaf springs being used in preference to coil for valve return action.

The cam design should be such as to permit of rather wide clearance between rocker arm and valve stem, giving more sudden opening of valve. In the designing of the moving parts considerable care should be taken to so dispose the centers of gravity and of inertia of the beams, rods and fitments that a minmum effort be necessary to their motion at the highest speeds, and the necessary return springs should be fitted besides the valve springs proper to insure constant contact between the valve rods and the cams.

Timing Is Most Essential.

One of the main points in the successful design of such a high-speed engine is tbat of timing. Let it first be accepted that the recommended timing will be altogether different from that which would be adopted in an engine where anything like fuel efficiency was looked for. We simply want the maximum power at practically any cost.

Exhaust valve lead will be increased over current practice, 65 degrees before lower dead center not being exaggerated, although a suitable and large exhaust port in bottom of cylinder would permit advantageously to reduce this figure. If ports are well designed, lag of exhaust closing would not need be more than 10 to 15 degrees, this depending largely upon the length of the exhaust piping and its effect on the momentum of the outgoing charge. The lag at inlet opening should not exceed 20 degrees in order to give the cylinder the maximum of time to fill itself. The suitability of an overlapping action of the exhaust and inlet valves can only be decided upon when the piping is laid out. It works at its best with a long exhaust pipe and a short inlet, and the auxiliary exhaust port is unfavorable to it. The lag in closing the inlet also largely depends upon the piping design and the carbureter resistance to gas flow, but it should, in the writer's opinion, be around 15 to 20 degrees.

These conditions of timing and of speed are of considerable influence on compression, but it seems to the writer that considering past experience and the special requirements of the engine as to speed and flexibility, a safe compromise could be struck between 90 and 100 pounds cold. A compression relief through sliding camshaft would be useful for starting, but the writer will insist upon the undesirability of special exhaust cams for the use of engine as a brake, as was made on a few European racing cars. Such cams are higbly desirable on touring cars, but in a racing car their use brings sucb perturbations in tbe carbureter functions as to greatly reduce the rapidity with which the car picks up speed after their operation, making them more detrimental to higb average speeds on a difficult course than would be occasional misuse of the mechanical brakes.

Hints as to carbureter design are too special a proposition to be insisted upon here. It should, however, be mentioned that the throttle should be as close to tbe inlet valves as possible. In fact, the most successful French designer of racing cars always made his racing engines with twin cylinders and bad a separate throttle for each pair located within the casting directly under the valves, and this he considers of vital importance.

Castor Oil Lubrication Will Grow.

Lubrication will best be by the simple combination of splash with an overflow and a return pump to upper part of crankcase. Castor oil lubrication, inaugurated this year, will certainly generalize next season as favoring the enormous piston speeds aimed at. The cost of it is such that it will only be used in the very last days of practice and on the race days. Provision should, however, be made for it at the start through specially tight piston rings and of all means which will avoid its invasion of the combustion chamber, as it is of a most searcbing nature and is prone to leave more carbon deposits than the majority of other oils.

A successful departure from standard ignition practice which was used on some of the best cars of this year's races was the low-tension magnetic make and break, and it certainly will be more generally used next year. It will probably be used together with a well synchronized system of simultaneous ignition at two distant points in the cylinder head. This was used in the most remarkable engines of the small car race, where the unfavorable before-the-race theoretical comment which the move suggested was completely upset by results consisting in the obtention of 25 horsepower at 2,750 revolutions per minute out of a single 4-inch bore cylinder.

Althougb the writer favors a single casting for the four cylinders, in a moderate size engine he will suggest for the special case under consideration that the cylinders be cast separate with a skeleton water jacket around the head, and be finisbed inside and out with a common water jacket applied on the complete assembled unit, thus making a three-bearing crankshaft possible without undue span between the bearings and leading to a more compact and evenly cooled engine. To allow easy and rapid variations in speed, the crankshaft and the flywheel should be light, especially the latter, wbose influence is great in slowing down and restarting for passing and negotiating curves, which we have mentioned as an important point for coming races.

The crankshaft will be mounted on three large ball-bearings. To make high piston speeds possible, the reciprocating parts will have to be of the maximum lightness. Although pressed steel pistons have attained quite a preeminence abroad, they are not

Two Famous French Makers, MM. Renault and Brasier.

likely to be universally used, and the writer's personal experience is that, with a mild close-grained material, a cast-iron piston finished inside and out can be made fully as light as any steel construction, and present incomparable advantages as regards ease of running and security against seizing together with less abundant and easier lubrication. The connecting rod will be at least four times the crank throw, and preferably be cut from the solid in a roughly shaped hand forged alloy steel billet. The recommended section will be tubular, and very little material left at the ends, which simply will have to hold the bushings, the latter being relied upon to provide the necessary stiffness to distribute the load on the journals. The piston end bushing will preferably be cast iron of the same grade as selected for the piston itself, and will not require to be very thick; the big end will preferably be of the full marine type and soft babbit lined.

Not much need be said concerning the crankcase except that weight is gained and strength increased in these very high engines by carrying it quite high up the cylinder barrels, whose lower end is thus made very thin and acts merely as a liner to guide the piston.

A multiple disk or a Hele-Shaw clutch will answer the purpose very well, especially considering the fact that too large

Passing Through Town During British Four-Inch Race.

flywheels, even quite light, are not favorable to very high engine speeds, and, although steadier, are not desirable in the machine considered. But the writer would, nevertheless, favor a cork insert cone clutch, even if a powerful spring is required as more certain in results and less affected by variations in lubrication. Locking pins should be provided, as in the Brasier cars, and a dashpot fitted to prevent reckless usage of this dangerous part, as will sometimes be made by a most careful driver.

Thinks Chain Drive Is Preferable.

The car will obviously be chain driven. The percentage of chain-driven cars has steadily been increasing in European races and live axle victories have made themselves scarce. In a race run under engine limitation rules there is no room left for loss of power, and on account of considerably lesser unsuspended weight the chain gives a much better utilization and considerably reduces driving wheel slip.

The gear box and differential will be in a compact casing close to the rear axle, to reduce chain length, and will be joined to the clutch through a shaft and two full universal joints. The jackshaft will also be universally jointed to accommodate frame torsions, and the chain brackets will be stiffly braced on the cross member to which the rear of the gear box will be suspended. Four speeds should be provided, with direct drive on third and fourth, and the first and second should drive to the differential causing without returning to the primary shaft.

Concerning brakes, a set of internal expanding in the rear wheels and two pedal actuated contractings on sleeves extended from the differential casing are long established and satisfactory.

In respect to the running gear, high front wheels with narrow tires are conducive to easy running, and the adoption of similar front and rear wheels has no advantage of value to offset the advantage in speed derived from the construction mentioned in the foregoing.

Preference for the Detachable Wheel.

Although no decision has yet been arrived at by the ruling bodies concerning the wheel question, it appears that preference ought to be given the detachable wheel, if authorized, provided that the design of the rear hubs and sprockets is such that the drive be taken up as close to the rim as possible without undue strain on the spokes.

In the design of the car, considerable attention will have to be given to wind resistance. In respect to this it should be noted that slanting hoods and centrally located radiators are not of necessity desirable shapes, although they may be means toward the end. In fact, one of the best studied cars in this respect in 1908 was the Mors, and it had its radiator in ordinary touring car location and shape. The radiator is a necessary evil as long as the rules will be such as to remove all chances for air-cooled cars, if they are to ever have any. A well-designed honeycomb or flat naked tube radiator can be made with very little wind resistance, and of relatively small size, if the engine is properly designed, so that it can be left at its usual excellent place and the thinking be done on other parts of the machine. In the Mors case, the parts under the hood were all treated as if directly exposed in order to give the easiest possible flow to the inrushing air. The slant of the foot boards was carried to the height of the hood, and a large sheet aluminum plate fitted underneath to gradually deflect the air toward the ground to the rear, at the same time protecting the mechanism of the rear half of the machine. Externally the hood was conntinued by a sheet metal apron of other than haphazard shape coming close to the driver, protecting the occupants, save for the driver's head, and thus annihilating the considerable windage which they often are the cause of; the protection of the hood and dashboard being lost at the distance the seats are from the latter. Considerable attention should also be paid to the rear shapes on which the air closes. This is a matter of elementary boat engineering, and yet Serpollet and Brasier probably were the first to think of it, and that after the building of many cars, which, although most carefully studied in their forward shapes, did not show advantage over common construction.

Advantages Possessed by the Europeans.

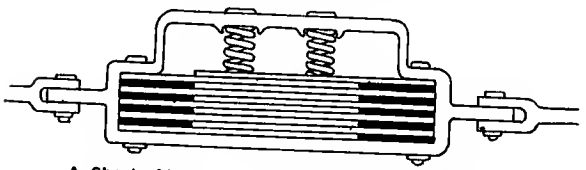
To close this study, a word will be said on what is claimed to be an advantage of the foreigner over the American, that of practicing. This does not exist to the extent believed on this side. The advantage of the foreign driver resides mostly in the experience the engineers, in the factory behind him, have of the racing problem, which is entirely different from that of making a good touring car, and also in the fact that the cars are generally ready months before the race. This, however, does not imply high speed practicing; the foreign driver tours with his car and gets sufficiently acquainted with it to feel "at home" behind the wheel. But the only real "test to destruction" takes place at the first race, and this explains the large quantity of mechanical troubles developing at the French race, which generally is the first of the season, in machines on which the drivers have had thousands of miles of so-called practicing without a hitch. It will be sufficient to mention the Fiat crankshafts and the Michelin detachable rims in the last French race, or the Hotchkiss axles in a previous instance, as striking examples.

That the American will have his word against the best foreigner, when the question will be handled with the same thoroughness here as it is abroad, is undubitable. The day should be close at hand, considering the impulse which the Locomobile victory and the creation of special roads should give to the question, and it is hoped that the foregoing consideration of one side of the problem will be of some help toward the end.

THE GENERAL UTILITY OF SHOCK ABSORBERS

By THOS. J. FAY, President Society of Automobile Engineers.

WERE springs perfect, with never a spring failure, accessories, known as "shock absorbers," would scarcely have a footing in connection with the automobile. Shock absorbers were originally devised in connection with railroad trains, in conjunction with the couplers connecting the cars, to enable the locomotive driver to start *one car at a time*. It is hardly necessary to point out the long train of cars could not be started by the engine were the couplings rigid, thus requiring *the simultaneous acceleration of the whole train of cars.*



A Shock Absorber of the Laminated Plate Type.

Couplers with a simple loss motion were tried in the early days, and, of course, the loss motion enabled the locomotive driver to take advantage of the same, with a view to starting one car at a time. It was soon found, however, that the cars were unable to stand the shock, and the spring bumpers, so called, came into vogue as a result. The spring bumper served very well for a good many years, but it always possessed the disadvantage of engendering oscillations, since it is true that the energy stored in a spring will be given up again, less the amount represented by the inefficiency of the process. To obviate this difficulty, laminated friction plates were placed in conjunction with the springs in such a way as to permit the springs to act, but the energy stored in the springs as a result of that action was dissipated by the friction of the laminated plates. In this combination will be found the source of the so-called shock absorbed as used in automobiles, and, as a matter of fact, its widest application to-day is in connection with railroad trains used to dissipate the energy of the coupler springs to kill the longitudinal oscillations.

In connection with the automobile, to consider the use of so much weight in the shock absorber system as will be found in the shock absorbers of railway cars would be out of the question, and since the weight of the shock absorbers must be something to take into account, *if they work*, while if they *fail to work* it is a crime to supply the requisite quantity of material for the purpose. There are two ways of solving this problem, the one of which is to use enough material for a direct application as they do in connection with railroad cars, the other of which is to apply pressure to a nest of circular discs or laminated plates, so connected with the lever system and linkages as to multiply the effect of that pressure for the purpose. Certainly the principle of lever advantage can be used to a very good purpose, and the fine examples of shock absorbers take this into account.

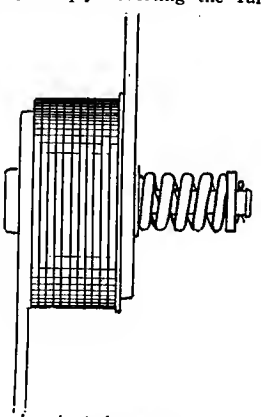
Friction Methods of Absorbing Shocks.

Shock absorbers of the friction type work both ways (as a rule), which means that the springs are snubbed both in action and in reaction. This is a matter that might be regarded as an advantage, excepting under certain conditions. As, for illustration, if a car in negotiating a series of depressions, happens to be of a wheelbase (considering the speed of travel) such as will set up a synchronizing periodicity, then it is plain that the friction type of shock absorber can prevent the springs from reacting within the period of time necessary to the process, with but one result, i.e., shock. This condition can be evaded by a chauffeur possessing enough skill to pilot an ox-cart, and it should be evaded, since, forsooth, one cannot tell what will happen to a car during the instant of spring failure.

There are shock absorbers of the class in which the dissipation of energy, by means of laminæ of plates or discs, does not take place. In this type of shock absorber springs or dash-pots are set to snub the reactive tendencies only. If springs, they may be of the helical type, working direct, or through a lever arm, and they may be simple or compound. A simple helical spring differs from a compound in that, in a simple spring the pull in pounds will be in direct proportion to the elongation or the compression, as the case may be; whereas, in a compound helical spring the pull in pounds increases disproportionately with the compression. The action of a spring so set is to limit the reaction of the spring suspension proper, the extent of which reaction in the absence of shock absorbers may be greater than the direct action of the springs, as is shown in the bumpometer record, Fig. 16. This reaction if not snubbed is probably the most potent factor for spring failures; the main leaves of the half elliptical springs in the absence of retainers are called upon to take the load under conditions of camber, indicating extreme fiber strains. The use of retainers modifies this individual action on the part of the main leaves, but the retainers do not serve as a cure for the evil, whereas the shock absorbers are specifically placed to limit the action, and if they are properly designed and suitably installed *they will serve the purpose.*

The Spring Checking of Rebounds.

There are several examples of springs in which the shock absorber feature is confined; in other words, the more ingenious of the spring makers are endeavoring to so design the springs proper as to eliminate the need for shock absorbers. The "Perfection Spring," as made by the Perfection Spring Company, of Cleveland, Ohio, is an example of what can be done by way of affording springs capable of resisting adequately in reaction as well as in action. Another scheme for accomplishing more or less the same purpose is effected by simply reverting the full eliptical springs at their ends, instead of using hinges. Retainers serve to a considerable extent for the same purpose, because they bring the short leaves into play in reaction, whereas without the retainers the main leaves would have to do all the work.

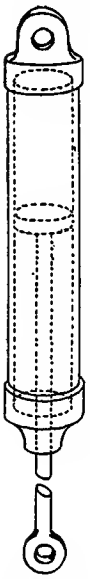


Laminated Disc Shock Absorber.

In recent times the idea of the cushion pneumatic spring has been developed to a certain state of perfection, and this spring will work just as well in reaction as it can work under the direct load. It seems to be satisfactory in truck work where it has been tried out, and a little experience along this line may indicate further successes. There is one other type of spring which is suitable for use in reaction, namely, the flat band coil (clock) spring. This product seems to be favorably considered by some autoists, and there is scarcely any reason why it should not do the work. Some experiments conducted in New Jersey last year, under the direction of Mr. J. M. Ellsworth, were with a view to ascertaining the extent to which shock absorbers would govern the action of springs and indicate the much desired level platform. The reaction involving a standard touring car of good characteristics as indicated on a bumpometer designed for the purpose, showed that the reaction from the normal static position was considerably more than the downward motion.

Some of the tests show that the reaction was 50 per cent. more

than normal downward motion from a static point, and repeated trials seemed to indicate that, with the shock absorbers, when properly adjusted, the reaction was kept within one-half of the normal downward motion, considering the normal static position at a base line. A common complaint made at that time was one that bad for its basis the lack of permanency of adjustment of the shock absorbers, they were capable of doing the work were they properly adjusted.



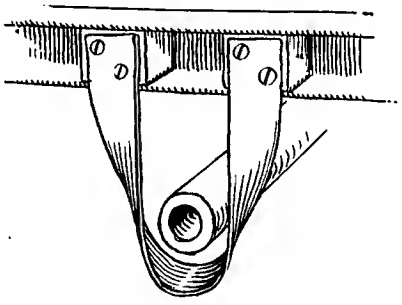
Dashpot Idea.

The makers of shock absorbers have evidently realized the arduousness of this service, because they have all redesigned along more rigid lines, and it is believed that this delicacy of adjustment is a condition of the past.

There is one other point having bearing on this phase of the question that should not be overlooked. If a car is so badly designed that the springs will not take care of the downward motion, it will be futile to expect the shock absorbers to take care of the reverse motion. Shock absorbers are not intended as supports for structurally weak springs or as cure-alls in cars of a high center of gravity, excess top hamper, short wheelbase and high speed. A spring maker will not be able to furnish springs to satisfy a condition such as this, and, as before stated, if the springs fail there is no chance whatever of the shock absorbers succeeding. These devices are auxiliary in their relation, and their success depends upon the success of the parts to which they relate.

Autoists are naturally curious to know which of the type of shock absorbers extant are the best suited to the occasions; they are prone to believe that there must be one best way. There never seems to be any one way that is better than a half-dozen others, unless all the conditions are previously fixed in view of that one way. The very fact that shock absorbers come as an afterthought would rather preclude the chance that they could have any fixed bearing upon the previous conditions as established upon the designs of cars. If cars are designed or constructed without taking the shock absorber question into account, then it is fair to assume that of the types of shock absorbers available that some one of them may be suitable to the occasion, all things considered.

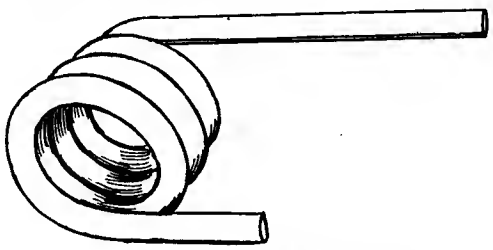
In the selection of shock absorbers for cars that are constructed independently of them, it becomes necessary to consider the car performance. If the springs proper are sufficiently supple initially, and will not permit the body to contact with the axle under severe conditions, thus limiting the performance to be corrected to excessive rebound; in such a car the reactive members might be limited to a gradual snubbing action above the static level. On the other hand, if there is an excessive vertical bounce and a series of oscillations, the shock absorbers might well be of the drag class, snubbing the action of the springs above and below the static level.



Scheme of Leather Limit Stop.

When cars are in the process of design, it is quite possible to eliminate the need of shock absorbers to the extent they are required in some examples of design. This is not to say that the shock absorbers could be eliminated, or that it would be desirable to eliminate them, any more than it would be a good idea to reduce automobiles to their simplest form. The fact that shock absorbers are used, and the further fact that they serve a useful purpose is no license to design cars so badly that even good shock absorbers would fail to can the oscillations.

Plea for Better Materials.—The success that has attended the shock absorber zone of activity is, despite the use of inferior materials in many cases and frightfully sloppy methods of applying the devices to cars. When the shock absorber interest more fully realized the terrific strains that shock absorbers fell heir to, they did move up, and they did correct more glaring faults with rather a good showing of promptness. On the whole, however, the material used in shock absorbers and the manner in which the materials were applied did not reach the high plane of automobile design for a long time. It was the lack of appreciation of the work shock absorbers had to do that retarded their progress to a marvelous extent, and it is because they have intrinsic value that they survived. There was a time when autoists preferred to wrap their springs with "Sampson" cord rather than be beguiled into fancied security by adopting shock absorbers that would not stay in place.



Simple Type of Spring Shock Absorber.

Fortunately, the situation developed a certain stability because of the underlying merit of the scheme, and the various types of shock absorbers are now to be had in much more stable form. It is not believed they have reached the limit of possible improvement, although they probably are on just as high a plane as any other branch of automobiling at the present time. There may be a little room for improvement by way of better spring materials, more permanent friction members and more secure blocking devices, but the latter part of this suggestion is open to the whole automobile, and not limited to shock absorbers.

The Influence on Cost of Maintenance.—If shock absorbers have the effect of leveling the platform and preventing oscillations, as well as rolling, it is equivalent to saying these same shock absorbers will materially reduce the cost of maintenance of the car. This is as plain as can be, because the life of a car on a hard level road is ever so much longer than the life of a car if the road inequalities are sufficient to engender shock conditions. It is the function of the shock absorbers to abort shock in that they snub the violent reactive tendencies that are due to the energy stored in the springs during the downward swing of the body. This energy stored in the springs must be dissipated by some device provided for the purpose, or it will be dissipated in the process of wearing out the elements of the car. Every violent motion imparted to the elements of the car construction is resisted at the terminals of the inter-relating members at the expense of high pressure, the inconsequence of which is that surface erosion must take place.

There is still another point of view involving the question of the kinetic ability of the materials used, as, for illustration, the dynamic life of any given material is much shortened if the material is subjected to violent shock loads. Distance rods, for instance, are stressed to double the static load, which in itself does not indicate the most serious factor, generally overlooked. In the first place the distance rods must be double weight, because the shock imparts double strain, but the life would be shortened even with twice as much material.

WINTER TROUBLES WITH COOLING WATER

YEAR after year, as Winter comes on, the question of the freezing of the cooling water is discussed anew. It is a serious matter and a feature in automobiling that will ever have to be dealt with, unless perchance oil or some other medium will ultimately be found to displace water, in Summer and Winter alike. A perfectly satisfactory cooling medium would have properties as follows:

(a) The specific heat would be that (or near) water;
(b) The specific gravity would be that (or near) water;
(c) The mobility would be nearly constant under all conditions of temperature;
(d) The solution would not support electrolysis;
(e) There would be no separating out of the components;
(f) Precipitation would not take place at any temperature;
(g) The boiling point would be that (or greater) of water;
(h) The solution would be neutral as respects its reaction;
(i) The rubber hose joints would not deteriorate in contact with the solution;

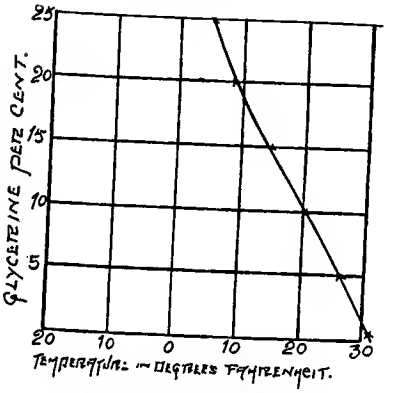


Fig. 1—Solutions of glycerine and water.

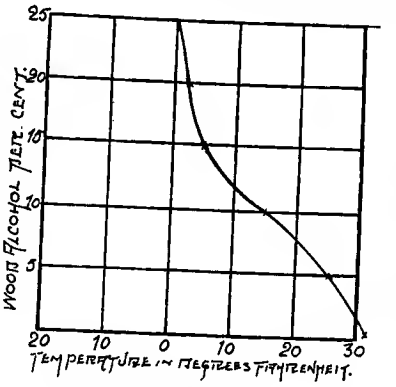

Fig. 2—Solutions of wood alcohol and water.

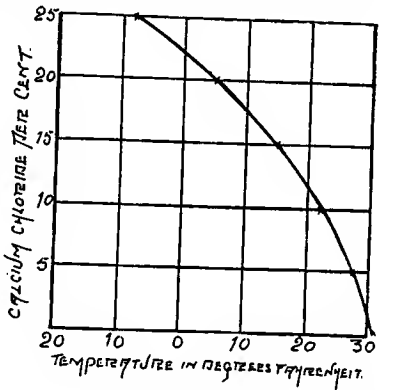

Fig. 3—Solutions of calcium chloride and water.

(j) The metals would not deteriorate in contact with the solution;
(k) Non-inflammable or nearly so.

Water answers all these requirements, excepting that its boiling point is a little lower than it ought to be for the best results. The best thermal efficiency of a motor will be when the jacket temperature is somewhat above the boiling point of water; there is not therefore quite sufficient margin, and the water is boiled off too easily.

Water is non-inflammable, and that is more than can be said for most oils. Light mineral oils, on the other hand, possess the high boiling point, so much to be desired, and the oil would therefore not waste away. Just how efficient this oil would be for the purpose is a matter that has not been settled conclusively, although some work has been done along this line and the author is using oil at the present time.

In the mean time it will be well to go over the whole matter the extent possible, in the light of present knowledge, rather with the hope of benefitting the many who come into the field with their first Winter's experience as yet in the embryo. Of the modia at present used, there is alcohol, glycerine and solutions of calcium chloride. Water is used with all of them, and in general, it is proper to say, the more water used the better if the solution will not freeze.

Solutions of Glycerine and Water.—These solutions work very well indeed, although it is true that the glycerine does attack the rubber hose joints, but not so rapidly as to become over troublesome. The chart, Fig. 1, gives the freezing points for the several mixtures of glycerine and water, and, as will be noted, no solution is considered above 25 per cent of glycerine (by weight), for the reason that, as before stated, the more nearly pure water is the solution the better, all things considered. It has been found that 25 per cent glycerine will serve in such weather as is experienced in New York. The author has used this solution and without any freezing trouble at all through three Winters. The solution will thicken up, but it will not solidify, and unless it does it will not disrupt the piping. The "slush" formation goes through a gear pump with apparent ease, and that is probably the most troublesome point in the circulation system.

If the system gets hot, it is water that boils off, and to replace the same is all that has to be done for, say, three months. After a time the solution looses all semblance of its original balance, and to start over again, with a new solution, is the wise course.

Solutions of Wood Alcohol and Water.—Wood alcohol differs from glycerine in one very essential particular in that it is the wood alcohol that boils off instead of the water. This is a misfortune, since wood alcohol answers every purpose in every other way. True, there are impurities in some grades of wood alcohol that under certain circumstances can do damage. With the low percentages, used in cooling and at the temperatures that prevail, it is not believed there is any danger from the use of this product in cooling work.

Fig. 2 gives the freezing point of solutions of water and wood alcohol, in which the alcohol is referred to in per cent, by weight. The balance of the solution is pure water (hydrant), and it will be understood the mixture will have to be adjusted at frequent intervals. The wood alcohol will soften the rubber hose joints, rather slowly, so that it differs only in degrees from the glycerine in this respect.

Wood Alcohol and Glycerine in Water.—Since either one of the ingredients added to water will lower the freezing point, it is a fair inference that they combined will do the same thing, each in its proportion to the water present—allowing that there is no chemical combinations—they being merely intimate mechanical mixtures. Assuming that the wood alcohol is to be preferred on some counts as less liable to choke up the constricted passageways, then it is well to consider the advisability of reducing the quantity of glycerine and substituting alcohol instead. It is very likely that by the use of both wood alcohol and glycerine, the total quantity of water can be increased, and this is a step in the right direction on two counts, *i.e.*, (a) cost and (b) stability.

With 10 per cent of glycerine in the water, the freezing point is 20 Fahrenheit. This leaves 90 parts of water, to which add alcohol, in amount equal to the glycerine added, plus excess alcohol solution to make up for water in the same—say, 10 per cent—and the effect of the alcohol present will be to lower the

temperature 13½ degrees Fahrenheit. The result will be a mixture, with a freezing point slightly below zero, with improvements in other ways besides. This solution then would consist of 10 per cent glycerine and 11 per cent of wood alcohol, in which 10 per cent water will be found. The balance to be water.

This solution would still serve fairly if through lack of attention all the alcohol were to escape. The glycerine, then, would be as a safety medium and might be of great advantage on that account. On the other hand, to be rid of over half the usual amount of glycerine used is a positive advantage.

Solutions of Calcium Chloride and Water.—Of this material and its uses but little has been said, excepting that it should be chemically pure. Its performance in the cooling system of automobile motors has not been commented upon at any great length, and experience is wanted. Even if it is chemically pure, this is not to say there will be absolutely no electrolytic action. To what extent these salts will precipitate is a matter that should receive some consideration. The average "thermo-syphon" system is ripe for precipitation of the salts of metals suspended in water. The reason for this lies in the fact that the precipitation takes place at certain temperatures below the boiling point of water, and it is the thermo-syphon system that affords strata of water at several levels of temperature. In the thermo-syphon system the water is steaming where it contacts with the hottest zones around the combustion chamber, and the rather sluggish movement of water tends to support precipitation.

The efficiency of the phenomenon called emissivity will be low, if the surfaces are coated with a crust of any kind, as salts of metals. Sodium chloride has not been proposed for the purpose, although it will lower the freezing point of water almost as well as calcium chloride. As a matter of fact, 15 per cent of sodium chloride (common salt) gives a temperature of freezing of 12.2 degrees Fahrenheit, whereas the same percentage of calcium chloride affords a freezing temperature of 15 degrees Fahrenheit. Beyond this degree of concentration the calcium has the most marked effect, but it is positively a hazard to use a more concentrated solution.

Common salt is cheap; that is one thing in its favor. Electrolytic action would follow its use, but this is true of all such (metallic) salts. It would not be possible to eliminate the action by using chemically pure salts, for in battery work the salts are chemically pure, the object being to eliminate other than desired electrolytic phenomena.

Radiators are costly, delicate and composite in construction—that is to say, there are a plurality of metals in the makeup of radiators, hence electrolytic action would follow, due to the difference of potential natural to different metals immersed in a saline bath. Fig. 3 shows the freezing point of calcium chloride, of the several degrees of concentration up to a saturated solution. It must be remembered that the saturated solution is ascertained at 60 degrees Fahrenheit, and increasing the temperature increases the capacity of the water to hold in suspension the salts. Any approach to the saturation limit then is attended by danger of precipitation. On the other hand, the Ohmic resistance of solution is lowest at about half saturation. In the long run it is experience that counts, and it is still a question as to the extent to which saline solutions can be used with safety. No autoist cares to do the experimenting if his radiator is to be the "dog to try it on." There is no other point against saline solutions, especially common salt. Cast iron undergoes a change in its structure when it is immersed in salt water. The castings seem to rot. The rot is to a great depth and is different from oxidation. Sea water has the same effect, and in sea water the salts are diverse, including sodium and calcium.

From what has been said there would seem to be no solution so good as water, but unfortunately water will expand when it freezes, and it will freeze, on small provocation in a radiator. The efficiency of this device is a guarantee that the necessary heat exchange will take place, with a small difference in temperature below 32 degrees Fahrenheit.

Oil as a Cooling Medium.—Of this liquid for purposes of cooling there are points in its favor that renders it even more efficient than water. In the first instance, oil has a higher boiling point—about double—than water, and as a result the oil will not waste away.

The heat exchange takes place at a higher temperature, and the thermal efficiency of the motor will therefore be higher. The cooling system can be with less surface, hence lighter, and the work of the fan is of less importance. As a general proposition, oil will absorb heat in the ratio of 10 to 7, as compared with water, and too with half the drop in temperature, which is at a saving of cooler surface. On the other hand, the oil works at a higher heat level, which is the secret of the better heat exchange for a given radiator surface.

Of course, very soft solder for the joints of radiators might melt out were oil used, should the heat balance take place at a fairly high level of the temperature. Solder can be so soft as to melt in boiling water. Thus no radiator should be held together by solder with a low fusing temperature for, aside from the above consideration, the strength of the joint will be lower for the solder of the low fusing point.

In a given radiator the temperature of the heat balance depends (a) upon the efficiency of the radiating surface, and (b) upon the extent of that surface. Radiators differ as much as 100 per cent, as respects efficiency of the surface, and in cases in which water boils off alarmingly it is always a good possibility that the oil will work without giving trouble of any sort, if indeed the power of the motor is not actually increased.

Air cooled motors are efficient in the use of fuel, because the heat abstracted through the cylinder walls is low, in comparison with the heat "sponged" off the surfaces by cooling water. The air cooled motors, on the other hand, have unequal temperature zones. Oil cooling stands as a happy medium in that the inequalities are leveled, and the adjacent zones are of a common temperature—(a) lower than in air cooled motors, (b) at a higher heat level than in water cooled motors.

With oil, the circulating pump should be of greater capacity than it is in some examples of pumps to be seen on cars. On the other hand, "leakage" with oil is lower than with water. The oil packs the pumps. One more point: The oil kills pump noise and profusely lubricates the pump, and, again, should there be a small jacket leak to the cylinder, it would not be of such great consequence, although a leak of any moment would cause excess pressure and "spouting" in the cooling system.

The Quality of Oil to Use.—This is a matter that can only be put in abstract terms. Oil is subject to a great variety of substitutions, and reliance must be placed in the refiners. Any refiner who will study the conditions and fairly meet them will be justly rewarded. The oil should have properties as follows:

(a) A constant mobility under the several conditions of temperature;
(b) The minimum body;
(c) The highest possible specific heat;
(d) The highest possible boiling point;
(e) The highest possible flash point;
(f) No acid reaction whatsoever;
(g) Fair lubricating properties;
(h) A stable chemical state of equilibrium, under the conditions of service.
(i) Absence of rosin or gum of any sort;
(j) Free from jelly formation;
(k) Low priced.

Of the oils to be had it would seem as if a light, thin, pure mineral oil would be the most reliable, in most, if not all respects. Animal fats become rancid under certain conditions and acid in time. Vegetable oils are prone to the same tendencies. Fish oil would be worth trying, merely as an experiment.

In any case the "overflow" pipe from the cooler should not lead to a point adjacent to lamps, or any other source of flame, for, should the oil reach its boiling point, the vapor would ignite readily and this is something to avoid. To be sure, oil is now used extensively in automobiles, and it does not add to the fire

hazard perceptibly when compared with gasoline which is handled with great safety. At all events, it will be well to stick to water rather tban to take all the brands of oil tbat can be bad upon paying tbe price. The "oil man" has oil to burn, but the man with an automobile can scarcely afford to add fuel to the flame.

Some Basic Considerations.—A little further light on the question will tend to put oil before the mind's eye as a good future possibility. It was said oil will permit of the heat balance at a bigher level than that possible with water. Taking this as a basis, it is to show that, for a given "wetted" surface of cooler, the heat exchange will increase because of the difference in temperature as follows:

$$W = \frac{1}{223} FtA = \text{Emissively in watts.}$$

W = emissively in watts;
F = increase in temperature in degrees Fahrenheit;
t = number of water cycles per minute;
A = area of wetted surface in square inches.

If it is assumed that tbe loss to the cooler must equal about 50 per cent of the value of the fuel, while the useful work equals 16 per cent, then for a 16-horsepower motor the loss to jackets will be 50 horsepower. With water for cooling, the value of

F = 100 degrees in round numbers, taking a hot summer's day for it and assuming that thc temperature should remain stable at about 200 degrees Fahrenheit.

Transposing the formula, we have:

$$A = \frac{223W}{F\,t} = \frac{223 \times 37{,}300}{100 \times 60} = 1393.7$$

$W = 50 \times 746 = 37{,}300$.

t = number of times heat is sponged off by water, per minute: say 60.

The area of a cooler with oil, if the temperature of exchange would be 200 degrees above the surrounding instead of 100, as with water, would be:

$$A = \frac{223W}{F\,t} = \frac{223 \times 37{,}300}{200 \times 60} = 693.1$$

In other words one-half the surface, if double the temperature, is taken. These relations are independent of the efficiency of the surface; any surface that would do for water, and perform in a fitting manner, would be reduced one-half were the working difference in temperature doubled.

There is a common notion that motors have to work at low temperatures. This notion is fitted to the wrong detail. It is the water that has to be kept from boiling. The limit, excluding water, is preignition. The weight efficiency of a motor will fall off if the heat is beyond a certain point, but this same efficiency is not as high, with water, as it would be with some cooling medium that would not abstract so much of the fuel value from the cylinder walls. As a matter of fact, there is a fallacy in the formula due to this influence, but, in the absence of data, it is better to abandon the fallacy, since the error is on tbe safe side.

If preignition sets in it is a sign of excess compression, low speed, or light flywheel. These matters can be corrected. If oil will equalize the temperature adequately, and accomplish the task at a bigher thermal level, provided the weight efficiency will approach the maximum in tbe process, the adoption of oil will be as one of the distinct advances in automobile work. In the meantime the inexperienced autoist will be wise to look as high as the universal joint in his neck will allow, provided he keeps his feet on the ground. A man that cannot afford to ruin an automobile will do well to let oil experiments come down the line, to be adopted by the makers of automobiles first, or to be worked out by auto enthusiasts who can afford to take tbe risk. There are many pitfalls to be encountered, mainly because oil (the name) covers a multitude of sins.

THE ABSTRACT ABILITY OF KEYS FOR SHAFTS

LET,

D = diameter of a shaft in inches;
B = breadth of key in inches;
L = length of key in inches;
T = twisting moment in inch-pounds;
S_1 = working stress of shaft in pounds;
S_2 = working stress of key in pounds per square inch.

Then,
$$T = \frac{\pi D^3 S_1}{16}$$

EXAMPLE:

Let,
$$D = 1.25;\ B = .25;\ L = 2;$$
$$S_1 = 16{,}000;\ S_2 = 16{,}000.$$

Then,
$$T = \frac{3.1416 \times 1.95 \times 16{,}000}{16} = 6130$$

If the key is from the axis a distance equal to

$$Y = \frac{D}{2} \qquad \text{Then } T = B\,L\,S_2\,Y.$$

That the strength of the key should equal that of the shaft is assured, hence:

$$\frac{\pi D^3 S_1}{16} = \frac{B\,L\,S_2\,D}{2}$$

and,
$$\pi D^3 S_1 = 8\,B\,L\,S_2.$$

Therefore:
$$L = \frac{\pi D^3 S_1}{8\,B\,S_2}$$

Exploiting the example further we have:

$$T = B\,L\,S_2\,Y = .25 \times 2 \times 16{,}000 \times \frac{1.25}{2} = 5000.$$

Thus showing that the shaft is stronger than the key in the ratio of 6,130 to 5,000. This would not indicate harmony.

It was said:

$$L = \frac{\pi D^3 S_1}{8\,B\,S_2} = \frac{3.1416 \times 1.25^2 \times 16{,}000}{8 \times .25 \times 16{,}000} = 2.419$$

Thus, we find the key should be nearly 2.5 inches long, to be equal in strength to the shaft, but, should it be impossible to lengthen the key, as in a gear case, for instance, in which no more than 2 inches can be allowed, then the remedy lies in a compromise, if a reduction in the value of T can be considered. The compromise would come by way of increasing the breadth of the key.

If a compromise is not permissible, the diameter of the shaft must be increased enough to swell the value of T adequately.

If the key and the shaft are not of equally good materials, the values taken for S_1 and S_2 must reflect the difference. If the hub that is keyed on is of different material, again, an allowance must be accordingly made.

If two keys are fitted (usually at 90 deg.), it is best to assume that only one of them will have to do the entire work; it is not easily possible in practice to fit two keys alike. The key that fits the best must do all the work, until it deforms enough to allow the other key to go to work. If the "scab" (second) key is not a fair fit tbere is no safety in having it there. Anyway, the shaft is weakened and harmony cannot reside in a two-key job.

In automobile work, hubs are invariably so short as to require close figuring when keys are considered. It is not uncommon to find lost motion in timing gears, due to short keys on small-diameter shafts. Even flywheels are with lost motion betimes, and when this is noticed it is high time to look for a repair shop.

LETTERS INTERESTING AND INSTRUCTIVE

HOW TO CALCULATE DIMENSIONS OF GEARS.

Editor THE AUTOMOBILE:

[1,638.]—I should appreciate very much if your correspondence department could give me information of any simple rule or formula which you have for figuring the size of cams and required diameter of timer gears and half timer gears; also commutatore and timer gears for four-cylinder four-cycle motore. What horsepower should a motor of four-cylinders four-cycles 1¼ hy 1½ develop? A SUBSCRIBER.

Berkeley, Cal.

There is no simple rule that you will be able to use to give you a constant gas velocity through the influence due to changing the contour of cams. Most internal combustion motors disregard the question of a constant gas velocity. The lift of the valves should be about 8 millimeters (25.4 millimeters equal one inch); having fixed upon the lifts of the valves, you have established the maximum eccentricity of the cams. You have not established the interval of time the valves should stay open. This phase of the question could not be discussed sufficiently in limited space, but fortunately THE AUTOMOBILE (issued Nov. 5, 1908, page 639) discussed this matter at great length.

How to calculate the dimensions of gears for the half-time shaft is very completely dealt with in the catalogues of the Brown & Sharp Co., Providence, R. I. It will be impossible to do the subject the same justice in the space here afforded. In relation to the power that you might expect from a four-cylinder motor, 1¼ times 1½ inches, bore and stroke, respectively, it is only possible to give an arithmetical value which according to the A.L.A.M. would be as follows:

$$\text{H.P.} = \frac{1.25^2 \times 4}{2.5} = 2.5 \text{ nearly}$$

This is on the assumption that the piston speed will be 1,000 feet per minute. Since your stroke is 1½ inches the crankshaft speed for 1,000 feet per minute piston speed, would have to be 4,000 revolutions per minute; this is higher than anything any one has yet had the pleasure of witnessing. Should the crankshaft speed have to be lowered to, say, 3,000 revolutions per minute, the power would then be about three-fourths of that given in the formula, with a better chance of actually realizing the same because the gas velocity would be more nearly in accord with accomplished facts.

SPLIT PORCELAIN TUBES IN SPARK PLUGS.

Editor THE AUTOMOBILE:

[1,639.]—I recently changed my spark coil on an old model car, substituting a modern high-priced coil instead. I expected to be out of all ignition troubles as a result, but find that the porcelain tubes on the spark plugs fail rather too frequently. Could you tell me why? P. H. D.

New York.

The time was when this difficulty could be traced to inferior porcelain or to the means of "taking up." In other words, the porcelain tubes were pinched and cracked as consequences. On other occasions the defect was due to unequal expansion, and between the several causes, some one of which seemed to be present rather too frequently, autoists were ever wont to complain, and justly, since the tubes are fragile enough at best, without resorting to unequal pressure due to an ill fit. The main point, however, is to call attention to a new trouble due to the higher efficiency of spark coils as they may now be had. In the first place, the old sources of trouble are almost, if not quite, eliminated, and the new one will be avoided under proper conditions.

Modern spark coils will spark across a considerable gap, but as the gap increases, so does the strain on the porcelain tubes. This "electrostatic" strain will become enough to disrupt the tubes in some cases, if the electrodes are spread apart as much as they may be ere the spark dies out. Care should be exercised not to go the limit in this respect.

SPELTER IS USED FOR BRAZING CAST IRON.

Editor THE AUTOMOBILE:

[1,640.]—Can you give me through "Letters Interesting and Instructive," the formula for the compound ueed in the brazing of cast iron. A SUBSCRIBER.

Boetonia, Cal.

In the regular brazing process, which can be used to braze cast iron, "spelter" is employed.

TWO AND THREE-PORT MOTORS.

Editor THE AUTOMOBILE:

[1,641.]—Please explain the principles and construction of the "three-port" motor. G. P. AMES.

Brooklyn, N. Y.

In the two-port motor, as illustrated in Figure 1, the functions are as follows:

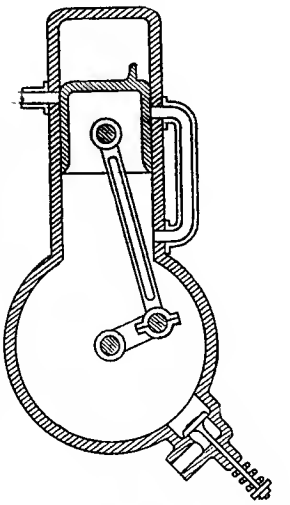

Fig. 1—Two-port motor.

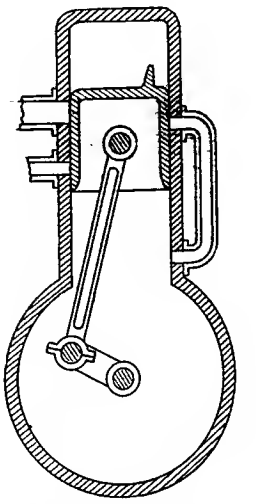

Fig. 2—Three-port motor.

The first stroke of the piston produces a vacuum in the crankcase and tbe mixture rusbes in (as a consequence) through the check valve in the motor case. The second stroke compresses the mixture, and when the communicating port is uncovered the mixture surges into the cylinder. The next (third) stroke compresses the mixture entrapped in the cylinder, since the ports are then covered by the piston, and at the proper instant the mixture is ignited.

From this point on it is a normal repetition of functions, and once the motor gets under way it two cycles. The three-port example differs in that the mixture is taken in through a third port uncovered by the piston instead of through a check valve in the case, and the details in practice change accordingly. Tbe drawings show the difference so clearly as to demand no further discussion.

THE UTILITY OF THE OFFSET CRANKSHAFT.

Editor THE AUTOMOBILE:

[1,642.]—In talking to automobile salesmen the descriptions of their products more frequently than not include a reference to offset crankshaft. Can you briefly state the advantages derived?

New York. M. B.

The practice of offsetting the crankshaft in automobile motors is rapidly gaining converts, and there are numerous examples of offsetting to be seen at the present time. In this scheme, it will be remembered, the crankshaft is not set in the plane of the middle of the cylinders. In other words, the crankshaft is

set slightly to one side. The exact amount of this offset seems to be a variable with different designers, but the object is always the same. When the piston is in the position of maximum compression involving the ignition and flame propagation, it is the idea to have the connecting rod in the vertical position. The force of the explosion will then come on the connecting rod endwise and the piston will not be pressed unduly against the cylinder walls.

THE TREND IN MODERN SPRING PRACTICES.

Editor THE AUTOMOBILE:

[1,643.]—I am curioue to know why it is that epring troubles are so prevalent in some care and entirely abeent in others. It cannot be alwaye a question of the quality of materiai, becauee I have eeen epring breakagee repeatedly with varying gradee of materiais on a given car. What are the other influencee aeide from the quaiity of material that ehould receive consideration? L. L. D.
New York.

The old practice of fixing a uniform curvature of the spring leaves frequently leads to breakages due to distortions set up at the spring perch. This tendency is now aborted by making the spring leaves in such a way that the curvature begins at points beyond the spring perch, so that the clamps when they are pulled into tight relation do not straighten out the plates. It is still the custom to use a leather pad on which to rest the springs because thereby the coefficient of friction becomes that of leather, and creeping tendencies are as a consequence remote. There is also the question of the camber given to the respective spring plates. If the plates are all of the same thickness, they should all be curved to the same radius, for then the extreme fiber strain would be equal in all the plates for every alteration in camber incidental to the service they are placed to perform.

MORE FOR THE MAN FROM DULUTH.

Editor THE AUTOMOBILE:

[1,644.]—In answer to query No. 1,601, will say that I believe the party will find the unaccountable knock, when ascending hills on the high epeed, to be in hie torsion rod, it having jarred looee and needs to be tightened. Have had the eame trouble myself, and, after quite a lot of looking around, I located it. BOX 826.
Aurora, Mo.

Editor THE AUTOMOBILE:

[1,645.]—In letter No. 1,601, October 27 ieeue, I notice that a friend from Duluth is having trouble when pulling up grade on high gear. I think that he will find that hie trouble is backfire caueed by what ie called static eiectricity. For a remedy, first separate all battery leade and ground by 1-inch space, fastening same with wood or some non-conducting fastenere; and if this does not remedy the trouble try interchanging the unit coils in the spark coil caee. Sometimee the latter ie all that ie necessary.

In short, it eometimes happens that the leads or epark coils become "shorted" by this static or iatent electricity and cause a backfire when the mixture is just right. I hope that if our friend from Duiuth bas faith eufficient to try the remedy here suggested he will aleo report through your vaiuable columns what measure of eucceee he has. A MINNESOTA SUBSCRIBER.
Owatonna, Minn.

"HUMBLE CHAUFFEUR" ANSWERS "SOREHEAD."

Editor THE AUTOMOBILE:

[1,646.]—I am tempted to send thie reply to the right honorable Mr. Sorehead, L. D. F., Auburn, N. Y.:

"Gracious Patron of Chauffeurs:

"Your deiightfui biiiet doux ie just received, and I hasten to acknowledge the pieasure and inspiration it affords me. The gentiemanly expreseion of your amiabie attitude iooeens my hand from the wheei and iifts me out of the right front eeat to lofty heights of eerene beatitude. Hence

Where the motors cease from throbbing
And employers are the beet;
Where the carbureters clog not,
And the chauffeurs are at reet;
Where the reetless, reckless road-kings
Are meek and reverent,
And induige not in expietivee,
Nor to their epieen give vent;
Where there is no cuehion greasing,
And the iampe do never break,
Where the License is iegitimate
Without a poker etake;
Where the 'Choeen' really care for
And operate the car,
Politeiy waive their ealary
To epare Sorehead a jar;
Where there are no paper coiiare,
Where there ie no 'Forty per,'
Where ths garage smeiis like roees,
Mingied with eweet ecented myrrh;
Where the inner tube ie cheriehed,
And there is no 'eoda-hop,'—
Aii are college cuitured chauffeure
And empioyere are tip-top,—
The chosen all are iinguiete
Of profound ability,
They bow and ecrape and paiaver,
With killing courteey;
Where owners havs no 'heli-sticke'
To grudge to 'firemen,'
Where evii iooking gobiine
Ne'er stupid eeem again;
Where the gasoline fraternity
Ne'er bump into a dray,
Nor wreck a nervous eyetem
Nor honk along the way.
No prieon etripee are prayed for
By pioue Sorehead jaye
Who pen-paint with a master hand
The chauffeurs' beastly ways.

"But I am brought back to commonpiace existence with a thud. I vociferousiy long to upiift the Employers' profeseion, but modestly hesitate to suggest poesibie ways and means of improvement in their morale and mannere because I am your

"Sterling, Ill. "HUMBLE CHAUFFEUR."

THE AUTOMOBILE CALENDAR

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, General Manager, 29 West 42d St.

Jan. 5.....—New York City, Fourth Annual Meeting Society of Automobile Engineers. (Will adjourn until January 19 after opening eeeeion.)

Jan. 18-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers.. M. L. Downs, Secretary, 7 West 42d St., New York City.

Feb. 6-13.....—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York.

Feb. 15-20.....—St. Louis, Mo., Annual Show, St. Louis Dealers and Manufacturing Aeeociation.

Feb. 15-20.....—Detroit, Wayne Pavilion, Automobile Show.

Mar. 6-13.....—Boston, Mechanics' Building, Seventh Annual Automobile Show, Boston Automobile Dealers. Chester I. Campbell, Manager, 5 Park Square.

Mar. 27-Apr. 3..—Pittsburg, Duquesne Garden, Automobile Show, Pittsburg Automobile Dealers' Association.

Races, Hill-Climbs, Etc.

Nov. 26.....—Savannah, Ga., Grand Prize Race, Savannah Automobile Club and Automobile Club of America.

Jan. 1-2.....—Philadelphia, Two-day New Year's Run of the Quaker City Motor Club.

FOREIGN.

Shows.

Nov. 28-Dec. 13.—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France (Pleasure Vehicles, etc.)

Dec. 20-28.....—London, Stanley Show, Agricultural Hall.

Dec. 22-29.....—Paris, Eleventh Annual Salon de l'Automobile. (Commercial Vehicles, etc.)

Jan. 16-25.....—Brueeele, Show Organized by Belgian Chamber Syndicate, Palais de Cinquantenaire.

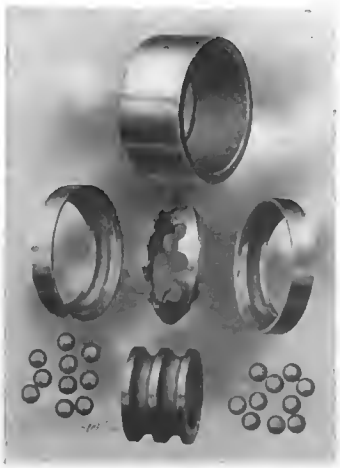
NEW DEPARTURE TWO-IN-ONE BALL-BEARING.

There are few places on the automobile where improvement has not been brought about by the substitution of an anti-friction type of bearing for the plain types formerly employed, but there are likewise few places on a car where the problem has not been complicated to greater or less extent by the fact that both thrust as well as radial loads have had to be carried. The front wheel hubs, for instance, where the thrust load not only frequently equals the radial pressure on the bearing, but sometimes exceeds it. The bevel gear drive, differential, and gear-set also afford instances where the requirements call for a bearing capable of sustaining a thrust load that is often practically the equivalent of its radial carrying capacity. The New Departure Manufacturing Company, Bristol, Conn., has been devoting its efforts to the development of a ball-bearing that would be capable of not only sustaining equal thrust and radial loads, but which would be capable of bearing greater loads for its size, and the result has taken the form of the New Departure "two-in-one" annular ball-bearing. which first made its appearance on the market early in the year.

Assembled Bearing Complete.

Sectional View of Bearing.

While especially adapted to automobile use, owing to its dual ability as expressed by its title, it has also been designed for general use and has already found numerous applications in special machinery and for power transmission. Its value in automobile work would arise from its ability to withstand radial or thrust loads, or any combination of the two, with the use of but a single bearing with its attendant simplicity of mounting. In order to bring about this result, two rows of balls are employed in staggered relation to one another, and the ball races are so arranged that the line of pressure is either at an angle of 45 degrees or 60 degrees with the horizontal, when the axis of rotation of the bearing is in a horizontal plane. The makers claim this has been accomplished without departing from that simplicity which characterizes the usual type, and that is evident from the fact that exclusive of the balls there are but five parts to the complete bearing, and when the latter is assembled these are permanently combined, making the bearing self-contained.



The Various Separate Parts.

These parts, in the order of their assembly from the shaft outward, are the cone, the separator, the two cups and the shell, the order in which they are named being illustrated by the cut showing the dismounted bearing, while their relative positions are shown in the cross-sectional view of the bearing. From this it will be evident that the line of pressure of the cone, cups, and balls makes an angle of 45 degrees with the horizontal, something which is equally true of both rows of balls, this feature adapting the bearing to withstand a load from any angle, while the additional row of balls is said to increase its capacity one and one-half times. Two semi-circular races are turned in the cone to receive the balls, while the sheet steel separator is so stamped that the ball retaining notches are staggered with reference to each other. These openings are made slightly larger than the ball diameter, so that the contact between the ball and separator is said to be a point contact at one end of the axis of rotation, while the weight by separator is carried on the balls at the top of the bearing. By maintaining the relative positions of the balls at all times, cross friction is claimed to be entirely eliminated, while the friction introduced by the use of the separator is practically a negligible quantity. One of the most radical departures in the construction of this bearing is its permanent assembly, sufficient metal being provided in the shell to permit of drawing the latter tightly over the cups; this, the makers claim, absolutely maintains the relationship of every part of the bearing. And they are so perfectly confident of the status of every bearing that leaves their works that this is an advantage in many ways. A large range of sizes is now being manufactured, for which standard dimensions of bore and outside diameter have been adopted.

LICENSED STATUS OF THE E-M-F SETTLED.

Ever since the formation of the Everitt-Metzger-Flanders Company, of Detroit, there has been more or less confusion regarding the status of the Northern Motor Car Company, as well as of the relation of the new company to the licensed association. The Northern Manufacturing Company joined the A. L. A. M., April, 1903, later changing its title by amendment to its charter to that given above, and this corporation sought permission to assign its license under the Selden patent, which carries with it membership in the Licensed Association, to the new E-M-F Company. This permission has just been granted, and the transfer includes all the business of the Northern company. While this winds up the existence of the latter as a factor in the automobile industry, former purchasers of Northern cars will be cared for by the new company.

When seen at the Association headquarters, Mr. Metzger said that the formal transfer of the property had been completed, and the work of organizing the factory forces of the new company was so well advanced that he felt confident the 10,000 cars the company had planned for would be completed in time for delivery during the coming season.

The officers of the E-M-F Company are: President, Byron Everitt; general manager, Walter E. Flanders; treasurer, Charles Palms; secretary and general sales manager, William E. Metzger.

SHAWMUT PLANT SUCCUMBS TO FLAMES.

Boston, Nov. 13.—The plant of the Shawmut Motor Company in the suburban town of Stoneham was destroyed by a fire which started in the factory building early this morning. It was discovered by the night watchman, but so rapidly did the flames spread over the oil-soaked floors that the combined efforts of the local fire department and companies from the surrounding places of Winchester, Wakefield, Melrose, and Woburn, could not stop its headway, and besides burning the Shawmut plant it consumed three tenement houses and narrowly missed a church. In the factory were ten finished cars and others in process.

Points of the New CADILLAC "30"

THE 1909 undertaking of the Cadillac Company of Detroit, Mich., will prove of especial interest to the many Cadillac adherents, and undoubtedly will swell that pronounced contingent as well. The Cadillac company, in view of its great experience, consistent practices, and sane policies, is well qualified to meet the demands of 1909. The Cadillac "30" is a commodious touring car of conventional design, seating five passengers with ample room, has a wide side entrance, rich upholstery, and a display of taste in the finish. Easy riding is due to adequate springs and a harmonious relation of power and weight, and the distribution of the same. The road performance will be that due to a 106-inch wheelbase, standard tread, 32-inch wheels, with 3½-inch pneumatic tires and adequate power.

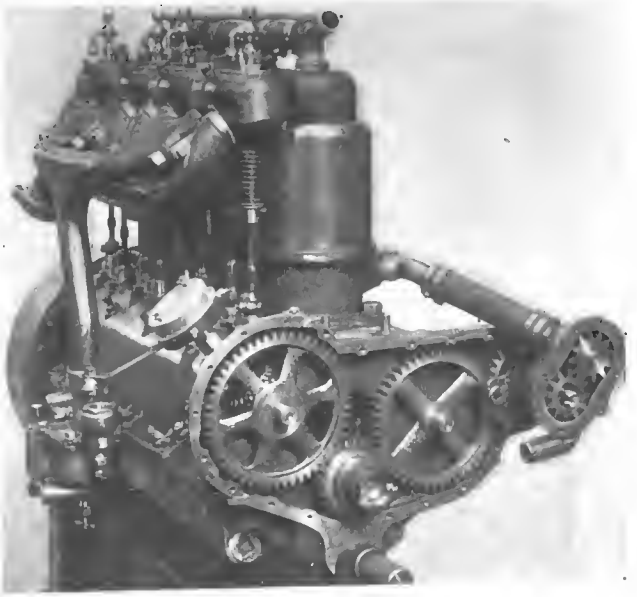
Some Features of the Motor.—Rated by the company at 30-horsepower, with cylinders 4-inch bore and a stroke of 4½ inches; cylinders and pistons of fine gray cast-iron from the Cadillac foundry. The water jackets are of copper, securely placed, and the valve details are usual to the Cadillac products. The crankshaft of chrome (alloy) steel is supported on five good adjustable bearings, is balanced, and runs in true centers. This same crankshaft is so nicely designed and fashioned as to enormously enhance the value of the motor in question.

The connecting rods are of die forged special steel, nicely shaped, and balanced with pistons to afford a true kinetic balance of the reciprocating parts insofar as such a condition is possible. The crankshaft is offset to relieve the pistons of undue pressure, and the valves (inlet and exhaust on one side) are interchangeable, of liberal size, and the valve gear (tappets, etc.) are up to the usual Cadillac standard, including hardened steel cams. The crankcase of aluminum is of rigid construction, due to the scientific design, with walls thick enough to abort noise. The half-time gears are of ample proportion, and are noiseless, since they are set to run on the pitch line, and are profusely lubricated.

Motor Accessories.—The water circulation is vigorous, due to the working of a gear pump. The cooler is of liberal size, attractive appearance, and is made of vertical copper tubes, passing through closely pitched horizontal copper plates. The fan is of liberal size, and placed just back of the radiator, under the hood.

Fuel System.—Includes a Cadillac float feed carbureter of well and favorably known characteristics, healthy piping and a commodious copper gasoline tank. The lubrication system on the Cadillac "30" is especially noteworthy. It is a continuation of the well-known Cadillac system, including a double-acting force pump and an oil pan in the crankcase, with an oil reservoir alongside the motor. The oil from the reservoir is pumped through the "sights" to the places demanding lubrication, which includes maintaining the level in the motor case oil pan, from which the distribution is by "splash" of an improved form.

Ignition System.—The magneto system comes as an extra and the regular system is by jump spark, storage battery, and auxiliary dry cells. The quadruple coil is located on the dash, and is appropriately finished. The muffler is rather more ambitious than custom dictates, in that it not only serves to subdue the noise, but it is provided with a cut-out that serves as a "safety" as well. Moreover, the exhaust may be directed to a whistle and a footwarmer at the will of the autoist.



The Motor of the 1909 Cadillac "Thirty."

Transmission Gear Set.—The primary transmission is by means of a clutch of suitable design, thence through the main shaft to a selective type gear set. Three speeds and reverse are provided, and the gears, shafts and high duty parts are of right design, using chrome nickel steel. The gears, etc., are heat treated, and the accuracy of finish assures duplication of parts. The shafts and spindles rotate on annular type ball bearings, and the work as a whole shows the earmarks of quality. The sliding is through a nicely designed side lever, on the right, while a foot pedal operates the clutch.

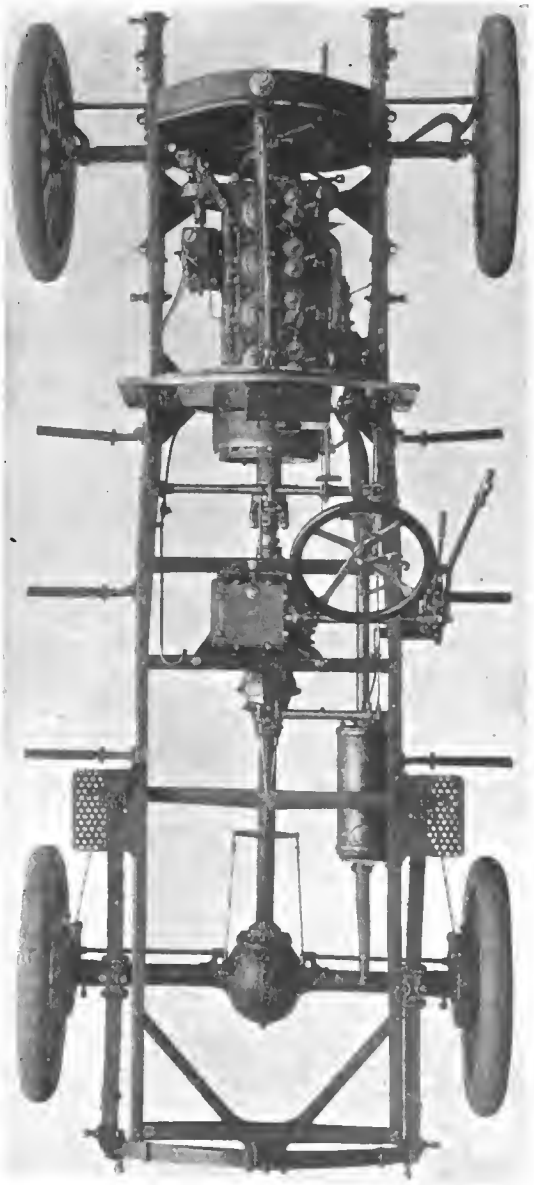
Pertinent Chassis Features.—Channel section side frames and laterals of

the same material are secured in a neat and substantial manner. The frames are of the "drop" type, with an eye to ground clearance; the offset is to 30 inches in front from 33 inches at the back.

Spring Suspension.—This is of the platform type at the rear and half elliptical fronts. Ball joint sbackles are used; spring perches are rigid, but the rear perches are free to oscillate, hence the springs are free to perform their functions. The live rear axle housing is of cold drawn seamless steel, witb a good ground clearance under the differential. Annular ball and Hyatt roller bearings are used, and the wheels are pressed into tapers at ends of the sbafts. From the transmission gear set to the rear axle the propeller shaft is provided with universal joints in oil tight housings, and rolls on annular type ball bearings. The front axle is also a seamless cold drawn tube with drop forged steel sockets electrically welded to place. The wheels, artillery type, are of selected second growth hickory of appropriate design, with substantial steel bubs, front and rear, accommodating 32 x 3½-inch tires. The front wheels rotate on two-point ball bearings, with ¾-inch balls inside and 9/16-inch balls outside. The cones are tool steel.

Braking System.—Two pairs of powerful double acting bands engage on drums attached to the respective rear wheels. The brakes are compensating, of good diameter and wide face. One set is internal expanding while the other is external constricting. The facings are camel's hair fabric. The control of the brakes is by means of a foot lever for the service brakes, working the constricting bands, while the emergency brakes are of the expanding order, also by a foot lever. Means are provided for take-ups and adjustment at all points.

Steering System and Control.—The mechanism is of the worm and worm gear type, fitted with two ball thrust bearings, and with especial care not only to eliminate lost motion but to keep it out. The linkages are of strong design, good appearance, and with ample bearing surfaces. The spark and throttle levers are conveniently situated upon the steering post.



The Cadillac's Neatly Proportioned Chassis.

Some Pronounced Cadillac Tendencies.—Particular attention is called to the facilities afforded in the Cadillac establishment for turning out accurate parts, thus assuring ease of replacement in due course of time. Tbe cursory examination of an automobile might lead to the conclusion on the part of the uninitiated that a replacement is a perfectly simple matter in relation to which there should be no trouble at all. They overlook the fact that there are from 800 to 1,000 diffcrent kinds of pieces in a well designed car, and possibly 50 per cent. more of such units involved in an inferior design. There is no way under the sun by which a car can be assembled without using a sledge hammer, a file, and "cuss" words, unless the interrelating members are ground to a finish witbin limits of "tolerance" well below a thousandth of an inch.

A visit to the Cadillac plant will disclose complete sets of the finest instruments of precision and a testing equipment sufficiently commodious to enable them to make a running test on every automobile shipped, even in tbe hurry season, when the pressure for deliveries is most felt. The Cadillac Company makes no secret of their splendid facilities along these lines, nor are the conditions enumerated merely new to them, hence a novelty to be heralded from the housetops. As pioneers in automobile work, with a considerable previous practice along lines involving the manufacture of machinery, they were in a position to realize the necessity for check methods in the shop, and means for arriving at the true state of affairs without waiting for disagreeable returns from their patrons.

Fortunately a large number of automobiles cannot be built in a haphazard way, if they are intended to run for any length of time at all without hesitating at the brow of every hill. The haphazard method of doing things does not of course involve quality.

There is one other point made by the Cadillac Company that should be of interest to their patrons, *i.e.* the shop system was especially devised with the idea of accomplishing the respective tasks within a pre-scbeduled time. It was not the purpose to try to do things within less time than they naturally would take, for that would end in a slight to quality, but it was with the intention of arranging the start at the propitious moment. Deliveries may therefore be expected with a precision not to be outdone.

Standard Finish of All Styles.—The standard color is royal blue, including body, hood, frame, axles and wheels, with light blue striping. The fenders and radiator are baked black enamel. The dash is highly finished mahogany with brass edges. The door strip and hood sills are also mahogany. The seats are luxuriously upholstered in full hides of hand buffed black leather, tufted over deep coil springs and fine quality genuine curled hair. The car will be made in three styles, touring car, roadster, and demi-tonneau. Price is $1,400, f.o.b. Detroit, including three oil lamps and horn.

Headquarters of the Taximotor Company, of Boston, in the Motor Mart, Park Square, and Its Equipment of Thomas Taxicabs.

HUB UNEXPECTEDLY IS CAPTURED BY THE SWIFT TAXICAB

BOSTON, Nov. 16.—"But Boston is so very different. You can't compare it with other cities, and particularly with New York. What would go down there wouldn't take with us at all, and people don't want taxicabs." So said the many wiseacres who thought they knew what the staid population of the Hub was hankering after in the shape of urban transportation, and they would have none of the new innovation. Mind you, these were the men who had been making a living out of Boston's needs for going to the theater, shopping, and the hundred and one other uses to which the cruising hack is put for time out of mind, but they could not see the taxicab at all. And that was only last July.

What has happened to their theories and their cocksure opinions about what the population of the country's center of culture in the few months intervening may best be illustrated by the photograph recently taken of the morning line-up for inspection at the headquarters of the Taximotor Company, which has extensive offices and shops on the Church street side of the Motor Mart. It shows no less than 40 of the handy little Thomas taxis, comprising the entire fleet attached to the Boston concern at present, but the number will not long remain at this figure if Manager W. P. Barnhart's appeals to the Buffalo factory for more have any effect, for by "more" Mr. Barnhart means 20 additional cabs, or an increase of 50 per cent. at a lick.

Old-time livery stable keepers may have thought that Boston's population did not want to thrust the equine and his two-wheeled chariot out of their affections in the unfeeling manner that has actually taken place, but the developments of the past quarter tell a very different tale indeed. And it is not the result of any change of heart on the part of these self-constituted authorities, but is due wholly to the push and hustle of the E. R. Thomas Company in showing the old-timers that the open season for competition between gasoline and horseflesh was on in earnest and that the people of Boston wanted taxicabs just as much as did the cab riders of other American cities, whether the men who had collections of worn-out two-wheelers and "chemical" four-legged motors that they were averse to relegating to the scrap heap and the farm, willed it or not. Persuasion and common sense business arguments availing nothing, the Thomas company gathered its forces and lit on the cab business of the Hub. It organized the Taximotor Company, which was duly incorporated with W. P. Barnhart as manager, and A. Z. Mitchell, of the Thomas home office, as treasurer and secretary, and opened up shop in the Motor Mart with a few cabs.

The start was actually made on July 18 last when 20 of the Thomas cabs first reached there and were put in service, so that Boston's appreciation of the improvement they represent over former methods of transportation may be readily gauged by their increase in the interim. But it has not been all plain sailing by any means—quite the contrary, in fact; so that much of the result accomplished in that very short space of time must be credited to the energy with which the problem has been attacked right from the start. As an example of the uphill nature of the task, the innovators found confronting them may be mentioned the obstructive tactics of the police, the commissioners being very much averse to granting licenses to the drivers *at all* at first, on the highly enlightened ground that the presence of these vehicles on the streets would have a tendency *to obstruct traffic* in the crowded portions of the city. And this from the omniscient center of thought! The italics are the writer's, but they fail to equal the occasion. Naturally, established interests in the same field did not hesitate to add the weight of their influence in retarding as much as possible the introduction of the motor-driven cab, but it was a foregone conclusion right from the very outset that the Bostonese were quite as much in a hurry to get there with increased comfort at the same expense for traveling as were the inhabitants of some less enlightened centers of population that might be mentioned.

But despite drawbacks of every nature, opposition, police discrimination, impossibly green drivers and the hundred and one kinks that have to be straightened out in the course of establishing any new innovation firmly on its feet, the taxicab has taken the Hub bodily. This is shown by the fact that the cars of the Thomas fleet make an average of $20 a day, and business is so good that many more could be put into service at the same remunerative rate.

INTERESTING KINKS IN FRANKLIN CONSTRUCTION

By CHARLES B. HAYWARD.

SYRACUSE, N. Y., Nov. 16.—Whether it be due to the fact that the average publicity man is not mechanically inclined, or, on the other hand, has more than enough to do with his own particular worries, certain it is that be seldom gets beneath the surface in sending out information regarding the cars his company is making. He tells the specifications of new models in stereotyped form, and expatiates on the improvements made in comparison with the particular form of design or construction that previously characterized the car, but he rarely tells what the car is made of, or how it is made, except by the trite phrases "Of the very best materials," and "By the highest skilled labor," which have accordingly come to mean about as much as the "Havana" cigar, and other incidents of daily life, the truth of which goes unquestioned merely through long asserted repetition.

Much to Be Seen in the Franklin Factory.

Thus it is that a tour of inspection through one of the large factories devoted to tbe manufacture of automobiles is a matter of considerable interest, and the home of the Franklin cars at Syracuse, owing to the numerous features whicb distinguish them, offers more than the usual reward as a compensation for the time spent. There are several matters of prime importance in the construction of any car that might well be made more of in publicity announcements, such as the thorough testing out to which the entire transmission of the Franklin cars—tbe gear-set, propeller shaft and rear-axle driving unit—are subjected to in connection witb a hydraulic brake, before being mounted on tbe chassis, but it is naturally the little things that strike the initiated eye more forcibly.

One of these is the practice adopted by Designer Wilkinson of sbrinking a steel band on tbe periphery of the flywheel, thus enabling a light wheel of large diameter to be employed with perfect safety in connection witb a high-speed motor. This in itself is a very small thing, but it forms a striking illustration of the painstaking attention to detail that is manifest in every part, beside being an indication of the fact that expense is not spared to attain lightness.

Probably notbing strikes tbe experienced visitor quite as strongly as the multitude of operations necessary to tbe completion of the Franklin wood frame, when compared with the small amount of bandling that the now practically universal pressed steel frame calls for before it becomes a component part of the car. And, unlike the latter, this handling begins long before the raw material reacbes the factory at all, for in order to be absolutely certain of its supplies the Franklin Company buys the timber standing and seasons the ash strips at its own plant. Ash has been selected as the most suitable material, not alone owing to its strengtb and lightness, but likewise for its great resiliency. Instead of using a single piece for the side members, flaws are absolutely guarded against by the laminated construction adopted, the pieces being glued and screwed together througbout their length while the joints are protected by facing strips top and bottom, and aluminum end pieces.

Franklin Frame Construction Speaks for Itself.

What the Franklin frame is capable of withstanding has probably never been more strikingly illustrated than was the case when it survived the shock of meeting a stone wall at 40 miles an hour on one of the record-breaking transcontinental trips, and its durability is even better vouched for by the report current among Syracuse garages that a greater number of pressed steel frames receive the kindly attentions of the Franklin repair department in the course of a single season than have ever been known to default in the case of the laminated ash frame during the entire period that this construction has been in use, which means since the Franklin has been on the market.

Franklin and air-cooling are inseparably associated and not a few of the interesting operations to be seen in no other plant of the kind bave to do with tbe motor. The latter, with its dome-shaped head and combustion chamber, concentric valves and auxiliary exbaust, is absolutely *sui generis* in the world of automobile motors, but its features are too well known to call for further description. An item of interest in connection with its construction is to be found in the manner of shrinking the stamped steel cooling fins on the cylinder castings, these light flanges being made too small to pass over the cylinder when cold. Tbey are expanded by immersion in a bath of tar or asphaltum, maintained at a temperature in excess of that reached by the motor in operation, and then readily slip over the casting. The arrangement of flanges on each cylinder varies according to its location on the crankcase, the first cylinder naturally requiring less cooling than any of the others; the second needing slightly more than the first, and the fourth more than any of the otbers, tbe amount of surface presented by the flanges reaching its maximum in the case of the latter, as the effects of convection are least in the case of this cylinder, owing to the fact that the air is already heated before reacbing it; this arrangement is similarly carried out on the six.

Die-cast main bearings constitute another feature of interest on the Franklin, particularly as the Franklin company was responsible for the development of this particular process and made use of it for otber commercial applications before undertaking tbe manufacture of automobiles. With its aid, bearings that do not vary a thousandth of an inch are obtainable, thus doing away with the laborious and costly hand-fitting necessary in assembling the ordinary poured bearing and making it possible for a Franklin owner to obtain an absolutely interchangeable duplicate of a bearing for his car at any time.

Resilient Wood Saves Many a Jar.

The underhung arrangement of the full elliptic springs is anotber Franklin feature that has been consistently adhered to and which accounts in large measure for the easy riding of the car, although the designer does not attribute this exceedingly desirable characteristic to the feature of suspension alone, for wbile it is essential to absorb as much of the shock as possible, and nothing is quite equal to tbe full elliptic spring in this respect, it is quite as important to deaden what does get past the springs, and for this purpose nothing is in the same class with a resilient piece of wood. As one of the Franklin engineers inquired, "Did you ever try to break a rock with a steel-handled sledge hammer?" Hence this added function of the wood frame which could hardly be more appropriately explained than by the foregoing query, as anyone who has ever tried the expedient mentioned has no desire to repeat it.

Whether it be in the macbine tool departments, the assembly floor, motor tcsting rooms, or the capacious body building shops, there are numerous operations, the manner of carrying out which is apt to hold the observant eye longer than necessary to give the casual glance and nod of assent to the guide's statement usually accorded the general run of routine work. And in noting that many things are done differently, when mental comparison is made of the results of more or less recent visits to other shops, with what is now passing in review, the conclusion is forced home that many things are likewise done better. As is the case with old established makers, the builders of the Franklin turn out a very large proportion of all the finished parts that enter into the construction of the car, and nothing is left undone to make each component as perfect as is possible with the best facilities obtainable for the work. The plant is several stories high and spreads over a considerable space of ground, an addition providing many thousand square feet of floor space having been just completed, this having been found necessary to handle the increased output.

Cross-Country the Aeroplane now Travels

By W. F. Bradley

Henry Farman En Route on His First Cross-country Aeroplane Trip.

PARIS, Nov. 10.—Flying has entered upon a new era, the era of journeys from town to town, and from point to point. It is Henry Farman, the first European to cover a circular kilometer, who has established a unique record by a flight from Châlons-sur-Marne to the old cathedral town of Rheims, separated by 17 miles, covered in 20 minutes.

Since returning from New York the Anglo-French aeronaut has not been seen much in the neighborhood of Paris. He had sworn never to fly again at Issy-les-Moulineaux, the ground on which he won the $10,000 prize last January for a kilometer flight, and had been busy searching for a more suitable training ground further afield. Châlons-sur-Marne, to the east of Paris, was selected, and it is here that several flights, none of them of very great importance, have been made during the past six weeks.

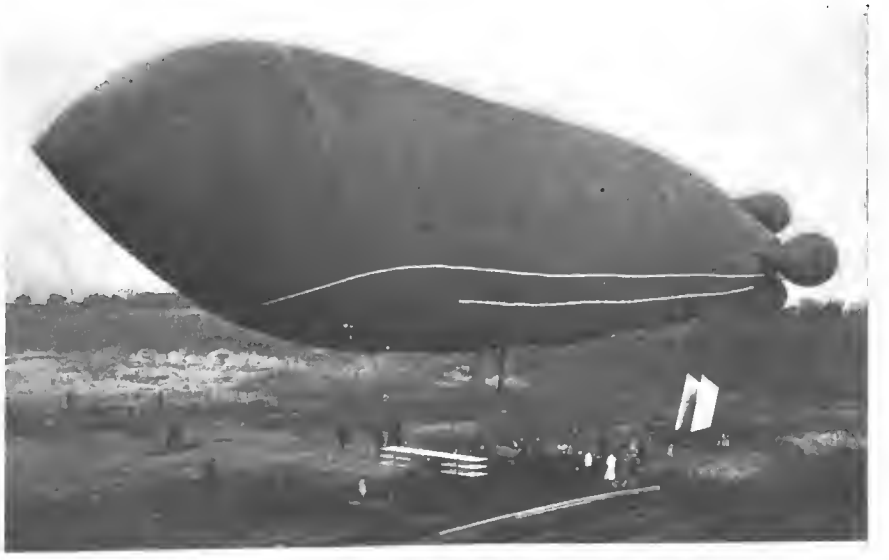
On a recent Saturday afternoon more careful preparation than usual was made, but although there was enough gasoline on board to make a flight of three hours, it was not generally known that the machine would pass out of the limits of the flat military ground. On the first swing of the propeller the engine started; a second later the assistants had released hold, and Farman and his aeroplane were soaring aloft to a height that appeared unnecessarily high. A few seconds' maneuvering, as if seeking his bearings, and the pilot was off in a straight line for Rheims, the cathedral of which could be clearly seen from the steering wheel of the artificial bird 200 feet above the ground.

"He's going across country," yelled the small crowd, and immediately there was a rush for the cranking handles of the automobiles, a banging of doors and a rattle of changing gears. The country being absolutely flat, it was possible to follow, watch the flying machine pass over the railroad, rise considerably higher, and fly over the small forest of the Grandes-Loges. The passage of the Marne Canal stopped the pursuing automobiles for a few seconds, and Farman disappeared from view. But a few minutes later he was seen again, now passing over the village of Petites-Loges, leaving the church steeples of Verzy and Verzenay on his right, now flying over Beaumont, now over the river, sailing above St. Leonard, and finally settling down near the Pommery wine establishment on the outskirts of Rheims.

"Yes, those first few minutes up aloft, with unlimited space before me, were rather exciting," declared Henry Farman when questioned about his flight. "Even before I had cleared the flat military ground the question cropped up, 'What will happen when I get above those tall poplar trees over there at Mourmelon?' A touch of the elevation rudder and the machine had risen still higher. Nevertheless, it was impossible not to feel anxious as I soared over the forest of waving green, and to ask again and again 'Am I high enough to clear?'

"You say that I was 250 feet high? Well, it is doubtless true, but I never realized it, for all the time I had the impression of being very near the tree tops. But when the forest was passed there was another difficulty in the mill and the village of Mourmelon. I watched the wind closely, for above these high trees there are eddies and currents which tend to draw you down, while over the open spaces there are air currents which cause you to rise higher. But the machine never faltered. It was a severe nervous strain, watching the wind and paying attention to the steering, while at the same time listening with all one's might for a 'miss' in the motor. But despite this it was the finest moment of my life to soar above my fellow men, to pass above the fussy railroad engine spitting out fire and smoke, to look down at the automobiles raising their cloud of dust on the white highway, to soar free and unfettered in the pure heavens."

The distance in a straight line from the Chalons camp to the outskirts of the city of Rheims is 17 miles, which, having been



Clement Dirigible Airship Containing Most Powerful Aerial Motor Yet Built.

covered in a fraction under 20 minutes, gives an average speed of ahout 51 miles an hour for Farman on his record trip. The rate of travel is faster than that generally maintained hy Wilbur Wright, but is slower than the average speed of Bleriot, the chief of the monoplane school. The comparison, however, is not altogether a fair one, for the monoplane is hy its nature a much faster type of machine than the hiplane as used by Farman, Wright and Delagrange.

Farman's first flight was made a little more than a year ago—Octoher 26, 1907—when he covered 770 meters at Issy-les-Moulineaux and won the Archdeacon cup. On January 13 of the present year he covered a kilometer in a closed circuit and became entitled to the Deutsch-Archdeacon prize. On March 21 he made a European record of 2,004 meters in 3 minutes 31 seconds. As the Wright brothers were not then generally helieved in, this was claimed as a world's record. The next important flight was on July 6, when Farman remained aloft 20 minutes 19 seconds, winning a prize of $2,000 offered by M. Armengaud for not less than 15 minutes in the air. Demonstrations in Belgium and near New York, none of which developed any remarkahle performances, occupied the rest of the summer, and it was only a few weeks ago that Farman settled down to serious work at Chalons.

Bleriot's Extended Flight Startles the Peasants at Work in the Fields.

Farman's winning of the height prize, which took place near Chalons 24 hours after the cross-country run, was a very tame affair. A line of balloons was stretched 82 feet from the ground, and the aeronaut told to fly over it. On the first attempt Farman cleared with 10 or 12 feet to spare, settled down to the cheers of the crowd and was the possessor of a cash prize of $500.

Bleriot Next Made Cross-Country Flight.

PARIS, Nov. 11.—Right on the heels—or should it he the wings?—of Farman, Louis Bleriot has attempted and accomplished a cross-country journey. Bleriot's flight loses much of its éclat by reason of it heing attempted 24 hours after that of Farman, and also because two stops were necessary hefore the trip was finished. Bleriot, who had been training on the B[illegible]uce Plains for several days, principally with a view to winning the height prize, resolved, when he heard of Farman's record. to do something equally as good. His machine was smashed, for during the afternoon he had attempted a flight with the guide ropes of the elevation rudder crossed, with the consequence that when he wanted to come down he went up, and when he wanted to rise he descended. At one moment the monoplane stood almost on end, and when the pilot finally realized what had happened be came down with such a run that a few of the rihs of his machine were broken. Mechanics worked all night fixing things up, and next day all seemed favorahle for a free soar.

Bleriot mapped out his course; from his field at Toury, near Chartres, he was to reach Artenay, swing round some captive balloons placed there to guide him, and regain his starting point, making a total distance of 20 miles. The outward journey was made without difficulty, but at such a high speed—the estimate is 65 miles an hour—that the pursuing automohiles were left behind, and for a short time the aeroplane was completely lost to view. When found, Bleriot was in a field, verifying his magneto, which had suddenly developed symptoms of irregularity. An hour and a half later all was right again, and without any outside help the flying machine rose into the air and continued its interrupted trip. Before the starting point was reached again there was another stop, of a few seconds only, in order to verify the working of the engine. Again Bleriot was able to get away without outside help, and at 5 o'clock fluttered down at the door of his shed, so satisfied with his first free trip that he declared he would never again be content to circle round and round a field.

The two cross-country flights, one with a biplane, the other with a monoplane type of machine, have sent France delirious with joy. Though Farman owes allegiance to the British crown, he has lived so long in France that he is claimed as a native, and the two performances are looked upon as a national victory which will lower the prestige of Wilbur Wright. The natives have hegun to take courage and to remark that after all they are as good flyers as the American. More thoughtful followers of the sport point out that if Wright is not willing to hreak away from his regular routine at Le Mans he runs the risk of finding himself deserted in the middle of France, for there is much more interest in a free flight across country than in the most wonderful work over a chosen ground. Douhtless Wilhur Wirght will not he sorry if this does happen, for he has never sought crowds.

Over $221,000 Offered in Aeronautic Prizes.

PARIS, Nov. 12.—Over $221,000 in cash prizes is offered by various European bodies for competition among pilots of flying machines of the heavier-than-air type. The list is headed by the $50,000 prize of the *Daily Mail* for a flight from London to Manchester, a journey that is not likely to he attempted during the ncxt twelve months. Michelin's annual prize of $4,000 will he awarded to Wilhur Wright at the end of this year, if the present long distance record is not heaten in the meantime. The flight from Paris to Clermont Ferrand, also proposed by the tire manufacturer, is not likely to be attempted during 1909. The Grand Prix of the Aero Cluh of France and the $20,000 offered by the Monaco Sporting Cluh will hoth be won before the cnd of the coming year.

The sum of $2,500 will doubtless be won during the next six months hy a flight over the 20 miles of water separating France from England, and a further sum of $5,000 awaits the first pilot to carry Commandant Renard across the English Channel on either an aeroplane or a dirigihle halloon. There are $2,400 for the aeroplanist who will risk a flight across the city of Paris.

Finally Came Presentation of the

AT one stage of the proceedings attendant upon the final festivities in connection with the Vanderbilt Cup race of 1908, the famous artistic silver trophy shared the same reposing table with the plutocratic gold cup of the 1908 Grand Prize race at Savannah, scheduled for Thanksgiving Day.

The incident came last Thursday night at the West Fifty-fourth street home of the Automobile Club of America, to which came a thousand and a few more to see the formal presentation of the Vanderbilt Cup to the proper officials of the Locomobile Company of America and to honor the maker and the designer, and the driver and his mechanic. The invitations were issued by the Cup Commission in behalf of the Locomobile Company, which was the host of the occasion.

The function being in the A. C. A. clubhouse, it was an expected courtesy that President E. H. Gary should be the first speaker introduced by Russell A. Field, who pleasingly filled the post of master of ceremonies. Judge Gary congratulated the Cup Commission on the conduct of the race, the maker and designer upon the production of the winning car, and the driver and mechanic who were so instrumental in securing victory. "Give Americans a little longer to prepare, and they will always occupy first place," said President Gary.

William McAdoo, a former police commissioner of New York City, was the succeeding speaker, and he supplied some excellent advice, which told the autoist that when the road was clear he could utilize his speed, but recklessness should be curbed and the rights of other highway users should be recognized.

Then came the presentation of the cup by Jefferson deMont Thompson, chairman of the Cup Commission, who formally turned the trophy over to S. T. Davis, Jr., president of the Locomobile Company. Among other things he said:

"This in an American year. We have won the athletic championship of the world, and we have won the classic trophy, to capture which in years gone by France, Germany, and Italy have spent a million dollars. It has at last fallen to the lot of an American manufacturer, an American designer, and a driver with American blood in his veins to win it."

In accepting the trophy S. T. Davis, Jr., said that the winning of the cup had been the crowning achievement of three years of effort. The offering of the cup was due to the patriotism of William K. Vanderbilt, Jr., and his rules were responsible for the fine material and workmanship required of cup aspirants. Mr. Davis outlined the efforts of his company to win the cup, and gave all the credit to Mr. Riker.

There were loud calls for Designer Riker, who modestly declared that he had had little to do with the success of the car, which was due to the material and the skill of the workmen.

Winthrop E. Scarritt, a former president of the A. C. A. and also of the A. A. A., supplied one of his ebullient orations.

George Robertson, the pilot of the winning car, was a retiring hero, and accompanying him was John J. Hayes, winner of the Olympic Marathon race, the two 1908 international winners receiving the heartiest of receptions.

A. R. Pardington, the man responsible for prevailing upon Mr. Vanderbilt to offer the cup, told of the difficulties of the first races. Mr. Pardington declared that the parkway will be so far completed next year that both the Vanderbilt and Grand Prize races can be run over it exclusively.

Moving pictures of automobile events here and abroad were followed by a supper and a general jollification. Of course, there was racing talk and ideas of all kinds.

Among the notables in the throng were the following: J. A. Kingman, Joseph Tracy, Percy Owen, S. A. Miles, H. M. Swetland, Alfred Reeves, C. R. Mabley, Harry Fosdick, L. R. Perlman, W. D. Gash, Frank Eveland, Charles E. Miller, Alexander Dow, Peter Fogarty, A. W. Church, Harry Miller, Joseph Jones, Dr. J. N. Lanehart, chief surgeon of the race; Major C. J. Crowley, of the Irish Brigade; H. F. Donaldson, Rene Petard, J. J. Lannin, of the Garden City Hotel; H. F. Mollenhauer, J. J. Mann, of Paris; F. E. Moscovics, J. J. Woodward.

Popular Type of Garage with Well-Lighted Floors.

Minneapolis, Minn.—Deals have been closed for property on Hennepin avenue on which two of the largest garages in the country will be erected. The Maxwell-Briscoe company has plans under way to erect at Hennepin avenue and Ninth street a two-story building with basement fitted out in the most complete manner. Last week the Pence Automobile Company purchased the corner property at Hennepin and Eighth street. Work will be commenced at once on a six-story building with basement in which they propose to have facilities for doing all kinds of repair work. The building will have a heating and lighting plant in the basement, where power will also be generated for use in the shops.

Madison, Wis.—The Hokanson Automobile Company have started work on their new $12,000 garage, which they hope will be ready for occupancy by December 1. The structure will have a ground floor 77 feet by 132 feet, in the rear a second story for the repair shop 38x77 feet. There will be an elevator in the building and the basement will be fitted up as a heating plant. The entire work is of steel construction, doing away with all posts, so as to give the greatest amount of floor space possible; in fact, they claim that the building will give them a greater amount of space than any garage in Wisconsin.

Fond du Lac, Wis.—A stock company has been formed by a number of the business men of Fond Du Lac, Wis., which has taken over the automobile garage and salesrooms formerly controlled by G. W. Worthing, and will immediately start work on plans for a new building designed for automobile sales rooms, repair and garage facilities. Mayor E. W. Clark is one of the prominent men in the concern, and with the aid of G. W. Worthing, who has been retained as manager, the arrangements will be rushed as fast as possible. The agency for the Jackson car has already been secured.

Salt Lake City, Utah.—Work has started on the new garage and salesrooms for the Tom Botterill Company of Salt Lake City, which when finished will be one of the finest structures of the kind in that vicinity. The building is to be of the Spanish mission style throughout, having a frontage of 67 feet and depth of 170, with full cement basement. Although the present plans only call for one story, the arrangements of the roof and walls are such that other stories may be added later if necessary.

Westcott Garage Company.—The garage and automobile business formerly conducted by Chas. H. Childs & Co., in Utica, has been purchased by the Westcott Garage Company. This new firm, which has just been incorporated with Addison Westcott as president and William B. Westcott as secretary and treasurer, are making numerous improvements in the building that they may be in better shape to handle the increased business and to make it more convenient for their customers.

Asheville, N. C.—The increasing popularity of the automobile has caused the organization of a new concern to be known as the Western Carolina Automobile Company, which will be located at 61 South Main street. The agency for the Cadillac has been secured covering seventeen counties in this section of the State. Provision is being made for a first-class repair department with competent workmen.

Philadelphia, Pa.—It is said that a five-story public garage is to be erected at a cost of $500,000 on the corner of Broad and Fitzwater streets, which is to be directed by the Philadelphia Auto Company. Besides the thoroughly modern repair shop in the building, there will be 287 rooms, each large enough for two machines, which will be rented at $25 and $20 per month.

Washington, D. C.—The Auto Livery Company, which has built up such a prosperous business in Washington is putting up a new garage to accommodate 75 machines and 60 chauffeurs. Washington with its many visitors is essentially a place for the successful operation of an efficient taxicab service which this company has done its best to supply.

Chattanooga, Tenn.—George Reif and S. F. Webb have opened a garage at 10 West Sixth street and will do a renting, storage and repair business. They intend to take the agency for a well-known machine within a short time and will then move to Chestnut street.

Harrisburg, Pa.—Work is now in progress on the remodeling of the quarters of the Motor Vehicle Company, on Mulberry street. The new salesrooms will be 50 x 100 feet, with a large repair shop in the rear. The company will handle only Jackson cars.

Findlay, O.—Preparations are under way for one of the finest garages in the State outside of the larger cities. The C. F. Jackson Company has procured a lease in the Corwin block and will start immediately putting it in shape for garage purposes.

Little Rock, Ark.—W. L. Tedford is making arrangements for erecting a two-story brick garage of approximately 50 by 140 feet. Besides taking the agency for a number of cars, facilities will be provided for repairs and storage.

Brooklyn, N. Y.—The Grand Avenue Garage has just been incorporated in Brooklyn with a capital of $10,000 by F. H. Knauss and E. V. Slauson, of this city, and C. L. Beare, of New York City.

Minneapolis, Minn.—Plans are being made for a garage to be built at 1900 Lyndale avenue for M. H. Davin. It is to be a two-story brick structure, 100x135 feet, and will cost $12,000.

Kansas City, Mo.—The Kansas City Taxicab Company has approved plans for a three-story garage to cost $50,000.

A Leading Garage in the City of Mexico.

DIRECTOR PAGE ON THE FRENCH ROADS CONGRESS

WASHINGTON, D. C., Nov. 16.—Upon his return from the International Good Roads Congress in France, which he attended as chairman of the American delegation, Logan Waller Page, director of the Office of Public Roads, Department of Agriculture, gave THE AUTOMOBILE correspondent the following interview regarding the work of the congress:

"Inasmuch as there were three official languages at the congress—French, German, and English—it was impossible to make it much of a deliberative body. It was possible, however, for a general exchange of views on many matters pertaining to roads, and we were given the opportunity to inspect some of the great continental roads, and the methods of maintain them.

"The international bureau of roads, which was one of the things accomplished by the conference, and which was suggested by me, will have two or more representatives from each nation, and is patterned after the international bureau of navigation. The various members of the bureau will gather all the information regarding roads in their respective countries that may be of value, and submit it to the bureau. It will be gone over by experts, after which the information will be published and scattered all over the world."

Mr. Page had the satisfaction of seeing pass a resolution which he introduced, favoring the erection of a suitable memorial to the great French highway engineer, Tressauget. Tressauget preceded Telford and Macadam by 40 years, and in reality designed the broken stone road which is known as the Telford road. It was at his suggestion that the great system of what is called "continuous repair" road were established in France, and is still maintained. Under it a man, known as a cantonier, has charge of a certain section of the road, about five miles, and he goes over every foot of this daily, smoothing out irregularities, keeping the side drains clean, and trimming the trees and shrubbery.

"The reason French roads are so much better than other roads, and this a point that I wish Americans generally might realize," continued Mr. Page, "is that they are better kept up. The point to good roads is not so much their construction as their maintenance after they have been built. So far as road construction is concerned no country to-day has better or more economical roads than the United States, but in the maintenance of them we do nothing. We build a road, then let it go to pieces, and then build it over again. While there is considerable agitation for good roads in this country, there is little organized effort for them yet, although the automobilists are doing a great work in awakening general interest in road improvement. The best roads are in the 'State-aid' States; that is to say, States which have a road maintaining fund, but there still remains much to be done in the way of interesting State legislators in the improvement and maintenance of public highways."

N. A. A. M. SECURES FREIGHT CONCESSIONS.

Announcement is made by S. A. Miles, general manager of the National Association of Automobile Manufacturers, that its traffic department has again been successful in obtaining concessions of great importance to all the members of the N. A. A. M., the A. L. A. M., and the A. M. C. M. At a meeting of the Southern Classification Committee, held at Cincinnati last week, at which the associations named were represented by Mr. Marvin, manager of the N. A. A. M. traffic department, important changes were made in the Southern Classification. The Southern classification governs rates in the Southern States south of the Ohio and east of the Mississippi Rivers. It also, in certain instances, governs the through rates to points in the South from points in Central Freight Association territory (lying between Buffalo and Chicago), and rates from points east of Buffalo on shipments routed via Southern Dispatch lines.

AUTOMOBILE ENGINEERS MEET IN JANUARY.

In accordance with its custom the Society of Automobile Engineers will hold its fourth annual meeting In New York City during the course of the shows, and in order that members in New York for the purpose of attending either one of these functions may have an opportunity of being present, a dual date has been decided upon. The first sessions will be held Tuesday, January 5, adjourning to Tuesday, January 19, the first date falling in the week of the show to be held in the Palace under the auspices of the A.M.C.M.A. and the second during the week of the licensed show at the Garden.

In addition to an interesting list of technical papers the annual election for officers will be held, and it is anticipated that there will be an excellent number of the members in attendance. Further details of the places of meeting and the remainder of the program will be made public as soon as decided upon.

A. L. A. M. ANALYZES THE ENGLISH TIRE TESTS

CONSIDERABLE interest has been aroused by the reports of the tire slippage tests made on the Brooklands track in England by S. F. Edge, and Henry Souther, consulting expert of the Mechanical Branch of the Licensed Association, has made an analysis of the figures as published, which adds to their value. An instrument especially designed for the purpose made it possible to accurately record the number of revolutions of each of the wheels independently and for identically the same period of time, the tests thus giving the turns of each wheel separately.

The chief result determined was that the revolutions of the rear wheels were greater than the revolutions of the front wheels. That is, the driving-wheels would slip. Not content with tbe mere fact that they slipped, and that the slippage was greater with greater speed, Mr. Souther prepared from the data obtained in those tests a curve, which shows graphically what may be assumed as a fair average.

While the results as published simply indicate the number of revolutions that the rear wheels exceed the front wheels in the particular tests and with that particular machine, the data does not give the size of the wheels or the size of the tires or the length of the course. Without consideration of the other details that are involved, the results obtained by Mr. Souther's analyses indicate the percentage of tire slips.

From these results we have now added to our knowledge of automobile operation, the fact that on a level racing track of the best sort, with plain round tread tires inflated as is usual for racing, the percentage of slip of the rear wheels is about

0.3	for a speed of	40	miles	per	hour
0.6	" "	50	"	"	
1.1	" "	60	"	"	
1.8	" "	70	"	"	
3.7	" "	80	"	"	
5.4	" "	90	"	"	

In addition it appears that the driving-wheel on the inside, running around a curved track, slips a very little more than the outer wheel. This is clearly accounted for by the fact that the centrifugal force going around curves reduces the weight on the inner wheel, permitting it to slip more readily than the outer.

THE WAY OF THE POLITICIAN.

There is a State Senator in New Jersey—the automobile law of which commonwealth it should be here remembered finds general disfavor from owners of motor-driven vehicles—and this legislator professes belief in various kinds of reforms, though his "new ideas" do not include any betterment in autoing conditions.

Crediting this supposedly astute politician with wisdom apparently beyond his years, the autoists asked him how they could better their lot and obtain amendments to a law which is unnecessarily severe on owners, injurious to the industry, and sadly detrimental to the State itself. In words that could not be mistaken the reform servant of the people advised the autoists to organize and go into politics. This advice was not disregarded.

And now for the sequel.

Among the candidates for a winter job at the State capital was this Senator, and he, among others, was asked how he stood on such relevant questions as lights at night for all vehicles, an increase in the speed limit for the open country, a tourist privilege in the matter of registration, and a curb on the indiscriminating activities of rural justices. The reform Senator didn't say much for the things which the autoists wanted and to which they thought—and still think—they were entitled.

A circular letter then found its way to the autoists and their friends in the district which the Senator has quite ably represented in the past. By a margin somewhat meager the reformer missed being a senator again this winter, and the awful charge is made that the autoists contributed in the distressing result.

Alarmed at the power which their stronger-hearted brethren have shown, a few weaklings from the ranks of the autoists are talking of "disciplining" the fighters for what they have accomplished, expressing fear that there will be harmful effects in the legislating that may be done at Trenton. Any such attitude is humiliating, as well as cowardly, and nothing will ever be gained by weak-kneed tactics at this late day. The New Jersey autoists have asked nothing unreasonable—in fact, they have been quite modest in their requests—and it is a thousand times better to be soundly trounced when your cause is a just one rather than to submit tamely to a continuation of injustice, which will be transparent to all in the course of time. The Jersey autoists are on the right track, and if they will firmly and consistently follow out their course as outlined, the final summing up will be substantially acceptable and gratifying.

* * *

INFINITESIMAL LEAKS FOOT UP.

Were all the water that sweats from the pores of a glacier and tumbles down the steep declivities to land in a tight-bottomed river, the trace of the river on the landscape would be erased and a lake would be there to tell the tale. The lake of broad expanse is but a defeated theory rendered impotent, merely because the river bed lacks homogeneity. The water seeps to lower levels and inefficiency holds sway.

It is so in other walks; in the automobile, for illustration, and to like extent, from the thermal point of view at any rate. Under far more favorable conditions than can be found in the average automobile, full 80 per cent. of the fuel goes to produce carbonic acid and water for the most part.

Likewise in the mechanism losses abound at every point of surface contact. Every squeak and each vibration is at the expense of the motive power. The very tires, that so effectually "swallow" the road inequalities, exact toll for labor performed, and the flywheel, that serves as a saving bank for the energy, exacts a banker's tribute, and a usurer's interest betimes.

Last, but not least, the muffler that cans the noise salts it with energy at the expense of the motor's power, and so it seems the little leaks and the trifling extravagances foot up to a grand total of over 90 per cent. of the thermal value of the fuel. It is the extravagance of nature conspiring with the egotism of man that renders this statement possible, and yet the automobile is a commercial success and pleasurable to contemplate. On the other hand, while practical men busy themselves in pursuits the returns on which are a scanty per cent., there is work to do for the conjurer who can cast a spell on nature and weave a web that will imprison the major portion, or, the share that intelligence should exact.

The cocksure featherweight who prates about establishing standards, hoping thereby to nail progress to a spot on earth no greater than the indentation made by a gnat's heel, wobbles about within the confines of the box called opportunity in a manner befitting the nature of his stunted perception and obtuse ways.

A. L. A. M. MEETS AND RE-ELECTS CLIFTON TO PRESIDENCY

AT its annual meeting for 1908, which was held at tbe association headquarters, No. 7 East Forty-second street, New 'ork, the board of managers of the Association of Licensed ıutomobile Manufacturers re-elected Colonel Charles C. Clifton, f the George N. Pierce Company, president for the ensuing ear. Thomas Henderson, of the Winton Motor Carriage Comany, was chosen vice-president; L. H. Kittredge, Peerless Motor ar Company, secretary, and Colonel George Pope, of tbe Pope anufacturing Company, treasurer. The executive committee or the coming year is as follows: Charles Clifton (Pierce), . T. Davis, Jr. (Locomobile), Thomas Henderson (Winton), . H. Stilwell (Franklin), and Herbert Lloyd (Electric Vehicle). S. D. Waldon, of the Packard Motor Car Company, was ppointed the A. L. A. M. representative on the Good Roads Cenal Committee.

The routine business of the meeting consisted of the reading f the reports of the various committees, that on the management nd which also treated of the present policies and work of the ssociation, being read by E. P. Chalfant, the assistant general ıanager.

Colonel George Pope, chairman of the sbow committee, reorted that the work of preparing for the ninth annual show) be held in the Garden under tbe auspices of the association 'as well advanced and that the show would surpass its predeessors considerably in both size and effect. The show comittee also granted an audience to representatives of the Motorycle Manufacturers' Association to consider the request of the ıembers of the latter for additional space at the Garden.

L. H. Kittredge, chairman of the handbook committee, reported that the sixth edition of tbe association's annual catalogue, officially known as the A. L. A. M. Handbook, would be issued shortly and contain matters of special interest.

The meeting, whicb was held Tuesday, November 10, was the largest ever assembled of the board of managers of the association, the following being in attendance: Elmer Apperson, Apperson Bros. Automobile Company; J. S. Clarke, Autocar Company; W. C. Durant, A. H. Goss, and C. R. Hatheway, Buick Motor Company; W. C. Leland, Cadillac Motor Car Company; Hugh Chalmers, and R. D. Chapin, Calmers-Detroit Motor Company; M. S. Hart, Corbin Motor Vehicle Corporation; Wm. E. Metzger, Everitt-Metzger-Flanders Company; H. W. Nuckols, and Herbert Lloyd, Electric Vehicle Company; J. H. Becker, Elmore Manufacturing Company; H. H. Franklin, and G. H. Stilwell, H. H. Franklin Manufacturing Company; E. W. Heading ton, Haynes Automobile Company; E. R. Hewitt, Hewitt Motor Company; A. N. Mayo, Knox Automobile Company; S. T. Davis, Junior Locomobile Company of America; Samuel Regar, Lozier Motor Company; C. W. Matheson, Matheson Motor Car Company; H. B. Joy, and M. J. Budlong, Packard Motor Car Company; L. H. Kittredge, Peerless Motor Car Company; Charles Clifton, George N. Pierce Company; Colonel George Pope, Pope Manufacturing Company; A. L. Pope, Pope Motor Car Company; G. E. Mitchell, Alden Sampson Manufacturing Company; F. B. Stearns, F. B. Stearns Company; A. H. Ackerman, Studebaker Automobile Company; E. R. Thomas, E. R. Thomas Motor Company; E. S. Church, Waltham Manufacturing Company; Thomas Henderson, Winton Motor Carriage Company.

MAN UNNAMED WILL SELECT CARS FOR PRESIDENT-ELECT

WASHINGTON, D. C., Nov. 14.—More than passing interest attaches to the official announcement made to-day that ter March 4 the automobile will be the official vehicle at the hite House. As is well know, President-elect Taft, unlike esident Roosevelt, is fond of riding in an automobile, on count of the ease with which it can be made ready and the ed with which it can take him anywhere he pleases to go.

An officer of the War Department, whose name is kept secret til certain plans can be formulated, and who is said to be authority on automobiles, has been detailed to select two s for Mr. Taft and his family for delivery after March 4, ment for same to be made from the public treasury. The sident-elect has not signified his preference for any parlar make of car, and the officer commissioned will inform omobile manufacturers of the general type of car wanted and they can make bids for furnishing two of them. The competition promises to be very lively, as this is the first time on record that an automobile will be used by a President of the United States, to the exclusion of the horse-drawn vehicles used by all his predecessors, and it will not only give the manufacturer who is lucky enough to be chosen considerable prestige, but will likewise give a big boost to tbe automobile industry.

While President Roosevelt has occasionally used automobiles, particularly during the summer seasons spent at Oyster Bay, he has consistently refrained from purchasing one for the White House stables. To-day, in company with Mrs. Roosevelt, he made a trip in a White steamer belonging to the War Department to Alexandria, Va., to witness some school games in which his youngest son competed.

FRENCH MAKERS ASKING IF SALON IS NECESSARY

ARIS, Nov. 12.—After holding an automobile show for 11 successive years, and making it the most attractive of all ublic exhibitions held in France, constructors are beginning ık themselves if after all it is worth while. At the present ent a circular is going through trade circles against the holdof any show in 1909. Those having signed it comprise a proportion of the leading firms—firms producing more 100 cars per year. The curious feature of the anti-show is that the firms popularly supposed to be at the head of use to acknowledge any connection with the circular, and those having signed, when questioned on the matter, assume iplete ignorance that is mystifying.

re appears to be a certain objection to continuing the show on the ground that it is too costly, and that the automobile industry has now settled down to the same position as any other trade, and has no need of special demonstrations. Few, however, are willing to state these views openly. "If the other firms do not want a show, we can very well do without it," is the general view. In official quarters the possibility of the eleventh show being the last is laughed at. "If the Salon were stopped money grabbers would step in and hold small exhibitions at which dealers would exhibit, if the factories would not. The individual cost of the Salon is so low that to abandon it would be folly." Meanwhile exhibitors are looking at the electric light, decoratinon, and wage bills, and wondering if it is wortb wbile to go to all the trouble and expense.

DETROIT WILL HAVE TWO SHOWS.

DETROIT, Nov. 16.—Whether Detroit can support two automobile shows a year is to be given a practical demonstration this Winter, according to present plans. Last Winter the Detroit Automobile Dealers' Association decided to branch out for itself, and hold a show in which the score or more of retailers both be given a voice in the management and a share in the dividends. They got both. It was freely predicted at the time that this foreshadowed the passing of the Tri-State Automobile & Sportsmen's Association, which had given six shows up to that time, being one of the pioneers. The association followed later with a show that left the promoters in a happy frame of mind.

Now the Detroit Automobile Dealers' Association is preparing to repeat last year's success, the show which will follow the one in Chicago to be given at the Wayne pavilion. The Tri-State Automobile Dealers' Association, far from being a dead one, has engaged Light Guard Armory for the last week in January, following the New York shows and preceding the one at Chicago, and will endeavor to show the Dealers' Association what a real automobile show is like. Manager McMasters is busy with the details for the Tri-State show, and expresses himself as well pleased with the outlook.

BRITISH SHOW OPENS THE SEASON.

LONDON, Nov. 13.—The seventh annual exhibition of the Society of Motor Manufacturers & Traders has opened its doors. As far as can be judged from present indication, the most interesting class will be that of the small four-cylinder car, in which the British maker has for some years been specializing. The trend of late has been in the direction of greater economy of maintenance, and the small car promises overmuch in this direction.

One of the special features will be the new "Silent Daimler" car, built under the patents of Knight, late of Chicago. Cars of similar type will be staged by the Minerva Company, who hold the Belgian license, and by the Panhard firm, but the production of the Mercedes concern, which is officially stated to have acquired the German rights, will not be ready till the date of the Paris show.

The exhibition of racing cars was expressly forbidden, and a second innovation, more indicative of common sense than the first, is the barring of all syren noise and horn blowing.

The show will remain open till Saturday, November 21.

PHILADELPHIA'S SHOW, JAN. 27 TO FEB. 3.

PHILADELPHIA, Nov. 16.—Necessity for a larger floor space than that afforded by the First Regiment Armory will necessitate the holding of next January's automobile show uptown, in the Second Regiment Armory, Broad and Susquehanna avenue. The change in location necessitates a change of date also, the Second's armory being engaged for the early part of the week originally decided upon by the show committee. The announcement was, therefore, made last week that the show would open on Wednesday, January 27, and continue till February 3, inclusive. J. H. Beck, whose work at several former shows made their success possible, has been secured as manager. He has opened offices at Room 216, Odd Fellows' Building, Broad and Cherry streets, in the heart of the automobile district.

CLEVELAND TRADE TO RUN ITS OWN SHOW.

CLEVELAND, Nov. 16.—At the annual meeting of the Cleveland Automobile Dealers' Company, held last Friday evening at the Cleveland Automobile Club, a show committee was authorized by the organization to conduct the next Cleveland automobile show. This is quite a departure from the method followed in former years, which has been that of engaging a manager. This committee consists of Hobart M. Adams, Clarence M. Brockway, and W. D. Price, who will have in charge the entire detail and the entire management of the 1909 Cleveland automobile show, to be held February 15 to 20, inclusive.

Brennan Construction, Harrall 1,200 Pounds Commercial Car.

THE HARRALL COMMERCIAL CARS

The Brennan Manufacturing Company, of Syracuse, N. Y., has recently completed a commercial car of 1,200 pounds capacity for the Harrall Buggy Company, of South Boston, Va., the details of which are of more than passing merit.

Take the chassis into account. A channel section steel 3x3½ inches of depth and flange, respectively. The width is 42 inches and the platform length is 118 inches. Allowing for the machinery and the driver's seat, the platform area is 42x72 inches. The chassis is suspended on semi-elliptical springs, perched on 1½ inches square front and rear axles. The front wheels are 39 inches in diameter, fitted with 3½-inch twin solid rubber tire. The rear wheels are 43 inches in diameter, fitted with 3¾-inch twin solid rubber tires. The steering gear is irreversible, of substantial design and accurate construction, and the linkages are straight line with liberal bearings, provided with means for oiling.

Model 7 has a power plant, two-cylinder opposed, 5 inches bore and stroke, respectively, water cooled, and rated by the makers at 16 to 18 horsepower. The motor connects with a planetary transmission, thence to a jackshaft and side chain drive. As usual with planetary gears, the high speed is direct drive and one low speed is provided in addition to the reverse The ignition is by means of jump spark and suitable battery.

Rapid Combination Chemical Fire Fighter.

Hutchineon, Kan., hae succumhed to the march of progress and has adopted the combination chemical car manufactured by the Rapid Motor Vehicle Company, of Pontiac, Mich. The chief of the Hutchinson fire department has rendered a very favorable report on the new machine.

LATE FALL ACTIVITIES OF THE AUTO CLUBS

"TRAPPING" RECEIVES SEVERE BODY BLOW.

PHILADELPHIA, Nov. 16.—A Philadelphian, with the able assistance of Barrister Edwin S. Nyce, ex-secretary of the Norristown Automobile Club, dealt a blow at the "trap" habit last week, from which it cannot recover for many moons, if at all. Automobilists generally have long but vainly insisted that the mere fact of a numbered tag being attached to a car which had exceeded the speed limit, did not necessarily imply that the owner was in the machine at the time. Magistrates throughout the State have taken it for granted, and have "soaked" the buyer of the tag accordingly. This question came up in the case of Charles W. Bacon, a Quaker City real estate operator, whose car was "piped off" by a trapper, and who was later ordered to appear and pony up.

But Bacon is a scrapper, and so is Nyce, whom he retained to fight the case, which came up in the Montgomery county court last week. Judge Weand was on the bench. His Honor, after hearing the facts, threw a bombshell into the trappers' ranks by handing down an opinion in which he sets forth that there was nothing in the pleadings to connect the defendant with the automobile in question, or with the act of violating the law, nor did it appear that the defendant was the owner of the car or was in it at the time. To sustain the conviction, it would be necessary to hold, without evidence, that the defendant was the owner of the machine and the occupant of it at the time. The proceedings are otherwise irregular, concludes Judge Weand, "in that the justice, after fining the defendant, required him to give bail for his appearance."

Henceforth, unless the Lower Providence township justice carries the case higher—which he will hardly do, in face of the rebuke administered to him by Judge Weand for collaring a fine and then compelling his victim to furnish bail—it will be impossible for every Thomas, Richard, and Henry who holds a justice's commission to issue summonses right and left after every clear Sunday, on the mere say-so of a trap artist who benefits financially in proportion to the number of victims he can corral. It does look as if it would be a lean Christmas up Lower Providence way.

MARYLANDERS WILL HAVE THEIR FIRST CLIMB.

BALTIMORE, MD., Nov. 16.—For the first time in its history the Automobile Club of Maryland, November 21, will conduct a hill climb. The contest will be under the rules and sanction of the A. A. A. racing board. The events have been divided as follows:

Class A—Cars selling for $850 and under.
Class B—Cars selling for $851 to $1,250.
Class C—Cars selling for $1,251 to $2,000.
Class D—Cars selling for $2,001 to $3,000.
Clase E—Cars selling for $3,001 to $4,000.
Class F—Cars selling for $4,001 and over.
Class G—Cars driven by amateur drivers only, $3,000 and under.
Class H—Care driven by amateur drivers only, $3,001 and over.
Class K—Free-for-all.

Owners who drive their cars for pleasure are the only ones eligible to participate in Classes G and H. The start in each of the events will be a flying one. The climb will be held on the Belvedere avenue hill, from Falls road to Roland avenue. A special electric timing apparatus will be used.

The club has decided to send circular letters to all car owners in Maryling enlisting them in the fight against the proposed special tax which Governor Crothers and the Maryland Automobile Commission desire to impose on autoists. The letters will also urge these owners to become members of the club.

The club members have gone on record as opposed to long tours. This action on their part was brought about by the reading of the report of the touring committee. The majority of the members are in favor of runs with time for a good dinner.

COL. JOYCE BOOMS MINNESOTA ASSOCIATION.

MINNEAPOLIS, Nov. 16.—No organization in the entire A. A. A. fold is making greater or more rapid strides in membership than the Minneapolis State Automobile Association. To Col. Frank M. Joyce, president of the association, is due a major part of the credit. Thanks to his hustling recruiting methods thirteen new clubs have been organized with a total membership of 1,800. Col. Joyce is confident that by the first of the year he will have raised the total to twenty clubs.

Under the inspiration of Col. Joyce's success in the State at large, the members of the Minneapolis Club are making strenuous endeavors to increase the club's membership during the winter months, so that by the opening of the touring season it will reach the 1,500 mark.

Local autoists are much interested in the new hill which is being framed for presentation at the next session of the Legislature. This bill will provide for State registration handled through one set of officials, so that it will be possible to obtain positive identification of any car in the State. It is also planned to have owners pay a State license tax, in lieu of a personal tax on their machines. This license tax would be figured on the horsepower of size and weight of the car. It is proposed to use the money derived in this way in good roads work, it being the idea of tbose framing the bill that such an act would meet with strong approval among the farmers and their representatives in the Legislature. It will be provided in the bill that no registration numbers shall be issued until the State license tax has been paid, and this will mean that 100 per cent. of the owners of automobiles will contribute to the funds of the State. As it is now it is said that of 5,000 machines in the State, about 1,500 are being paid for in the personal taxes of their owners..

Another provision of the bill will be copied from the Connecticut law, which provides, in the section applying to the rate of speed, that automobiles "shall at all times be driven at a reasonable rate of speed."

Other sections will specifically define the rights of automobiles as regards other vehicles and the rights of other vehicles as regards automobiles. The recent elections have changed the complexion of the Legislature somewhat, and the auto club members are confident that their bill will stand a very good chance of being passed.

RECENT WORK OF COLUMBUS AUTOMOBILE CLUB.

COLUMBUS, O., Nov. 16.—The members of the Columbus Automobile Club feel that since the club was organized last Summer they have already proven the good work which can be accomplished by a live club. During the few months of the club's existence the members have succeeded in bringing about one change in the city, that of traffic regulation, which they correctly think is not only of great importance in adding to the ease with which all traffic can now move, but of far more importance is the increased safety to all and especially pedestrians. Heretofore Columbus had no rules at all governing traffic, all vehicles wandering up and down the streets wherever they wished and on either side, so that the pedestrian was in constant danger, as he had no idea which way to look for passing vehicles. The automobile club took the initiative in applying to the city council for traffic ruling and with the help of the Columbus Vehicle Owners' Association carried it through successfully. When the new ordinance went into effect the club backed up its previous work by paying for special officers to assist the regulars for the first few days in the more crowded sections of the city.

In regard to the work usually taken up by automobile clubs the capital city enthusiasts have not been negligent. The committee on road signs has not been idle, and although it has not erected any signs so far, a report was turned in at the last meeting

containing recommendations as to the style, cost and number of signs to be placed. The work will be well organized and everything made ready during the Winter in order that the work may be started early in the Spring. In the matter of a club home rooms have been secured in the Northern Hotel, which are being remodeled preparatory to the club taking possession December 1.

WHAT PHILADELPHIA CLUBS ARE DOING.

PHILADELPHIA, Nov. 16.—The local automobile organizations are showing no evidences of winter torpidity. The Quaker City Motor Club will inaugurate its winter social season Wednesday night, December 2, with a banquet at the Hotel Walton. This function will be the first of the kind in the club's history, its activities being hitherto more along sporting lines. A score or more of celebrities, including Governor Stuart and Mayor Reyburn, besides other State and municipal dignitaries and the high lights of automobiledom, will be present as guests.

The Automobile Club of Philadelphia has appropriated money to revise the map tentatively issued last year and to issue four additional maps by March 1 next. These maps will cover territory as far east as the Delaware river, as far north as Easton, as far west as Lancaster, and south to within six miles of Wilmington, Del. Macadam roads, stone roads fit for spring traffic, and dirt roads will all be plainly indicated. The committee in charge of this work is also engaged in the completion of maps of the Water Gap region and the country beyond Lancaster. New radiator emblems, incorporating the A. A. A. insignia and the words "Pennsylvania Motor Federation" and "Philadelphia" are being delivered to members.

PLANS FOR ROAD IMPROVEMENT IN VIRGINIA.

NORFOLK, VA., Nov. 16.—At last the work of the Tidewater Automobile Association in its campaign for better roads seems to be bearing some fruit. The task of building a macadam road from Norfolk to Richmond has been actually started by the engineers on the Richmond end, who are preparing plans for a new road between that city and Petersburg. St. Julian Wilson, State highway commissioner, who has become much interested in the work which the automobile association has been striving to accomplish, has notified the Norfolk promoters of the plans at the Richmond end and recommended that they, with the aid of the Suffolk automobilists, direct their energy toward this end of the route. Work has already started with renewed vim to get the county and State authorities in this section interested in order that this half of the route shall not be the last completed.

TO EXTEND SHENANDOAH VALLEY PIKE.

WASHINGTON, D. C., Nov. 14.—Members of the Automobile Club of Washington, as well as automobilists throughout this section, are greatly interested in a movement that has been started to extend the famous Shenandoah Valley pike from Staunton to Richmond, Va. The project has the indorsement of financiers in all the cities and towns between Winchester and Richmond. From Hagerstown, Md., through Martinsburg, W. Va., Winchester, Strasburg, Woodstock, Harrisonburg, and to Staunton, Va., there is a fine turnpike 140 miles long, and with an extension to Richmond, it will be a highway about 225 miles in length, without a break. The Shenandoah Valley is the finest touring ground in this section.

WORCESTER CLUB TO HOLD ENDURANCE RUN.

WORCESTER, MASS., Nov. 16.—The Worcester Automobile Club completed arrangements for holding a 200-mile endurance and reliability contest on Tuesday, December 8. According to the rules of the contest the route willl not be known to the drivers until the start of the run, which will not only require all bonnets to be sealed, but gasoline consumption will be taken into account when the final reckoning comes. It is planned to start from the clubhouse at daylight and check in at the starting point every two hours. The interest shown by the local dealers and owners has assured the club of success.

MOTOR FEDERATION UNDERTAKES CAMPAIGN.

PHILADELPHIA, Nov. 17.—With the purpose in view of having a good roads bill introduced in the Pennsylvania legislature at its coming session, the Pennsylvania Motor Federation is undertaking an active campaign of education on the subject of good roads. The first tangible result of this is to be seen in Governor Stuart's open support of a $60,000,000 highway to connect Philadelphia and Pittsburg, as published in to-day's papers. This is due, somewhat, to influence brought to bear by the Federation, which has succeeded in having a request made for an appropriation of this amount.

In connection with the announcement of the governor's stand in the matter, the Good Roads Committee of the Federation is to-day mailing 14,000 circulars to the supervisors and mayors of thirty cities, the burgesses of 1,000 boroughs, and to 1,500 secretaries of town boards, thus including every supervisor in the State.

The Federation is working in the interests of a bill to secure a $50,000,000 appropriation for good roads, but owing to the necessity of obtaining a constitutional amendment, this cannot be put through until 1912. In the meantime, the Federation is asking for an annual appropriation of $5,000,000 until 1912, and there seems to be every prospect of obtaining it.

MILWAUKEE CLUB TO BUILD HOME FOR ITSELF.

MILWAUKEE, WIS., Nov. 16.—The membership of the Milwaukee Automobile Club has become so large that the board of directors has been increased from nine to fifteen members. The six new directors are: George C. Forgeot, Alfred Kieckhaefer, one year; George A. West and Oscar F. Fiscbedick, two years; M. C. Moore and O. Z. Bartlett, three years. The committee appointed to have charge of the matter of building a clubhouse consists of Clarke S. Drake, George A. West, C. W. Norris, Lee A. Dearholt and M. C. Moore. Sites are now being inspected. A campaign has been started for new members to insure a broad response when the actual work on the new clubhouse is begun.

A delegation of officials of the Milwaukee Automobile Club made a 200-mile tour to Monroe, Wis., November 14, as guests of W. L. Hibbard, agent for the Chalmers-Detroit, and instituted the Green County Automobile Club into the Wisconsin State A. A. The Green County Club has a membership of sixty.

HARTFORD CLUB WILL GO AFTER OFFENDERS.

HARTFORD, CONN., Nov. 16.—That the Automobile Club of Hartford is determined to force observance of the provisions of the present law is evident from the action just taken by the club attorneys. Several prominent members have been notified to appear before the board of governors, Wednesday evening of this week. The law-breakers will be given a hearing, and in two or three instances application will probably be made to the Secretary of State for the revocation of license. As matters now stand several daily newspapers in the State have taken a decided stand against autoists, and are clamoring for the repeal of the present law. Hence it is up to someone to do a little missionary work, and the local club intends to do its share. Various other clubs in the Connecticut Automobile Association will have the disturbing element on the carpet.

CHICAGO A. C. HAS AN EXCITING ELECTION.

CHICAGO, Nov. 14.—The annual election of the Chicago Automobile Club was fiercely contested, there being three tickets in the field, the third and last one, the opposition, sweeping everything before it, electing every one of its men. The results eliminated from the board of managers such well-known auto lights as Sidney S. Gorham, Burley B. Ayers and Charles E. Gregory. The new list of officials is as follows: President, Ira M. Cobe, re-elected; first vice-president, T. J. Koehler, re-elected; second vice-president, T. J. Hyman, re-elected; secretary, C. A. McDonald; treasurer, George S. Whyte; directors, Joseph F. Gunther, re-elected; John Farson, re-elected; Claude Seymour, re-elected; Ban B. Johnson, Allan S. Ray and F. W. Blocki.

Benjamin Briscoe, President of Maxwell-Briscoe Motor Company: "The bugaboo of threatening overproduction in the automobile industry is nothing new. The same cry was raised when the industry was just beginning to see its own great possibilities. It will require years to satisfy the requirements of the home markets. When that has been done—and we are a long way from it—there is the foreign market and then the commercial vehicle, which will keep us busy for a long time to come. The Maxwell factories alone will market nearly 10,000 motor vehicles of all kinds during 1909. That doesn't look as though we were afraid of overproduction."

When Mr. Briscoe made this statement he had just returned from California, whither he had gone to conduct negotiations for the erection of the fourth Maxwell-Briscoe factory.

C. L. Fleming, Manager of Union Carriage Company, St. Louis, Mo.: "Although not as yet established in its automobile plant, the Union Carriage Company is already figuring on a further addition. This will be necessary, as we have decided to increase our output to 1,000 complete cars for 1909. Before election we were undecided and to be on the safe side announced 500 as the number of cars which we would put on the market. But since election conditions have changed, and many inquiries are being received daily. Some days the number reaches 80, and all are good prospects. Last week we received orders for 12 more of our motor storm buggies."

Alexander Winton, President Winton Motor Carriage Company: "We have given the 'sixty' a most exhaustive series of tests and our every expectation has been realized. This, however, is only natural, for the 'sixty' is free from experimental features, representing elements that had already proved their worth in smaller power. The 'sixty' is produced to meet the demand for high power and large carrying capacity and is in every respect a car on which six-cylinder enthusiasts may place their faith without risk of disappointment." It is further stated that deliveries of the new $4,500 Winton "Six" will begin at once. This car has six 5 by 5 off-set cylinders, rated at 60 horsepower, carries a seven-passenger body and is equipped with a four-speed transmission, direct drive being on third speed.

William Mitchell Lewis, President of the Mitchell Motor Car Company: "In 1904 we were the $1,500 car pioneers, and built 315 automobiles of this model. The first car was sold to Horatio W. Hall, our Chicago agent, and is still in active service, as are 300 other machines of the 1904 output. Showing how accurately the Mitchell Company anticipated the requirements of the public, it is only necessary to add that the 1904 pioneer car was a four-cylinder 4 by 4 engine. This practically is the average of the present popular medium-priced car. The present 1909 model Mitchell—the entire output of about $3,000,000 worth of these cars has been assimilated by Mitchell agents—has a 4 1-4 by 4 1-2 engine, a wheelbase 3 inches longer, magneto ignition, selective transmission and refinements that the wisdom of Designer John W. Bate has suggested. The new 1909 $1,500 cars are capable of a speed of 55 miles an hour."

FOUR 1909 HERRESHOFF MODELS.

DETROIT, Nov. 16.—More than passing interest attaches to the filing of articles of incorporation at Lansing of the Herreshoff Motor Company, aside from the added impetus given the automobile industry in this city. Charles F. Herreshoff, famous as the designer of fast boats, and of late years consulting engineer for some of the largest automobile plants in America and Europe, has decided to make Detroit his future home, and is giving his personal attention to every detail of the new car which will be placed on the market, and which will be named after the designer. The claim made for the Herreshoff motor is its extreme refinement of construction and simplicity of design, the weight of the motor being reduced fully 40 per cent. without impairing its strength, thus permitting some radical changes and improvements in the construction of automobiles.

Although the creator of some of the fastest speed boats known, Mr. Herreshoff has always regarded this work as a side issue, his greatest fame being gained as a designer of auto frames, axles and transmissions, and as consulting engineer. The Herreshoff Motor Company has taken over a large plant here, and already has 500 men engaged on the 1,000 cars it will produce this season, and of which there will be four models.

BOSTON TRADE VERY OPTIMISTIC.

BOSTON, Nov. 14.—Boston's automobile trade is enthusiastic over the present condition of the trade and the future prospects. Not only in this city, but all over New England there is apparent a remarkable optimism concerning motor vehicles, and agents in the smaller cities are sending in larger orders than ever before, and seem to be confident of their ability to dispose of the machines as rapidly as they can be shipped to them from the factories. Locally there is hardly a dealer who is not much further ahead on orders than ever before at this season, and some of them have already begun to fear that they will have an experience similar to that of two years ago, when their allotments ran out before their customers were satisfied.

Present conditions amount almost to a boom, for the demand is not limited to any one class of car, but is felt by all classes, low, medium, and high priced. The immediate demand is for enclosed cars, and some dealers claim that they cannot obtain enclosed bodies rapidly enough. But there is always a very strong demand for open cars to be delivered in the Spring, and one dealer in high class cars shows figures to substantiate his statement that he has taken four times as many specifications up to date as he had taken a year ago at this time.

LACROIX AND BREYER ARE ON LA PROVENCE.

PARIS, Nov. 12.—Paul Lacroix, American selling agent of the Renault Frères, recently arrived from New York on the *Provence* and will stay in Paris not more than one week, probably sailing again on the same boat, leaving Havre the 14th, in order to be present at the Savannah race on Thanksgiving Day. The hurried European trip has been made solely for the purpose of arranging details for next season's business.

Another automobile passenger on the *Provence* on her next outward trip will be Victor Breyer, European representative of the American Automobile Association, who is making his annual trip to the States, and who will attend the Savannah race.

RAINIER FACTORY TO BE KEPT RUNNING.

SAGINAW, MICH., Nov. 13.—That the Rainier automobile works located here, which recently went into the hands of a receiver, will be kept in operation has just been announced by Jesse Walton, of New York City, the receiver, after a conference with the local management. It is not yet known just what form the reorganization of the business will take, but local capitalists are sufficiently interested in the business to keep it going at its present location. The company has a valuable site of 25 acres on the river front, with a modern brick plant.

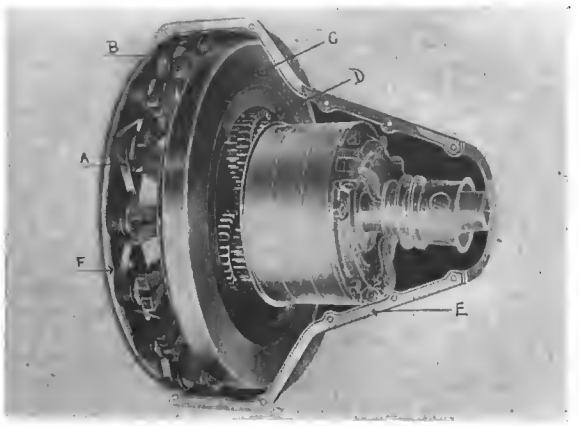

Fig. 1—Showing the complete assembly, with flywheel.

THE NEW FORD IGNITION SYSTEM.

The Ford Motor Company, of Detroit, has burned its bridges in so far as batteries, wiring coils, etc., are concerned, in that a magneto is built into the flywheel, and in itself constitutes the whole ignition equipment.

Fig. 1 shows the assembly complete, in which the letters denote: *a* = one of the magnets; *b* = one of the armature coils; *c* = flywheel on which magnets are mounted; *d* = planetary gear set; *e* = lower half of case; *f* = spider, holding the coils in rigid relation to the frame.

The spider holding the coils is shown in Fig. 2, while Fig. 3 shows the magneto on one face of the flywheel.

The Ford Company sets forth a manifold of claims for this system, and points out that the ignition is concentrated to but one point, instead of having its component parts spread out.

The functions of the "Ford" magneto are not unlike the similar functions of magnetos in general, excepting that the

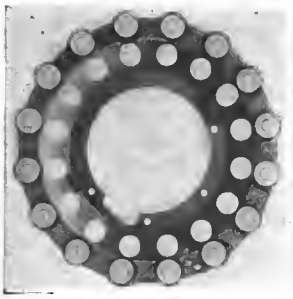

Fig. 2—Coil Spider, complete.

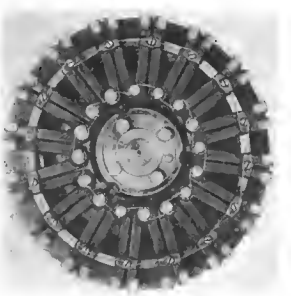

Fig. 3—Magnets on the flywheel.

"Ford" idea demands the use of multipolar magnets. In the operation of this system as applied to the Ford model "T" automobile for 1909, the permanent magnets, fixed on the flywheel, are caused to rotate past the coils, thus building up a "magnetic flux" in the circuit. This flux pulsates, and in doing so induces electrical potentials in the coils. For the rest, it is a matter of convenient timing and the windings of the coils as will induce a sufficiently high electromotive force in the secondary electrical circuit.

There are sixteen coils and an equal number of permanent magnets. The coils are of copper wire, suitably insulated, and one end of each is to "ground." The work in general is common to that which obtains in the construction of all electrical generators on a high plane.

The Ford system does not preclude the use of a battery auxiliary, but the need of the same is eliminated, besides concentrating the ignition system in such a way as to facilitate manipulation.

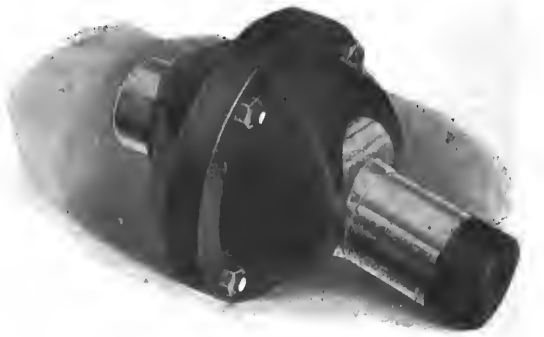
STUDEBAKER CUP FOR THE A. A. A. TOUR.

South Bend, Ind., Nov. 16.—Col. George Studebaker has decided to offer a trophy to be known as the Studebaker Gold Cup, to be contested for at the same time as the Glidden and Hower trophies, during the A. A. A. annual tour. The cup is valued at $5,000. Colonel Studebaker believes that the automobile has reached a stage of development where something more than the present rules of the Glidden contest must be required to prove efficiency, and although he imposes no specific conditions, he makes the donation with the suggestion that all devices known to the contest committee shall be utilized to guard against repairs and replacements.

A DUST-PROOF UNIVERSAL JOINT.

The Hartford Auto Parts Company, Hartford, Conn., will entertain the trade during 1909, in a most acceptable manner through the good office of its "Type C" dust-proof Universal joint, and the self-lubricating feature of the same should gain for it admittance to the elect.

Recognizing the potency of the crystallized fact that in any structure no link is stronger than the weakest, the "Type C"



Exterior View of the "Type C" Assembled Joint.

joint is designed, according to the makers, to sustain under all torsion that can emanate from a crankshaft of the finest grade whose diameter will equal the diameter of the hole in any one size made of the "Type C" universal joint.

The ball and socket feature is adequately shown in the illustration, but to conclude without quoting the makers on the question of accessibility would be to do the subject scant justice: "As simple and accessible as the most critical could demand. Without tools the joint can be taken apart in a few seconds and the matter of assembling the entire drive equipment on a car should not demand over ten minutes of a workman's time."

The J. S. Bretz Company, Times building, New York City, is the authorized vendor.

"Type C" Joint Dissembled, Showing the Parts.

INTERESTING NEWS IN GENERAL

Edition De Luxe of Rambler Magazine.—An attempt at something a bit above the ordinary in house journalism is in evidence from Thomas B. Jeffery & Co., makers of the Rambler automobiles. A special edition of the *Rambler Magazine*, printed in two colors and packed from cover to cover with snappy illustrations and instructive views showing the best method of building and selling automobiles, is now being mailed to dealers throughout the country. The book contains a picture of the Rambler factory, claimed to be the largest automobile plant in the world; a portrait of Thomas B. Jeffery, who made its great success possible; the announcement of the new Rambler models; the details and exposition of all the special Rambler features, including the new Rambler spare wheel; a profusely illustrated story of the methods of making and testing of Ramblers; and a story of the sales organization and the great record made by this concern during the past eight years. This magazine much resembles a standard publication.

Difficultiea of Touring the South.—J. H. Smith has just returned to his home in Atlanta, Ga., with some interesting tales of the experiences he encountered while on a 2,000-mile tour among the mountains of Georgia and North and South Carolina in a Pope-Hartford touring car. One day while trying to reach Greer, S. C., through mud and rain, he was obliged to dig a path around a deep mud hole in the Tugaloo river bottoms. Having no shovel in his tool equipment, he was compelled to make the best of a tire iron, which naturally made very slow work. A few days after reaching Spartansburg a street car butted into his machine and smashed the lamps, fenders, radiator and almost everything else that would bend on the front of the car. After awakening the motor sufficiently to back off his car, Mr. Smith loaded bis machine with the broken parts and drove to a repair shop, where he rigged up a radiator out of a tin box which did duty for the rest of the trip.

Twenty-six European Makers Use Hele-Shaw Clutchea.—This clutch, exploited in this country by the Merchants & Evans Company, Philadelphia, is now used by some twenty-six separate European automobile makers in their 1909 products. This clutch, it will be remembered, is of the multiple disc type, differing from other multiple disc clutches in that the discs do not bear on their flat faces, but have conical grooves that engage on their faces. The members are submerged in oil, but the action is such that the engagement is attended with much certainty, and without evidence of "fierceness." For a given motor, the clutch ability is said to be attended with but little pedal pressure. The actual contact surface is a maximum, while the effectiveness is multiplied through the angularity of the engaging faces.

To Sell Remy Magnetos.—Automobile trips have been undertaken for all kinds of things, and that now being run by A. T. Mosher and Harry Harter in the interests of the Remy Electric Company, Anderson, Ind., adds a new phase. They are making a run of several thousand miles, which will take them from Anderson, Ind., to Savannah, Ga., to New Orleans, Galveston, Tex., St. Louis and back to Anderson, for the purpose of demonstrating and selling the new Remy high-tension magneto. This is of the inductor type and is extremely simple and effective, as there are no moving wires or connections in the primary circuit.

Goodyear's California Performances.—The W. D. Newerf Rubber Company, of Los Angeles, Goodyear tire agents for the Pacific coast, have been particularly energetic in equipping competing cars in various events. According to the Newerf Company, the Goodyear tire now holds the San Francisco-Los Angeles record, on a White steamer; the San Francisco-Los Angeles and return record, the San Francisco-Portland record, Los Angeles-San Diego record, on a KisselKar, and also Los Angeles-Newhall, and the Los Angeles-Victorville records. Forty-one out of forty-seven firsts is clamed for track events with a tourist car.

Annual Meeting of the A. S. M. E.—The twenty-ninth annual meeting of the Society will be held in the Engineering Societies building, 29 West Thirty-ninth street, New York, December 1 to 4. The notice says: "Tbe professional and social opportunities afforded by these meetings are being realized by the members, as is sbown by the constantly increasing attendance. Five years ago at the annual meeting there were 474 members and guests present; last year, notwithstanding the general unsettled financial conditions, there were 1,232 in attendance, which shows an increase in the past five years in round numbers of 750."

Earl Now Known as Petrel.—The defunct Earl Motor Car Company, of Kenosba, Wis., manufacturers of the Earl friction drive cars, bas been reorganized under the name of the Petrel Motor Car Company, and its product will be named the "Petrel." Samuel W. Watkins, founder of the Beaver Manufacturing Company, Milwaukee, builders of engines and motors, is at the head of the new company. The Petrel company will occupy the former Visible typewriter plant at Kenosha, the Earl's old bome.

Willard Company Haa New York Depot.—The Willard Storage Battery Company, of Cleveland, O., has opened an office and battery depot at 1876 Broadway, corner of Sixty-second street, New York City, where it will take care of its battery business for the metropolitan district. The depot will be fully equipped with apparatus for assembling, charging and crating batteries ready for use. The depot will also take care of the charging of vehicle batteries and batteries for sparking, lighting and other purposes.

No Advertising for Palace Show Program.—An announcement from the American Motor Car Manufacturers' Association contains the information that the Palace Show program will contain no advertising. They will be distributed free, with a full list of names and business of each exhibitor. The show committee is of the opinion that the tone of the show is kept higher by keeping out the advertising and distributing without cost.

Three Tire Replacements in a 24-Hour Race.—A remarkable tire record is claimed in the 24-hour race at Los Angeles, Cal., when the winning Locomobile completed the around-the-clock contest with only three replacements of its Fisk bolted-on tires. That is to say, the car used only seven tires for the entire race, and in these events tires are generally "burned up" by the dozen.

Two Indiana Companies Consolidate.—The Stanley Automobile Manufacturing Company, of Mooreland, Ind., has consolidated with the Troy Buggy Works Company, of Troy, Ind., and has moved its entire plant to that place. With the increased facilities the company will continue to manufacture the Stanley automobiles in the name of the latter company.

Archbishop Joins the Automobilists.—One of the latest converts to the use of the automobile is Archbishop O'Connell, of Boston. A 40-horsepower Pierce Arrow landaulet has been presented to him by the laity of tbe city of Boston. The committee wbich was appointed to examine a number of cars chose the Pierce Arrow as being what they desired for a present to the Archbishop.

Champion Will Make Magnetos.—At Flint, Mich., the Champion Ignition Company bas been organized, with Albert Champion, of Boston, at the head, to manufacture magnetos.

IN AND ABOUT THE AGENCIES.

"Alco," Northweat.—The American Locomotive Company's "Alco" will be handled in the Northwest for the first time by the Victoria Motor Car Company, of Minneapolis, Minn., a new company composed of Charles H. Robinson, Arthur W. Armatage and Robert H. Rose. The territory given the new company extends to the coast, and elaborate arrangements are being made to handle the business in a satisfactory manner and to make a record the first year. This company has commodious quarters at 1312 Hennepin avenue, where over 7,000 feet of floor space will be devoted to the "Alco" line, garage and repair departments.

Overland, Wichita, Kan.—Tbe Star Automobile Company has been formed in Wichita, Kan., by a number of men interested in the automobile industry and the agency for the Overland car has been arranged for. The company will erect a two-story building designed especially for sales rooms and garage purposes. The incorporators include Hugh E. Roberts, E. N. McGregor and A. C. Houston.

New Goodrich Tire Branches.—The B. F. Goodrich Company, of Akron, Ohio, has established branches in the following cities: Kansas City, Mo., 1728 Grand avenue, manager, Fritz Oberhue; Minneapolis, 827 Hennepin avenue, manager, E. W. McCreery; Pittsburg, 5900 Penn avenue, manager, H. L. Bouker; Atlanta, Ga., 64 North Pryor street, manager, E. V. Wilkinson.

Rauch & Lang Company, Ohio and Indiana.—The Rauch & Lang Carriage Company, makers of R. & L. electrics, announce that E. W. Livensparger, of Cleveland, has been appointed district agent for Ohio and Indiana, where he will establish all agencies. Branches have already been arranged for at Lima and Canton, Ohio, and at Fort Wayne, Ind.

Middleby, Philadelphia.—William P. David, long connected with the Maxwell agency in Philadelphia, is at the head of the Standard Motor Company, 616-618 North Broad street, which has just been awarded the local agency for the Middleby car, manufactured by the Middleby Auto Company, of Reading, Pa.

Studebaker, Atlanta.—The entire line of Studebaker cars will be represented in Atlanta by the Georgia Motor Car Company under the management of George

W. Hanson, who will act as distributing agent for the State of Georgia. Garage and salesrooms have been secured on North Pryor street.

Brush, Philadelphia.—The little Brush car effected a lodgment in the Quaker City last week, when the Oxford Automobile Company, 1615 Willington street, secured the local agency. Already arrangements for the placing of a number of sub-agencies are well under way.

Michelin Tires, Pittsburg.—The Pittsburg Auto & Repair Company has secured the exclusive agency for Western Pennsylvania, Eastern Ohio, and West Virginia for Michelin tires.

Republic Tires, Kansas City, Mo.—The Republic Rubber Company will be represented in Kansas City by E. P. Moriarty & Company.

PERSONAL TRADE MENTION.

George B. Adams, a pioneer of the auto trade world, has become connected with the Detroit-Cadillac Company of 303 West 59th Street, Manhattan, and will devote his attention to selling the new Cadillac "Thirty." Mr. Adams will be remembered as far back as 1899, when be occupied the position of president of the Adams-McMurtry Company, whicb at that time held the agency for Packard cars in New York. This agency was later changed to a branch and Mr. Adams became the manager. Since that time Mr. Adams has been connected with the Pope and American Locomotive companies. He was one of the organizers of the original trade association in New York, in wbich he held the position of vice-president.

Ernest H. Brandt has tendered his resignation as general manager of the Detroit-Cadillac Motor Car Company, of New York City, to accept the management of the Eastern distributing depot of Thomas B. Jeffery & Company, makers of Rambler automobiles. The headquarters will be in the Rambler Building, 38 West Sixty-second street, New York City, and Mr. Brandt will have charge of territory comprising Virginia, Maryland, Delaware, New Jersey, Pennsylvania, east of Altoona; eastern New York State, and western Connecticut.

Charles B. Shanks, sales manager of the Stearns Motor Company, was in Minneapolis during the past week, on his return from his Pacific coast trip, on which he started in September. Mr. Shanks is much enthused about the prospects in all the cities he visited, including Chicago, Denver, Portland, Spokane, and Seattle. In his opinion there will not be enough high quality cars made this year to satisfy the demand. Up to date the Stearns factory has taken more orders than ever before in a whole season.

Eugene Grunewald, superintendent and chief engineer of the Moline Automobile Company, of East Moline, Ill., was united in marriage on November 11 to Miss Pauline Haak, a young society woman of Davenport, Ia., the ceremony being performed at the home of the bride's father in that city. Mr. and Mrs. Grunewald left for an extended Eastern tour immediately after the ceremony, and will attend the Grand Prize race at Savannah, Ga., on Thanksgiving Day before returning to Moline.

George Holloway, who for the past 16 years has been general superintendent of the Elmore Automobile Company, has accepted a position with the Vim Motor Manufacturing Company, of Sandusky, Ohio. The Vim company proposes to enter the automobile field with a two-cycle motor of much the same design as the marine engine made by it at present.

Alfred Measure, manager of the Morgan & Wright branch in Boston, and for the past eight years connected with that firm, has accepted a position as office manager for Alvan T. Fuller, Boston agent for the Packard and the Cadillac. Mr. Measure was in the bicycle business before going with the Morgan & Wrigbt firm.

David J. Post, of the Veeder Manufacturing Company, Hartford, Conn., and a member of the American Motor Car Manufacturers' Association's show committee, has sailed for Europe to attend the London, Paris and Berlin automobile shows, gathering data and the latest ideas in European showdom.

E. LeRoy Pelletier has again been chosen to manage the show of the Detroit Association of Automobile Dealers. Mr. Pelletier looks after the advertising and publicity of the Everett-Metzger-Flanders Company and the Studebaker Automobile Company.

William J. Slater, advertising manager for the Firestone Tire & Rubber Company, has severed his connection with that concern to take up the general management of the Kalamazoo (Mich.) *Telegraph*, a newspaper in which he is financially interested.

R. B. Jackson, who was general manager of the E. R. Thomas Motor Company, of Buffalo, np to Oct. 1, 1908, has rented the old Northern plant at Detroit, where he is preparing to start in on the manufacture of automobile parts.

J. S. Conwell, formerly general manager for the Auto Vehicle Company, makers of the Tourist car, has joined the Maxwell-Briscoe Company selling forces as general manager in the Southern California territory.

Louis J. Sackett, well known to the automobile trade, is exploiting the merits of the Stearns cars for Wyckoff, Church & Partridge in the territory east of Buffalo and Pittsburg.

H. J. Edwards, chief engineer of the Dayton Motor Car Company, has sailed for Europe to attend the London and Paris automobile shows.

Harry Sheldon, representing the Con-Continental Tire Company, is spending a few weeks on a visit to the Pacific coast territory.

Dan J. Cohen, formerly with R. M. Owen & Company, has been added to the sales department of the Oldsmobile Company.

Russell Huff, chief engineer of the Packard Motor Car Company, has sailed for Europe to attend the Paris show.

R. H. White, of Detroit, has joined the selling forces of the White Company.

GEORGE A. BURNHAM KILLED.

DETROIT, Nov. 14.—George A. Burnham, general factory manager for Morgan & Wright, was accidentally killed while duck hunting at the St. Calir flats near Pearl Beach, this afternoon. Mr. Burnham was out in a boat and while trying to put his gun back of him a cartridge exploded, the load entering the neck at the base of the skull. Mr. Burnham was 34 years of age and had been in the employ of Morgan & Wright since 1893, with the exception of 1 year during the Spanish-American war. He left a widow and three children.

HAYNES INCREASES CAPITAL.

KOKOMO, IND., Nov. 16.—In order to carry on operations on a more extensive scale than heretofore, the Haynes Automobile Company, one of the oldest concerns in the country, increased its capitalization from $300,000 to $600,000 at a meeting of the stockholders held here last week, at the same effecting a complete reorganization. A large part of the increased capital stock has been subscribed by local investors, so that Kokomo stockholders will be largely in the majority. Home control of the company has been vested in the local interests for the coming five years by the terms of the reorganization. This step has been contemplated for some time, and would have been taken earlier in the Fall, had it not been for the unsettled business conditions. The directors chosen at the stockholders' meeting are as follows: Elwood Haynes, C. H. Haynes, Henry C. Davis, Stephen Tudor, A. L. Thalman, William Johnson and George W. Charles, of Kokomo, and W. M. Haynes and C. C. Cartwright, of Portland, Ind.

The directors held a meeting immediately after the completion of the reorganization and passed a resolution creating a board of trustees, composed of three members of the directorate, and empowered it to vote a majority of the stock as a unit for the next five years, in order to insure local control of the company's affairs. The trustees selected were H. C. Davis and Richard Ruddell, of Kokomo, and C. C. Cartwright, of Portland.

The Haynes plant had a very modest beginning, but its growth has been rapid and both its buildings and machine equipment entitle it to rank high at the present day. The entire Haynes force is now busily employed in getting out a series of 200 of the new Model X cars.

ELECTRIC VEHICLE REPORT.

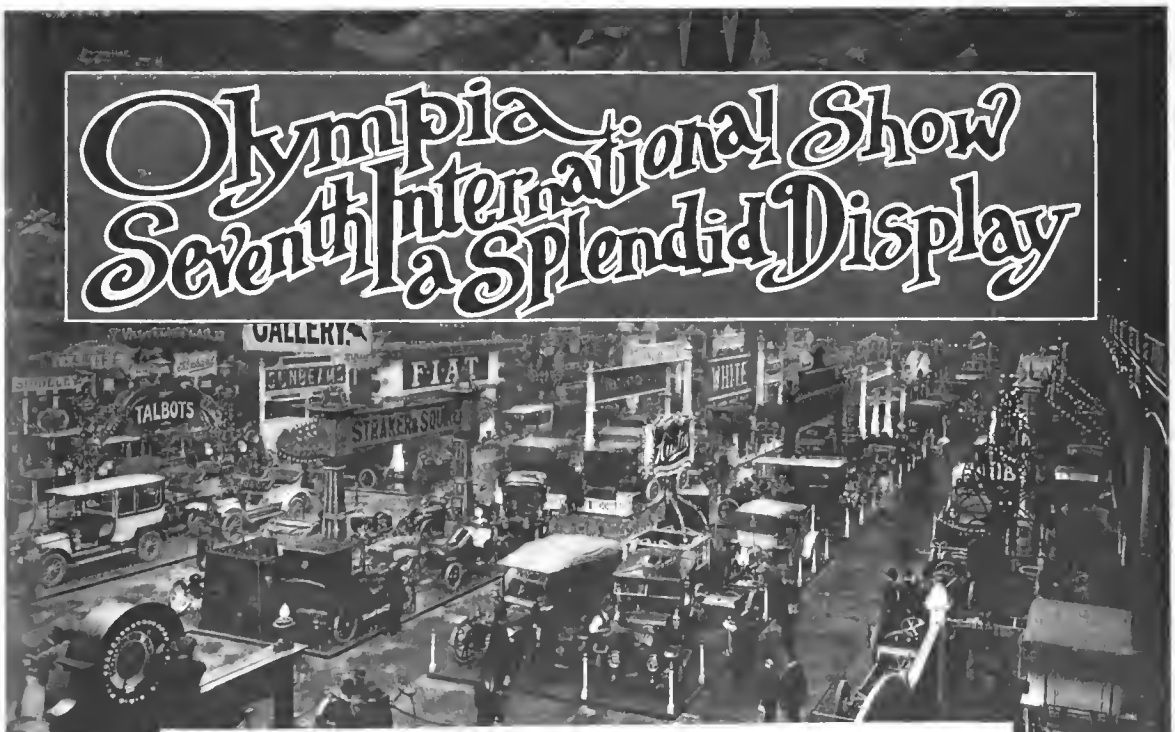
HARTFORD, CONN., Nov. 16.—Halsey M. Barrett and Henry W. Nuckols have filed their report as receivers of the Electric Vehicle Company of business during the month of October. According to the September report, the receivers had cash on hand amounting to $208,188.45 and collections brought the figures up to $304,804.53, including $77,914.04 for royalties. The October report shows a balance on hand of $175,834.28, November 1. Cash sales for the montb amount to $22,592.02, which also includes charges on account.

Listed in the receipts is an item of $77,914.04 from Selden royalty, and in the disbursements is listed an item of $76,580.41 to the Licensed Association. It will be noted that practically all the money received from the Selden royalty was turned over to the Licensed Association, the reason for which is that after the company had passed into the hands of the receivers a new royalty agreement was necessary, and this came about in due course with the consent of the courts. A definite maximum sum that the Electric Vehicle Company should receive in any one year was fixed and the company before the month of October received this sum, with the exception of about $1,300, and the excess over $1,300 was turned over to the Licensed Association. The balance on hand November 10 is smaller than that of October 1, but it must be borne in mind that a larger force is now employed and that more extensive operations are being carried on than heretofore. All things considered, the receivers are doing exceptionally well.

Vol. XIX New York—Thursday, November 26, 1908—Chicago No. 22

THE AUTOMOBILE

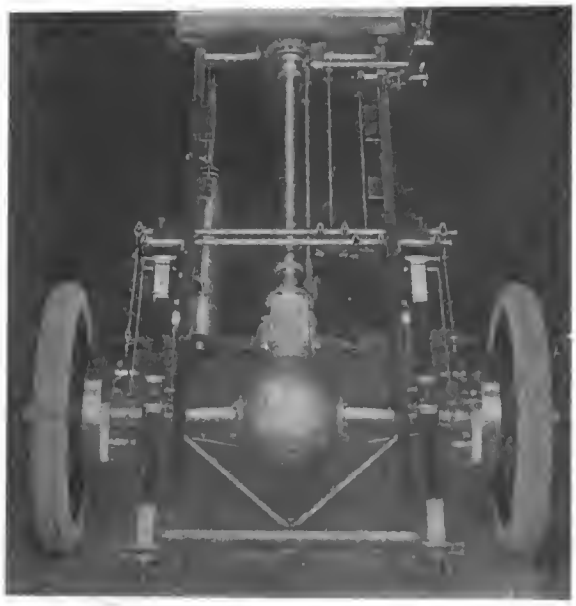
Olympia Seventh International Show a Splendid Display



LONDON, Nov. 13.—The Society of Motor Manufacturers and Traders opened their seventh annual pleasure vehicle show at Olympia this morning, under the patronage of the King. Unlike previous years, there was no opening ceremony, but there was no lack of visitors in consequence, and from the opening hour of 10 a. m. a steady stream of better class visitors made their way in. This of itself marks a distinct change from former shows, when the first days have not attracted much attention. Already good signs of business are apparent and the end of the first day finds the general body of exhibitors in an excellent humor.

In all past exhibitions the racing car has been a big attraction, and the stands that included the battered victors of the season's speed contests always attracted interested crowds. This is to be no more, for, complying with public opinion—or that section of public opinion which is represented by two or three noisy half penny papers—the promoters decided that anything that savored of motor racing must be banished forthwith. Hence it is that the Hall to-day contains neither racing car, nor is any literature permitted to be distributed that appertains to so terrible a sport!

But while many will be found to criticize the promoters' action in this respect, the majority both of exhibitors and of purchasers will probably agree with the decision to abandon trial rides. The experience to be gained in a few minutes' ride around the building would not materially influence a purchaser, and yet such runs have in



Gear-boxless Sheffield-Simplex Chassis.—Rear View.

the past been a big source of trouble and expense to the exhibitors. The serious purchaser can now make a definite appointment for a more thorough test and the only person that will be disappointed is the man who is accustomed to go up to Hammersmith for an afternoon's outing on the cars. This class became too numerous for the comfort of the exhibition to tolerate.

Everywhere can be observed the tendency towards reduction of noise. Just as a year ago engine flexibility and the perfection of the lubrication system were the aims of the designer, so now noiselessness is the feature on which greatest stress is laid. In the case of the Daimler-Knight valveless engine absolute silence of operation is put forward as its biggest advantage. Numerous other makers retaining the mushroom valve engine have adopted the plan of covering the whole of the valve arrangement with an aluminum plate, and also, of altering the form of the valve lifting cam. Throughout the rest of the car this quieting process is apparent. The exhaust long ago ceased to be objectionable, so now the incoming gases are silenced, the Daimler and Iris carbureter being prominent in this respect. The gear pump has been replaced on several cars by the smoother-acting centrifugal variety, or better still, has been omitted altogether, the natural circulation being now relied on. Other instances present themselves in this refining process, and if for the next show designers will but consider the question of reducing the dust raising properties of their cars, the public will have little to complain of.

Of general tendencies of design much is apparent. During the past season the various voiturette races in France and the "four-inch" race in this country have shown what excellent results can be obtained from a well-designed and carefully constructed small car. As a result there is a big increase in the number of such cars staged, these being frequently met with on the stands of the best known makers.

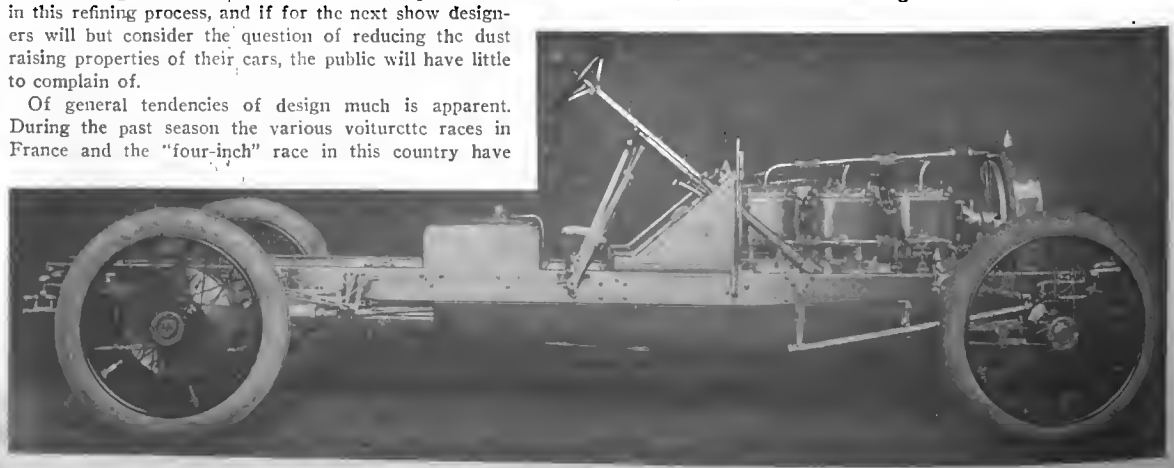
The single cylinder engine has almost lost its premier position by reason of the popularity of the small four-cylinder variety, in which the bore is as little as 65mm.—this being the case with the De Dion and the Martini. Even the six-cylinder engine has found its adherents, and such cars as the 12-horsepower six-cylinder Delaunay-Belleville are well worth inspection. Interesting examples of these small cars will be detailed later.

What the Motors and Their Appurtenances Show.

A second feature of note in engine construction is the re-introduction of the twin-cylinder type. At last year's show this form of engine had almost entirely disappeared and engine types seemed definitely to have resolved themselves into the single, the four and the six. The popularity of the engine of about 10-horsepower has now led to the feeling that something between the one and the four is required, so that the twin-cylinder engine is likely to have a greater vogue than ever. Hardly less noteworthy than the increase in the voiturettes is the prevalence of the "four-inch" engine—usually with a five inch stroke, but tending, if anything, to exceed this value. The increased power given by these small engines is well indicated by the generous provisions of covered bodies on such cars, whereas in former years nothing smaller than a 30-horsepower 4½ by 5 engine was considered sufficiently powerful for a limousine or full-sized landaulet. As a natural result the bigger type of car tends to decrease in numbers, and by next year this decrease should have assumed definite proportions. Beyond the big car there still exists a class which is to all intents and purposes a racing car with a small and uncomfortable touring body fitted. Among cars of this type that are on view may be noted the 100-horsepower Germain and the 90-horsepower Napier, Fiat, and Gobron-Brillié.

The general success of the long stroke and high piston speed engine in the four-inch race showed itself almost too late to affect the present models. This tendency, however, can be observed in the case of the smaller cars, where the stroke is between 1¾ and 1½ times the bore. Apparently not a single car in the show has an engine with stroke less than the bore—a change from last year, when several examples of the 4 by 3 and 5 by 4 type were staged.

Cylinders all cast in one block now find general favor. The former big objection of excessive cost of replacement when a cylinder was damaged is greatly discounted now that the public realize that cylinders do not require replacement every few months. From the maker's point of view the saving of space, as well as the general simplification of the piping and water connections, makes the block casting a favorite.



Side Elevation of Chassis of the Gear-boxless Sheffield-Simplex, Showing Undershield and Gasoline Tank in Position.

In the Deasy 15-horsepower model, as in the 18-horsepower Ford, this method is carried even further, and the top half of the crankcase forms one casting with the four cylinders. This design makes a very neat job indeed, and by casting the supporting arms in aluminum and bolting to the engine casting, the latter is kept from becoming unduly cumbersome.

Ball bearing engines have not increased in numbers and the practice may therefore be regarded as still under trial. In other parts of the running gear the ball bearing is almost universal.

The general introduction of forced lubrication systems was a feature of last year's exhibition, and to such an extent has this commendable practice been carried that now the splash system with drip feed is retained only on the cheapest type of voiturette.

Carburetters are still far from settling down to uniform design, and hardly any maker has retained the 1908 carbureter without change. The two and three jet type is frequently met with, but the uncertain spring controlled devices are still in great numbers. On the Daimler three-jet carbureter a water-heated silencer is fitted.

A year or two ago the pressure fuel tank at the rear seemed likely to disappear, its two enemies being its liability to choking of the pipes and its alleged dust raising qualities. The latter has in general been disproved by the Royal Automobile Club experiments, while the first named trouble is obviated by dispensing with the exhaust gas and employing in its stead air pressure from a pump driven off the camshaft. The fact that this air pump might be made larger and used to operate a self-starting system does not seem to appeal to the generality of designers and but a few cars—the S. C. A. T. and the 60-horsepower Fiat for example—are so equipped.

The many other forms of self-starters so eagerly brought forward two years ago have all entirely disappeared

In the ignition section the high tension magneto is almost universally employed. Even the low tension variety has finally lost its popularity with the Italian cars and is not found save on a couple of Fiats. In spite of the fully-proved reliability of the magneto, however, there is still a general practice of fitting an accumulator and coil system as a standby, but whereas last year this was invariably of the high tension distributor with one coil type, several makers have this year used the low tension distributor with a special four unit coil having but a single trembler. This is found to give a good synchronization of the former type with less cost and insulating trouble.

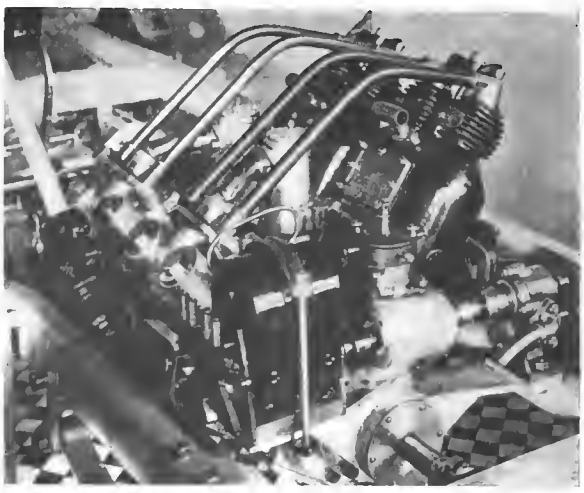
In the Matter of Gear Boxes and Clutches.

A general—and necessarily hurried—examination of the cars leads to the conclusion that clutches are in the same position as last year, as far as popularity of the rival form goes. Several new makers fit the disc clutch, and particularly is the new Hele-Shaw clutch remarkable in that all parts, save the phosphor bronze outer plates, are of pressed steel, thus effecting considerable weight-saving. On the other hand one or two makers, including Austin and Weigel, have reverted to the leather cone clutch, so that the balance of power is almost unaltered. The other types of clutch, whether of the expanding or the contracting variety, have almost disappeared, and the Motobloc and the Mors are probably the sole remaining exponents of the two types. The use of cork inserts has not yet come into favor on this side.

Meanwhile the hydraulic clutch is being quietly worked out, and it is said that by the next show a satisfactory example will be exhibited of this combined clutch and gear which would seem likely to oust, altogether, the present unmechanical devices.

The gearing question now seems to demand but little attention and most of the cars have the form of three or four speed gear box, which has served them for several years. The use of third direct and an indirect fourth gear, a feature of the last Flow, has but a few fresh adherents.

It was rumored that several Panhards of new and popular power would be shown, fitted with the epicyclic gear. This, for a well known French firm, would be sufficiently a novelty to cause comment, but the non-appearance of these cars makes it necessary to await the Paris show for further information.



Motor Shown by the Two-Stroke Engine Company, Ltd.

In spite of the flexibility of the six-cylinder engine, only one maker has been found to dispense with the gear-box. The 45-horsepower Sheffield Simplex has this feature to recommend it, but even here a reverse has, of course, to be fitted, and while arranging for this in the rear axle casing, the makers have thoughtfully added a low forward speed "for emergency use," so that the novelty of the step rather disappears. All the same this proceeding effects an appreciable saving both in weight and in the number of parts, and the increased simplification of the chassis is certainly surprising.

Several other makers—notably Napier in his smaller cars—have arrived at a similar result by moving the gear-box up to the engine, of which the flywheel is placed right forward against the radiator. As will be shown later, the Napier gives a very neat and simple car.

For the final drive, there can be no doubt but that the chain is dying out, except for the highest powers, and here again it only shares the honors with the shaft-drive. In its turn the shaft and

Chassis of the F. N.—A Well-known Popular Type.

bevel drive is rivalled in medium powered cars hy the worm drive, and another year will prohably show a hig advance in popularity of this last type, which, when well designed and cut, possesses such advantages over other forms of gearing as regards quietness and smoothness of action.

Almost all cars retaining the chain drive that are exhihited have well designed oil tight chain cases, a feature which at once removes the greatest objection to this form of drive.

In the rear axle itself the straight tooth or spur differential shows an increase in use, so that the hevel wbeel thus tends to disappear from motor car practice altogether.

But little change is apparent in frame design, which still adheres to the pressed steel form. What alteration has heen made is in the direction of lowering the height at the rear so as to accommodate the covered body, which increases greatly in popularity each year.

As a concluding feature, the popularity of the wire wheel on all types of car must be recorded. The wire wheel has always had several firm supporters, of which the Lanchester, that origin of so many new ideas, was perhaps the most prominent. Two years ago, however, the Rudge Whitworth detachable wire wheel opened up a new range and since then this more mechanical device has spread to an extent that may be judged from the fact that such firms as Daimler and Napier, along with a dozen others fit Rudge-Whitworth detachable wheels as standard on all models. It certainly requires some time before the eye becomes accustomed to the wire wheel, but once the novelty has worn off, its many advantages, including those of lightness and strength, greatly favor its general use.

With the known falling off in the demand for the larger powered cars and the big increase of competition in the smaller section, it was generally anticipated hy the puhlic that a general drop in prices would be manifested. This has not been the case and although in certain instances prices are slightly helow those of last season, the usual rule seems to have been to improve the details and so to keep the price up to its former level. By the introduction of new low-powered models, however, many of the biggest makers—such as Napier, Austin, Delaunay, Fiat—have now brought their productions within the reach of that immense section of the community, "the man of moderate means."

These small cars differ only in size and in detail finish from their bigger companions and the high class quality of work has heen retained to a big extent, so that a wide and excellent range is available for the choice of the purchaser.

A walk around the stands with an outside examination of the hetter known cars shows how completely fhe design of the higher powered vehicles has settled down to broad standard lines. There are, it is true, several notable exceptions, such as the new valveless Daimler and the gear-boxless Sbeffield-Simplex—tbough here again the exception is only in respect to one unit of the car—but with all others a description of one might he applied equally well to balf a dozen others.

Some of the British Cars at the Show.

For most visitors the first stand to be inspected will probably he that of the Daimler Company, which, by a curious coincidence, occupies the center position of the huilding. When two months ago the Daimler Company announced their intention of adopting the Knight valveless engine exclusively for the coming season, there was much criticism of their action, many helieving that the firm had been too precipitate in deciding to concentrate on these engines right away. Mr. Knight's descriptive paper before the Royal Automobile Cluh a few weeks ago and the publication of the results of extensive tests that have been made, have led most people to believe that this engine marks the commencement of a new era in motor construction—for in addition to demonstrating the advantages which such an engine offers for the four-cycle motor, the new engine has directed puhlic attention to the possibilities of tbe two-stroke motor, to which class the Knight engine was at first erroneously supposed to belong.

Four models of Daimler cars are heing shown, the 22-horsepower, 38-horsepower, 48-horsepower and 57-horsepower. All are of the new type, and, with the exception of the last, have four cylinders. The 57-horsepower six-cylinder car is stated to have been constructed primarily to fulfil a special order for the United States.

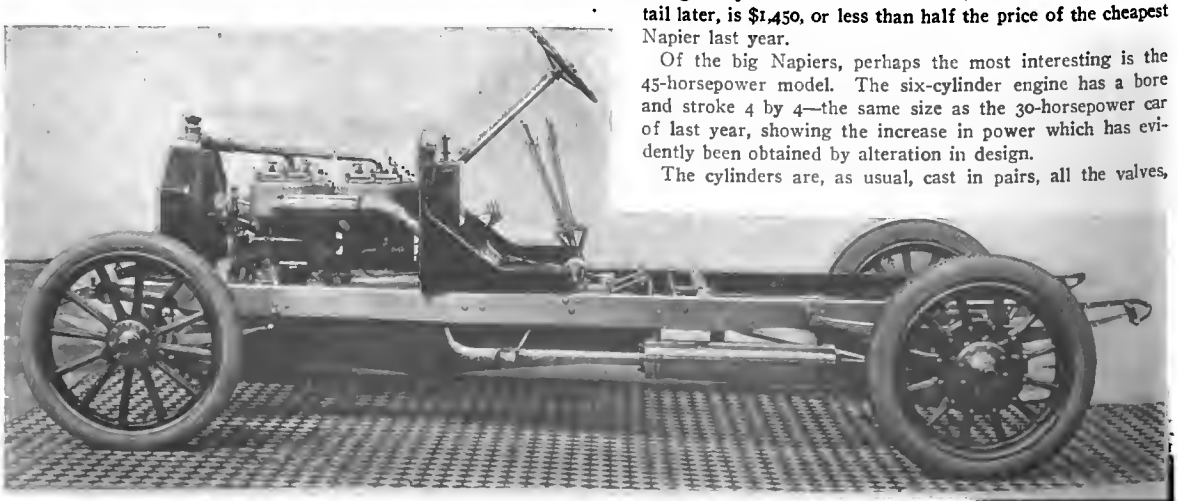
Once such staunch supporters of tbe chain, the Daimler Company bave now abandoned this drive on all cars, except the 48-horsepower model, shaft drive with bevel gearing being employed.

The pressed steel side frame members are parallel throughout and are connected by tubular cross memhers. Rudge-Whitworth wire wheels are fitted as standard on all models, but wooden artillery wheels will he substituted if the purchaser desires. The chassis prices of these cars range from $2,375 for the 22-horsepower to $4,000 for the 57-horsepower.

On the adjoining Napier stand much of novelty is likewise to be seen, though here there is not so much a radical alteration in design as the provision of new models in a section hitherto untouched by this maker. Always associated with the high-class six-cylinder car, the Napier name still applies to the several models of this type that are staged, varing in power from 30 to 90-horsepower. But, in addition to these, the popular 15-horsepower four-cylinder car attracts general attention, and also the 10-horsepower two-cylinder light car. The price of this last, possessing many features of interest which will he noted in detail later, is $1,450, or less than half the price of the cheapest Napier last year.

Of the big Napiers, perhaps the most interesting is the 45-horsepower model. The six-cylinder engine has a bore and stroke 4 by 4—the same size as the 30-horsepower car of last year, showing the increase in power which has evidently been obtained by alteration in design.

The cylinders are, as usual, cast in pairs, all the valves,



Effective and Solid Construction of the Chassis of the 45-60-horsepower Four-cylinder Op

whicb are interchangeable, being operated by the one camshaft. This in its turn is driven by helical gearing to reduce the noise. Tbe general elimination of noise of details in this way bas led to the adoption of "Noiseless Napier" as the title of the cars for next season.

The system of forced lubrication to every working part is the same as was used on last year's cars, and as any excess is taken from the well by the pump and restored to the tank, it would seem impossible for the engine to give trouble by smoking. The chrome-nickel crankshaft, with disc webs, runs in plain bearings. The comparatively small flywheel carries the flat disc clutcb and between this and the gear-box two separate Hooke's joints are interposed to insure absence of any binding due to momentary frame distortion.

The gear-box has three forward speeds and reverse, the layshaft and reverse pinion being at rest when top gear is engaged. The gear shafts are unusually large in diameter and as short in length as possible, and these factors, together with the intermediate ball bearing for each shaft, prevent any humming of the gears, which the firm contends is due in general to springing of the sbafts. The gears themselves slide on feathers solid with the shaft, instead of being on a squared shaft as formerly.

Behind the gear-box the foot brake is combined witb a ratchet sprag—a device now rarely met with—and this is linked up to the reverse lever to prevent any possibility of accident. In the rear live axle the two internal shafts have the driving gears integral witb them, the differential gears being of the straight tooth type.

The 30-horsepower model is the third of the series which includes the 10 and 15-horsepower cars. The cylinders, cast in pairs, have bore of 3¼ inches and stroke of 5 inches. The valves are all enclosed.* The remaining features are the same as those of last year's 30-horsepower car, with, however, the difference that a general lightening of parts has reduced the weight by no less than five hundredweight.

The 60-horsepower car is a bigger edition of the 45-horsepower having cylinders 5 by 5, while the 90 horsepower model, cylinders 6 by 5, is apparently a touring edition of the Grand Prix races, which were built for that contest but which never competed, owing to the barring of wire wheels by the French club. These wire wheels are standard on all Napier cars for 1909.

Further on, the Sheffield-Simplex is an example of several similar high class six-cylinder cars, but in itself it is remarkable in that it has no gear-box—in the usual sense of the word. The six-cylinder engine has its 4½ by 4½ cylinders cast in pairs, and the crankshaft is built in three pieces bolted together, a method of construction necessitated by the use of ball bearings. These bearings are of very big dimensions, ⅞-inch balls being used. Dual ignition is fitted, and the wires are in the form of a built-up cable with separate short leads to the plugs. The engine control is effected by a foot throttle pedal, sliding sideways. The movement is quite free, and as no pressure is required to keep the pedal in any particular position, great steadiness of running can be secured on the roughest of roads. The other foot pedal operates the clutch, and then, after a short neutral travel, the shaft brake. From the disc clutch the power is transmitted through a double universal joint to the real axle casing. Here, before tbe bevel pinion is reached, a short lay shaft is provided, which, in very compact form provides a low gear and a reverse. It is claimed that this low gear is never required, except for starting on the steepest of hills. The absence of the gear-box certainly improves the chassis, which presents a strikingly simplified appearance to the eye. Two views of the chassis are shown on page 732 of this issue THE AUTOMOBILE.

On many other stands British cars of known worth are staged, but as in most of these cases smaller models are manufactured with special details, consideration of these exhibits will be deferred till later.

*The disc clutch on this model is placed wtthin the gear-box, which latter is also extended to cover the foot brake.

The Two-seated Victoria Made by Alldays.

Some Distinctive Features of the American Exhibits.

The American firms that have established agencies over here are well represented at the show. In many cases the standard models have been slightly departed from to fall in more fully with British ideas, and agents are confident that the coming season holds out good business prospects for them. The White stand is always a center of attraction, for these cars are well known to British motorists and have quite a notable list of patrons. Rollin White was busy all day explaining numerous special points of interest of the new models, both the 15 and 40-horsepower types being shown. The many departures from previous White practice give additional interest. The frame is of pressed steel and the two forward cross members carry the engine, the weight of which thus comes behind the front axle. The short ball bearing crankshaft and the adoption of Joy's valve gear are further points of interest, and, altogether, the new Whites are certain to cause a big increase in the numbers of steam car owners over here.

Another American exhibit to which much attention is being paid is that of the Cadillac cars. The name Cadillac has always been associated with the well-known single-cylinder vehicle which has behind it such an unvarying list of successes in reliability competitions, ending up with the famous standardization tests of this spring. Hence unusual interest is shown in the new 26-30-horsepower four-cylinder model which has just arrived. The spun brass jackets on the separate 4 by 4½ cylinders are noteworthy, as also are the separate combustion heads—a practice which in these days of accurate machinery might well be re-introduced generally. The circulation of the oil from one crank pit to the next is very ingenious and should prevent any fouling of the rear cylinders when hill climbing. The engine is ungoverned, but control is easily effected by the provision of both foot and hand throttles, as well as an interconnection of clutcb pedal and throttle to prevent any racing of the engine when gear changing. A similar interlocking arrangement prevents the clutch engaging till the gears are fully in mesh, a point which should reassure the novice. Taking the car right through, the general design and workmanship are such as to reflect great credit on the Cadillac firm, and a good seaosn might safely be predicted for it.

The popular Ford cars are shown both in the 15-18 four-cylinder type, which is practically unaltered from last year, and in the new and distinct 2024 horsepower. Like the British Deasy mentioned before, the cylinders of the new Ford are cast in one block integral with the top half of the crankcase. The enclosed flywheel and epicyclic gears, all running in oil, are points of special note. The low tension magneto, combined with the fly wheel is also a novelty and should give a powerful spark and efficient firing at low speeds.

Many American firms—Rushmore, Goodrich, Stewart & Clark, Jones, and others—are to be found in the accessory section.

ALL READY FOR SAVANNAH RACES.

SAVANNAH, GA., Nov. 23.—As the day of the great race draws nearer Savannah is giving itself up more wholly than ever to the celebration of this, the greatest event in her modern history. The business section of the city is hung with Automobile Club of America colors, and most of the cars about town bear the club's bannerettes. Savannah's whole heart is in this race, and no one would so abuse hospitality as to intimate that the coming contest is not to be the greatest ever run in this or any other country.

Savannahians have above all an ambition that Thursday will see a new world's record set up. It is hard to convince them that with nineteen right-angle turns on the course, with several stretches of pretty rough going for racing cars, and the stops necessary for tire changes and fuel replenishment in so long a contest as 400 miles, it is unreasonable to expect an average rate as fast as 70 miles per hour.

There has been a lengthening of the course some eight miles, some curves have been softened, and turns have been banked. The magnificent 3½-mile Ferguson avenue stretch has been added, which will admit of unlimited speed, but after all there remains but this and the homestretch as the only portions available for any continued high speed. Single laps have been made at 70 miles an hour rate, but it is not to be expected that this should be maintained. If the Locomobile's Vanderbilt course average of 64.3 miles be beaten, the Savannahians should be well satisfied.

The banking of the turns has been a disappointment to the foreign drivers for two reasons. In the first place they are accustomed to skid around turns, and again the turns rise at the start and slope at the finish. The drivers say that this should have been reversed. It is also suggested that objection to any figures made standing as a road record may be made on the ground of the route being thus a specially prepared course, whereon actual road conditions are not encountered.

The Savannahians have spared no expense and left no stone unturned to improve on their excellent arrangements and management of last Spring. They have built a new and larger press stand, and erected west of the old stand a new stand with a seating capacity of ten thousand. The capacity of the old stand was also increased to 6,000. Eleven telephone stations have been established, connected with the score boards facing the grandstands and parking spaces. Along the front of the old stand, which is really the grandstand, the new stand being in the bleacher class, supply pits have been dug. Another supply station has been established at the head of Ferguson avenue, which is solely for tire supplies.

The troops have been ordered on duty by the adjutant-general. They number 500 and will be in command of Major W. P. Stephens. The course will be patrolled by 134 flagmen. One hundred and fifty men are at work on the course every day.

A great crowd is expected from neighboring States and cities. All the southern railroads have been selling excursion tickets with coupons attached, good for a seat on the new stand and exchangeable at one dollar on account of grandstand seats, which are sold for $3 for the two days. No single day grandstand seats are sold. Boxes seating six sell for $50. The Northerners have chosen the west end of the stand.

Chatham county has borne the expense of building the new roads, and the City of Savannah has resurfaced the roads within the city limits. The Savannah Automobile Club erected the grandstands and telephone line and will pay the flagmen. The profits of the race will go to the advertising fund of the city. The Automobile Club of America will not receive any of the race receipts, though at different times it is reported to have received appropriations amounting to $7,000 toward the cash prizes and other purposes. All other expenses attendant on the conduct of the race itself, relating to publicity and the contest committee and the cost of the $5,000 Gold Cup, are borne by the New York club.

Two serious accidents have marked the preliminary practice, one fatal and the other also possibly with death as its outcome. On Friday as the S. P. O. was speeding up the White Bluff road, John Juhasz, its driver, in trying to avoid a dog, swerved to the side of the road, gouged a big piece out of a tree, and then dashed into a telegraph pole. The crew was hurled from the car. Marcus De Rosa, the mechanic, had a fractured skull and other injuries and died shortly after reacbing the hospital. Juhasz escaped with bruises. The car was not, however, hopelessly wrecked. It is now at a repair shop with hopes of its still being able to take part in the light car race with either Phil. Adams or Connors, who was Stricker's mechanic in the Vanderbilt race, as its driver.

The other accident occurred in front of the Buiek camp during Wednesday's practice. Robert Burman was driving a light Buick, when its left rear tire blew out. The car skidded into a telegraph pole and was completely wrecked. The mechanic, Joe Grinnan, had his skull, elbow, and six ribs broken. One rib punctured his lung and pneumonia has set it. Burman escaped without injury.

All hands, both European and American, are well equipped in the matter of camps. All the foreign training quarters are located at points along the course. Three of the Americans have suburban establishments, the others making their headquarters at the local garages, where they have adequate shop facilities already at hand, the Acme and the Lozier having the most pretentious outfits, and the Buick having a shop alone by the trackside.

The Acme occupies the same quarters at Bonabella on La Roche avenue as it did last spring. A commodious cottage belonging to Robert Saussy lodges the camp captains and crews. A big boathouse by the riverside has been turned into a shop and garage. The eommander of the camp is C. H. Tucker, sales manager of the company. With him are Frank Clemmer, engineer; Ed. Lengel, head tester, and "Doc" Harry Fricburg, mechanic. Len Zengle, driver, and Charley Gross and Moses Saxon complete the force. The Acme stock ear racer, a seven-passenger touring car, and a runabout are the artillery force outside of the Grand Prize racer itself.

Prior's Woodlawn Villa, quite a pretentious estate on the White Bluff road, has been leased outright by Harry Lozier. A barn has been converted into a shop. C. A. Emise, salcs manager, who is in command, has Mrs. Emise and two children with him. Harry Michener, driver, Ralph Mulford, substitute, and Tom Lynch, mechanic, are noteworthy members of the force. Mr. Turcott is here from the Plattsburg factory in eharge of the mechanical force. In addition to the new racer, a Briarcliff model touring car is available for studying thc course.

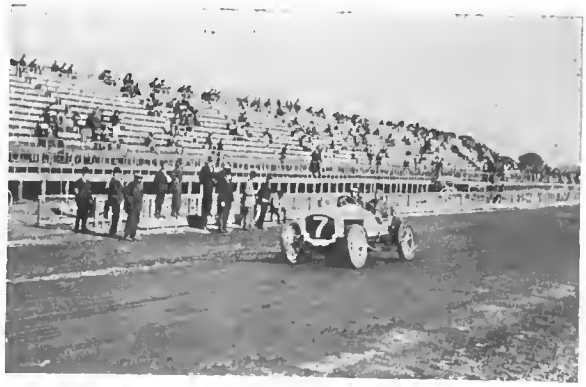
W. L. Marr, designer, has pitched the Buick camp a half mile out the White Bluff road. A building fully equipped as a shop and garage has been erected. John Hancock, superintendent of the factory, is with him. Ten mechanics are under their orders, in addition to Robert Burman, Ewing Easter, and Earl Jeffers, the drivers. C. A. Hearne, who is to drive his own ear, also has his mechanic at the camp.

The Simplex is stored at the Southern Automobile Company's garage, across the street from the De Sota. Joseph Seymour, the driver, and T. M. Pepperday, his mechanic, are in full charge.

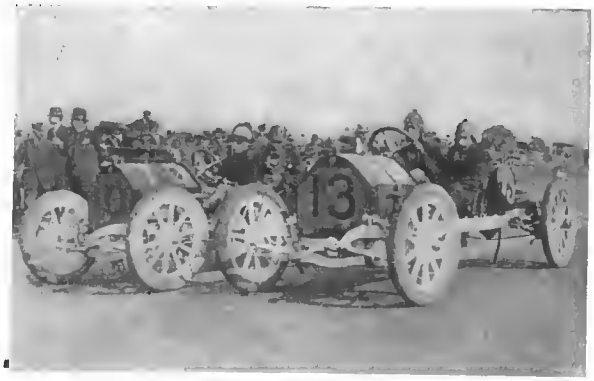
Carl W. Kelsey, sales manager, has leased a shop at 214 East Broughton street. Three mechanics from the factory will also serve in that eapacity for Arthur See, Joseph Munweller, Thomas Costello, and Mr. Kelsey himself, who will be the pilots of the Maxwell "mosquito fleet." The fourth mechanic will be a local man. Mr. Kelsey maintains military discipline, heading the procession to and from the course. He also insists that each man walk for an hour before breakfast to assure his physical condition.

The Chalmers-Detroit light car outfit has established its headquarters at Bryam's garage, in command of G. G. Behn, assistant

Michener in Lozier on Course at Isle of Hope.



Zengle Takes His Acme Past the Big Grand Stand.



Two Chalmers Detroit Candidates for Small Car Race.

Lancia "Lampo" with Driver Hilliard at the Wheel.

chief engineer. Lee Councilman, sales manager, is also on hand. Mr. Ford, the new advertising manager, and Carl H. Page, New York agent, are expected to-morrow. L. B. Lorimer and W. R. Burns have had out No. 10 and No. 13 each day for practice. L. J. Bergdoll, the Philadelphia agent, is still awaiting his car.

President A. C. Newby, of the National Motor Vehicle Company, has his six-cylinder at the Graham Automobile Company's garage, next door to the Pulaski. W. G. Wall, chief engineer, arrived to-day to take charge. G. A. Weideley, designer of the Premier, and Carl Fisher, of Indianapolis, came with him. Hugh N. Harding, who drives the car, is much in evidence.

F. T. Cameron did not arrive with the Cameron until last night. The committee received a telegram to-day, stating that the American Aristocrat would not be here to start.

Paul LaCroix has pitched the Renault camp at Barbee's at the Isle of Hope. The Italas are at Mrs. Hires' in the same district, where Henry Fournier receives many calls.

The Lancia camp is located at Castle Park on La Roche avenue. W. M. Hilliard, who will drive the "Lampo," is in charge, pending the arrival of President C. H. Tangeman, of the Hol-Tan Company to-morrow.

The S. P. O. is next door neighbor to the Lancia. The car, however, is now at Byram's garage, being repaired in the hope of its being able to start on Wednesday, with Paul Adams as its driver.

The Benz is at the German Club, and the Clement, De Dietrich, and Fiat at Thunderbolt.

Willie Haupt and the Chadwick are quartered at Police Headquarters. L. S. Chadwick, president, and H. B. Larzelere, sales manager, of the Chadwick Engineering Works, are in charge.

Heavy Attendance of Trade and Press.

Indications point to a large attendance of men prominently connected with the sport and industry, despite the remoteness of the week of the race. The trains and steamers all during the week have brought considerable contingents. To-day's arrivals showed a large increase in the number of early comers. Among them newspaper men were much in evidence. Among those already here are: Sullivan, *Herald;* Wolff, *Tribune;* Wetmore, *Evening Mail;* Gerrie, *Times* and *World;* Johnson, *Sun;* Meegan, *Telegraph;* and Curry, *American,* of New York; Kerrison, *American;* Reynolds, *Post,* and McNamara, *Herald,* of Boston; White, *Evening Times,* of Philadelphia, and Small, *Associated Press.*

Some of the tradesmen on hand are: William Du Cros, Dunlop Tire Company, London; J. C. Matlack and J. Wilbur Hobbs, Michelin Tire Company; J. C. Cockran, Continental Caoutchouc Company; S. H. Jacobs, Pennsylvania Rubber Company; George A. Weideley, Premier Mfg. Co.; C. A. Emise, Lozier Motor Company; Arthur Gruner, Chicago; Carl Fisher, Prest-O-Lite Company; L. S. Chadwick and H. B. Larzelere, Chadwick Engineering Works; Lee Councilman, Chalmers-Detroit Company; A. C. Newby, National Motor Vehicle Company, and C. W. Kelsey, Maxwell-Briscoe Motor Company.

Who the Starters Are, and the Weights Carried.

The following is a list of the starters in both races with the drivers, mechanics, and weights of the cars:

GRAND PRIZE RACE.

No.	Car.	Driver.	Mechanic.	Weight in Pounds.
1.	Clement-Bayard	Victor Rigal	Charles Gilbert	2775
2.	Lozier	Harry Michener	Tom Lynch	3075
3.	Simplex	M. J. Seymour	Tom Pepperday	3325
4.	Buick	Robert Burman		2700
5.	Chadwick	Willie Haupt	F. J. Breimer	2950
6.	Fiat	Felice Nazarro	F. Tagnano	2750
7.	Acme	Leonard Zengle	H. W. Freiberg	2500
8.	Benz	Victor Hemery	Gill	2925
9.	Lorraine-Dietrich	Arthur Duray	Mattbys	2875
10.	Renault	Francois Szisz	Martand	2525
11.	National	Hugh N. Harding	C. S. Kellum	2750
12.	Itala	Alexandre Cagno	Moriondo	3150
13.	Clement-Bayard	Hucian Hautvast	Chassangne	2700
14.	Fiat	Louis Wagner	Ferro	2750
15.	Benz	Rene Hanriot	Heim	2925
16.	Renault	Louis Strang	C. Anderson	2550
17.	Itala	Henry Fournier	Riva	3275
18.	Fiat	Ralph DePalma	Bordino	2775
19.	Benz	Fritz Erle		2875
20.	Itala	Giovanni Piacenza	Cosso	3300

SMALL CAR RACE.

No.	Car.	Driver.	Mechanic.	Weight in Pounds.
1.	S. P. O.	Herbert S. Conners		1984
2.	Lancia	W. M. Hilliard	Frank Strobel	2000
3.	Chalmers-Detroit	L. J. Bergdoll	Charles Howard	1900
4.	American Aristocrat	K. R. Manville		....
5.	Cameron	F. I. Cameron	J. J. White	1125
6.	Isotta	Al. Poole	W. Fehr	1500
7.	Gregoire	George Robertson	Glen Ethridge	1500
8.	Buick	R. Burman		1500
9.	Maxwell	A. See	Carter	1525
10.	Chalmers-Detroit	L. B. Lorimer	J. H. Stickney	1900

16.	Buick	Earl Jeffers	W. C. Mahoney	1550
17.	Maxwell	Carl W. Kesley	H. Cawood	1450

STRICKER LAID AT REST IN NEWARK.

Funeral services over the remains of Emile Stricker, who was killed during the twenty-four-hour race at Birmingham, Ala., Tuesday, November 17, were held at the quarters of the Professional Chauffeurs' Club of America, 158 West Sixty-fifth street, New York City, at ten o'clock Friday morning. The body was taken to Newark, N. J., in the afternoon and placed in the receiving vault in Fairmount cemetery, to await further instructions from abroad. Prior to the services a special meeting of the Chauffeurs' Club, of which Stricker was a charter member, was held and the following resolutions on his death were passed:

Whereas, Our beloved brother, Emile Stricker, has been suddenly removed from our midst by the divine hand of Providence, to the great sorrow of his relatives, many friends and fellow club members; be it

Resolved, That we, the members of the Professional Chauffeurs Club of America, tender our sincere sympathy to the bereaved family of the deceased and hereby express our deep appreciation of his sterling qualities and marked ability, and regret the personal loss which each member of this club has sustained by the death of our friend and fellow member; and be it further

Resolved, That these resolutions be printed in the official organ of this club, the "American Chauffeur," and that copies of the resolutions be sent to the family of the deceased, also spread upon the minutes of this club.

GOOD ROADS MEN MEET IN INDIANA.

INDIANAPOLIS, IND., Nov. 23.—Advocates of good roads from all parts of the State will meet here to-morrow night for the purpose of organizing the Indiana Bureau of Good Roads into a permanent association. The meeting will be presided over by R. A. Brown, temporary chairman, until officers are elected.

The meeting will be held in the assembly room of the Board of Trade building, and it is expected that automobile owners, farmers, rural mail carriers and others interested in good roads, will attend. There will be addresses by W. G. Blatchley, State geologist; W. H. Roberts and John Mendenhall, county commissioners, and Clarence Kenyon, who made a special study of highway construction in Europe during the last summer.

The bureau believes that a better system governing road construction should be adopted. To this end it will ask the Legislature to create a State Highway Commission.

At this time road building is accomplished by very unsatisfactory methods, without regard for the season when it should be done. Farmers are authorized to haul gravel on the roads at $3 a day, the amount being allowed on their taxes. As a result they haul gravel when they have nothing else to do and merely dump it in the middle of the road.

It is probable the Legislature will be asked to give the highway commission a liberal appropriation to carry on the work.

BENEFITS DERIVED BY HEAT TREATING STEEL

By THOMAS J. FAY, President Society of Automobile Engineers.

THE latter day practices of the makers of automobiles take into account, primarily, material soft enough to be worked on a commercial basis. Since the materials have to serve for divers purposes, they have to be rendered hard or dynamic and in other states, depending upon the service. It is possible to start in with certain selected grades of steel, initially soft, but susceptible of transformation, if heat treatment is resorted to. In this article an attempt will be made to expose to view some of the methods by which initially good steel may be readily fashioned into shape and thereafter rendered hard or soft, ductile or dynamic, as the exigencies of the service may demand.

of the variations, and it may serve to indicate the desirability for system and a well-defined uniformity in practice.

It is not claimed that all the "heat treatments" given in the tabulation will be found valuable for use; on the other hand, the contrary will be found true. It is the idea to afford a wide range of specific forms of heat treatment, and in so far as it is possible to do so, extend proof of the value or otherwise of the several modes of treatment.

It will be understood tbe treatment proper for one grade of steel would be fatal for another. It follows that there may be grades of steel demanding some one of all the formulæ given

THE RANGE OF TEMPERATURES FOR THE SEVERAL TREATMENTS OF STEEL.

There are dozens of detailed ways of heat-treating steel, but the principal remains the same in all, differing perhaps as respects temperature and time, calling into play the influences of quenching baths, and the effect of varying rates of time, in heating and quenching. The above tabulation will suggest some

under some one of the several likely conditions. It is better to afford a diversity of formula, rather than to restrict the same, merely to court brevity. The table in question, in itself, offers no suggestion of the exact treatment to use in any given case nor does the same table include every possible treatment.

The table, together with some data on the subject, should, however, materially aid in the process. It is by far better to be able to identify the respective modes of procedure in some way, than to go about it haphazard. As regards the steel itself, there are several points that can be taken as more or less fixed, viz.:

(1) Steel for "cementing" (case hardening) may be alloyed or not, but it should be low in carbon. If the same is alloyed, the carbon sbould be lower than if the steel were of the carbon-steel genus.

(2) Iron almost devoid of carbon may be case-hardened (cemented), but the time required to grow a depth of carbon will, of course, be comparatively great in iron or in mild steel.

It will be to no purpose to attempt to improve upon the language of "Harboard"* in his definition of "tempering," viz., "The hardness conferred upon steel by rapid quenching is not suitable for any induetrial purpose, and has to be modified or 'tempered' to suit the particular requirements of the case. This may be done by rebeating the hardened (quencbed) steel to different temperaturss. The operation of tempering may tberefore be defined as modifying the degree of hardness conferred upon steel by quenching, by heating to certain definite temperatures, and slowly or rapidly cooling. Tempering reduces the brittieness and the hardness and considerably increases the toughness and ductility of the materials, and by varying the conditions of heat treatment almost any required degree of hardness may be produced."

In annealing steel it will be well to remember that the process will be moet beneficial as a rule if the steel is heated to a point above Ar_1 by a margin of about 30 degrees C. in eome grades, a matter depending upon the carbon contsnt.

*Harboard: The Metallurgy of Steel, p. 641, Sec. Ed.

Cementing steel is also a product singularly free from impurities when the results are noteworthy.* Krupp cementing steel, for illustration, rarely has more than ten points of carbon, no matter what the other components may be. Tbis is provided the steel is for "cementing." In this steel the sulphur and phosphorus are both held very low, indeed, and the manganese does not exceed 0.50 per cent. What is meant by low sulphur and phosphorus is something to define in view of the great diversity of opinion of this phase of the subject.

Sulphur Limitations (in automobile work):

0.010 = a very satisfactory low limit;
0.015 = a moderately satisfactory point;
0.020 = the top limit for capital results.

Phosphorus Limitations (in automobile work):

0.010 = a very satisfactory low limit;
0.015 = a moderately satisfactory point;
0.020 = the top limit for capital results.

It is not impossible to use steel if the sulphur and phosphorus are in excess of the top limits given, but the idea here is to fix the range of desirable contents. In heat-treated steel there are many things to conspire against the user of inferior steel, and the chances of ill results are so great as to demand the use of none but the finer grades of steel.

The silicon should, in most cases, be low as well; in fine, it seems, the nearest approach to pure iron plus the alloying elements, would best serve the purpose. Then the carbonizing process may be conducted under conditions of the greatest possible safety and the "failures" will be few and far between. The usual object in cementing is to attain extraordinary results, hence it would seem as if the steel should be of extraordinary quality. Indeed, it is true of steel that the "metalloids"† should be as low as possible anyway, whether the steel is for case-hardening or not. If steel is not to be "cemented" and it is desired to render the same hard by quenching, the carbon must then be higher (than that in cementing steel) by a considerable amount. In carbon steel, it is true, that if the carbon is below 20 points, there will be no appreciable increase in hardness as the result of quenching from even very high temperatures. Obviously, then, the carbon must be above 20 points if the hardness is to be due to the effect of quenching.

If the carbon is up to about 40 points, quenching will result in a very considerable hardness, while if the steel holds nickel, chromium, tungsten or vanadium, the hardness will be more pronounced. If, on the other hand, great hardness is demanded, from strictly carbon steel, the carbon should be even up to 90 points. If the steel is to be tough as well as hard it is a matter of oil quenching and subsequently tempering. Water quenching alone results in great hardness, but the steel would be brittle. Subsequent tempering would reduce the brittle character of the steel, while oil treatment imparts far greater toughness.

The carbon content then sbould be fixed higher for carbon steel than would be required for alloy steel, if the hardness is to be as a result of quenching and subsequent annealing, rather than by the cementing process. There are some practices to be condemned in connection with the hardening of steel (especially alloy steel), as, for illustration, the use of cyanide of potassium. It is not well to raise the temperature of one end of a piece of steel to a point high enough to engender hardness as a result of quenching after immersing the same in the cyanide. If one part is raised to a high temperature, and the other part is kept at a lower temperature (black), the result is, a zone between the hardened and the soft parts which is neither one or the other of the conditions that should obtain. The cyanide of potassium seems also to be incapable of imparting a safe hardness to the steel unless the steel itself is very low in carbon and free from alloys. In that event the depth of the hard skin is but microscopic and of no value in actual practice.

It is not uncommon to see camshafts with cams hardened by applying the flame of a "bunsen burner" to the cams, raising the heat to a high point (how high no one knows), then the cyanide is daubed over tbe heated surfaces and the quench is applied. It is plain enough that the purchaser of an automobile who has cams thrust upon him (hardened in this way) will not be afforded an insight to the fact in the "elusive" literature of the publication department of the makers of such automobiles.

The structure intervening a hard and a soft layer may be good and it may not. It is satisfactory in the cemented work, if the steel is primarily a low-carbon product. It is not satisfactory if the whole of the member is not raised to the same temperature. It is not proper to heat one end of a member and leave the other end cold. There is a junction of the two conditions that will not be equal to the other portions of tbe member in point of hardness, on the one hand, and of strength on the other.

From these crude methods of spoiling steel (in the attempt to harden it) to the most approved methods of heat treating is a long way. What is wanted for the most signal success is a complete equipment knowledge of its use, and the requisite qualities of the steel.

Required Equipment for Heat Treating.

(1) Exact means of determining the temperature.
(2) Suitable means of attaining any temperature up to 1,400° C.
(3) Exact means of maintaining a constant temperature for long periods of time.
(4) Means for quickly adjusting the temperature and changing the same.
(5) Means for protecting the steel to be treated from contact with objects that would tap the heat and render the temperature uneven.
(6) Means for slowly raising the temperature of the parts to be heat treated.
(7) Means for slowly cooling the parts to be heat treated.
(8) Means for quickly lowering the temperature of the parts to be heat treated.
(9) Suitable tools for deftly handling the parts without exposing them to air, or to such outside influences as would abort the desired action.
(10) Arrangements of the equipment such as would protect the manipulator from the poisonous fumes of the chemicals used in the process.
(11) An adequate forging plant.

In general there are two main methods of proceeding with the heat-treating process. The first is the one in which the parts to be treated are exposed to the burning gases and the atmosphere to a certain extent, and, the second, is a process by which the parts are submerged in a media of metallic salts, and the whole is raised to the desired temperature. In this way the parts to be treated only contact with the salts and the temperature is held quite uniform throughout the mass. The salts protect the steel from contact with the air or gases during the process. Of the two methods, the second is much to be preferred, yet even so, it is the method least used.

Muffle furnaces belong to the first method of heat treating, in which coal-gas is used as the source of heat. They work very well, indeed, and a good manipulator can deliver splendid product as a result of their deft use. It is not possible to protect tbe steel, however, from contact with the products of combustion, and it is not easy to uniformly heat the steel throughout its section, especially if the parts are bulky. It cannot be said tbe muffle furnace temperature may be measured with great accuracy, nor will one be sure that the temperature of the parts to be treated, will be the temperature as shown by the "pyrometer."

The pyrometer only contacts with the hot gases and not with the parts to be hardened. On the whole, however, the work done by the muffle furnace in the hands of a skilled manipulator is not to be harshly criticised, because the results are truly good. Certainly, the muffle furnace is a vast improvement over an open fire of any kind. It is also a fact that the muffle furnace is superior to a "bunsen burner," by means of wbich a hot blast

*Freid Krupp A. G. Essen un Ruhr.
†Sulphur and phosphorus are classed as metalloids.

is directed against tbe parts to be heated. Surely, this is not the way to realize good results. Certainly, it is not possible to maintain uniformity, if a bunsen flame is applied to one side of a piece and the other side is exposed to a cold draught.

The muffle furnace has the advantage of affording an indirect and uniformly heated atmosphere. This atmosphere does not seem to hold in its composition, elements or conditions such as tend to destroy the structure of the steel. On the other hand, it is not to be said that the atmosphere of the muffle furnace is the best possible. The exact atmosphere of the muffle furnace cannot be stated because the condition is one of partial combustion interstratified with the products of combustion. The coal-gas itself is a considerable variable, but it might approximate the composition as follows:

PRINCIPAL CONSTITUENTS OF COAL GAS.

Formulæ.	Names.		Volumetric per cent.
H	Hydrogen		25 to 50
	Light carburetted hydrogen		35 to 52
C_2H_2	Acetylene	Convertable Hydro Carbons	3 to 20
C_3H_6	Propylene		
C_4H_8	Butylene		
C_4H_4	Acetylene	Carbureters	?
$C_{10}H_8$	Napthalene		
CO_2	Carbonic acid		0 to 2
CO	Carbonic oxide		0 to 2
CN	Caynogene		5 to 9
NH_3	Ammonia		0 to 0.06
CS_2	Bisulphate of carbon		to 0.004
H_2O	Aquous vapor		to 2.5
N	Nitrogen		to 8
P	Phosphorus		trace.

Carbonic acid, carbonic oxide and water would constitute the chief products of combustion, the carbonic oxide would, of course, only be present if the combustion were incomplete. The nitrogen would remain as such (inert) and to these products must be added the atmospheric air requisite to dilute the gas for burning.

It has not been claimed by many who have taken an interest in the question of heat treatment of steel tbat the contact of the heated steel with the products of more or less complete gaseous combustion would lead to any ill results. That the steel will be in a more or less receptive state is not to be denied, hence it is a matter not to be entirely disregarded, this question of the contact of the steel with the atmosphere in which it is heated.

The more recent experiments on the subject tend to indicate that the atmosphere in which the steel is raised to a high temperature, does influence the situation in more ways than one. Nitrogen, for illustration, seems to increase the penetration of carbon. If parts to be cemented are packed in cementing materials and an excess of nitrogen is constantly supplied in any suitable way, the penetration of carbon will be to a greater depth in a given time.

The Influence of Nitrogen Upon Cementation.

If the cementing materials are high in nitrogen, the same results will follow, to a less extent, in all probability. If, however, it can be shown that nitrogen increases tbe penetration of carbon in steel at a cementing temperature, this is equal to saying the gas atmosphere in contact with the incandescent steel will influence the results, for good or ill. If we do not know the extent of the changes that may result, we do not know if the changes are beneficial or otherwise.

Under such conditions it is the safest to eliminate the atmosphere if it can be done with safety. It is not always the case that carbon is to be imparted to the steel, and on some occasions increasing the carbon content is far from the right thing to do. The most approved method of beat treatment of steel must be that in which the steel is submerged in a media of the most beneficial sort. In this way the steel is protected from contact with all but the desired contact media. This summary of the investigations of G. Shaw Scott was reported in the *Horseless Age*, Feb. 12, 1908, and while it cannot be regarded as conclusive and final, it is nevertheless pertinent, and normal to general expectations in this work.

"G. Shaw Scott, of Birmingham University, in a paper read before the Iron and Steel Institute of Great Britain, sbows the influence of nitrogen upon the penetration of carbon into iron or steel in the process of carbonization or cementation. The mixtures employed in cementation by various manufacturers are very numerous, including coke potassium ferrocyanide potassium cyanides, hydrocarbon vapors, bone, animal horn, graphite, burnt leather, animal black, barium carbonate, etc., either alone or in combination, each maker having a different formula. In every mixture used nitrogen exists under some form or other, however.

Mr. Scott took a certain number of identical bars of soft steel and subjected them to cementation with various mixtures and under given conditions. The bars were then broken, and their structure examined under a microscope. The first two experiments were made with anthracite and coke. Two bars, one surrounded with coke and the other with anthracite coal, were heated to 900° C. for four hours, and showed a penetration of from 0.15 to 0.16 millimeter (0.0059 to 0.0062 inch) only. The third experiment was made with burnt leather under the same conditions as before, and showed a penetration of 0.0622 inch, ten times greater than the former.

Thinking that this was due to the effect of nitrogen, two other bars were taken, one being previously heated to 550° C. in an atmosphere of ammonia for four hours, and placed in a special cementation chamber, with a non-nitrogenous agent, as burnt sugar, for eight hours, during which they were subjected to a constant temperature of 1,000° C. This experiment, after a number of repetitions, showed a ratio of penetration of 45 to 32 between the two bars, the ammonia vapors assisting the penetration of the carbon.

At 1,000° C. cementation can be easily accomplished, since with a non-nitrogenous agent the steel approaches its melting point, and the preliminary ammonia treatment influences the steel during the first few seconds of the process only. Mr. Scott, therefore, built a special furnace in which two boxes could be placed. One of these boxes had a tube for the admission of the ammonia gas; this tube was 0.472 inch diameter and 2.36 inches long, and was screwed into one side of the box, small apertures allowing the escape of gas in the opposite side. The second box has similar dimensions to the first, but had no tube and was hermetically sealed. Bars covered with burnt sugar were placed in each box, and both boxes placed within the furnace, where they were subjected to a temperature of 900° C. for four hours. The ammonia gas was passed into the first box during the whole time. The bars were then allowed to cool.

After the bars were withdrawn from the boxes they were examined and showed very different aspects. The bars which were untouched by the ammonia were blue-blackish and were easily cut with a saw, while the others could not be sawed and presented a whitish appearance. The treated bars showed a penetration of .0708 inch, while the untreated bars did not show more than .0566 inch. This completed the experiments.

It is evident from the above experiments that the presence of nitrogen in cementation acts beneficially in causing a deeper penetration of the carbon into the steel."

While the above experiment is very interesting in itself, it is of more interest here in that the reverse point of view tells us that if carbon is not wanted to a great depth, it will be desirable to avoid contact with the nitrogen in such form as to render it potent as an agent. There are other gas problems in the same way, and while time may afford the requisite data by means of which the best results may follow, the fact remains, for the present it is wise to eliminate all unknown quantities.

Of "muffle furnaces" there are many sizes, shapes and types; they serve for many purposes and, as before stated, in the hands of skilled manipulators, serve the purpose very well, indeed. There are other and superior methods of heat treating, however.

(To be continued.)

How To Prolong The Life of A Tire

By Hiram Percy Maxim

WHAT is the matter with our Tires? This question is probably asked by the autoing public more times a day than all other automobile questions put together. That there is very much the matter with our auto tires is undoubtedly the case, and it is the writer's object to point out what is probably the greatest trouble.

The primitive tire is the metal band around a wheel which forms a tread. The modern pneumatic tire is a band of compressed air around a wheel which forms the yielding tread we require for an automobile. The metal tire is able to hold its shape and its position on its wheel by virtue of its natural strength. The air tire is not only unable to hold itself together, but it is striving with all its might to dissipate itself. It requires some form of a retainer or envelope for holding it—and just here, in more senses than one, lies the rub.

The container or envelope which many years of experience has taught is the best compromise, is a combination of rubber and cloth fabric. The former furnishes the air tightness, while the latter furnishes the mechanical strength to withstand the strains. For convenience in repairing accidental air leakages a removable inner tube is used, which leaves the strain and wear resisting to the outer portion of the structure, which then becomes merely an outer casing or "shoe," as it is termed.

Now, it so happened in the course of the development of the automobile that as vehicles became rapidly larger and heavier and speeds higher and higher, this outer casing became thicker and stiffer until a very resistive structure resulted. Where the ordinary tack or nail would once always puncture, with the thick casings they were not long enough or strong enough. To-day it requires quite a robust nail to get through and puncture an inner tube. Some of us came to believe that tire troubles were beginning to be conquered, especially for the first few hundred miles after new casings were put on. This belief has always been short-lived, however, for a worse difficulty was confronted in the form of ruptures or bursting of the outer casings, or "blow outs," to use the popular term. This trouble is now the most pronounced form of tire trouble, some autoists believing it to be 90 per cent. of all tire trouble.

The failure of a casing is, of course, a very serious form of trouble, as a car cannot go on until a new casing is substituted for the one which ruptured, even though we overlook the very important expense involved. Under such circumstances the tire is, of course, blamed, and usually another make is tried next time. After trying every make and finding no material difference, the autoist, in exasperation, demands an explanation by asking the question with which this article opened—"What is the matter with our tires?" This question has not been satisfactorily answered publicly, and it, therefore, is a matter of considerable interest. In the accompanying illustrations the tire itself will be found to give its own answer.

Fig. 1 shows a 4-inch tire in its natural form as it would appear if cut open. The fabric which is incorporated in the rubber is shown distinctly. The inner tube is shown inside. Let us now see the effect upon this structure of deformation, for deformation and reformation, back and forth, is its daily life.

Fig. 2 shows a moderate deformation, such as would occur when a properly inflated tire ran over an obstruction approximately 1 inch high, something that occurs a great many times a minute during the running of a car. It will be seen in the illustration that the walls of the casing are slightly bent. When we bend such a relatively thick wall we require that the material in the wall "work" or stretch or "flex" very considerably. The more we bend the wall the worse this working or flexing.

Now let us look at Fig. 3. This shows what occurs when an *improperly* inflated tire runs over an obstruction approximately 1 inch high. Observe the bad bend in the fabric and imagine the result of repeatedly bending this material back and forth this amount, thousands and thousands of times. This is what happens when an improperly inflated tire is in motion. Obviously it must break the wall structure at the sharpest point of the bend sooner or later. It will be sooner if the bend is sharper, due to the tire being softer, and later if the bend is gentle, due to the tire being harder.

At this point let us examine ourselves and ask how we inflate our tires. Most of us must answer that we pump the tire until it *looks* fairly round where it bears upon the ground. Then we usually kick it, apparently on account of some extra accurate gauging ability of the toes of our boots. Look at Fig. 4. This is a photograph of a 4-inch tire on the rear wheel of a car, and which has been pumped by gauge to exactly 30 pounds pressure. *It looks fairly round.* In a hurry or on a hot day it is very easy to feel sure it is pumped up enough.

Now look at Fig. 5. This shows the same tire pumped up to 50 pounds pressure. It must be confessed there is difficulty in

Fig. 1—Four-inch tire in natural form.

Fig. 2—Moderate deformation of well-inflated tire.

Fig. 3—Deformation of improperly inflated tire.

telling the two figures apart. But this is not the worst. Examine Fig. 6. This is the same tire pumped up to 90 pounds pressure and photographed from the point which most tires are viewed from when judging their inflation. Ninety pounds is the pressure the tire should have, and tiremakers so advise.

Although it is three times higher pressure than that in Fig. 4, and nearly twice as high as that shown in Fig. 5, it would take a careful measurement to determine it. No amount of "looking" or kicking would give even a fair approximation of which was which—and here we have the real "nigger in the wood-pile" of our blow out troubles.

We inflate our tire by guessing at the degree of inflation, or attempting to judge it by the appearance of the tire, whereas the photographs clearly show that there is but little difference in outside appearance between a tire pumped up to 30 pounds pressure and one pumped up to ninety pounds. There is hardly a bit of difference between the appearance of 50 pounds and ninety pounds. Yet 50 pounds corresponds to the sharp bend shown in Fig. 3 and 90 pounds corresponds to the gentle bend shown in Fig. 2.

There is one more experiment we should make. This is to catch a tire actually passing over the 1-inch high obstruction, so we may study deliberatively just how things are. Look at Fig. 7. This shows our 30 pounds inflation, which is the favorite

Fig. 4.

Fig. 5.

Fig. 6.

Showing tires blown up to 30, 50, and 90 pounds pressure, and which shows that the appearance of the tire is deceptive.

of our wives and daughters on account of its soft riding qualities, passing over the obstruction. Notice the terrible punishment the thick and stiff wall of fabric must be receiving. The bend shown in Fig. 3 is not nearly as bad.

Now turn to Fig. 8. This shows our 50 pounds inflation passing over. This pressure is the average existing in the great majority of tires the country over. While its deformation is not as bad as the 30 pounds pressure of Fig. 7, yet we can easily see that it is enough to rapidly bring about a fabric rupture, when we realize that the passing over 1-inch high irregularities is practically continuous in the running of a car.

Now, finally, let us see what the deformation would be if we kept our tires pumped up to where the tire maker tells us we should keep them. Look at Fig. 9. This shows the properly inflated tire taking a 1-inch high obstruction. The bending and punishment of the casing is entirely different, and a casing would be able to stand it longer, probably, than the rubber tread would stand the wear it is subjected to. In other words, *although a properly and an improperly inflated tire have very nearly the same appearance when standing upon a flat surface, they suffer an altogether different degree of punishment when passing over irregularities.*

This really tells the story. The only thing remaining is to tell how a tire should be inflated to be sure that it is done properly.

The only way to properly inflate a pneumatic tire is to use a tire pressure gauge to measure just what pressure is actually in the tire. Such a gauge is shown in Fig. 10 when actually in use. The gauge is a small pressure gauge screwed onto the tire valve stem, and provided with a little lifter for lifting the tire valve so that the pressure in the tire may freely enter the body of the gauge. The tire pump or the inflating bottle tube is screwed to the gauge. With this arrangement there is no trusting to appearances. One positively knows.

And, now, in conclusion: With the tires of a car always hard it goes without saying that they will last longer. It is not impossible always to have them properly inflated, although it is by no means always easy to insure it. The ordinary chauffeur is not at all fond of pumping up a large tire, and he is very prolific in finding and devising reasons why it should not be done. He does not pay the tire bill, however. Tank and mechanical inflators are appearing upon the market in increasing numbers all the time, and perhaps this may assist in securing proper inflation. But in any event, unless the writer is very much more in error than he thinks he is, he can answer the question with which this article opened. This answer is: "We do not keep them properly inflated."

CONSTRUCTION OF LIQUID TACHOMETERS*

By AMASA TROWBRIDGE, Member A. S. M. E.

IN any instrument designed for measuring the speed of a revolving wheel or shaft, the centrifugal force developed by the revolution of some part of the measuring instrument is almost universally used to give the indications. This centrifugal force should be applied as to eliminate, as far as possible, the errors due to friction or wear. This, its makers assert, cannot be attained by the use of a solid body as the flying balls in a ball governor, or the moving weights of a shaft governor. The Veeder tachometer, makes use of a liquid in a device similar to a centrifugal pump. By careful experiments extending over nearly eight years several forms embodying this principle have been perfected. As the paddle of the pump does not touch the case in which it revolves, there is no wear between the revolving paddle and stationary case. The bearings are so constructed that the wear is slight and does not affect the readings. The liquid does not change its character appreciably under any circumstances, and consequently the indications of the instrument will be correct after it has once been properly graduated.

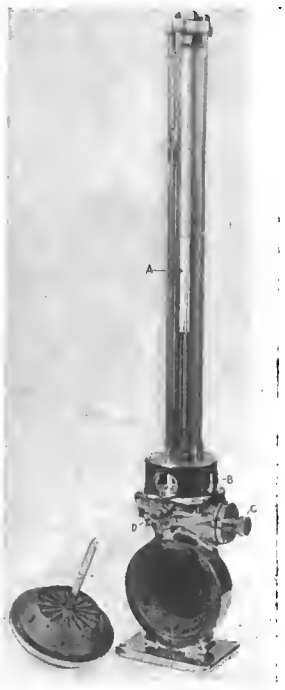

Fig. 1.—Veeder liquid tachometer.

The principle on which the liquid tachometer acts is, that the pressure developed by the centrifugal force of the liquid, when the instrument is running at a certain speed, is a definite quantity. This pressure forces liquid up the indicating tube A, Fig. 1, and is balanced by the pressure due to the height of the column of liquid in the tube.

Referring to the formula for centrifugal force, which is $F = \frac{Wv^2}{r\,g}$, we notice in this formula that there is but one variable, when r, the radius of the paddle, and W, the weight of the liquid, are fixed. Hence the indications of the instrument depend entirely on the velocity and do not change if wear is eliminated. The friction of the pump, generally speaking, need not be considered, nor its efficiency. If there be no flow of the liquid, the force F is expended in maintaining a pressure P, and this is equal to the pressure Wh due to the height of the liquid column. When the column is at rest, that is, when the speed is constant, F equals P, hence $\frac{Wv^2}{r\,g} = Wh$. It is obvious from this that W may be varied at will without materially affecting the height of the column. This is found to be the case, and it makes little difference in a liquid tachometer whether the liquid employed be something heavy like mercury, or light as alcohol. The indications are essentially the same for both liquids.

It is, of course, highly important that a suitable liquid should be chosen for such an instrument. In the first place it is necessary to choose a liquid which will not freeze at any temperature commonly encountered. It should be also as safe as possible in regard to fire, because it may frequently be used in the neighborhood of an internal combustion engine, where inflammable vapors would be dangerous if allowed to escape. Also, it should be readily obtainable; and such that its viscosity will not be materially altered by the ordinary change of temperature. The viscosity of the liquid makes a slight difference in the height of the indicating column.

EFFECT OF VISCOSITY ON REVOLUTIONS REQUIRED.

Material	Kerosene.	Water.	Alcohol.	Benzine.	Sperm Oil.	Paraffin Oil.	Valvoline Oil No. 2	Glycerin.
Revolutions required	852	851	850	849	807	792	788	779

A series of experiments was conducted to determine the relative viscosities of various liquids. The more commonly used liquids were tested in the following manner: An instrument having a long tube was put on the testing machine filled with one liquid and run at such speed as to give a fixed height of column. The first liquid tested being alcohol, a height of column corresponding to 850 r.p.m. was taken. The other liquids were each in turn put into the same instrument, and the revolutions of the instrument required to maintain the same height of column were taken, as shown in above table. It is surprising to find that benzine is more viscous than kerosene. Experiments are still being conducted on this point, the results of which are not ready for publication. Other points which must be considered are the lubricating qualities of the liquid and its liability to corrode the metal of which the instrument is made.

The Veeder tachometer, in one of its present forms, is shown in Fig. 1, with paddle removed. This instrument embodies all of the necessary points enumerated above. The only moving part of the instrument is the paddle, which imparts the necessary centrifugal force to the liquid contained in the body of the instrument. A small reservoir B is located directly above the paddle case. In the center of this reservoir is a glass tube through which the liquid flows to the glass indicating tube A. A suitable zero mark is provided around this small tube in the center of the reservoir. The liquid rises by capillary attraction in this small central tube somewhat above the level of the liquid in the reservoir. This enables the instrument to be set at zero very handily, a displacement plug operated by a small thumb nut shown at C enabling the operator to raise or lower the height of the surface of the liquid to exactly the zero mark. The glass indicating tube is about 12 inches high, although a scale fully 3 feet high can be used where extreme accuracy is necessary.

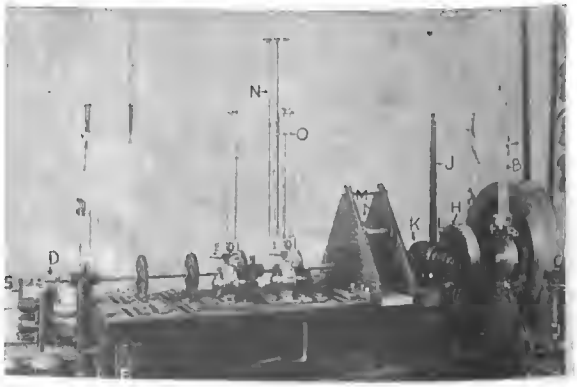

Fig. 2.—Testing machine, with paddle wheel shaft driven by geers.

*Paper presented at the New York meeting (December, 1908) of The American Society of Mechanical Engineers.

Free passage is provided from the reservoir to the center of the paddle wheel, allowing the liquid to flow freely to the paddle wheel, from which it is thrown out through very small orifices in the periphery of the paddle case. At the front of the instrument is a small handle *D*, which operates a valve to choke the passage from the pump to the indicating column. This prevents

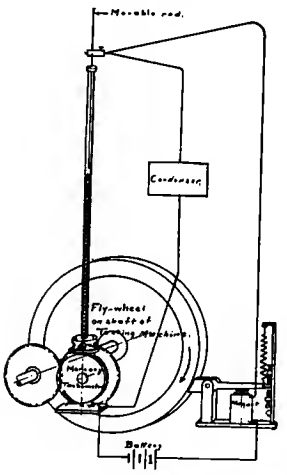

Fig. 3.—Automatic speed controller for testing machine.

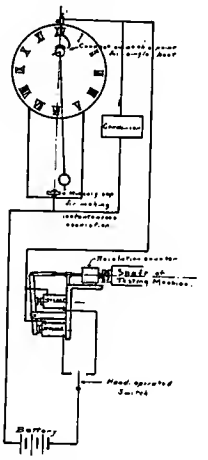

Fig. 4.—Connections for the speed counter.

the dancing or vibration of the liquid column, due to any sudden fluctuation in the speed of the revolving body whose revolutions are being indicated. The liquid used in this instrument is alcohol colored with an aniline dye. This liquid has been found extremely satisfactory, although other liquids may be used in place of it for certain cases.

It is evident that the graduations in this instrument will not be evenly spaced from zero up to the maximum. The height of the liquid column depends on the centrifugal force, which varies with the square of the speed of the paddle; hence, the graduations will be more open at the top of the scale for the high speeds than at the bottom, where the low speeds are measured. This is an advantage in some ways, especially on automobiles, since the graduations are large at high speeds when the vibration is greatest. Of course it necessitates a number of different instruments to cover the ordinary ranges of speed because the readings from zero up to about one-third of the maximum reading of the instrument are of no value, the graduations being so close that they are entirely omitted.

The liquid is admitted to the paddle case from the reservoir by passages on both sides. When the liquid is admitted from one side only, a slight change in the position of the paddle axially makes a change in the indications. This is not found to be the case where the balanced admission opening is used.

The blades of the paddle are radial, for the purpose of making the instrument reversible. The radial blade is, of course, not the most efficient, but, as stated above, the efficiency need not be considered. A ball thrust bearing is provided for the paddle shaft, thus eliminating any wear that would prove injurious. The outlet for the liquid consists of a number of small radial holes, equally spaced around the periphery of the paddle case. With a single discharge opening it is found that if through wear of the bearings the paddle becomes eccentric with the case, then reversing the instrument changes the indications. The diameter of these outlet holes is very small, to check any surging of the liquid. They discharge into an annular groove extending around the paddle case, and this annular groove is connected by a single hole to the indicating tube.

One of the greatest difficulties encountered in making this instrument has been to get the entrained air out of the liquid. The small passages used in the pressure side offer little opportunity for it to escape, hence it stays in the paddle case. The trouble has been eliminated by so shaping the paddle that as soon as the paddle revolves this air is forced to the center of the paddle and is discharged through the center openings. If the air is allowed to stay in the paddle case it furnishes a compressible cushion for the column of liquid, and materially reduces the effective area of the blades, especially in the small diameter paddles. A slight change in the temperature of this air also affects its density to such an extent as to alter the reading of the instrument. Some instruments having glass sides were built for the purpose of studying the action of this air to determine ways for eliminating it.

The sensitiveness of the instrument is such that at the maximum speed for which it has been made commercially, namely, 2,500 r.p.m., a difference of one or two revolutions is very noticeable. This shows that the instrument can be made to indicate within less than one-tenth of one per cent. Under ordinary circumstances the indications will be correct within one-fourth of one per cent.

The instrument is portable, and can be readily handled, and there is no difficulty in holding the column practically vertical. It may be used either by holding it in the hand, the paddle wheel shaft being driven by a short flexible shaft pressed against the end of the revolving member whose revolutions are to be measured, or it may be fastened down and driven by gears, as in Fig. 2. This latter is the preferable method because the instrument is then held very steadily, and the entire attention of the operator can be given to reading the indications.

To carry on the experiments for these instruments, Mr. Veeder built a testing machine, shown in Fig. 2. This testing machine is run by an alternating current motor used exclusively for this purpose. The motor is connected to the testing machine through an Evans friction cone, which gives a ready means of changing the speed of the machine through a certain limited range.

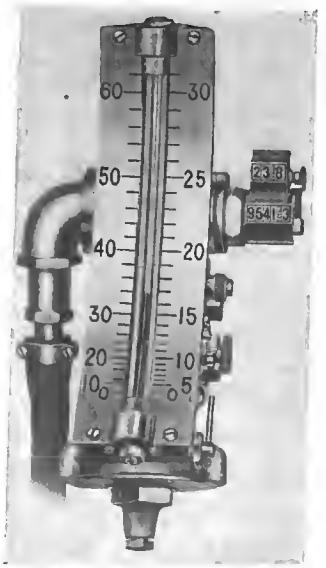

Fig. 5.—Type of tachometer for automobile service.

To keep the speed of the testing machine constant, a mercury tachometer *B*, Fig. 2, having a tube about three feet high, is placed at the driving end of the machine. This tachometer controls an electrically operated brake, which bears against the periphery of the fly-wheel, as shown at *C* in Fig. 2. Because the inertia of this wheel is very great in proportion to the force applied by the brake, there are no sudden fluctuations of speed. The mercury tachometer is an extremely delicate instrument and either makes or breaks the circuit which operates the friction brake. An insulated rod is carried through the top of it and connected, as shown by the diagram, Fig. 3, to the brake magnet. By adjusting the vertical rod, the tachometer will control the testing machine through a considerable range of speed. The action of the brake is clearly shown in the diagram. A condenser is used to avoid oxidation of the mercury at the point of contact.

To check the testing machine, the shaft of the machine is connected to a revolution counter, as shown at *D*, Fig. 2. The connection between this counter and the shaft is automatically made at the beginning of a minute by master clock. At the end of a minute, this connection is automatically broken by the same clock, and the difference in indications of the counter

shows the number of revolutions made by the shaft of the testing machine in the minute. Slight changes in the speed of the spindle of tbe testing machine will, of course, be very evident from this method of checking.

The diagram, Fig. 4, shows the method of connecting tbe clock to the revolution counter, which is driven by the end of the shaft of the testing machine. Special attention is called to the fact that the connection is made by the clock for one single beat, or half period, of tbe pendulum only; that is, while tbe pendulum swings from left to right. This necessitates that the time during wbich there is a complete circuit is a small fraction of a second, namely, while the point of the pendulum passes througb the mercury cup at the middle of the clock, hence at tbat point which the pendulum passes with its greatest velocity. This arrangement determines that exactly one minute shall be the time between the throwing in of the revolution counter and its disconnection. It was also found necessary to insert a condenser in tbis electric circuit for the purpose of preventing an arc, as in tbe case of tbe mercury tachometer.

At *F*, Fig. 2, tbere is seen the band switcb by which the circuit is made ready for the clock to throw the revolution counter into or out of gear. By throwing the switcb one way the clock will throw the counter into gear. If thrown over on to the other side, the counter is thrown out of gear at the end of that minute. By using this hand switch it is possible to make the count extend over as many minutes as may be desired. The shaft of the revolution counter is carried by the lever *G*, Fig. 2, and has on its end a key which engages positively in one of a number of slots on tbe end of the testing machine sbaft. This counter bas been safely operated at as bigh a speed as 5,000 r.p.m., and this method of registering is such that it is absolutely reliable.

In Fig. 2 tbere is sbown at *H* a friction clutch, the outer part of which is driven by the fly-wheel shaft. Between the bevel gears *K* and *L* is a jaw clutch, keyed to the shaft carrying the inner part of the friction clutch. This is operated by the lever *J*. Tbe first part of the motion of the lever engages the jaw clutch with one or the otber of the beveled gears. Its remaining throw engages tbe friction clutcb. By throwing the lever one way or the otber, the direction of rotation of the main sbaft of the machine may be changed.

For calibrating any particular instrument, the fly-wbeel end of the shaft is operated at a constant speed, usually 1,000 r.p.m. Under ordinary circumstances, with a speed of 1,000 r.p.m. the variation will be less tban half a revolution either way from the standard. With special care, this can be reduced to ¼ revolution, or a total variation of one-twentieth of one per cent. This speed is transmitted to that part of the shaft which directly drives the instruments througb tbe back-gearing shown at *M*. By means of tbe changes accomplished by these back-gears, the speed of the fly-wheel need not be changed during tbe calibration of the instrument.

The device shown at *N* in Fig. 2 is used for calibrating the instruments. The screw in this device has a very accurately cut thread with 14 threads to the inch. At the top of the device is seen a plate with 100 graduations equally spaced. From this it is seen that a vertical adjustment of the sigbting piece shown at *O*, Fig. 2, amounting to about 0.0007 in., can be measured.

A number of instruments of a given size are set on the testing machine at once. The height of the liquid column in these instruments is then measured, a record being kept for each instrument. The average of these readings is tben taken for establishing a suitable scale to be used on instruments of that size. The calibrating device is removable and can be shifted from instrument to instrument without cbanging its setting. In this way very small variations in the different instruments can be noted and any errors due to bad workmanship or imperfections in the parts can be readily detected.

Among the many applications to which this tachometer has been adapted, the first has been for laboratory service in testing dynamos, engines and other machines having revolving members. The instruments have also been adapted for switchboards, grouped with the otber instruments. Here they give a continuous indication of the r.p.m. of either the engine or generator.

Another use to which these instruments have been adapted is as a speed indicator for automobile and locomotive service. The type commonly used on automobiles, sbown in Fig. 5, has a double paddle, the larger diameter used for low speeds, the smaller for high. To make use of this, a double scale is put on the instrument, one reading to about 30 miles per hour, the other twice as higb, and the instrument is arranged to use either of these by simply shifting a small lever, which turns a three-way valve. If the lever is pulled toward the operator, a valve closes the passage from the large diameter paddle to the indicating tube and opens the passage from the small diameter paddle, and the instrument is set for the high-speed scale. If the lever is pushed back, the opening from the small paddle is closed and the one from the large paddle opened. There is no harm done if the liquid flows over the top of the instrument as it is returned to tbe reservoir. In tbis instrument there is a reservoir on each side of the indicating tube, so that the major portion of the indicating tube is nearly over the center of gravity of the free surface of the liquid. When the car is running at low speeds, however, the column of liquid in the indicating tube is not directly over the center of gravity of the free surface, with the result that any acceleration of the car makes the liquid indicate somewhat higher than it should, while any retardation has the opposite effect, this being due to the inertia of tbe liquid. For automobile service these errors are not great enough to make any particular difference.

In the form of instrument used for railroad service, the center of gravity of the free surface of the liquid lies at the center of the indicating tube, so that acceleration or retardation of tbe car, or an inclination to either side, has practically no effect on the indicator.

These speed indicators have ball-bearings throughout and all the features enumerated above, which go to make a permanently accurate instrument. An odometer giving the mileage for each trip, as well as the total mileage, is attached to each one, thus making them complete devices.

WHEN PURCHASING WOOD ALCOHOL FOR COOLING

THE idea in using alcohol in the cooling system, is to get away from the use of water. In other words, the freezing point of the liquid used must be lowered, to prevent freezing in the system, and the consequent disruption, which is bound to follow if the solution solidifies, since then bulk increases and is irresistible. It would seem quite out of place to purchase alcohol for the purpose, were the same half water, since water is to be displaced in the system. In the purchase of alcohol then, for the purpose, care should be exercised to order the same as free from water as possible.

According to tbe United States Pharmacopœia, "alcohol" should hold 91 per cent. alcohol and 9 per cent. water, "proof spirits" only hold 55 per cent. of alcohol, and "absolute alcohol" will run about 98 per cent. of alcohol with 2 per cent. water. An alcoholometer reads Zero (0) in water and 100 if tbere is no water present. Tbe alcoholometer, then, shows by its workings the percentage by volume of alcohol present.

Because of the high price of grain alcohol, the formula for which is C_2H_6O, it is customary to use wood alcohol, the formula for which is CH_4O, and because of this difference in the composition of the two grades of alcohol, the alcoholometer should be purchased to use with wood alcohol on the one band, or with grain on the other, depending upon the kind of alcohol taken in any given case.

LETTERS INTERESTING AND INSTRUCTIVE

A PROBLEM IN SIDE LEVER BRAKE CONTROL.

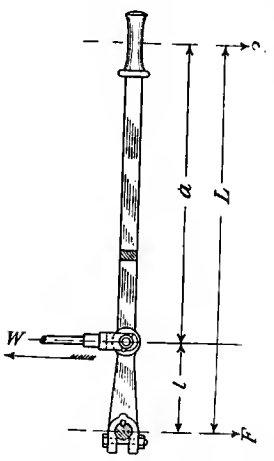
Editor THE AUTOMOBILE:

[1,647.]—I desire to equip an old car with a new set of emergency brakes, and am puzzled about the length of the side lever, and the point at which to fasten a cable (above the fulcrum) in order to be able to work the brakes, without too much of an effort on my part, when I desire to apply the brakes. Will you tell me how to solve this problem?

New York City. LAZY.

In the absence of data in relation to the car, and also, in relation to the brake-drum shoes, and means of applying pressure, it is only to be able to advise you in relation to the "side lever," which, apparently, is all that you want to know.

The illustration will enable you to grasp the situation, if you will there note the reference letters, and then use the formulas of levers of the second class, viz.:



Illustrating Side Lever Brake Problem.

$P = \frac{W l}{L}$ = pull exerted by the operator, say 50 lbs.;

$W = \frac{P L}{l}$ = equivalent strain resultant of the pull "P" in pounds (neglecting friction);

$l = \frac{P a}{W - P}$ = distance from the fulcrum to the work rod in inches;

$L = \frac{W a}{W - P}$ = length from the fulcrum to the point of pull, in inches;

$a = L - l$ = the distance from the point of pull to the work rod, in inches.

For a pull of 50 pounds, if $l = 6$ inches and $L = 30$ inches; we would have:

$$W = \frac{50 \times 30}{6} = 250 \text{ lbs.}$$

Likewise, any other similar problem can be solved, and knowing what the value of "W" should be, one can solve for the dimensions by means of the formulas, assuming some of the dimensions.

ENERGY OF BATTERY SHOULD BE CONSERVED.

Editor THE AUTOMOBILE:

[1,648.]—I have two spark coils, and would like to know which is the best, since they both give about the same length of spark. No. 1 coil takes about one ampere of current, while No. 2 coil takes very much less. It looks like the one taking the least current would be the best.

Belton, S. C. G. D. ROGERS.

The problem is one involving two fundamental ideas, viz:

(a) the spark must be adequate for the purpose;

(b) the battery energy should be conserved.

The coil that shows the highest ampere reading is the one not to use if the other coil will deliver a spark of sufficient energy to accomplish the purpose. Sometimes the voltage of the battery is more than it ought to be in view of the coil used. This ends in lack of economy, at the expense of excess battery. Each coil has its constant, that is to say, the voltage of the coil should be considered, in selecting the battery.

CASE HARDENING NICKEL STEEL PRODUCT.

Editor THE AUTOMOBILE:

[1,649.]—I would like to know the exact difference between nickel steel of the ordinary grade, and the same kind of steel to be casehardened?

New York. CURIOUS.

Nickel steel may be of any of the compositions in which nickel may be a component. If, however, the steel is to be "casehardened," it is necessary that the carbon content be held at a very low point.

If, in casehardening steel the carbon is high, the shell will be glass-hard, as desired, but the core will be hard also. The result will be, on the whole, the steel will not possess kinetic properties to any extent, and in the absence of these properties the steel will fail to sustain, under shock, loads.

On the other hand, if the carbon is low the core will remain soft while the shell will attain "glass hardness" by virtue of the cementation, due to which the carbon will be increased, by artificial means, in the shell, to a sufficient depth to serve the purpose.

The shell will be just as hard in the cemented low-carbon steel as in the higher carbon material, the strength under shock loads will be vastly greater.

A GRAVE DEFECT OF DESIGN.

Editor THE AUTOMOBILE:

[1,650.]—I have a "double-opposed motor" and lately, when I was sailing along, the bottom of the water tank fell out, leaving me in a bad way. Closer examination enabled me to discern a leak of water to the combustion chamber of one of the cylinders, and I decided that I must have run the motor (for some distance) without water, to the end that the casting must have been damaged, but I cannot locate the trouble more than to assure myself that the water does not get into the cylinder. What can you make of it?

New York City. N. B.

Your trouble is easy enough to locate, but it will not be so easy to repair. The water tank blew out because the explosive mixture accumulated in the water system, as a result of a defect in the cylinder-head plug, brought about through the difference in expansion, between the inner and the outer walls, and the fact that the threads on the plug or hole were stripped.

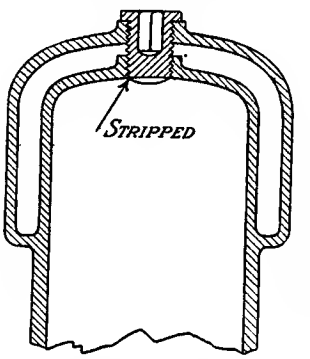


Fig. 1.—Threaded bronze plug in cylinder head.

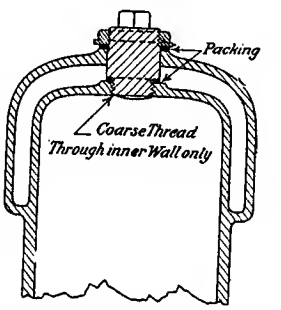

Fig. 2.—Steel plug threaded into inner wall only.

Fig. 1 will show the details of design and the repair will depend upon whether or not the threads were stripped off of the plug or the cylinder-head hole. If the threads in the hole are stripped, it is to have the hole enlarged and rethreaded, besides having a new plug made to fit the new diameter. Instead of the scheme of design, Fig. 1, adapt the scheme Fig. 2. Even so, it is a fact that plugs placed in this fashion are defective, in that the difference in expansion are not compensated for in any

way, and brute force must struggle with that which skill would manage without an effort. Under the circumstances, Fig. 2 shows the lesser of the evils. If the work is well done, the repair in this fashion, will sustain.

PICRIC ACID DESTROYS THE CYLINDER.

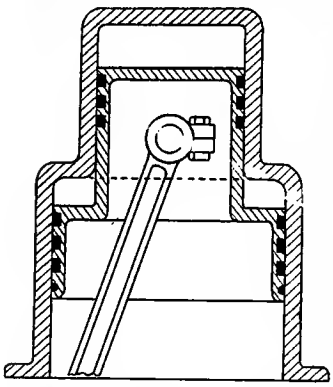
Editor THE AUTOMOBILE:

[1,651.]—Have you any data on the subject of picric acid being used by ths racers in the Vanderbilt Cup race? Do you know what proportions were used?

Will you aleo explain to me why tbere is a practical limit to ths size that cylinders may be bored? What is it that fixes the limit—is it weaknese of cylinder walls or difficulty in cooling or carburetion?

Will you explain ths double piston system of the Gobron-Brillé? Is there an increase of horsepower resulting from their arrangement?

THE QUESTION MARK.
Far Rockaway, L. I.



Section of Double Piston Idea.

Picric acid belongs to the detonator family and when mixed in gasoline, after it is dissolved in alcohol, it does increase the rate of flame propagation, resulting in more power. A saturated solution of picric acid in alcohol can serve as 5 per cent. of the total fuel, the balance gasoline. It must be remembered that picric acid is an etching ingredient, which is another way for saying that it will destroy the cylinder walls.

In relation to the question of the sizes of cylinders, enough is to say there are no such limits as you would seem to think. Cylinders for internal combustion motors are built in very large sizes, say, 20 inches bore. In automobile work, it is the weight efficiency that limits the use of the larger cylinders, it being the case that the weight efficiency decreases rapidly with increasing bore of cylinders.

The idea of the double piston, as used by the Gobron-Brillé Company, is illustrated in the figure herewith.

WHY USE FIVE CYLINDERS IN A MOTOR?

Editor THE AUTOMOBILE:

[1,652.]—The evolution of the gasoline engine as applied to motor vehicles, bringing about an increase in the number of cylinders, seems to have skipped the number five in its progress. There are four-cylinder cars and six-cylinder cars, but the writer has not beard of five-cylinders being used in the commonly accepted type of four-cycle multiple-cylinder motors. Why is this? The answer might be that an addition of 25 per cent. of power to that developed in four cylinders is inadequate to the additional expense of the different crankshaft construction alone, not to mention other expense featuree, six-cylinders giving 50 per cent. increase being preferable. And in these days when lower-priced cars are receiving the attention of manufacturers, the matter of one or two cylinders more than four may, perhaps, be neglected by many makers. But for smooth running and perfection in cars of 35 to 50-horeepower, why not five cylinders? Why not five instead of six? To be sure they could not be mounted in pairs, but many makers now assemble six singly. Five cylinders certainly provide the best poesible order of firing for multiple-cylinder four-cycle engines. A glance at a diagram showing five crankshaft cranks 72 degrees apart around the circle, with the order of firing in cylinders numbered from front to rear, say one, three, five, two, four, one, reveals that the cranke receive the firing alternately around the circle, without interruption of that order, effecting a more perfect distribution than is possible with six cylinders. Then, too, the difficulties attending the demand of a six-cylinder engine upon the carbureter and the possibility during the "overlap" of one cylinder pulling the charge from another would be considerably lessened in an engine of five cylinders. Cars fitted with an engine of this type, with crankshaft somewhat off-set, and piston connecting rods as long as consistently possible, equipped with high-tension magneto, perhaps an extra complete magneto carried to replace, in emergency, would, it seems to the writer, bs deserving of the attention of many a prospective buyer. Why not a five-cylinder car?

C. H. G.
LaCrosse, Wis.

Why five cylinders? Why not seven cylinders? There is just as much meat in the cocoanut.

Six cylinders are chosen for the reason that the kinetic balance is more perfect than can be, this necessary condition with five cylinders, or, for that matter, with any number less than six cylinders, from all accounts. In any event, the prime reason for using more than one cylinder is to attain the desired power in any given case, with the highest weight efficiency, that is to say, the desired power capacity, attended by the minimum weight. This prime consideration presupposes any number of cylinders—including 1, 3, 5, 7, or the even numbers 2, 4, 6 and 8.

When designers find it an advantage to use more cylinders, rather than increasing bore, of the smaller number of cylinders, they have to take into account two conditions, viz.: (a) static balance and (b) kinetic balance. The static balance is not difficult of attainment, since it demands symmetry of figure and equal weight at equal radii spaced 180 degrees. The weights do not have to be in the same radial plane for a static balance. It is even possible to arrange a static balance, with unsymmetrical shapes, by using balancing weights, but directly rotation is set up the static condition is displaced by the mass in motion, which motion may be uniform or it may be accelerating. For the condition of rest, equal and apposite weights of equal radii will remain at rest, even though they are not in a common radial plane. Directly motion is imparted, the difference in planes will assert itself, and lack of symmetry will introduce disturbing moments. The fifth crank, and its relation, would not balance an opposite force in any plane sufficiently to afford the real kinetic balance of the "six." In other than automobile work a five-cylinder motor is used, and evidently the difference in running balance is not so very great as to preclude the use of the "five," if the platform is stable, and if the weight in the base is so great as to assure a low center of gravity, etc.

Carbureters work well on eight-cylinder motors, so that there should be no insurmountable difficulties in connection with six cylinders. The off-set to the crank is a matter besides the number of cylinders.

All the accessories you name could go with any number of cylinders.

THE BOSCH MAGNETO IN THE VANDERBILT.

Editor THE AUTOMOBILE:

[1,653.]—In an effort to establisb definitely the true cause responsible for the loss of a position of suprsmacy attained by the Chadwick in the recent Vanderbilt race, first reported ae due to ths burning out of a magneto, it has been learned that neithsr of the Bosch magnetos in use on the car during ths race burned out. A report circulated to that effect has proven absolutely false, and since has been recalisd by the Chadwick Engineering Works, whicb founded its first beliof on erroneous information.

A searching investigation clearly proved that nothing but malicious interference in the mechanism of the magneto, by a wilful hand, with the apparent object of disabling either the magneto or the car, was responsible for the unfortunats handicap of the Chadwick.

With reference to the Renault and No. 7 Matheson, both of wbich experienced ignition trouble during the Vanderbilt race, as was stated in the various trade papers, it is ths general prsvailing opinion that these cars were during the race equipped with a Bosch magneto, because this magneto is the standard equipment on cars of their manufacture. For reasons tbus far not ascertained anotber make of magneto was substituted in this particular instanc for ths "Bosch" standard equipment. In the cass of tbe Renault car, according to the printed statements, this substitution was accomplished the very night before the race.

It is thus evident tbat wherever ignition troubls was reportsd the Bosch product was not responsible. In all other cases wbere Bosch magnetos were employed, ignition gavs as usual splsndid results.

In simple justice to our product we would aek you to give this letter ths prominence it deserves in correction of previous statements as appeared to the contrary in various publications.

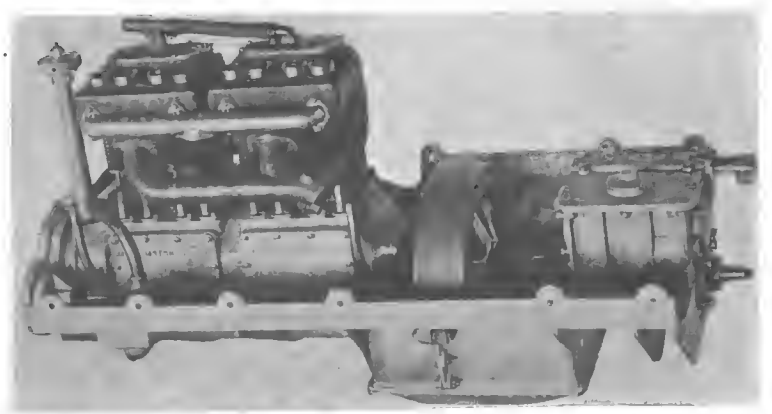
BOSCH MAGNETO COMPANY,
New York City. E. H. Heins, Vice-President.

MORA - 1909 Light Four

THE Mora Motor Company, of Newark, N. Y., is making adequate provision for the coming year by way of a light four-cylinder model, which will be turned out as a touring car or with a "racy" type body, to suit the individual taste. The company will also place at the disposal of the trade the same type of car fitted with a limousine. The illustrations accompanying this article will go a long way toward showing the nice arrangements, neat design and clean-cut work. These products are bound to attract a good deal of attention, because of a close conformity to the conventions and a certain well-defined selection of details in the design, backed up by precedent.

Some Features of the Power Plant.—In the motor the Mora Company has retained what it terms the unit construction aluminum pan, which has been a feature in its cars for the last four years. The company also points out that the power plant is substantially the same as that used in the "sealed-bonnet record car" in the past. The cylinders are 4 by 5 1-8 inches bore and stroke respectively, while the crankshaft is of the three-bearing type, with supports of liberal dimensions to the base of the pan. The rear end crankshaft bearing is 4 inches long, while the middle and front are 3 1-8 inches long. The pistons are of unusually long dimensions, with bronzed-bush piston pins, in turn held fast in the rod by a taper bolt. The motor is of the water-cooled genera, with a gear pump circulation and a cooler of liberal proportions, placed over the front axle. The ignition is by a four-unit coil, using a storage battery for the electrical supply, and the carburetion is well up to the usual Mora standard. The motor is rated at 24-28 horsepower, and is located under a neat and secure bonnet at the front.

In Relation to Transmission System.—From the leather-faced cone clutch to the three-speed selective change gear system the transmission shaft and other details are of rugged construction and clean design. The cast aluminum supporting pan, which has always been a feature of Mora cars, is here again in evidence, since it acts as a support for the transmission, as well as the motor. As the maker states, "it serves to keep the transmission and motor in perfect alignment." It also acts as a competent mud protector, and aids from the point of view of accessibility, which question of accessibility is also considered elsewhere throughout the car as well. From the transmission gear to the rear axle the power is lead through a hardened steel block, squared in the direction of rotation and rounded in the fore and aft plane. This block slides in a hardened steel casing, with a square hole, which casing in turn is fixed to the change-gear shaft. Through the bevel drive the power is transmitted to the live rear axle, and right here attention will be called to the provision of a neat adjustment by means of which the bevel pinion can be accurately mated.



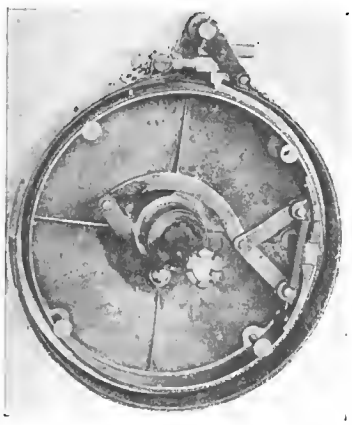
Mora World's Record Sealed Bonnet Power Plant.

Features of the Chassis.—Beginning with the pressed steel channel section drop frame, rigidly supported laterally, suspended on springs of adequate mass and neat design, the eye quickly takes in a straight line drive brought about by the use of the drop frame. Another look and the "I" section front axle intercepts the view, while the brakes on the rear axle are rendered conspicuous through use of 14-inch diameter drums. But if the brakes are large, they are no less efficient because of the use of equalizers, and the wheels are fitted with ball-bearings, with suitable provision for lubrication. The general appearance of the chassis is that of a well-designed car with semi-elliptical springs, front and rear, which general appearance, however, does not disclose a progressive series of nice details, as, for illustration, the emergency brakes interlock with the clutch, whereas the foot brakes do not interlock. The control, in other ways, is that which would give an autoist nothing to think about but the pleasure of riding, due in a large measure to the details of design of the tried-out carbureter, in which the single nozzle is concentric with the float and the regular air supply passing through little holes in the side of the nozzle chamber, with a cylindrical shutter placed to close these holes. The auxiliary air on the other hand is admitted to a spring-retained poppet valve. It was stated that the ignition is by a four-unit

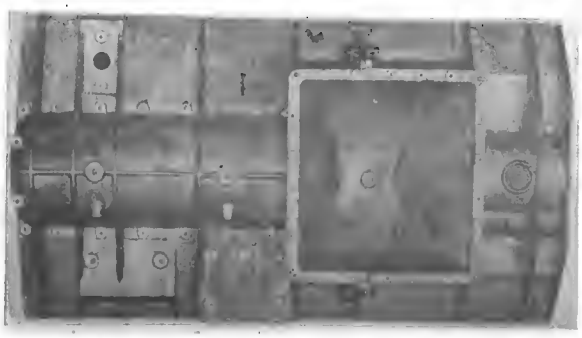
Universal Joint Parts, Showing Liberal Driving Faces.

spark coil and storage battery; this is only true when the car is sold at $1,850. At $2,000, the dual ignition then provided includes a magneto. In view of the excellence of the illustrations here afforded, and considering the sustained reputation of Mora cars, the balance of the story can be anticipated.

Relation of Quality to Price.—In view of the price at which the Mora cars are sold, it is rendered desirable to take into account the characteristics of the cars themselves, and to note the numerous refined details. In order to be able to appreciate the wonderful advance that has been made in automobiles, notwithstanding the trend in the direction of lower price, the very refinements to which reference is made must be taken into account and constitutes the best reason for a moderate price. Refinements in this case manifests itself by way of simplicity in design, the elimination of unnecessary parts, and symmetrical members that are more easy to make. By adopting die forgings, and pressed steel members instead of castings of inferior metal, the cost of machining is naturally reduced, the number of "wasters" are very materially cut down, and the purchaser gets a better automobile for less money. There are few experienced autoists who would fail to remember that divers of the improvements to be noted in this car were merely as unfilled wants when products cost twice as much as the amount named for this product, nor will their memory have to take them back more than three or four years at the best. In view of these facts, the Mora Company claims its product is on a high plane, due to consistent effort, aided by absolutely modern facilities.



Brake Drum, Showing Linkages and Take Up.



Plan of Mud-proof Aluminum Pan Construction.

POPE REORGANIZATION PLAN APPROVED.

HARTFORD, CONN., Nov. 23.—Reorganization of the Pope Manufacturing Company, which went in a receivership a little more than a year ago, is now practically accomplished, much to the satisfaction of all interested parties. Vice-Chancellor Howell, of Newark, N. J., on Thursday of last week, filed an opinion authorizing the sale of the Pope plants, and various other assets, to a reorganization committee for the sum of $1,500,000. The opinion of the Vice-Chancellor is somewhat lengthy and covers the situation thoroughly. But one objection was raised from the start, and that was by the holder of 100 shares of the actual par value of $10,000, and he held out to the very end, and contended that the offer was "grossly inadequate."

Charles E. Gross, of Hartford, counsel for Albert A. Pope, and George A. Yule, receivers, appeared before Judge Sbumway, of the Superior Court, asking for an order for the sale of the Pope assets to the reorganization committee, at the sum named, and Judge Shumway passed the order in conformity with that issued by Vice-Chancellor Howell the day before, thereby endorsing the action of the Jersey official.

Vice-Chancellor Howell has also authorized the sale of the Pope company's Hagerstown plant, from which the mechanical equipment has been removed, for $57,000, and of the Elyria, Ohio, bicycle factory which is owned by the Federal Manufacturing Company, whose stock is the property of the Pope concern, for $35,000.

A. L. Pope, one of the receivers, expresses satisfaction over the outcome, and states that the New York counsel, Joline, Larkin & Rathbone, were arranging for applications for the sale of the assets to be made in two federal courts, at Boston and Baltimore.

Henry V. Poor, of New York, is secretary of the reorganization committee and the members of that body are Harry Bonner, Frederick H. Ecker and Augustus Hechscher. The plan of reorganization provides for the issue of $800,000 in six per cent. notes, secured by a first mortgage, $2,500,000 of six per cent. cumulative preferred stock and $4,000,000 of common stock.

The receivers will at once pay the final and fourth dividend of 25 per cent. which will clear up the company's indebtedness. Since the receivership the company has made good progress and the outlook for the future is regarded as very bright. The remaining plants owned and operated by the company will henceforth be conducted on a different basis.

APPERSON FACTORY TO BE ENLARGED.

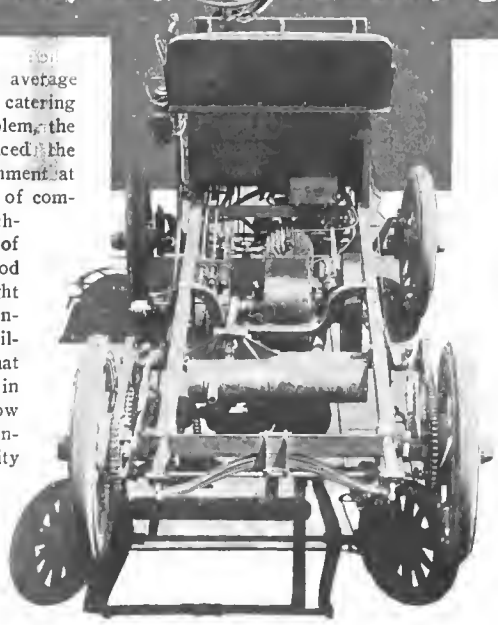
KOKOMO, IND., Nov. 23.—Plans have been approved by Apperson Bros. Automobile Company for the construction of a large three-story building, which will add 50 per cent. to the present available factory floor space, and work will be commenced at once on this addition and pushed to completion. Although the company owned sufficient available land for the new structure, it has purchased adjoining ground that can be so utilized as to allow of again doubling the plant at a later date.

While the Appersons are this year building a variety of models of various horsepowers and types, the two leading cars for 1909 are the new Model O, a four-cylinder 30-horsepower, selling at $2,450, and the new "Six-Forty." The latter, with the option of three-passenger body, baby tonneau, or five-passenger touring body, sells at $3,900. Sales Manager George H. Strout announces that the company has this year doubled the number of Apperson dealers, and has on hand unfilled orders and contracts for more cars than during any previous year. The company is now building a largely increased quantity of machines, and has been delivering 1909 models since August 1.

To Abolish the Crank.—Edward M. Agylman, of Janesville, Wis., in connection with the Janesville Machine Company, is working on a self-starter for automobile motors that promises overmuch, and for which he has applied for letters patent.

Knox Commercial Cars

DURING the years when the average automobile manufacturer was catering to the pleasure phase of the problem, the Knox Automobile Company placed the weight of their extensive establishment at Springfield, Mass., largely in favor of commercial automobiles. They approached this subject with a good deal of delicacy, realizing that, however good and serviceable the automobiles might be, it would still be necessary to convince merchants of their dependability under all of the conditions that are natural to the service, and in spite of a certain prejudice. How much of a problem it has been to convince merchants of the desirability of using automobile delivery wagons and trucks, instead of horse-drawn vehicles, is a matter that will never be understood excepting perhaps by the pioneers who made the attempt and brought it to a successful issue.



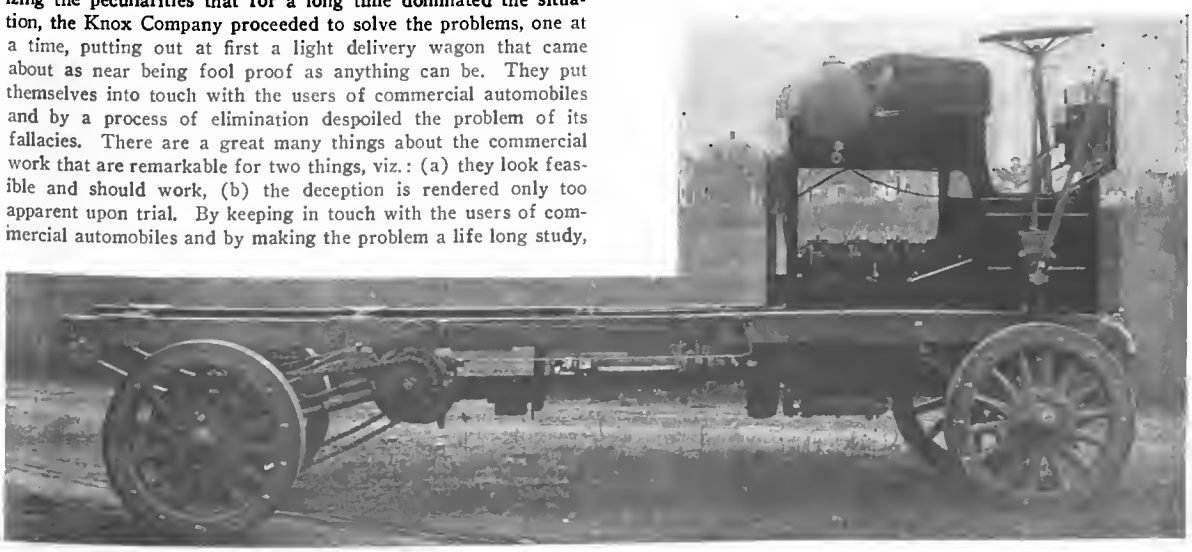
Model 20, Three-quarter-ton Commercial Chassis.

The Knox Company evidently fully appreciated the importance of gradually converting merchants to the idea of the automobile as a means of transportation, and they point out among numerous other conditions, the fact that the transportation managers of the big industries fully realize that horses have to be fed, watered and cared for; but they were horsemen and they were not able to understand that a machine had to be rested, cleaned, oiled and adjusted. Were they to consult a locomotive engineer (these transportation managers) they would be told that a locomotive has life, and wearies in operation just as does any animate thing, hence the locomotive has to be rested, and to be given a small share of the same careful attention as should be accorded an animal.

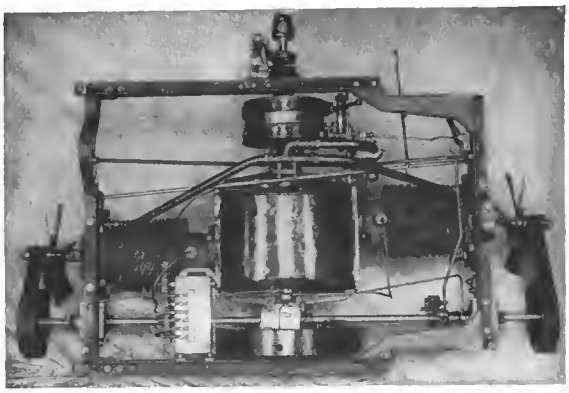
Simplicity and Ruggedness Applies to the Situation.—Realizing the peculiarities that for a long time dominated the situation, the Knox Company proceeded to solve the problems, one at a time, putting out at first a light delivery wagon that came about as near being fool proof as anything can be. They put themselves into touch with the users of commercial automobiles and by a process of elimination despoiled the problem of its fallacies. There are a great many things about the commercial work that are remarkable for two things, viz.: (a) they look feasible and should work, (b) the deception is rendered only too apparent upon trial. By keeping in touch with the users of commercial automobiles and by making the problem a life long study, as it were, the Knox Company were enabled to eliminate the fallacies and to reduce Knox trucks, not necessarily to the point, such as would seem to accord with the views of theorists who do not build trucks, but to a point consistent with the actual requirements to be found on investigation. The Knox Company point out that they did not simply investigate and then build a lot of trucks to fill a long felt want, whereas they did go slow. They built cars and they tried them out; they made the necessary modifications as the result of service and so on, until to-day the Knox line of commercial automobiles covers this zone of activity perfectly.

Model 20 Chassis Rated at ¾ Ton.—This article is illuminated by an illustration of the model 20 chassis, which is a well known and favorably received type of the Knox output. This type is turned out to suit express and other light service, limiting the capacity to 1,500 pounds, in which the merchandise platform is 44 inches wide and 84 inches long. The body may be covered or opened to suit the purchaser. This same chassis is turned out with a panel top delivery body in artistic effect, having the same platform area. The speed of this automobile is 15 miles per hour, with means of regulating the speed down to the lowest required limits. The tread is 56 inches, which is suitable for tracking on street car rails, and the wheel base is 85 inches, thus affording a short turning radius in congested streets.

The frame is angle steel 3x2x1-4 inches, with "I" section front axles of adequate proportions, while the rear axle is 1¾ inch square. Timken roller bearings are used for all road wheels, and the solid tires are 32x3 inches front, and 36x3 inches rear. Semi-elliptic springs are used.



Powerful Five-ton Knox Model 18, Which is Equipped with Fifty-horsepower Water-cooled Motor.



Two-cylinder, Twenty-horsepower Power Plant of Knox D-7.

The motive power is the product of a single cylinder Knox air cooled motor, delivering to a planetary type of transmission gear affording two speeds forward and reverse, thence to a double side chain drive. The clutch is incorporated into the planetary gear and the foot brakes apply thereto. The ignition is by means of a Connecticut coil and timer, utilizing dry cells, while a Lavigne oiler, supplemented by grease cups, takes care of the lubrication. The balance of the equipment consists substantially of a horn and the necessary tools, odometer, a suitable gasoline tank, carbureter of course, while the mud guards as well as the leather trimmed operator's seat are provided with chassis, independent of the body.

Model 18, 5-Ton Truck Equipped with 50-Horsepower Motor.—This truck is the result of a positive demand on the part of merchants for a stout and commodious truck to be used in heavy goods delivery work. The standard platform of this truck is 72 inches wide and 14 feet 6 inches long. The wheel base is 154 and the tread is 67 inches. The truck is geared for 12 miles per hour and uses 36x5 inch solid front tires, with 36x4 inch "daul" solid rear tires. The front axles are 2½x4 inches, "I" section and the rear axles are 2¾ inches square.

The 50 horsepower motor of the water cooled type has four cylinder 5½ inches bore and stroke respectively. The Knox Company resorted to the use of water cooling in this large size, for reasons that are perfectly good and require no further comment. The illustration of the truck will indicate that the motor is situated in the front, in a getatable space under the driver's seat. It will also be observed that the cooler stands out in front of the body work proper with which the water circulation is suitably connected, and a pump is used for the same. The general design and construction of the motor are along lines consistent with the Knox practice, including the oiling system known as DeDion, involving an oil sump in the track case. The gasoline is by gravity feed from a round tank about the motor, back of the driver's seat. From the motor through the clutch to the transmission is by way of substantial, simplified means, and the transmission itself is the selective type, three speeds forward and reverse. The double side chain drive is used, and semi-elliptical springs of ample proportions serve to suspend a 5-inch channel steel frame. As in other Knox cars the road wheels roll on Timken roller bearings, and the chassis equipment is sufficiently complete to check with that as before stated for the model 20 chassis. In this truck, however, there is one essential difference, i.e., the ignition is by means of a magneto, supplemented by a coil and dry cells.

Front Axle and Spring Construction of Knox D-6.

Some Features of Model D-7 Power Plant.—The illustration shows a double opposed air cooled motor, characteristic of the Knox methods, in which the air cooling is very effective. This power plant is self contained, mounted on its own frame, including a planetary transmission with the clutch and speed changes integral. The oiling system is by pressure feed, mounted on the same frame and two fans (one for each cylinder head) are set to pour an air current over the cooling surfaces. This separable power plant may be quickly dropped down and substituted by a new one when desired, thus rendering it feasible to quickly and cheaply make repairs, without keeping the automobile out of service during the interim of repairs. In this way several commercial automobiles may be kept in quite continuous service, utilizing one extra power plant, the same to be kept in good repair and to serve as a supernumerary.

With a view to rendering the subject a little more clear, an illustration of the front axle and spring suspension of one of the Knox types of delivery automobiles is given, which in itself is sufficiently clear to render any further statements and explanations thereof unnecessary. There are certain features that are common to all the Knox products as for illustration, the "wheel steerer" is used on all the models. The side levers are placed to the right of the driver, and in a nice relation. While adjustments are rarely necessary, provision is made for easy access to such parts as may possibly require attention in the course of time. This latter condition is in spite of the fact that the whole power plant can be removed in some of the models, even when repairs are necessary, and on the whole it is the claim of the Knox Company that it has been guided by actual experience, spread over a wide range of commercial pursuits, and that if it has eliminated any features that would seem to be of value, it was influenced by actual experience in harmony with the best phases of theory, modified by practical considerations.

SOME FEATURES OF THE APPERSON TAXICAB.

The regular Apperson "Model O" chassis is used, subject to such modifications as the wide experience of the makers, the Apperson Bros. Automobile Company, Kokomo, Ind., would naturally indicate. To assure continuity of service, a dual ignition system is used, incorporated into which is a magneto and a storage battery auxiliary. For the control, a three-speed selective transmission gearset is used, and the shaft drive leads to a "full" floating rear axle. Of the wheels, there is much to be said in their favor, since they are "dished," and the design is such that the weight is carried on "plumb" spokes.

In view of the modern chassis, it would not be out of place to expect body work of some pretentions. In this relation it is not to disappoint the reader. The body work is of the most modern description, by way of a stylish landaulet, upholstered in fine leather with broad cloth head linings. The top may be pushed back at will, and the design is such that all the windows are concealed within the body work, and the window frames fold down. The taxicab complete sells for $3,000, and while it is primarily a taxicab, it is nevertheless suitable for town-car service, and may be equipped accordingly.

The New Gear Box of the 1909 Darracq Taxicab.

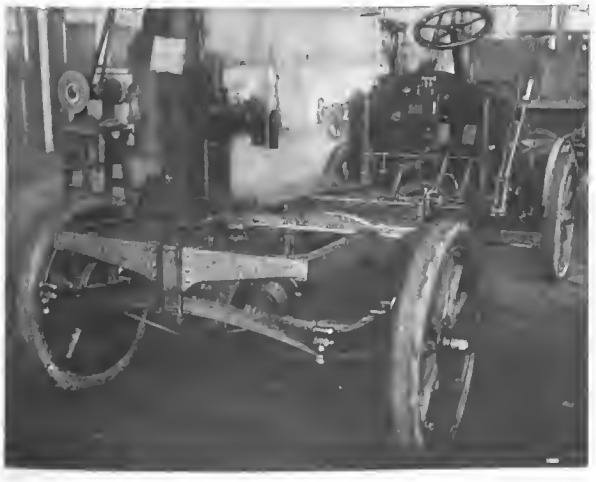
NEW DESIGN FOR 1909 DARRACQ TAXI.

PARIS, Nov. 20.—For 1909 a complete change of design is made on the Darracq taxicabs, well known in the States by reason of their extensive employment in most large cities. The gear-box on the rear axle, which is one of the distinctive features of the Darracq taxi, has been found unsatisfactory for the rough work these vehicles have to perform. It has, therefore, been removed and placed in the usual position to the rear of the engine, and on the subframe carrying the entire power plant. The selective gear change has been abandoned in favor of the straight through type, giving three speeds forward and reverse.

The most important change is in the clutch control. A broad leather-faced cone clutch is still employed, but the spring, instead of being within the cone, is now inside the gear-box and separated from the clutch by means of a stout universal joint. Any slight deformations in the subframe, or a little error in lining up, will not now prevent the proper working of the clutch. The spring itself is contained within a stout tubular housing carrying the thrust bearing, but prevented from turning in the forward extension of the gear box in which it is housed by means of a suitable stud. The clutch pedal operates direct on the outer face of this housing by means of a couple of arms, one on each side of the shaft.

The engine is slightly smaller than last year, but has undergone practically no changes in design. Lubrication has been rendered automatic by the adoption of a Dubrulle dashboard lubricator positively driven off the camshaft. There are two feeds only to the crankchamber. On the previous models the flow of oil was assured by pressure from the exhaust. The engine is in one casting, with valves on one side, and intake and exhaust manifolds integral. There have been a few minor changes on the carburetter, the air inlet being mechanically opened at the same time as the gas intake, in order to abolish the "panting" which sometimes occurred on opening out the engine suddenly after being throttled down. Brake connections have been simplified and are now entirely mounted on the subframe. The brake drums, too, have been increased in size, and are now of the same diameter as those employed on the 60-horsepower cars. Compared with the touring models, the chassis is a particularly robust construction, being considerably deeper and of broader section than any other models produced by the firm.

From the gear box the drive is taken to the rear wheels by means of propeller shaft, differential gear and rear live axle, all of a much stouter construction than on the touring models. A single-torsion rod is carried from the differential housing to a point on the subframe.



Chassis of the Darracq Taxicab for Coming Season.

THE FRANKLIN'S UNENCUMBERED DASH.

A feature of the Franklin models for 1909 will be an unencumbered dash. As will be seen by the illustration the dash is clear of oilers, coil boxes, wires, switches and other devices, and only the magneto button, needle valve stem, and primer rod remain. The oiler is now placed next to the engine base, where it is operated through gear connections with the driving shaft, and the oil is kept fluid by heat from the engine base. The ignition of the Franklin is such as to require no coil box.

New Dashboard of the Franklin.

The toe board is an auxiliary convenience, made as it is in three pieces, easy of removal. These are cast aluminum plates, held in position at the bottom with pins, and at the top with thumb catches. The steering column is free from all levers, the spark and throttle control being operated through the center of the steering tube, the center of the steering wheel forming the base for its operation.

The dash for the six-cylinder cars is made of mahogany; that for the others is finished to correspond with the rest of the automobile. The manufacturer, the H. H. Franklin Manufacturing Company, Syracuse, N. Y., feels confident that the new dash will meet with popular favor.

THE TREND IN WARNER INSTRUMENTS.

The Warner Instrument Company, of Beloit, Wis., has placed on the market a new style auto-meter. The shape is similar to that of an alarm clock, 4 inches in diameter and 2 inches thick. There are four openings on the face, one giving the number of miles traveled on the trip, another the total number of miles traveled since the instrument was started, the third giving the speed per hour, and the fourth is a receptacle for a small electric light bulb to light up the dial at night. It will register 10,000 miles, and a turn of a handle places it back at zero.

LICENSE THE DRIVERS OF ALL VEHICLES.

The drivers of all vehicles should be licensed. Then police control of traffic in New York and other large cities would be as absolute as it is in London, where the finger of the "Bobby" can stop the progress even of a king. That is the idea of an ex-police commissioner of the metropolis, and the common sense of the proposition is so apparent that it is strange the plan has not been duplicated in this country before.

In the large cities, and especially in New York, Chicago, Boston, and Philadelphia, street traffic of all kinds has assumed such huge proportions that the dangers to the users of the road have multiplied astoundingly, as is shown in the increasing number of accidents. If "every driver of any kind of a vehicle" had to have a license, which was revocable temporarily or permanently, there would be more consideration and a quick decrease in recklessness of those entrusted with the guidance of horse-drawn or motor-driven vehicles.

Before a law of this sort can be put into effect in the average American city, there inevitably must come the creation of a sentiment in favor of it which will convince the politicians that the general public demands it for the common good. There will come a prolonged resistance from the thousands who now guide horses through the crowded streets without any examination as to their qualifications, and whose utter incapacity frequently finds demonstration in the accident reports in the daily papers.

But the automobilists should no longer hesitate to place themselves squarely on record as being in favor of licensing all drivers and the revocation of such licenses for culpable conduct in their use of the streets. The public has been longsuffering, but has reached the limits of its forbearance, according to the signs of the times, and while purging their own ranks, the autoists can see to it that the drivers of horses are included among those who must give more consideration to one another and the man who must cross the road to get on the other side of the street.

* * *

PREJUDICIAL RESISTANCE IN AUTOMOBILES.

The mechanical losses in any automobile may be resolved into two components, viz.: The losses that follow functional activity along lines consistent with the advantages mutual to necessity considering correct design, and the losses in excess due to eccentricities in design. This latter series of losses might well go in the category of prejudicial resistance, or be eliminated.

To what extent prejudicial resistance holds sway in automobiles in general, is a matter that must in the long run receive some attention. If it amounts to as much as 10 per cent. of the power of the motor, it is a large factor, since the fuel required is in the ratio of 100 to 16. In other words, to realize 16 horsepower at the flywheel, fuel to the value of 100 horsepower must be supplied. If 10 per cent. of this goes to prejudicial resistance, inherent in the design, it is a matter of 10 horsepower in fuel to be noted, rather than 1 6-10 horsepower, as might be supposed by those who fail to keep track of the inherent value of the fuel, instead of the mechanical losses.

But there is one other source of prejudicial resistance that sinks the foregoing into peaceful slumber, as a bottle of milk sways the consciousness of an infant. The inequalities of inferior roadways furnish prejudicial resistance on a large scale. The average town car will do well with a 16 horsepower motor, whereas the same car on touring duty over the unkempt roads of America would scarcely make adequate headway on double that horsepower to say the least.

Under these conditions prejudicial resistance foots up to the enormous value of 100-horsepower in gasoline, all of which is chargeable to the ill-kept roads that indicate the need of double the power to do the same work in a satisfactory manner on paved streets.

The average road commissioner is so busy trying to invent a theory to fit the ability of rubber tires to agitate the top dressing of his ill-made roads that it will doubtless be a task to enlighten him on the subject sufficiently to enable him to understand that prejudicial resistance costs the community more than the cost of good roads. Roughly, the extra gasoline required for the 60,000 cars that the State of New York has on license, assuming that each car does 10 miles per day for 300 days per year, would cost enough to pay 4 per cent. on more than one hundred million dollars per annum, which is to take no notice of what the future holds by way of increasing numbers.

EX-POLICE COMMISSIONER WOULD LICENSE ALL DRIVERS

WILLIAM McADOO, a former New York City Police Commissioner, and before that Assistant Secretary of the Navy and also a Congressman, was one of those who spoke at the recent presentation of the Vanderbilt Cup. In his witty and novel interesting speech Mr. McAdoo devoted his remarks largely to the traffic problem and a discussion of how the inevitable and lasting automobile was to be regulated by law. He declared that the solution of the question lay largely with the autoists themselves, who had the power to compel reasonable laws and should have the public spirit to obey them.

"I do not know," said Mr. McAdoo, "whether it was Shakespeare or Roosevelt who said that men must play many parts. I have been a legislator, a sailor and a Police Commissioner. I must say that I felicitate myself that I am no longer a Police Commissioner when I gaze upon this assemblage of 300 law-breakers, with an average of $100 in fines. I am prouder of what I have done to regulate traffic and make the streets safe than anything I may have accomplished. I am proud to have been the one to have established the Brooklyn Bridge safety zone.

"I have been studying traffic control in London this summer from a New York point of view. You autoists and the Burglars' Union are trying to undo the police. I am getting more acquainted every day with the underworld, for you autoists are the greatest aggregation of law-breakers on earth; I will say, however, you are a fairly intelligent lot of law-breakers. One of my first acts as Police Commissioner was to change the caps of the bicycle cops to white. Then the West End Association gentlemen came and told me that the autoists would see the white caps and slow down, and I replied that that was just why I put the white caps on the cops, and if I were Police Commissioner now I'd put red lights on them at night."

Mr. McAdoo then recited a hold-up that the Riverside cops had once made on him, and used it as a text to show how policemen seek to get a record and square themselves for not being on their jobs by filling up a record of arrests made.

"Efficiency in a cop," he continued, "does not consist in making arrests, but in showing good judgment. My idea is to let automobilists hit it up a bit when the road is clear, and hold them down under the limit when the children are coming out of a schoolhouse. (Great applause.) I don't believe in police traps or making arrests. I want the policeman who makes no arrests, but is on his job all the time.

"The London rate of speed is higher than our own, despite the more crowded traffic. One-fifth of our accidents come from violating the law in turning corners. In London they make them turn the corners wide. Our own corner curbs are ground down by illegal short turning. Homecomers tell of the power of the upraised finger of the London 'bobby.'

"The reason for this is that in London *every driver of any kind of vehicle is licensed.* When you ask him to show his license, you have command of the man's living. To regulate traffic in New York properly the police will have to get absolute control of the streets. The mounted cops are the first, the greatest step in this direction. We need to get civilization out of barbarism. The automobile is a part of our civilization of to-day. It is here to stay, and you yourselves must be the ones to curb the reckless.

"I believe that the American automobile is to be the automobile of the future. In the early days of bicycling it was more fashionable to ride a Humber. That was all changed, and with our automobiles, as with our bicycles, we will dominate the world, and before long, mark my word, it won't be fashinable to own a foreign automobile."

TWO IMPORTANT LEGAL DECISIONS IN PENNSYLVANIA

PHILADELPHIA, Nov. 23.—Local automobilists were naturally delighted when, some days ago, Judge Weand in the Montgomery County Court, at Norristown, released an autoist who had been arrested on the charge of overspeeding, the evidence showing that a car bearing the number set alongside his name in the records of the State highway department at Harrisburg had broken the speed laws of Lower Providence township. The judge had based his action on the failure of the prosecution to show that the owner of the car (the purchaser of the tag) had been in the automobile at the time. This decision makes it incumbent on the "trap artists" to prove that the owner was in the car at the time of an alleged offense.

But as if this blow at the roots of a well-paying industry were not enough, Judge Wilbur F. Sadler, in the Cumberland County Court, at Carlisle, last week added to the "trap artists" woe by handing down a decision to the effect that an arrest and fine based on speed made over a measured quarter or half mile, or, in fact, over any other distance than a mile, is illegal. This case also originated in the Montgomery county "trap" district. Albert E. Cauffman, chauffeur for John Kays, a Carlisle attorney, was timed by the "trappers" over a measured quarter, and the calculations having figured out a rate in excess of the limit, a constable was sent to Carlisle who arrested Cauffman. The latter's employer fought the habeas corpus proceeding, and when the evidence was all in, Judge Sadler ruled that it was necessary to give proof that one full mile—the distance specified in the law—had been traversed in less than the State limit (three minutes in the open country and six minutes in built-up sections). The court also read a lecture to justices of a county who make a habit of issuing warrants for service on alleged violators who live outside that county, saying that the law gave them no license to do so. He held, also, that actions for auto speeding are civil or penal, rather than criminal, and that the State cannot be a party to the action. Cauffman was discharged.

These decisions gave evidence that the campaign of the Automobile Clubs of Philadelphia and Norristown, to put a stop to the illegal arrests and finings in Montgomery county, is already bearing fruit.

NEXT YEAR'S GRAND PRIX IN CHATEAULAND

PARIS, Nov. 20.—Angers, in Chateauland, has been officially selected the scene of the 1909 Grand Prix and voiturette race to be held the end of June or early in July. The decision was taken this week by the Racing Board, and immediately confirmed by the full committee of the club. In return for holding the race in their district the local authorities are under an obligation to raise a subvention of $20,000 and to assist in much of the detail work of preparing for the big event. Already the Angers committee has shown a considerable amount of activity, and when they put forth their candidature, presented plans of a suitable plot for grandstands and ravitaillement posts, together with options on the rental; a complete plan for the barricading of the road, with contracts for the work by local firms; options for various plots of land around the course, a guarantee that drinking

water would be supplied, and prices for transporting it; also a written statement from the roads department that the entire course would be put into condition for racing early in the new year.

The Racing Board has become wise as the result of years of experience in organizing races, and this year has withheld its decision until terms had been arranged for the rental of every plot of land, and for every piece of work that will have to be accomplished. As there are a dozen districts desirous of obtaining tbe race, competition makes it impossible for overcharging to be indulged in. It is declared that tbe club has also on foot a big scheme by which all the hotel proprietors will agree to a fixed tariff for food and lodging during the period of the races.

It is roughly a triangular course 46.18 miles round that has been selected on the banks of the Loire, to the west of Tours and Saumur. As, in all probability, ten rounds will have to be made, the total distance will be 461.9 miles. The voiturettes will probably be required to cover six rounds, or a total distance of 277.08 miles. Although one side of the triangular course is rather narrow and winding, fast time can be made, and even with the 130 millimeters limit an average of 70 miles an hour is anticipated.

Only one matter in connection with the annual race now remains to be settled: whether tires shall be changed by hand or with the aid of dismountable rims and wheels. The International Association was unable to come to a decision on the point and left the matter over to another meeting to be held in Paris during the Salon. The majority of those interested appear to favor the use of both dismountable rims and wheels.

THE 1909 INTERNATIONAL RACING RULES.

By A. L. RIKER, Vice-President Locomobile Company of America.

ALL racing cars built abroad for the season of 1908, by virtue of an international ruling, were restricted in design as to their cylinder bore. For the Grand Prix and other events intended for large cars the bore was 6.1 inches; for the English Isle of Man contest the limitation was 4 inches—tbus the name, "Four Inch Race." Similarly, the bore of the cars constructed for the small-car race run on the day preceding the "Grand Prix" were restricted. In spite of these limitations, the cars were speedy, and notably high averages were made. In fact, the average time made by the winner of the "Bresia circuit" is a new record, faster work than has ever been accomplished before with a motor of unlimited bore or stroke. The Grand Prix was won at an average of 69.2 miles per hour; the Voiturette race the day before tbe Grand Prix at an average of 50.02 miles per hour.

At first thought it would appear that the tendency to limit the size of racing motors in this manner is most admirable, but when a study is made of the strokes of the foreign racing cars of 1908 it would appear that many of the motors are in reality freaks, particularly when it is considered that the short-stroke motor is gaining ground all the time, and that a few years ago, when the bore was unlimited, the foreign designers made the short stroke in preference.

For 1909 the Europeans have decided to reduce the bore still further, from 6.1 inches to 5.1 inches. It was hoped that some limit would be placed on the stroke, because The Automobile Club of America, in reply to the request of the racing powers abroad, advised a classification by volume, a most sensible thing. The wisdom of this plan would be obvious to all; it not only places four and six-cylinder motors in the same class, but it encourages rational motor design and the building of cars that will have a commercial value after the race.

A four-cylinder motor of 5.1 bore and a reasonable stroke, say six inches, is a very good size, and a manufacturer could easily turn such a racing car into a stylish and speedy roadster with little trouble, and the result would be a car that could contain all tbe value the race could offer in the way of experience, and instead of being a freak would be a logical new model, perfectly tested. Just what a 5.1-inch motor with an extravagantly long stroke would be good for after the racing season, with the rules changing every year, is difficult to see.

The foreigners can very well afford to build such cars, owing to the large number of events held every season that are open to just such specially built racing cars; moreover, the motor car advertising on the continent is largely limited to contestants, and the makers can affort to go to greater expense than we, as they do not have so many automobile shows, do not have to do so much advertising in the newspapers and magazines—and, what is more important, the advertising they do is highly effective, owing to the relatively small and densely populated areas as compared with the United States.

The point might be made that a few of the racers built abroad for the 1908 racing season did not have abnormally long strokes. It is reported that the winner of the Grand Prix had cylinders of 6.09 inch bore and a stroke of 6.68 inches. But it must be considered that 6.1 inch bore is large and a real racing dimension, and it was not found necessary to lengthen out the stroke very much. Now for 1909 the bore is greatly reduced, and in order to make a fast car the designer is almost certain to build a very long stroke motor, like the cars in the Four-Inch Race in England or the Voiturette Race in France.

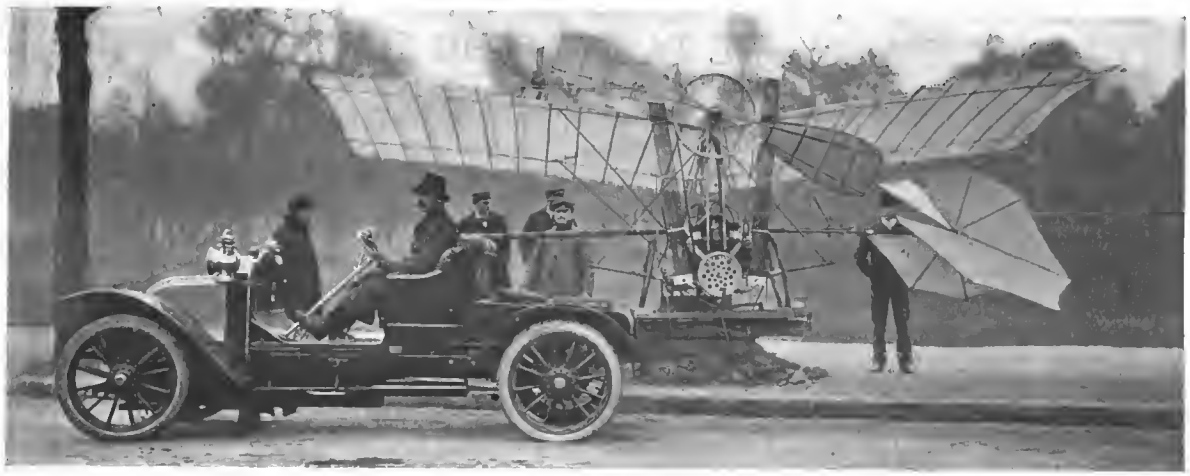
What is the position of the American manufacturer to-day who has a desire to build a car that can win the Grand Prix of 1909? Simply this: He must build for racing purposes only one or more freak cars. He cannot compete with the foreigners unless he does; if he does not lengthen out the stroke to some absurd point his cars will not have the speed of the foreign cars; he will not be racing on equal terms with them, and he will be beaten.

What, then, will be the attitude of the automobile public toward American manufacturers who are in sympathy with racing, experienced at it, but who do not care to build freaks, from whose motor performances they will learn little or nothing? Most likely it will be considered that they are "dead slow," or unpatriotic, or afraid of the foreigners. Not in the least. The American builder has had nothing to do with the formation of the 1909 racing rule, beyond an unheeded protest made by him through the medium of the A. C. A.

Is it too late to gain a reversal of the rule? If the volume could only be limited instead of the stroke it is certain that a large number of splendid fast American racers would be built, and their performances would prove the mettle of the American designer in a more impressive and conclusive manner than ever before. The present situation is more than unsatisfactory, but if it can be explained and thoroughly understood there is that much accomplished.

PENNSYLVANIA ROAD BUILDING LOOKS GOOD.

Harrisburg, Pa., Nov. 24.—In the annual report of the State Higbway Commissioner of Pennsylvania, Josepb W. Hunter, made public on Monday, there is contained a recommendation for an annual appropriation of from $4,000,000 to $5,000,000 a year, for ten years, to build roads and to outline a system of main bighways for the State. During the year 325.2 miles of roads were completed and 221 miles were under contract. During the present year much of this work has been completed, and Pennsylvania now boasts of over 700 miles of State road, with petitions in for the coming year for almost that much more road, and prospects of a great increase if the legislature passes a bill allowing a larger appropriation.



Santos-Dumont Off to St. Cyr with His New Aeroplane Strapped to His Runabout.

SANTOS-DUMONT TO FLY AGAIN IN NEW AEROPLANE

PARIS, Nov. 20.—Santos-Dumont, the first man in Europe to make a mechanical flight, has returned to the flying game after an absence of over a year, his new machine having the record of lightness and smallness. It is a tiny monoplane that has been christened the *Butterfly*, but which might have been more correctly termed the *Dragon Fly*. The two wings, only 16 feet from tip to tip, and formed of a wooden frame covered with fine varnished silk, are mounted on a metal framework carried by three bicycle wheels. The motor, not more than six inches from the ground, is an eight-cylinder 24-horsepower Antoinette, driving a two-bladed propeller, also of wood and silk, by means of a broad belt. The driving pulley is keyed to the fore end of the engine shaft, and the driven pulley is three feet above it in the angle formed by the two wings. The speed of the propeller is 700 revolutions a minute. Two packets of plain aluminum tubes mount up on each side of the engine and the propeller for the circulation of the cooling water. The pilot's seat is immediately behind the engine, and under the wings, not more than five or six inches from the ground.

Compared with Farman's aeroplane, tbe Santos-Dumont is but a toy, for the former has a bearing surface of 195 square feet, while the latter has but 29. To prove the handiness of his flying machine, Santos-Dumont dismounted the long bamboo tail carrying the rear rudder, mounted the whole apparatus on the rear platform of his little two-cylinder runabout, and drove off with it to St. Cyr, 12 miles away. The first attempt at flight resulted in the breakage of one of the wheels. The Brazilian aeronaut declares that he hopes to have his machine thoroughly tuned up and be in proper condition for the first aeroplane races to be held at Monaco next January.

BORDEAUX-PARIS AEROPLANE RACE.

PARIS, Nov. 20.—Still another aeroplane race for 1909, the latest event to be run from Bordeaux to Paris, distance by road 329 miles, in five daily stages of about 60 miles each. The stages are Angouleme, Poitiers, Tours, Orleans and Paris. There is a certain historic charm to the French in holding an aeroplane race from the western wine city to Paris, for it was between these two towns that the world's first automobile race was ever held, when Levavassor drove continuously for almost 49 hours, away back in 1895, and where De Knyff, Henry Fournier, Charron, Louis Renault, Farman and Girardot struggled for victory in 1899 and 1901, and where many an automobile and bicycle race was held during that "heroic" period when France was always on top.

No regulations have yet been drawn up for the aeroplane race, nor has the date been fixed, but it is believed that the race can be held during the summer of 1909, or at latest in 1910. The difficulty at present is not the lack of aeroplanes, for there are without doubt 250 flying machines under construction in and around Paris, but the need of men to pilot them. Apart from Wright, Farman, Delagrange and Bleriot, there are very few men in France who have had any experience aloft, and if some of the races projected for the coming season fail to materialize it will be entirely because of tbis lack of experienced men.

An aeroplane race across Paris, which was announced by *L'Auto*, has been withdrawn in favor of Bordeaux-Paris, the organizers recognizing that it was dangerous to the general public to invite flying machine pilots to pass over a crowded city.

AERO CLUB OF NEW ENGLAND MEETING.

BOSTON, Nov. 23.—The Aero Club of New England on Saturday evening celebrated its first anniversary, and incidentally observed the 125th anniversary of the first ascent by man in a balloon, with a dinner at the Boston City Club. There was a good attendance of members and a number of guests whose fame as aeronauts is international. Professor A. Lawrence Rotch presided, and the speakers included President A. Holland Forbes, of the Aero Club of America, and Augustus Post, wbo competed in tbe recent international race in Germany; N. H. Arnold, also a competitor in the international race; Mayor George A. Hibbard, of this city; Charles J. Glidden, W. K. Morrison, of Minneapolis, who recently made an ascent of 11,100 feet; and Vice-President T. E. Byrnes, of the New York, New Haven & Hartford Railroad. Letters were read from Professor Alexander Graham Bell and Orville Wright.

Before the dinner a business meeting was held, at which the following officers were elected: President, Professor W. H. Pickering, of the Harvard astronomical observatory; first vice-president, Frank E. Stanley; second vice-president, Frank B. Comins; secretary, Alfred R. Shrigley; treasurer, Harry G. Pollard; directors, Professor Pickering, Vice-Presidents Stanley and Comins, Henry Howard, T. E. Byrnes, W. P. Harris, and Winfield S. Shrigley; foreign representatives, Professor Rotch, Charles J. Glidden and J. C. McCoy; contest committee, Henry Howard, W. E. Eldredge and Henry A. Morss; ascension committee, Charles J. Glidden and H. H. Clayton, of the Blue Hill observatory; aeronautical engineer, Leo Stevens.

WHAT CLUBS ARE DOING THE COUNTRY OVER

NEW AUTOMOBILE CLUB FOR SAN FRANCISCO.

San Francisco, Nov. 19.—Automobiling in this city took a new lease on life last night, when the organization of the San Francisco Motor Club was completed and officers elected. A number of the younger element among the trade and also owners in the city felt that they wished an organization which should be primarily for pleasure and promoting of touring and speed contests, and not in any way to conflict with the work of the older clubs at present doing such good work for road improvement and posting of highways.

The election of officers resulted in Fernenado Nelson, who has twice lowered the record between San Francisco and Los Angeles, being chosen as president. Charles S. Howard, the head of one of the local automobile companies, is first vice-president, and William M. Klinger, second vice-president. Frank E. Carroll, of former bicycle and motorcycle fame, is secretary, and C. E. Starrett, treasurer.

With the completion of the election of officers the club immediately proceeded to lay its plans. Tony Nichols, as head of the contest committee, brought up the subject of an annual road race, and reported that he thought by careful management the county supervisors could be interested in the scheme, especially so, if the club was willing to give the profits of the race towards road improvement. It was decided to hold a short run to one of the many picturesque spots near the city before the Winter rains set in, making it a sort of picnic outing, the object being to bring all the signers of the constitution together.

WEBB NOMINATED FOR L. I. CLUB PRESIDENCY.

Brooklyn, N. Y., Nov. 23.—Frank G. Webb, vice-chairman of the A. A. A. racing board, has been placed in nomination for the presidency of the Long Island Automobile Club. Nominations for other officers to be voted for at the annual meeting of the club, which will be held December 10, are as follows: Vice-president, William Schimpf; secretary, Herbert G. Andrews; treasurer, Charles C. Cluff; governors for term of two years, Alfred Wilmarth, Dr. A. C. Howe, and Charles Jerome Edwards; membership committee, Walter L. Webster, William G. Morrison.

The nominee for president, Mr. Webb, is one of the best known automobilists in the United States, and has served with great credit and efficiency on the racing board of the American Automobile Association for several years. He will make a capable official at the head of the club, and his nomination will prove deservedly popular.

The annual dinner of the club will be held Thursday evening, December 10, and will be of the nature of a "beefsteak feast," to be followed by a high-class vaudeville entertainment.

MILWAUKEE A. C. CLOSES OUTDOOR SEASON.

Milwaukee, Wis., Nov. 23.—Nine machine loads of members of the Milwaukee Automobile Club participated in the last tour of the season on November 21, the occasion being the western championship football game between Chicago and Wisconsin at Madison, Wis., and the institution of the Green County Automobile Club into the Wisconsin State A. A. affiliated with the A. A. A. Ten other machines accompanied the nine as far as Madison to see Wisconsin get its annual whipping, this time by the score of 18 to 12. From Madison the nine machines went to Monroe for the jollification and returned to Milwaukee Sunday night.

The club is planning to keep the interest up during the winter by a series of indoor events with the hope that when spring comes and the new clubhouse is ready for occupancy the membership will be materially increased.

HARRISBURG CLUB PLANS ROADS CAMPAIGN.

Harrisburg, Pa., Nov. 23.—The Motor Club of Harrisburg is planning an active campaign for the betterment of roads in Pennsylvania, and has elected one of its vice-presidents, C. C. Cumbler, as a member of the Legislature, while the other three members of the county of Dauphin are pledged to support all fair bills for good roads and especially an increased appropriation for the road building work.

The Motor Club has recently erected over one hundred sign boards throughout the surrounding country, showing the way to and from the city to all outlying points in the State. This work was carried on by a special committee consisting of J. Clyde Myton, James McCormick, Jr., and Dr. John Oenslager. The contest committee through its secretary, W. R. Douglas, is planning for a big endurance test next May which the club hopes to make one of the greatest contests of the year in the East. Numerous promises of support have already been received.

ELMIRA AUTOMOBILE CLUB ELECTS OFFICERS.

Elmira, N. Y., Nov. 23.—New life was infused into the members of the Elmira Automobile Club at the annual meeting for the election of officers. The constitution and by-laws were amended, making the annual meeting in April, and reducing the entrance fees and dues. This was done in order to make it possible for every automobile owner in the city to become a member of the club. Elmira has as large a number of autoists as any city of its size in the country, and if the plans of the newly elected officers are carried out with the aggressiveness shown at the meeting, the club will have a correspondingly large membership in the near future. The following is the list of new officers: President, Clay W. Holmes; vice-president, F. N. Dounce; secretary, Fred H. Rees; treasurer, Edward B. Crocker.

HUB DEALERS AGAINST RECKLESSNESS.

Boston, Mass., Nov. 23.—Believing in the stand taken by the Springfield Automobile Club against reckless driving, a number of the Boston dealers have joined in the crusade by placing notices in their garages and repair shops warning all their drivers that any of them detected in the act of reckless driving will be discharged. The dealers recognize the fact that unless something is done to check the growing tendency of a few drivers to disregard the rights of others, more severe legislation will be enacted, which will only serve as a temporary setback to the progress of the automobile. They have taken this method of showing how they stand on the subject by doing all in their power to control the drivers over whom they have jurisdiction. The good work in this direction that has been inaugurated by the clubs should be emulated in every city where the trade is organized.

TO ORGANIZE FLORIDA STATE ASSOCIATION.

Tampa, Fla., Nov. 23.—At the recent meeting of the Tampa Automobile Club the most important subject which came up for discussion was the proposal, made by President Bryan, to organize a State association under the auspices of the American Automobile Association. Extracts were read from the rules of the national body relating to the formation of State associations. The plan met with such favor that a committee was appointed to confer with similar committees from the Jacksonville and Daytona clubs to carry the project to completion. The meeting was the largest in the club's history, and a great deal of interest was manifested in all the proceedings, especially so in regard to the plans of road improvement as put forth by the good roads committee.

MARYLANDERS HOLD THEIR FIRST HILL CLIMB

BALTIMORE, Nov. 21.—W. W. Lanahan, with his 60-horsepower Stearns car, carried off the laurels at Maryland's first hill climb, which was held under the auspices of the Automobile Club of Maryland. Out of the six events, Mr. Lanahan's car was the winner in three. In one of these, that for the free-for-all, his car made the best time of the day. The car, which was driven by Wilfred Smith, covered the distance of six-tenths of a mile in 43 1-2 seconds. The other events in which this car was the victor were Classes F and H. In the last race Mr. Lanahan was the driver, and he took the car over the course in 46 seconds flat. In the other event Mr. Smith made the distance in 45 1-2 seconds.

The Chalmers-Detroit cars made the next best showing, carrying off the first and second contests, their time being 1:03 1-2 and 54 1-2, respectively. The first event was won by this make of car in consequence of the actual winner, the 30-horsepower Stoddard-Dayton machine, entered by L. H. Shaab and driven by J. L. Cassard, Jr., being disqualified. Harry A. Tate, driver of the Chalmers-Detroit car, protested on the ground that the Stoddard-Dayton car had on it a magneto which was not included in the list price, and which would have carried the price of the car above that allowed for this class, $1,251 to $2,000. After an investigation, the judges decided in favor of the Chalmers-Detroit driver.

The hill on which the climb took place is the Belvidere avenue hill, between Falls road and Roland avenue, Mount Washington. It is an extremely steep affair, and it was necessary for the cars to make a change of gear on several occasions between the start and finish. The starts were all flying ones, and the trophies consisted of silver cups to the winners of each event. More than 2,000 people were lined along the course of the climb, while numerous autos were also to be seen along the way, which were filled with enthusiastic spectators. The summaries:

CLASS A—FOR CARS SELLING FOR $850 AND UNDER.

1.	Ford	15		Withdrawn

CLASS B—FOR CARS SELLING FROM $851 TO $1,250.

1.	Cameron	20		Withdrawn

CLASS C—CARS SELLING FROM $1,251 TO $2,000.

1.	Stoddard-Dayton	30	J. L. Cassard, Jr.	1:01 1-2*
2.	Chalmers-Detroit	24	H. S. Tate	1:03 1-2
3.	KisselKar	35	J. F. Heaver	1:05 1-2
4.	White Steamer	20	L. W. Trembiay	1:09
5.	Mitchell	30	W. P. Shuler	1:20

*First, but disqualified. Race given to Chalmers-Detroit car.

CLASS D—CARS SELLING FROM $2,001 TO $3,000.

1.	Chalmers-Detroit	40	W. C. Hood	:54 1-2
2.	Stevens-Duryea	24	Jack Sperry	:55
3.	KisselKar	54	J. L. B. Wilhide	1:04
4.	Winton	48	W. L. Duck	1:09 1-2
5.	Locomobile	20	Joeeph Paimer	1:36

CLASS E—CARS SELLING FROM $3,001 TO $4,000.

1.	White Steamer	30	Harry E. Mayer	Withdrawn

CLASS F—CARS SELLING FROM $4,001 AND OVER.

1.	Stearns	60	Wilfred Smith	:45 1-2
2.	Stearns	60	Wilson Rutherford	:46 1-4
3.	Stearns	60	Leo Shaab	:49 1-4
4.	Stearns	60	J. G. Nassauer	:52
5.	Winton	45	J. Basilicato	1:18

CLASS G—CARS DRIVEN BY AMATEURS, $3,000 AND UNDER.

1.	Ford	15	Osborne I. Yellott	1:05
2.	Winton	48	H. H. Heyser	1:10 1-2

CLASS H—CARS DRIVEN BY AMATEURS, $3,001 AND OVER.

1.	Stearns	60	W. W. Lanahan	:45
2.	Stearns	50	J. G. Nassauer	:51 1-2
3.	Stearns	60	S. A. Nattans	Withdrawn

CLASS K—FREE-FOR-ALL.

1.	Stearns	60	Wilfred Smith	:43 1-2
2.	Stearns	50	Wilson Rutherford	:45
3.	Stearns	60	J. G. Nassauer	:48
4.	Chalmers-Detroit	40	W. C. Hood	:50
5.	Stanley	10	H. W. Gill	:50 3-4
6.	Mitchell	30	W. P. Shuler	1:23 1-2
7.	White Steamer	30	L. W. Tremblay	1:34

SAID BY MEN PROMINENT IN THE INDUSTRY

David Fergusson, Mechanical Engineer, of the George N. Pierce Company, has just returned from abroad, where he visited the principal automobile factories of England and France, having inspected the new models of the leading German and Italian makes of cars. As a result on his observations Mr. Fergusson says: "Two tendencies in construction stand out prominently above all others. The first is the wide adoption of the shaft drive among makers who have, heretofore, produced none but chain driven cars, and the other is the abandonment of hall hearings for crankshafts in favor of plain bearings, in notable instances. The most prominent general tendency aside from the matter of final drive is the reversion to plain bearings. Several years ago two manufacturers, one French and the other German, both of whom stood high in their own countries, adopted ball bearings for the crankshaft. The outcome of their policy was watched with a great deal of interest by automobile makers throughout the world. This year marks the definite abandonment by them of their experiment, and their return to plain hearings."

C. F. Jensen, President of the National Retail Automobile Dealers' Association.—"Since leaving my headquarters in Joliet, Ill., I have seen a great many agents and they are all signing up for a great many more cars next year than ever before. It is remarkable how many agents in the small towns are contracting for 50 to 150 cars and declaring there is no question of their ability to dispose of them. The farmers in Kansas, Iowa, Nebraska, and Minnesota, are in fine financial shape and ready to buy cars, although the moderate priced machines will be most in demand among them. The cars selling for $1,200 or less are taking very well. while there is a steady demand for the high wheel buggy type. Our Dealers' Association is growing rapidly; the agents for cars appreciating the fact that many advantages can be secured by co-operation. There are many abuses in the trade which the Association will try to remedy and in doing so, we believe the manufacturer will he benefitted as well as the dealer. We are trying to help the agents to secure the agencies for cars in which there is a good profit and a fair working hasis." Mr. Jensen arranged for the automobile show at Grand Central Palace to be the headquarters for the Dealers' Association in New York and for each memher of the Association to have the courtesies of the exhibition.

Maxwell-Briscoe Motor Company, Through President Benjamin Briscoe, sets at rest the many merger rumors that have figured in the columns of the press of late. According to Mr. Briscoe's statement the Maxwell people are not involved in any merger negotiations whatever, nor do they know of serious negotiations being carried on elsewhere in the industry. As far as the Maxwell product is concerned, it will he turned out in three factories of the company, namely; New Castle, Tarrytown, and Pawtucket, and the output will he sold just as heretofore.

H. R. Averill, General Sales Agent, York Motor Car Company, York, Pa., returning from an extended trip through New York and the New England States, predicts that the 1909 season will be one of the greatest in the history of the automobile. While on his trip Mr. Averill met some of the most prominent auto dealers in the northeastern section of the country whose opinion it was that the 1909 season would be a record breaker. Pullman models are much in demand, and during the coming season more than 400 cars will he turned out.

DECORATIVE FEATURES OF PALACE SHOW.

A representative of the S. R. Ball Company, which has the decorating contract for the A. M. C. M. A. show which opens in the Grand Central Palace, New York City, on New Year's Eve, has returned from a trip abroad, where he has been looking up ideas to be embodied in the decorative scheme of the show. One of the artistic features will be 12 full-size statues of a woman holding above her head an automobile wheel with flying wings. These figures of white ivory composition draped in flowing robes will look down upon the main floor from the lower balcony. Other statues of mucb larger dimensions will be placed in the lobby, main stairways, and throughout the main court. The plans, if completed as mapped out, will mark a distinct advance, from tbe decorative standpoint, over anything that has previously been attempted in the automobile sbow line.

Goddess of Speed.

One of the 12 figures that will adorn the first balcony of the Grand Central Palace.

TEN NEW AUTOS A DAY.

AKRON, O., Nov. 23.—The International Harvester Company is turning out ten light-running automobiles a day at its factory in this city, and a daily sigbt is the running of test cars on the streets and highways. Tbe cars are used to test the engines, and each engine is run daily about 100 miles, ten cars being run every day. The same cars are used all of the time, new engines being put in daily. The roads in this vicinity are also used extensively by the Peerless factory in Cleveland, and it is for test purposes as well as for quick passages between the two cities that autoists of Cleveland and Akron are anxious to have Brecksville and Akron connected with a paved or macadamized road, as is now under consideration, in order to have an improved road all the way througb.

YORK'S AUTO PLANTS GET BIG ORDERS.

YORK, PA., Nov. 20.—York's automobile trade is enthusiastic, and large orders are received daily by the two local plants. The Pullman plant is running full time, having many large orders booked for the new 1909 cars.

The Hart-Kraft Motor Company, manufacturers of light gasoline delivery wagons, have entered into an agreement with the Post Motor Company, 1623 Broadway, New York, by which more than 1,100 wagons are to be erected and delivered for the metropolitan trade.

INDIANA DEALERS HAVE SUCCESSFUL YEAR.

INDIANAPOLIS, IND., Nov. 24.—Local dealers are just closing the most successful year in their history. This may seem a bit strange, in view of the recent financial stringency, but is nevertheless true as proved by tbe registration records of tbe Secretary of State.

The number of automobiles sold to Indianapolis people to November 15, this year, is 389. The total number sold in the State has been approximately 3,100, and it is estimated that about 50 per cent. of the automobiles sold in Indiana go through local dealers. It is probable that the total automobile business done by the dealers this year will reach $1,500,000.

DECORATIONS FOR THE GARDEN SHOW.

Since the big automobile shows began to be held in Madison Square Garden, each successive year has witnessed a marked improvement in tbe decorative scheme used for the occasion until, during the last four years, tbe interior of the famous old exposition hall has been made notably more magnificent for the exhibit of motor cars than for any other event in the place. A praiseworthy fact in connection with tbis dressing of the place is that the progress has been from the merely elaborate and ornate toward the chaste and elegant. At the forthcoming show, January 16-23, under the auspices of the Association of Licensed Automobile Manufacturers, the step in tbis direction will be more marked than ever before. There will be magnificence and elaborateness, but tbere will be less profusion, more simplicity and more richness in the general scheme. There will be a gratifying lack of the plaster statues seen in former years, and a tone of more solidity will prevail, as being more becoming to the standard makes of the oldest automobile makers that always comprise the Garden show. One of the few really showy pieces of decoration this season will be a sort of Garden fountain near the Madison avenue entrance. This is in the form of a low abutment of gray stone, curving about the first exhibition spaces facing tbe entrance. It will bave a trough-like basin, into wbicb water from griffin mouths will spray upon the electrically iridescent pool beneath and this falling water, too, will be electrically radiant. In the pool of the curving basin there will be goldfish and pond lilies, some of the lilies natural and some artificial. From tbe artificial flowers electric lights will radiate, while a concealed row of ligbts under tbe coping of the trough illuminates the falling spray.

New Emblem of the A. L. A. M.

Curved, Troughlike Electric Fountain that Will Be Near the Entrance at Madison Square Garden Show.

News in General

Chinese Ambassador Wu Ting Fang Rides in Eugene Christian's White Steamer.

Doubting Thomas Caved In.—The Rapid Motor Vehicle Company, of Pontiac, Mich., is circulating a story of "Doubting Thomas," who rode in the 1908 Glidden Tour in a Rapid truck. As the story goes, it was Thomas (not the truck) that "fell." The little pocket edition is in itself a work of art, aptly illustrated, and the performance of the Rapid truck is portrayed in terse, brisk terms. The theme is but a fitting presentation of what was at the time considered a remarkable performance. If touring cars came through with a clean score, it was but a normal expectation, but few were the critics that reflected a clean score for an overloaded truck under the savage punishment meted out. At the end of the tour the Rapid truck made for home under its own power over even worse roads than the "Glidden orbit," and arrived in good time, covered with well-earned glory and a smear of mud.

Diamond Company Paves a Street.—Although Akron, O., has profited a great deal from the rubber business, the Diamond Rubber Company feels that, by a recent agreement with the city authorities, it is able to help out the city in a very direct way. Desiring the vacation of a small part of a street in order to extend one of the new buildings, the company agreed to pave the remainder of the street in return, and the city accepted the proposition.

Something New for Auto Buyers.—The Winton Motor Carriage Company has issued its latest booklet under the title "Twelve Rules to Help Buyers," in which, as this head indicates, will be found a dozen methods as set down by the Winton Company which should be used when determining the merit of any automobile. Simplicity and freedom from all technical terms is the keynote which should make this interesting to the prospective buyer.

Petrel Motor Car Company a New Concern.—Through an error made in THE AUTOMOBILE issue of November 19, it was said the above named company was a reorganization of the defunct Earl Motor Car Company, of Kenosha, Wis. The plain facts are as follows: The Petrel Motor Car Company is a new organization and has no connection whatever with the defunct Earl concern excepting that the old Earl plant was purchased.

Cleveland to Have Taxicab Service.—The Citizens' Taxicab Company, of Cleveland, is making arrangements to put taxicabs on the streets of that city. It is announced that the Chalmers Detroit Motor Company, of Detroit, will furnish twenty of these taxicabs, ten of which are to be in service by the first of the year. The Charles B. Shanks Company, of Cleveland, will back this new venture.

Cleveland Motor Car Company's Officers.—At a meeting of the board of directors of the Cleveland Motor Car Company at the offices, 1659 Broadway, New York, on Friday, Nov. 20, the following officers were elected for the ensuing year: President, James Laughlin, Jr.; vice-president, James Laughlin, 3d; general manager and treasurer, James B. Strawbridge; secretary, Sidney H. Veal.

Speedwell Company Puts on Night Force.—The announcement comes from Dayton, O., that the Speedwell Motor Car Company of that city has found it necessary to put on a night shift. General Manager Loomis says that now Taft has been elected he feels more certain than ever that his company will be one of Dayton's largest industries in the near future.

Bergman Tool Company, Buffalo.—The Bergman Tool Company has bought property on Niagara street, Buffalo, where it is building a three-story concrete structure for the manufacture of wrenches, pliers, braces, etc. The National Sales Corporation, of New York, Chicago and Buffalo, has been appointed factory sales agent to the trade.

Union Pacific Gasolene Cars.—The gasolene motor coach business of the Union Pacific Railway Company has assumed such proportions that an independent company has been formed for their manufacture, known as the McKeen Motor Car Company, of Omaha. Connecticut coils, timers and indicators are used on all these railway motors.

Schaub Automobile Motor.—On page 695 of THE AUTOMOBILE, November 12, among other statements the rating of the two-cylinder Schaub motor was given as 4-horsepower. Later advices from the Schaub & Son Machine Company, 3064 Henshaw avenue, Cincinnati, O., is to the effect that this particular motor is rated at 10-horsepower.

Palace Show Will Have an Orchestra.—The brass band usually in evidence at former automobile shows will not be heard at the Palace show, which opens New Year's Eve, in New York. Instead the committee has provided for a full orchestra of twenty-five pieces, using only string instruments.

Road Work in the Southwest.—The automobile traffic between Silver Bell and Tucson, Ariz., has increased to such an extent that the old road connecting the two cities did not suit the auto owners, who have been able to get a better and shorter road constructed for them.

Count Goes Back to Japan.—Count Tsatsuma Ninagawa, who was sent to the United States by the Japanese Government to learn the automobile business, has left Dayton, O., where he has been for the past year in the shops of the Speedwell Motor Car Company.

Bus Lines Prosperous in the West.—M. S. McArthur and Neil Hinckley have been so successful with their bus line between Los Angeles and Palo Verde that they will increase the service by the addition of two 50-horsepower Apperson touring cars.

Hayes Wheel Company.—The Hayes Wheel Company has been organized with C. B. Hayes as president and general manager, to take over the plant and machinery formerly owned and operated by the National Wheel Company, Jackson, Mich.

Continentals at the Olympia.—One of the first bits of news to reach this country from the Olympia Exhibition, in London, is to the effect that out of 2,218 tires shown, 678, or 30 per cent. of them, were Continentals.

More Room for G. & J. Company.—The G. & J. Tire Company, of Indianapolis, has broken ground for the erection of an addition to its factory which will increase the floor space by 50,000 square feet.

Kissel Company Increases Capital.—The Kissell Motor Car Company, of Hartford, Wis., has filed an amendment to its articles of incorporation, increasing its capital stock from $100,000 to $200,000.

IN AND ABOUT THE AGENCIES.

Federal Tires, Boston.—The Standard Tire & Rubber Company, with offices and salesrooms at 102 Portland street and warehouse at 84 Chardon street, Boston, will soon announce the opening of an uptown branch to take care of the automobile trade in the sale of the new Federal tire handled by this company. The tire is made by the Federal Rubber Company, of Milwaukee, of which William P. Cronin, at one time manager for the Diamond Rubber Company, is president, and James S. Waddell is treasurer. Osborne S. Tweedy, formerly with the Diamond Company in Chicago, has been appointed sales manager, and Otis R. Cook, for twelve years with the F. R. Goodrich Company, will be manager of the tire department.

Delauney-Belleville, New York City.—J. J. Mann, for the Delauney-Belleville Company, of St. Denis, France, has completed arrangements with Brewster & Company, Broadway and Forty-seventh street, New York City, to act as agents for these cars in all the Eastern States. The body-building facilities of this concern should be a large factor in properly placing the Delauney-Belleville cars before the public.

Stearns and Midland, Milwaukee.—The Wisconsin Automobile Exchange, State agents for the Stearns and Midland lines, has moved to its new and permanent quarters at 239-241 Wisconsin street, adding another big agency and garage to the East Side motor row in Milwaukee. The repair line will be a specialty. A public garage will be maintained. A. E. Eckstein is general manager of the company.

Middleday, Philadelphia.—Middleday cars will be represented in Philadelphia by William P. David, formerly connected with the Kelsey Motor Car Company. Salesrooms have been arranged for on North Broad street, next to the West-Stillman Company.

Moline, Illinois.—Otto C. Owen, a brother of R. M. Owen, has taken the agency for the Moline cars for the State of Illinois outside of Chicago and vicinity. Mr. Owen will continue to act as the State representative of the Reo cars.

Overland, New York City.—The New York agency of the Overland Automobile Company has moved its quarters to 1657 Broadway. A Brooklyn salesroom will be ready for occupancy in a few days at 315 Livingston street.

Pope-Hartford, Waterbury.—A newly organized concern incorporated at $50,000, by C. S. Woodward, I. F. Backelder and H. F. Stackman, has taken the agency for the Pope-Hartford cars in Waterbury, Conn.

Stearns, Milwaukee.—The Wisconsin Automobile Company has been appointed agent for the Stearns car in Milwaukee. This company is erecting a two-story garage, 50 by 100 feet, on Wisconsin street.

Franklin, Hartford, Conn.—The new Franklin garage, conducted by Robert R. Ashwell at 341 Trumbull street, was formally opened last week, adding to Hartford's garages one of the largest in the city.

American, Los Angeles, Cal.—The American agency has been taken for Los Angeles by the American Motor Car Company, which has opened headquarters at Washington and Main streets.

Ke-Pa-Go-In Tires, Cleveland.—The Cleveland agency for the Ke-Pa-Go-In tires has been taken by the newly organized Zenith Motor Goods Company, of 2062 Euclid avenue.

Oakland, Hutchinson, Kan.—The Salt City Motor Company has opened a garage and salesrooms in Hutchinson, Kan., and taken the agency for the Oakland car.

Thomas Shock Absorbers, Philadelphia.—The Penn Square Automobile Company will be the Philadelphia agents for the Thomas shock absorbers.

Knox, Providence.—The Knox Automobile Company will be represented in Rhode Island by the Hitchcock-Banks Motor Car, 179 Aborn street, Providence.

Pittsburg "Six," Boston.—Stanley Webster has been made New England distributer for the Pittsburg "Six," his location being 1024 Boylston street, Boston.

Lane Steamer, Boston.—The Boston agency for the Lane steamer has been taken by the Cushman Motor Company, of 91 Church street.

Mitchell, Eastern Pa.—The Penn Motor Car Company, of Philadelphia, now represent the Mitchell car throughout Eastern Pennsylvania.

Cadillac, Cleveland.—The Barger Auto Company, Cleveland, agents for the Cadillac, has just taken possession of its new salesroom.

Thomas, Southern California.—R. C. Brassy, of Los Angeles, has been appointed agent for the Thomas cars in Southern California.

Pullman, Pittsburg.—The Auto Brokers' Exchange has been appointed the Pittsburg representative for the Pullman cars.

Franklin, Milwaukee.—The Milwaukee agency for the Franklin cars has been taken by Wm. F. Sanger.

PERSONAL TRADE MENTION.

P. J. Holm, formerly superintendent of the Northwestern Steel & Iron Works Company, of Eau Claire, Wis., has resigned and will go into the automobile motor and gasoline engine manufacturing field. Mr. Holm has organized the Holm Machinery Manufacturing Company, incorporated under the laws of Michigan, capital stock $100,000, and will build a large factory at Sparta, Mich. The plant will consist of a foundry, 200 x 200; machine shop, same dimensions; shipping house, pattern shop and storage building, 50 x 100 feet, with a testing shop of the same dimensions. Before going into the project, Mr. Holm secured contracts from automobile manufacturers for engines that will keep the plant busy for some time.

Theodore Deetjen, secretary and treasurer of the Wisconsin Automobile Exchange, 239-241 Wisconsin street, Milwaukee, and an assistant are making a tour of twenty-five of the largest cities of Wisconsin in Stearns and Midland demonstrators. The route will take them into every section of Wisconsin. This is the first time any Wisconsin agent has gone after business in this way, and the result of the personal tour is being watched with interest.

Monte Cross, shortstop for the Philadelphia Athletics in their championship days, and last year manager of the Kansas City American Association club, is putting in the winter in the shop of the Philadelphia branch of the Winton Motor Carriage Company, at 246 North Broad street. Monte expects to go into the automobile business for himself in the near future.

F. T. Sanford, who has been connected with the Napier Motor Company, of England, and well known to the automobile trade of New York, has opened a garage on Forty-third street, just off Fifth avenue, where he has the agency for the Thames six-cylinder cars.

Charles S. Hensbaw, of Boston, started from New York November 23 in a 1909 Haynes car on a 10,000-mile trip, which will include all the principal cities of New England. He will be accompanied by Loring Wagner, of Chicago.

E. J. Wall, for many years traffic manager of the Pope Manufacturing Company in Hartford, Conn., has gone with the New England branch of the Thomas B. Jeffery & Company, in Boston, in the capacity of business manager.

Dave Henry, formerly traveling salesman for the E-M-F Company, has accepted the position of sales manager for the Interstate Motor Car Company, of Chicago.

Charles P. Saunders, well known in the tire business in New York and Philadelphia, has joined the selling forces of the Firestone's Company's branch in Philadelphia.

Morgan R. Davis has been appointed general manager of the Penn Motor Car Company, of Philadelphia, agents for the Mitchell car in Eastern Pennsylvania.

Louis Elmer, the Ford agent at Hartford, Conn., is slowly recovering from his severe attack of pneumonia at the Hartford hospital.

J. D. Porter, who has been on the road for the E-M-F Company, has gone with the Cleveland branch of the Studebaker.

Quitting Time at the Factory of the H. H. Franklin M[illegible]

At the factory of the Franklin, Syracuse, N. Y., 6,000 automobiles [illegible] of the original thirteen Franklin cars, made in 1902, eight are known t[illegible] The Franklin factory has a floor space of 257,735 square feet. There [illegible] made, and 1,550 men are employed.

Vol. XIX New York—Thursday, December 3, 1908—Chicago No. 23

THE AUTOMOBILE

Italy Scores over Germany In Savannah's Grand Prize With France Third and America Last

SAVANNAH'S Grand Prize is history. Italy took the honors. Germany was the runner-up. France again lost, for the third time this year under international rules. America—well, she completed the list of twenty entrants. Wagner, the '06 Vanderbilt Cup winner, was the bright and particular star, he driving a Fiat. Hemery, the '05 Vanderbilt king, made the battle fast and furious with a sturdy Benz from Germany. Nazzaro, however, was the man who seemed to have the Thanksgiving Day turkey well in hand, when, alas and alack, a "blow-out" and a too hurried replacement relegated his Fiat to third place. This serious and sad-eyed, yet most capable racing pilot from Turin, had intended if successful to make his appearance at Savannah the last in his notably remarkable career. There's a girl in the case, of course, and she is to be Mrs. Nazzaro. Whether there will be a special dispensation for another race will have to be answered in Italy. Nazzaro is likely to ask for one more race.

Such a race as Savannah had has never been equaled in some particulars. The city and the county in which it is located worked with might and main, and the results were only such as are always obtainable when conscientious men devote themselves to their task. Tiedeman, and Battey, and Granger and a score of others figure in the list of honor, which might be extended to include all the inhabitants, for certainly the South laid itself out to do the proper thing and it did it genuinely and without hesitation. While it was accomplished in the name of the Savannah Automobile Club, the credit goes far beyond its membership.

It was up to the Automobile Club of America to supply a first-class "show," and this fell to Morrell and his contest com-

Nazzaro During One of His Greatest Straightaway Flights.

mittee associates. Circumstances may have helped, but the fact remains that fourteen of the world's best drivers, supplied with superb racing crafts, came from Europe for the "Grand Prix" on American soil. To this contingent were added six American starters, who recognized the handicaps against them and sought experience and did not delude themselves with the idea of winning the A. C. A. cup. To enter into a game at which you are a novice and your opponent is an expert, isn't the best kind of judgment. 'Tis possible that nothing of the kind may happen again.

Expected Catastrophies Didn't Happen.

Before the race it was in the minds of many that the somewhat tortuous course might cause catastrophies innumerable, especially in view of the fact that the promoting clubs and the tire companies had been quite generous in prize money, and thereby the drivers might be tempted to take chances which otherwise would be passed unheeded. But the course gave evidence of the conscientious efforts of Engineer Hull, the turns being well banked, the oiling abundant—a bit too much—and the drivers negotiated the corkscrew curves rapidly and skilfully and none came to grief. In fact, the only accident was caused by the tread of a non-skid tire coming off and striking Erle in the face, thereby causing him temporarily to lose control of his juggernaut and smash into a tree alongside the road. His injuries may be comparatively slight. This was the sum total of the accident column. One mathematician figured over thirty turns, which, multiplied by sixteen, meant considerable of a strain on the drivers. The real contenders, however, were hardened to the trying and circuitous journey, and, as an example, it is said that Hemery made over 50 trial trips, becoming as familiar with the route as possible. This driver is a regular track horse for work.

Wagner Took the Turn Skilfully and Fearlessly.

For the light car race of the day before Thanksgiving, a short 10-mile quadrilateral circuit was utilized, but it was in this contest that the most serious accident happened, caused by the overturning of one of the participating voiturettes.

Excellent Guarding of the Course.

In the guarding of the course Major W. B. Stevens did the work completely with a comparatively small number of soldiers, though the crowds gathered at various points were smaller and less obstreperous than the hordes which invaded Long Island on the day of the Vanderbilt race. 'Tis possible that the Southrons are more law-abiding, but it is also a certainty that the guarding was more capably attended to than that contributed by the so-called Irish Brigade at the Vanderbilt contest.

A conservative estimate would place the number of onlookers inside the 100,000 mark, figuring that fully twice as many saw the Vanderbilt race. The prices charged were not such as can be obtained in the vicinity of New York, for one could buy seats at $3 for the two days in the most favorably located stand. The other place of vantage was for those people who came from Southern points and whose railroad tickets included a $1 place of observation. Some 20,000 must have been massed around the finish. It should not be thought, however, that the interest in the Savannah race was confined to the people who saw it. Generous stories were taken by all the daily papers, and invariably it had a front-page location. In New York City the A. C. A. provided for its members and their friends a score board and direct reports from the course, and these were read to a large crowd which filled the assembly room of the clubhouse on West Fifty-fourth street.

Light Race a Good Introductory.

The light car struggle supplied a most interesting introductory to the two days of excellent motor sport, and while the verdict went to the consistent running Lancia, made by the famous Italian driver of the same name, and guided by the cool-headed Hilliard, the American contenders were ever apparent and dangerous. Burman's Buick showed wonderful flights of speed, but apparently did not possess the ruggedness of the Italian product, though the well-calculated driving of Hilliard may have been a deciding factor. A mighty good clip was the 52.59 miles an hour of the little Lancia, though the statistics give the fastest lap to the No. 10 Chalmers-Detroit, which went the route at 57.63 m.p.h. Next was Burman's Buick at 55.98 m.p.h., and the Lancia at 54.93 m.p.h. The other little chaps had some fast flights.

In the big race the greatest speed attained, according to Trego's special timing instrument, was the 101.1 miles per hour of the Renault, driven by Strang. The companion Renault, handled by Szisz, was luckless, or otherwise the '06 Grand Prix hero might have been in the forefront of the fight.

The average of the race was even better than that of the Vanderbilt, wherein Robertson's figures were 64.3 miles per hour. The Grand Prize winner traveled at the rate of 65.08 miles per hour, even with the twisting and turning road. It was hardly anticipated that Nazzaro's Florio Cup average of 74.3 miles per hour would be touched, though the city of Savannah offered a special prize of $2,500 for the man-machine combination which might accomplish it.

Protests That Were Not Insisted Upon.

Herr Carl Neumaier, president of the Benz firm, on Saturday withdrew the protest he had filed Friday against the award of third place to Nazzaro, which, if allowed, would have given Hanriot, a Benz driver, third money. The protest was based on the Fiat crack having received outside assistance in changing tires on the last round. Nazzaro's defense was that some well meaning soldiers had insisted in helping him, and that being unacquainted with English he was unable to make it clear to them that their assistance endangered disqualification for him. There was some talk after the race of a protest being lodged against Hanriot for obtaining from a touring car gasoline which alone enabled him to complete his final round; but nothing came of it.

Telling How the Battle Waged in the Big Race

By John C. Wetmore

The Big Crowd that Filled the Grand Stand—The Supply Pits Occupied the Foreground.

SAVANNAH, Nov. 26.—Fog again threatened a long postponement of the Grand Prize, just as it had the day before in the light car race. As it was, when the cars were lined up at 8:30 o'clock, the mist so thickly clouded the course that one could not see a hundred yards up the road. At the appointed hour of 9 o'clock conditions were just as bad. Half an hour later there was some improvement, but then prudence forbade sending the drivers away into the mist clouds. A quarter of an hour later Starter Wagner sent Rigal away. By the time the field of 20 was under way, however, the sun had triumphed and a bright, balmy day was at hand.

The Start.—All of the twenty entrants faced the starter, who sent them away at minute intervals in the following order: Rigal, Clement; Mulford, Lozier; Seymour, Simplex; Burman, Buick; Haupt, Chadwick; Nazzaro, Fiat; Zengle, Acme; Hemery, Benz; Duray, DeDietrich; Szisz, Renault; Harding, National; Cagno, Itala; Hautvast, Clement; Wagner, Fiat; Hanriot, Benz; Strange, Renault; Fournier, Itala; DePalma, Fiat; Erle, Benz, and Piacenza, Itala. The Americans had the best positions in line, four of them being in the first quintette, the other two starting seventh and eleventh, respectively.

First Lap.—With the field under way in 19½ minutes, the spectators had not long to wait for the head of the flying column to reach the grandstand. It was the Lozier, Mulford having gotten by Rigal. Then came Seymour, who had also passed the Clement crack. Haupt outfooted Burman and Hemery easily disposed of Zengle. All this time DePalma, the former bicycle rider, was coming like a whirlwind from the rear with the Fiat. When the racers had passed and the times were matched up DePalma was the leader, 12 seconds ahead of Wagner, who had beaten Hautvast 6 seconds, the Clement driver in turn leading Hanriot by 2 seconds. Nazzaro and Hemery, the favorites, were content with conservative laps in 23:42 and 23:54, respectively. Szisz was pushing the Renault hard in 22:41, a 67-mile-an-hour clip.

Second Lap.—Willie Haupt flashed to the fore in the second lap with the Chadwick and got a royal welcome from the spectators, who were eager to hurrah for an American as long as they had a chance. DePalma continued to climb up the ladder hand over fist. Scoring 21:36, the fastest lap in the race, equalled only by his own in the seventh round and showing a 70-mile-an-hour gait, the Italian-American lad increased his lead over the field. He led Hanriot, who had been going some also, by 1 minute 19 seconds, a good mile and a half of margin. Wagner, Erle, Cagno, and Szisz were also hitting the pace. Nazzaro and Hemery were driving well within themselves at 65 1-2 and 61 1-2 miles an hour averages. It was a magnificent struggle for the lead of seven leaders traveling at faster than 63 miles an hour.

Third Lap.—Before the third round closed, the three Americans, Mulford, Seymour, and Haupt, had lost their leadership of the procession, and Nazzaro was making the pace. De Palma suffered a five-minute delay and dropped back from the leadership into the ruck. Hanriot and Szisz had fought their way to the front and were having a neck and neck struggle for the premiership, the Benz leading the Renault by but 7 seconds, with Erle in hot pursuit a half a mile further back. Two of the Americans, Burman and Zengle, were out of the race for good. Nazzaro and Hemery and Wagner, the ultimate trio of leaders, were back in the second division, which included Cagno and Strang.

Fourth Lap.—The fourth round saw Nazzaro, Hemery and Szisz leading the procession. They were only leaders, however, so far as the order of passing the stand went, for Hanriot still held the lead, the Benz having covered 100.52 miles in 89:44. Another Benz man, Fritz Erle, was in second place on 44 seconds behind his team mate. The German pair had opened close to a two-minute gap on Nazzaro, who was being hotly pursued by Hemery, a half a minute further to the rear. Haupt was making the best showing of the Americans, the Chadwick being still in the middle of the European bunch with as many behind him as ahead of him.

Fifth Lap.—Hanriot still hung stubbornly to his lead, but by a round in 22 minutes flat, a 68.5-mile gait. Wagner had dislodged Erle from second place. It was now becoming a race that for closeness will long live in automobile history. The leaders were only seconds apart, their order and times being: Hanriot, 1:14:10; Wagner, 1:14:14; Nazzaro, 1:14:44; Szisz, 1:14:46; Hemery, 1:15:02; Erle, 1:15:12, for 125.65 miles. This was probably the most closely contested round of the race.

Sixth Lap.—Nazzaro and Hemery were now driving their cars for all they were worth in an effort to overtake the flying Hanriot. They managed to outpace Szisz, Wagner, and Erle, but Hanriot for the time being was too much for them, for the Benz showed a round in 21:52, which landed it 34 seconds ahead of Hemery and 1 minute 8 seconds to the better of Nazzaro. Wagner was their pursuer.

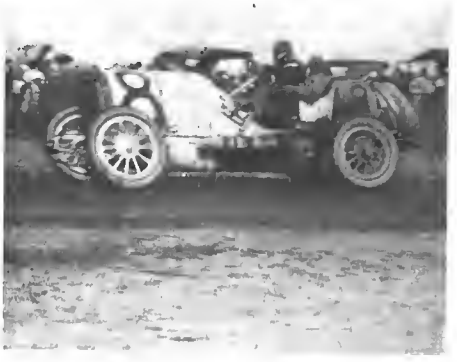
Seventh Lap.—Hanriot slowed down a bit in this round, but not enough, however, to cost him his lead. Nazzaro and Hemery were having a fine duel between themselves, the Frenchman leading the Italian by but 14 seconds. Both were hot foot after the runaway Benz. Wagner was hanging fire a bit, but DePalma had got his Fiat going again and was after the leaders in earnest with a lap in 21:36, which tied his record of the second lap. All this time the fat and prosperous veteran Fournier was not making a half bad showing with the Itala, plugging along pretty steadily at a 60-mile-an-hour gait. Seymour was driving

tbe best of the Americans, Haupt having thrown up the sponge for good during the preceding round.

Eighth Lap.—Before tbe halfway post had been passed, Wagner, Hemery, and Nazzaro, the ultimate leaders in the race, had fougbt their way into the three leading positions. At the end of the round, in fact, they occupied the positions named, which were the order of tbeir final finish. Wagner led Hemery 30 seconds, who had a margin of but 10 seconds over Nazzaro. The Fiat crack, following bis invariable custom, stopped at the half-way post to replenisb fuel. So did tbe Benz champion. Wagner, however, continued. Hanriot bad halted by the wayside and was now in fifth position, Hautvast having passed him. The other racers were now hardly in the running, so far as bopes of the first three places went. In the preceding round, by the way, Szisz had dropped out, having broken a bearing in the front axle of his Renault.

Ninth Lap.—The race had now practically narrowed down to a triangular duel among Wagner, Hemery and Nazzaro. Wagner lost his narrow lead this round by making his delayed stop for gasoline and oil. Entering the last half of the race, Hemery began to ride like a speed fiend possessed. Covering this lap in 22:22 he completed it with 39 seconds of precious margin to his credit. Wagner having fallen over a minute to the rear of Nazzaro, Hautvast, Hanriot, DePalma, and Erle were also spurting hard, but they were too far behind for their spring to be of much avail.

Tenth Lap.—The three-cornered fight for the lead kept the spectators "on their toes" all the time. They watched eagerly for the coming of the first of the trio and listened attentively for the figures as they were announced. Wagner got by Nazzaro, but was still 9 seconds behind Hemery.



Hemery, Who Looked a Sure Winner.

Eleventh Lap.—In the preceding lap, Wagner had made the 25:13 mile circuit in 22:11. He lowered this to 22:05 in tbis round, and by his sprint secured a lead of a minute over Hemery and 1 minute 19 seconds over Nazzaro. Cagno was put out of the race in this lap by a broken rear spring.

Twelfth Lap.—It was now up to Nazzaro to be up and doing something. He did it. A lap in 22:52 aided by a faltering of Wagner and Hemery gave him the lead, and a pretty good lead, too, considering how near the finish was. In fact, the score board was completely upset, Nazzaro leading Wagner by 2 minutes 39 seconds and Hemery by 2 minutes 44 seconds. It looked to be all over but the shouting for Nazzaro.

Thirteenth Lap.—Increasing his pace to a 23:38 lap, Nazzaro pulled still further away from Hemery. Wagner had slowed down to 24:45 and wound up the round 1 minute 5 seconds behind Hemery, who was 3 minutes 39 seconds behind Nazzaro. It looked to be more ever a cinch for the Italian.

Fourteenth Lap.—Hemery spurted gamely in this round, scoring 22:48 for tbe circuit and cutting down Nazzaro's lead to 2 minutes 27 seconds. Wagner went even faster, and at the finish of the lap had reduced the Benz's lead to 29 seconds by a round in 22:12, his fastest circuit so far.

Fifteenth Lap.—Nazzaro, having the race well in hand, slowed down a wee little bit. Wagner quickened his pace to 22:11, his fastest in the race, and Hemery raised his gait to 22:38. The two French pilots were making a magnificent effort to overtake the cool-headed Italian. To what a high pitch of excitement the closeness of the struggle had wrought up the spectators can easily be imagined. All hands were on their feet watching up the stretch for the appearance of the leader and straining their ears to catcb promptly tbe figures the timers gave out.

The Finish.—Nazzaro entered tbe final round witb a lead of 1 minute 52 seconds over Hemery, whose margin over Wagner's was but 2 seconds. Barring one of those bundred accidents that can befall an automobile racer, Nazzaro was the winner. Within 2 minutes after Hemery and Wagner had passed the stand, the megaphone man fired a bombshell into the crowd.

"Hemery has passed Nazzaro!" A telephone man had sent the message, but he gave no particulars. The crowd refused to believe its truth until the white Benz was seen coming down the stretch. Nazzaro was, indeed, beaten, but Nazzaro had not started until 6 minutes after Hemery, and the race was not over. Then came Nazzaro, the first of the trio to start. Then came at last, after what seemed hours of suspense to the waiting crowd, Wagner. There was a deatblike silence, and tben some one in the Fiat pit cheered. Then came the megaphoned time. Wagner had won. He had beaten Hemery by 56 seconds and Nazzaro by 2 minutes 27 seconds.

A puncture, in fact, two of them, had been the Italian's undoing. A tire was quickly replaced, but Nazzaro had gone but a short distance when he discovered that the tire he had just put on was soft and another change was necessary.

The finisb of Hanriot, who was fourth, was ludicrous. His Benz had run short of gasoline at tbe head of the slight decline forming the bome-stretch, and it literally coasted in. Its crew swayed their bodies and the crowd "rooted" to belp it along. It just managed to get across the tape.

At the conclusion of the race Wagner and Hemery were brought before the "royal box" in their cars and presented to tbe spectators, who cheered them heartily.

The first four finisbers were equipped with Michelin tires and divided among themselves $3,800 in prizes given by tbe Michelin Tire Company, made up of $2,000, first; $1,000, second; $500, third; and $300, fourth. Fifth and seventh places fell to cars fitted with Dunlops. Sixth, eighth, and ninth finishers were equipped with Michelins.

All nine of the cars that were timed for the entire 402.08 miles were fitted with Bosch high-tension magnetos, thus winning $500, first; $250, second, and $100 for third, offered by the Bosch Magneto Company.

Eigbt thousand dollars in cash was put up by the Automobile Club of America, which was won as follows: Wagner, Fiat, first, $4,000; Hemery, Benz, second, $2,000; Nazzaro, Fiat, third, $1,000; Hanriot, Benz, fourth, $750; Hautvast, Clement-Bayard, fifth, $250. The money will be handed over to the winners at the Automobile Club of America's clubhouse Wednesday.

With Governor-elect Brown as the chief guest of honor, it was evident that the State had lent itself in making the success one that encompassed Georgia.

In its comment upon the race, the Savannah *Press* editorially said: "From the very first the whole city entered into the movement with the finest possible civic spirit. No work was too hard, no concession in reason too great, to meet with an instant and favorable response. City and county authorities have pulled together as one man, and the military has responded promptly and gladly. Tens of thousands of dollars have been advanced by the various local interests, not for the purpose of taking a penny of profit directly, but by way of making Savannah known to the world as one of the very 'biggest,' most energetic, most virile cities of its size on the map. In this Savannah has succeeded."

Technical Consideration of the American Grand Prize

By David Beecroft.

NOTHING shows more conclusively the excellent workmanship in many of the high-grade racing cars than the fact that nine out of the twenty that started in the 402-mile Grand Prize race actually finished the course and three others were running in good shape when the referee declared the race off, making twelve out of twenty or 60 per cent. in commission after the gruelling experiences over the rough roads for almost seven hours. Of the eight that dropped out, one was due solely to an accident, namely No. 19 Benz, driven by Fritz Erle, which was overturned on the White Bluff road by the tire tread on the right rear wheel coming loose and striking Erle, who was knocked unconscious. This left but seven cars actually put out of the running because of troubles with the machines or the drivers. Two of these went out through broken springs, one through oiling troubles, one because of a broken camshaft, one a broken ball bearing, and two others because of troubles caused through running off the road.

That the foreign cars were in a class by themselves was evident from the completion of the second lap, when they began setting a pace all of their own, and running with the utmost regularity. The motors ran perfectly, the drivers not having to raise the hood throughout the entire race with several of the cars and having no other task than guiding them on the road, taking on gasoline and oil, and repairing tires. In the sixteen laps that each of the nine foreigners, to finish, flashed past the grandstand not a single instance of running on three cylinders occurred, and only one case of a motor in the symptoms of distress appeared. The cars were built for the task and trained to it. Before any of the cars contested in their first races this year they were given thousands of miles of touring work through Europe, when the drivers had a chance to learn every detail of them and when the cars had an excellent opportunity to get worn in.

The troubles with the American cars in most cases were due to lack of preparedness: either the cylinders were not properly worn in, the lubricating means had not been sufficiently tried out, or other parts duly tested. In connection with the American machines it must be remembered that three were stock machines with a few racing necessities added, and the others semi-racing cars which were but natural evolutions of stock machines and not out-and-out racing locomotives built expressly for the big road races of 1908. It is unusual in road races for cars to be eliminated because of broken springs, which, however, was due to the rough condition of parts of the course and some of the bad trolley crossings, two of which the cars had to cross.

Wagner with the winning Fiat had few other troubles than tires and stops for gasoline and oil. His motor sounded the best of the three Fiats, although he did not make as fast time as did DePalma. Wagner's motor had a very regular purr which was rhythmical to the extreme and an examination of the complete car at the end of the run failed to disclose any evidence of trouble to the running gear. In the twelfth lap when stopping at the grandstand pits to take on oil and a new tire the mechanician examined the jackshaft at the left end and used a bit of rope in tying up apparently some small part of the chassis which had nothing to do with the jackshaft. This was the only evidence of trouble the car had during the entire race.

Hemery's No. 8 Benz did not even give that much trouble, and the only stop made at the grandstand was in lap eight to take on gasoline and oil. Nazzaro with third honors had an equally clean record, his car running perfectly throughout the contest and tires only being the troublesome factors. Hanriot with No. 15 Benz in the first seven laps looked like a certain winner and was leading in time for several successive laps and the Trego timer reported him making the mile straightway at a speed of 100 miles per hour. But the pace broke the oil lead from the hand pump to the crankcase, and a delay of nine minutes in the eighth lap and seven minutes in the ninth frosted the fondest hopes of his admirers. Having to change two tires in one lap at this time was the expected result of the terrific pace he had set and still further separated him from the premier position. He further lost 2 minutes 31 seconds in the eighth lap when taking on gasoline and oil and ran out of gasoline at the end of the last lap, and his car was barely able to coast over the finishing line, which made his last lap about 3 minutes slower than his average.

Hautvast, in No. 13 Clement, drove a remarkably consistent race and had the Clement machine working at its limit most of the time. He made but two stops in front of the grandstand pits, one in the ninth lap when two minutes were consumed in changing a couple of rear tires and in taking on of supplies. Again in the last lap he stopped for 25 seconds. Lewis Strang, the winner of first honors on the same course last March in the stock chassis race, was in hard luck with his Renault machine, and although he made the fastest miles on the homestretch, running as high as 101.7 miles per hour, he never averaged high on his laps. He was over 25 minutes on the first lap and came past the grandstand with the bonnet off and completed the race without it. On the third lap he lost three minutes at the grandstand pits in changing a left rear tire; at the start of the seventh lap he lost nearly 15 minutes with tires and engine troubles.

Rigal in No. 1 Clement started off with bad luck in the first lap, when he was compelled to put on a second magneto, the first one going out of commission and costing him seven minutes at the start of the race. On the eighth lap he changed the two rear Dunlop tires and took on gasoline and oil, the three operations being completed in 3 minutes and 15 seconds, and the one man doing the tire changes in the minute. Rigal's car was not so fast as the Fiat or Benz but its regularity of running was such as to bring forth cheers from the grandstand as soon as it realized what the machine was doing.

After Rigal in the honor roll came Henry Fournier with his shaft-driven Itala, the only one of the three cars of this make to be running at the end of the race. For the first eight laps he drove consistently, doing all of them in 24 minutes and a few

seconds; but after this bis pace was slower. Laps 9 and 10 were slow, due to tire changes and taking on fuel, and the last six laps averaged more than a minute slower than the pace he set in the first half of the race. Cagno, driver of No. 12 Itala, withdrew at the end of the tenth lap because of breaking the long leaf in the left rear spring where it turned around the shackle bolt. The four springs on this car were completely taped, as were the shackle links and bolts, and it required the cutting off of this taping before the exact nature of the break could be discovered. When the trouble was detected the car was driven off the course at the end of the pits, where it remained until the completion of the race. Piacenza driving the third Itala No. 20 went off the road on the Isle of Hope turn and withdrew from the race and it was impossible to discover the exact cause.

Duray, driving No. 9 De Dietrich, met with misfortune in lap five, when the radius rod on the right side broke, allowing the jackshaft sprocket to pull back toward the rear wheel, after which the driving chain broke and cut Duray severely on the right arm above the elbow. He drove to the grandstand, where the wound was dressed, after which the broken parts of the car were repaired, 21 minutes 15 seconds being needed, and which

Strang's Renault Reached the Highest Recorded Speed.

was enough to put him out of the race. Later in the tenth lap three minutes were lost in taking on gasoline and changing a rear tire, and again in the twelfth 1 minute 48 seconds were needed in wrapping the injured arm. He had completed fourteen laps when the race was called off.

De Palma in No. 18 Fiat was picked by many as the possible winner of the race, and the way he reeled laps off at the start did much to convince others tbat the confidence many had placed in him was well placed. He did four laps in less than 22 minutes to the lap and there was only one lap made by any of the other drivers under the 22-minute mark, and that was by Hanriot's No. 15 Benz, which set the sixth lap at 21:52, whereas De Palma placed the mark at 21:36 in the second lap and duplicated it in the seventh and made a couple of other laps in 21:48 and 21:55. But the pace worked havoc with his oiling and tires and in the third lap his car actually roze for a time because of not having fed enough oil to the cylinders. He required 47:54 for the lap during which time he was lapped by nearly all of the others and lost every hope of getting within the first five. To add to this loss of time was 4 minutes 15 seconds in lap five, when he changed a tire and took on gasoline. In the sixth lap 7 minutes 30 seconds were lost in oiling the motor and overcoming the difficulties caused by lubrication. In the ninth lap 5 minutes were lost in taking on gasoline, oil and water. In the twelfth lap 1 minute 5 seconds were needed to take off an old tire from the car and hang a new one on; and in the fourteenth another 2-minute stop was needed for taking on more oil. It may frankly be stated that De Palma's entire troubles were due to the terrific pace he set and not increasing the oil feed in proportion to it. To add to these difficulties he had troubles galore. At the finish of the fifth lap when changing a right front tire the big jack slipped letting the rim of the wbeel down on the ground and making the car axle too low to get tbe large lever jack under and making it necessary to use a small screw jack to raise that side of the car enough to get tbe lever jack in position. Again at the end of the sixth lap when changing tires he changed the left front and right rear and put a couple of new ones on the back of his car. He then decided to change the left rear and in doing this the first demountable rim with tire he tried was too tight and after kicking for some time to get it on bad to roll it back to the pit. The second one be tried was no better and after wasting time be called for a third one which slipped on easily.

Something Concerning the American Cars.

Of the six American cars contesting not one finished the sixteen laps, but two were running at the finish, the Lozier and the Simplex. The Simplex suffered because of new eylinders which had not been worked down to the smooth finish necessary. The car handled by Seymour made good time in the first three laps, but at the end of the fourth had to stop at the pits for water and oil, losing exactly 5 minutes. A new tire was taken on at the same time. In the eigbth lap another stop of 4:30 seconds duration was made during which two old tires were thrown off the tire rack on the car and three new ones placed on it; this done gasoline, oil and water were taken on. Again in the tenth lap a 5-minute stop was made at the pits when a new tire was taken on and gasoline, oil and water replenished. None of Seymour's laps were made in less than 23 minutes, and the car, barring its motor troubles, as already stated, had no trouble whatever, but the frequent stops for tire changes. He was in the fifteenth lap when the race was called off and running fast.

The Lozier was the first car to stop in front of the grandstand, halting for one minute at the end of the second lap to take on water and put on a new rear tire. On the tbird lap another stop was made, and again in the eighth. The car plainly sbowed the results of not being ready for the fray, and like the Simplex had it had 2 or 3 weeks workout there would be a different story.

The six-cylinder Chadwick, driven by Haupt, after making the first two laps in a few seconds above the 23-minute mark, stopped at the end of the third lap and worked some time on the emergency brake lever. The third lap was two minutes slower than the previous two, and the fourth still slower. During the fifth a telephone message announced that the car bad quit the race due to the hand oil pump becoming disabled, which resulted in the reported burning out of one of the motor bearings, presumably a connecting rod one. General regreat was expressed on every hand that Haupt should have troubles of the same nature as De Palma, which were not in any sense due to faulty construction but rather to feeding too little oil.

The Acme six, driven by Zengle, in its first two laps gave promise of finishing the course and about a 26-minute per lap pace, but in the third lap broke the right front spring and was over 2 hours making the circuit. When it appeared at the grandstand the frame at that point was supported on a block of wood that was ropped and strapped in position. With this handicap the car made four more laps close to the 27-minute mark, but finally dropped out a couple of hours before the finish of the contest, the pace being too fast on such spring suspension.

Harding in the six-cylinder stock National car got into difficulties on the first lap when some waste got into the gasoline line requiring over 55 minutes to make the lap and remove the impediment. After this the car had a little carbureter trouble, but was running with good regularity, and during the eighth, ninth, tenth, and eleventh laps was running a neck-and-neck race with Seymour in the Simplex and caused the grandstand to begin computing on which of them would be the leader in the American car class. In the eighth the Simplex led by less than a minute. In the ninth it had increased this to 69 seconds. In the tenth it dropped to 56 seconds, but by the end of the eleventh it was increased to over 3 minutes. At this point the National stopped in front of the grandstand and pulled off the course, where it remained until the completion of the race, the apparent trouble being the disabling in some manner of the camshaft of the motor.

RACE FOR THE GRAND PRIZE OF THE AUTOMOBILE CLUB OF AMERICA, SAVANNAH, GA., NOVEMBER 26, 1908.

ALONG THE REPLENISHING LINE

Some Impressions of a Former Grand Prix Manager

By Victor Breyer

WHILE in Savannah and since I returned to New York, the same question has been put to me, not once, hut I should say a hundred times: "What do you tbink of the big race?" It occurred to tbe editor that it might interest some readers of THE AUTOMOBILE to know what my impressions were down there. Not that my humhle person is of much importance by itself, but merely because I was one of tbe very few French visitors in Savannab, and also on account of my close connection with last year's Grand Prix of the Automobile Club de France. Many people on this side not being aware of the fact, perhaps I may he allowed to mention that I was in charge of the general management of this event, whicb took place on the Circuit de Dieppe, and, by the bye, resulted in a brilliant win for Nazzaro. It was a new move on the part of the French club to nominate a special man to superintend the work, with results that for the first time in the history of automobile racing on our side the 1907 Grand Prix showed a profit, and a handsome one, too.

To revert to the race under notice, it is also a curious fact to record that outside of tbe competitors, I must have been tbe only person to witness all three of the hig speed races held this year, the first in date being the French Grand Prix, which was again held in Dieppe and won by Lautenschlager on a Mercedes; the second being the Florio Cup, which took place near Bologna, Italy, and saw Nazzaro again a winner; and the third, this last Savannah event. It may seem strange to many that I fail to mention the Vanderbilt Cup race in this enumeration, but it would hardly appear a really international affair to eyes that are European.

Having therefore witnessed the ahove trio of hig 1908 races, I am exceedingly pleased to say right here that the first American Grand Prize favorably compared with the other two, both in regard to sporting interest and management. In fact, I doubt if there ever was a better conducted affair, and will confess that I have not seen or heard of any. Of course, as will always be the case witb such a buge undertaking as the organization of a long distance motor speed contest on the road, some minor points may have heen defective, but I want to say tbat they were few and far between—fewer, in fact, to my mind than was the case in either Dieppe or Bologna.

On the race itself, nobody expects me to dwell at any length, since this bas been done tboroughly by men more able than myself. While the field of competitors could not be compared to the 48 starters in the French race, when outside of last Thursday's lot such makes as Mercedes (winner), Panhard, Brasier and Opel also came to the post, its standard was distinctly higber than the field for the Florio Cup event, out of which not only the above makers, but also the Benz and Renault stayed. It looked "classy" enough and well deserves to rank as the second biggest race of the year, as far as sporting interest goes, wbile I again repeat that it was second to none in the matter of excellence of the promoting arrangements.

It may look selfisb on my part, hut wbat impressed me as being very near perfection was the press accommodations. It seemed a perfect treat to work with such facilities, comfortably seated in front of a desk, with a splendidly clear view of the course, and all information supplied you. In fact, it was too easy, I must suppose, for it so bappened that I got the name of the Grand Prize winner cabled to Paris before the race was won. In other words, through a miscalculation on my part, just before Wagner made his sensational final appearance, I made out Hemery to bave won by a small margin and flashed the news over. Luckily not more than two minutes elapsed before I corrected the error, but for some little time there must have been considerable jubilancy in the German camp over on the other side. Anyhow, this is a personal matter. But speaking again of the press arrangements for this race, I would like to point out that on our side the trouhle comes from the fact that there are so many "dead beads" who manage to squeeze in as so-called representatives of so-called newspapers, while it seemed to me in Savannah that everybody on that press stand meant business, and did it, too.

It was a bit novel to me that every one seemed to be not only delighted, but also highly surprised at the way the course was guarded and kept clear. In Europe, ever since the bloody Paris-Madrid race ended the chapter of town-to-town speed competitions and made way for the circuit road races, I have never seen or known it to be otherwise. But I understand that such has not by far always been the case in this country, and it being so, the satisfaction of the Savannah promoters was only natural. Perhaps we, too, in France shall have our share of trouble in that line, for just before leaving Paris I learned that a decree rendered by General Picquart, the Minister of War, stated that tbe army would no longer be used for anything but purely military purposes. Therefore, the French club may confront a very bothering difficulty in the promotion of the big race next year near Angers, as far as guarding the course goes.

Speaking of the course reminds me that I wish to say a word about the one in Savannah. It certainly was a tricky course on account of all the sharp turns, and now that it is all over, I wisb to confess tbat I bad my fears about accidents. Not only me, hut the competitors themselves, and this is clearly shown by the fact that during the evening before the big race, two of the most prominent among the French drivers (everybody will understand me omitting names) gave me all necessary instructions in case something should happen them. At the same time three of the mechanicians started a $100 pool, the proceeds of which were to go to the widow of whoever bappened to be killed in the race. All this would look ghastly enough if the event were not over and we did not know that no really serious mishap was

Duray, One of the Favorites in the Early Betting.

recorded. This goes to show not only what skill must drivers in a big race possess, but also that even those speed monsters called racing automobiles are marvels as far as running, reliability, and control go. Now, again, the course was exceedingly well arranged. Of course, it was tricky and difficult, and nobody could make it smooth and easy. But nobody either could have got it nearer perfection than the people who worked on it did. Some of those banked turns were perfect beauties, and going round them at top speed with an experienced driver, such as Hemery, like my friend Batchelder and myself did before the race, was a treat.

Another point where the A. C. A. and the Savannah promoters got us Europeans badly beaten is in the oiling of the road. Despite numerous inquiries, I am yet at a loss to understand the exact composition of the material used in Savannah, but I noticed that there was not a speck of dust on that homestretch, even when three cars came tearing along it, while on our side dust has always been a cause of nuisance. In fact, this year on the Dieppe course, despite liberal tarring, it was simply terrible.

The timing and scoring board arrangements were good, although I doubt if many people on the grandstand could see the figures clearly enough on the board. It also occurred to me, who sat in the press stand protected by a roof, that some of the ladies on the other side of the road must have felt that "Monsieur Phébus" was a bit too attentive. On both days, once the fog had lifted, it was very hot, and I am sure that people sitting in that grandstand would have enjoyed a canvas over their heads. This is a point on which Old Europe scores; in fact, the grandstands at both Dieppe and Bologna were to my mind far too luxurious and expensive for such a temporary affair as a two-day automobile meeting. But I suppose none of the spectators complained; at any rate, there may be quite a "happy medium" between the two ways of doing it.

A matter of great satisfaction to me was the superiority apparent, as regards the interest for onlookers, by racing held on a comparatively short circuit. For several years I have been, on the other side, fighting for a reduction in the length of the course on which the road races are held, but with only partial success. As an example, I would say that in 1906 the French Grand Prix was held on LeMans circuit, which measured over one hundred kilometers (63 miles) for one lap. The year after, under my management, the Dieppe course was brought down to 77 kilometers (48) miles), but we are yet far from the 25-mile circuit arranged for last week's big race in Savannah. It falls under common sense that the people who put up their money to see automobile races—and the enormous expense connected with the promotion of same shows that as many as possible are required—will enjoy the sight much more when cars are seen to pass frequently and their struggle can be more easily followed. This was the case last Thursday, and more so again the day before, as the small car event would have proved entirely tedious had it not taken place over a very short circuit. Without a doubt, here we have one of the reasons of the meeting's success, and also another of the points you do better here than on our side.

Showing the Road Markings of the "S" Turns.

In conclusion of this too lengthy article, I would really like to say a word or two of the way the Southern people treated the visitors, and more specially the foreigners. All the drivers, who were in Savannah a considerably longer time than I was, expressed themselves as highly delighted at the reception accorded them. They even hinted about not being used to this on our side of the ocean, which was perhaps hard on us promoters, but may be true. As an instance, the attention showed the drivers in Thursday's race in providing them with specially reserved seats from which they could view the proceedings on Wednesday, was an unprecedented thing at home, and it certainly pleased them immensely, for they expressed thanks most heartily.

Seymour and Simplex Which Made Best American Showing.

As for Southern hospitality, I suppose all has been said about it, and I could only repeat the tale of all visitors down there. Indeed, the Savannah Automobile Club members were indefatigable in their desire to attend to all the wants of this guests, and I wish to say the same of all the A. C. A. officials. As far as I am concerned, it was a great tribute paid to the paper which I had the honor of representing on this occasion, and it is a pleasant duty for me to return thanks to all the American gentlemen who contrived to make my work easy and enjoyable.

The European drivers returned to New York last Monday highly delighted with their Southern trip. The only exception was Fritz Erle, the German driver, who was injured in the race and whom the doctors will not allow to take the trip yet. He is in the Savannah Hospital, and, in fact, the latest news made him out to be not near so well as could be wished for.

All the other drivers leave New York on the French steamer *Lorraine* which sails to-day (Thursday) for Havre. They were the guests while here of several functions including the Automobile Show's luncheon on Tuesday, dinner at Paul Lacroix's the same day, lunch at the A. C. A. club house on Wednesday, and dinner with the Fiat Company as a conclusion of their stay.

HOW THE LANCIA-HILLIARD DRIVING-WON THE LIGHT CAR RACE

SAVANNAH, Nov. 25.—W. M. Hilliard, of Boston, driving tbe Lancia *Lampo,* entered by the Hol-Tan Company, of New York, won the international stock car race to-day. He covered the 196-mile course in 6 h. 43 min. 33 sec. Robert Burman, in a Buick, was second in 6 h. 49 min. 49 sec., and L. B. Lorimer, in a Chalmers-Detroit, was third in 6 b. 53 min. 55 sec. The winning car was equipped with Continental tires, and the second and third with Michelins.

Hilliard, the victor, is a veteran at road and track racing. He began his racing career by winning the Boston *Herald* trophy at the 1905 Readville track meet. On July 15 of that year he won the Mount Washington hill climb in a Napier. Later, he raced on Ormond and Atlantic City beaches. He was a contender in the Briarcliff at the wheel of a Shawmut car, and also drove a Lancia at tbe opening of the Long Island Motor Parkway.

The light car race, which was promoted by way of a curtain raiser to the Grand Prize, was run over ten laps of a 9.8 miles rectangular course. It was well attended by Savannahans and by the visiting throng of Northern and Western racegoers. Although the grandstand held 4,000 and the bleachers 5,000, the Georgians and Southerners generally awaited the running of the Grand Prize itself.

At 10 o'clock, an hour before the time set for the light car race, the chances looked slim for the impatient squadron of little fellows being sent off on time. A fog, which had been prevalent mornings for several days was again doing business at the old stand. But a quarter of an hour before the appointed starting hour Old Sol triumphed and sent the mist clouds scampering away into nothingness. The crowd began to pour into the aisles and boxes, and when 11 o'clock came more than half filled the granstand seats and boxes. The monster bleachers, however, carried not over a couple of thousands of their 10,000 capacity. It was for these that the railroads had sold coupon tickets, and the hig crowds of excursionists cared only for the big race of the morrow.

Seventeen nominations had been made for the light car race. Only 15 faced the starter. The American Aristocrat entrant had telegraphed the management three days before tbat it would not be on hand. Tbe Gregoire arrived on Sunday, but came in such an impossible condition that George Robertson very properly refused to undertake its pilotage, the risk being too great.

"Wag" had bad the cars drawn up in the order of their start for near balf an bour. Sharp at 11 o'clock he sent the S. P. O. away. The others were dispatched at half-minute intervals, except that Cameron started a minute behind Bergdoll and Burman a minute behind Poole, the American Aristocrat and Gregoire being counted the same as though present.

The order of the start was: Connors, S. P. O.; Hilliard, Lancia; Bergdoll, Chalmers; Cameron, Cameron; Poole, Isotta; Burman, Buick; See, Maxwell; Lorimer, Chalmers; Hearne, Buick; Costello, Maxwell; Burns, Chalmers; Easter, Buick; Munweiler, Maxwell; Jeffers, Buick; Kelsey, Maxwell.

Tbe crowd had not many minutes to wait for the appearance of the first car. It was the Lancia. The troubles of the S. P. O. bad begun early and in the first round it had dropped to the tail end of the procession, so far as the order of running went. Lorimer held his place bebind Hilliard. Burman made a splendid rusb from sixth to third place in line, the Buick far outstripping all the others with an initial lap in 10:58, a 53-mile an hour rate from a standing start. Little Ewing Easter, tbe New York midget, was second in actual time for his Buick.

It was up to Hilliard to be doing something, so he quickened his pace to 10:42. Even this failed to dislodge Burman from what seemed a good hold on first place. Another Buick, driven by Jeffers, took Easter's place in third position. Munweiler forced his Maxwell from ninth to fourth place with a lap in 10:05, the fastest to date, and, in fact, tbe second fastest round in the wbole contest.

Burman in Buick, Who Won Second Place.

In the third round Burman increased his margin over Hilliard by an even minute, and E. A. Hearne, the Chicago amateur, another Buick man, fought his way into third place, a position he kept stubbornly to the end of the race. Jeffers had broken a steering knuckle and was out of it.

Burman was evidently out for s killing, and did not let up a little bit on the 53-mile gait he had laid out for himself. Tbis widened the gap between him and Hilliard, who was driving the Italian car very conservatively a half mile slower to the lap. Hearne clung to third and Cameron worked up to fourth in this, the fourth lap. The air-cooled car's performance was watched with some interest, as it had been backed for $50 against $1,500 in the books to coin. The Lancia, by the way,

was the pronounced betting favorite at three to one against it.

From the fifth to the ninth lap, both inclusive, the order was Burman, Hilliard, Lorimer. Cameron first bent his crankshaft in the fifth lap and in the next round for forced to retire altogether, having burned out his clutch.

The tenth round saw a shakeup of the score board. Hilliard during this and the preceding round let out a kink or two of the Lancia's speed. Burman was forced to return to his pit for a missing part, which provokingly could not he found by his assistants. It cost him a loss of some eight minutes, and the race itself, unless the Lancia had even more speed than Hilliard saw fit to exhibit to win. Burman's fatal lap took 19:08 to run. At its end the Buick was 3 min. 51 sec. behind the Lancia. Lorimer and Hearne all this time had heen seesawing hetween third and fourth places.

Another rather had lap for Burman was his fifteenth. It took him 15:47 to negotiate it. It cost him second place for the time being to Lorimer. In fact, it took three laps of hard riding for Burman to dislodge the Chalmers-Detroit as the runner-up.

In the seventeenth lap Burman regained second place. Hearne had dropped to third place in the twelfth round, and managed to hold it to the end, pursued in order hy Poole, See, and Kelsey.

This order—Hilliard, Burman, Lorimer, Hearne, Poole, See, and Kelsey—was maintained to the end. Hilliard beat Burman 6 min. 12 sec., who led Lorimer hy 4 min. 10 sec.

In the hattle of the tires, the Continental won first, the Michelin second, third, fourth, and fifth, and the Ajax sixth and seventh places. Hilliard won $500 in cash, offered hy the Continental Caoutchouc Company for first. Burman and Lorimer carried off substantial Michelin purses.

Bergdoll withdrew in the eleventh lap through a broken piston ring. In the fourteenth lap Easter ditched his car. His mechanic, Frank Thompson, was so hadly injured that he had to be taken to the hospital. Burns put his Chalmers-Detroit out of the race in the first round through a collision with a tree.

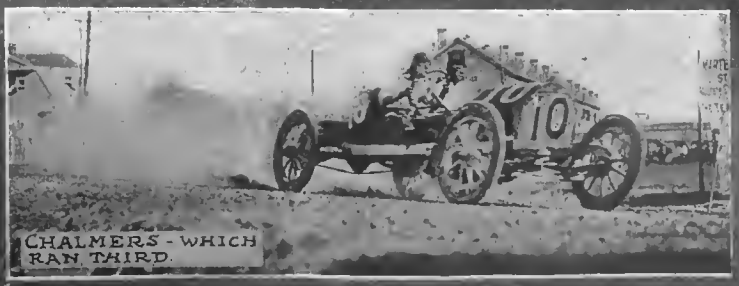
BUICK - WHICH MET WITH DISASTER



CHALMERS - WHICH RAN THIRD.

SOME OF THE TROUBLES OF THE LIGHT CARS

THE troubles that beset several of the light cars during the ordeal were those common to larger machines, some of them being entirely due to the cars not being well prepared, while others were the outcomes of carelessness on the part of tbe drivers. Hilliard, in his Lancia, was entirely free from trouble from start to finish, the only time he lost on the twenty laps being 15 seconds, when he stopped in the fourteenth lap to take on a couple of gallon cans of oil that the mechanician made use of during the remaining laps. Throughout the twenty laps the car ran with commendable regularity, doing all of the laps in 10 and 11 minutes with extra seconds. It was the only car in the race to do every lap but one in less than 12 minutes. Lap after lap as it came down the stretch Hilliard seemed out on a pleasure jaunt, but circumstances proved that he seemed to be getting the maximum speed out of it.

Burman's Buick that landed second honors, had troubles all of its own whicb apparently could be traced to the use of too light springs in connection with the underslung frame used. On the thirteenth lap both of the rear springs broke, and from that time until the finish of the twentieth the rear end of the car was carried from the axle by two chains and two straps whicb had been fitted as a precaution before the start of the race. As a result of these breaking, the right rear brake connecting rod snapped and the gasoline tank, a large cylindrical one in the rear, shook loose, shearing off a couple of bolts in the metal straps that held the tank in place. The shearing of these bolts meant going back over a part of the course to the Buick headquarters, where other bolts could be obtained. After once fixed, the gasoline tank gave additional trouble, and once or twice when the car swept past the grandstand the mechanician was holding the tank in place. Still a further outcome of the broken spring was breaking off, dne to vibration, the oil lead from the hand oil pump to the crankcase, so that for the last four or five laps the engine oil supply was the splash within the crankcase. Of his twenty laps, seventeen were made in less than 11 minutes each, a most remarkable performance when it is remembered that the winning Lancia only made eight laps under the 11-minute mark. Burman had three slow laps, the tentb, fourteenth, and fifteentb, in which he lost practically 17 minutes time as compared with his averages for the remaining seventeen laps. During the entire race the bonnet on his car was not lifted.

L. B. Lorimer's Chalmers-Detroit, which won third position, required six laps before it got into proper running condition and during which time four or five stops were made because of the carbureter float sticking, as Lorimer expressed it. In several instances it was necessary to get out of the car and open the bonnet before the trouble could be rectified, whereas at others rapid changing of the throttle worked the desired results. Only once during the contest was gasoline taken on, 5 gallons sufficing, and at this time the oil supply was looked after, both being done by one man, while the other worked on the carbureter. From the grandstand point of view Lorimer's performance was a race against Hearne's Buick, while Burman's Buick and the Lancia were fighting it out. At the end of the seventh lap Lorimer passed the granstand not 100 yards in advance of Hearne, and when they bore in sight at the end of the eighth they were in the exact same position, neither having the advantage of 10 yards over the other in the entire lap. On the ninth lap Hearne passed him, but stopping at the end of this lap for water and oil gave Lorimer a chance to rush past while the fuel replenishment was being made. Hearne stopped again in the seventeenth lap to take on oil and water and also put water on the tires. Hearne made fourteen of the twenty laps in 11 minutes and some seconds, but only in the eleventh lap did he get below the 11-minute mark. All through his driving was most consistent, having but three laps in which 13 minutes and some seconds were needed to do the 9.8 miles. His winning fourth place was a popular achievement because of his amateur standing, whereas many of the drivers he was fighting with were professional factory representatives.

Al. Poole, with the "Baby Isotta," wbich was given fiftb position, made a most consistent running, the car stopping but once in the twenty laps, wbich was at the end of the fourteenth to take on gasoline and water. Throughout the race the little motor was turning over at close to 2,600 revolutions per minute, and as the Isotta factory rates it at 17 horsepower at 2,000 revolutions per minute, its working power averaged close to 22 horsepower. Every time it came down the stretch it was running with the same regularity and rbythm, and it looked as if it could keep the performance up for an endless time. Sixteen of its laps were made in 12 minutes and some seconds, three of them requiring 13 minutes and some seconds, and one was made in 11 minutes and some seconds, it never getting below the 11-minute mark.

The next four positions went to the four Maxwells, No. 9 driven by Arthur See being first and C. W. Kelsey's No. 17 next, both of which completed the twenty laps. These two were the cars with 5-inch motors of the regular Maxwell 20-horsepower variety. The other two Maxwell Juniors, excepting the cylinders had 4.25-inch bore, did not complete the circuit of twenty laps, but were running at the finish, No. 12, driven by Thomas Costello, having finished nineteen laps, and No. 15, piloted by Joseph Muntweiler, baving finished fifteen laps. As was expected before the start, all of the Maxwells kept running, and while their speed was not equal to that of their four-cylinder opponents, they set an excellent example in the rôle of consistent working. Muntweiler's No. 15 had trouble in the twelftb lap when speeding along Water's road, the left front wheel came off letting the steering pivot drop onto the hard road. Muntweiler avoided an accident by noticing the wheel wobbling and applying the brakes. The trouble was due apparently, according to the driver, to leaving the cotter pin, whicb holds tbe nut on the pivot, out. As it was, the wheel did not stop rolling until in an adjoining field. Muntweiler pluckily set to work and got it on again, but had trouble with the nut because of the threads on the spindle being ruined when it fell on the road. After the first repair it ran for 1 1-2 miles, when the wheel again came off, this time unexpectedly and when traveling fast, with the result that when tbe axle fell it formed a pivot on the road turning the car completely around. After a second repair the car was able to reach the repair pit at the grandstand, where a new steering pivot was secured. This delay caused 40:38 and 41:46 to be the time for the two successive laps, but in spite of this the little car kept going and was running wben the race was called off. Costello, with the other little Maxwell, had a puncture in the third lap, the only one of the four Maxwells to have any trouble with tbe Ajax tires. In spite of this he made tbe lap in 19:23, but stopped at the grandstand and took on a new tire; this stop being just at the start of the fourth lap made his time in this lap 1 minute longer than the average of the remaining sixteen laps he negotiated. Kelsey, in No. 17, had no troubles of any nature and made one stop, in the tenth lap, to take on gasoline. Kelsey's performance was consistency personified in that he did thirteen of the laps in 12 minutes and some seconds, and the remaining seven laps in 13 minutes and some seconds, there being but 1 minute and 9 seconds difference between his fastest and slowest lap in the entire twenty circuits. Arthur See, driving the No. 9 Maxwell, however, beat Kelsey 2 minutes 6 seconds in the twenty laps, but did not do such consistent work, requiring 14 minutes and some seconds for three of the laps and setting a low-water mark of 12:15 for one lap as against Kelsey's low figure of 12:44. Compared with these times, however, Muntweiler, with the little Maxwell, made considerably faster time, doing five laps below the 12:55 mark set by Kelsey and setting a record lap figure for the Maxwells of 12:02, or approximately 49 miles per hour for the 9.8 miles. See's car stopped in lap 15 to take on oil and

Hilliard's Lancia Making Its Speed Evident by Passing Easter's Buick Rounding One of the Turns.

adjust the steering gear and in lap 19 he stopped for gasoline.

H. Connors, in the S. P. O., which was running at the finish, but had just completed the fourth lap, was in hard luck from the start. The car had been rebuilt from a different model touring car after its accident of the previous Saturday, and Connors and his assistants had worked night and day upon it. The back wbeels had a wider tread than the front ones, and several other glaring irregularities were noticeable because of the impossibility of getting duplicate parts to do the rebuilding with. The first lap was made in 19 minutes and some seconds, but in the second trouble with the engine developed.

Of the six cars that were not running at the finish, the first to drop out was unlucky No. 13, Chalmers-Detroit, driven by W. R. Burns, which just covered 4 miles of the required 196 miles and was the only machine not to make a complete lap. On the second bank turn, on the White Bluff road, the car's front wheels, provided with plain tread tires, failed to hold the turn and skidded over it, and the car collided with a tree throwing the mechanician out, and Driver Burns, remaining in his seat, was rewarded for his heroic efforts by losing four of his front upper teeth and injuring tbe roof of his mouth by striking upon the steering wheel. The accident was not due to taking the turn too wide, but too fast for the plain-tread tires. The heavy fog of the early morning was equivalent to a rain, and in connection with the oil made a slippery surface.

Not an bour later anotber car came to grief on this same turn, Earl Jeffers in No. 16 Buick being the victim. Jeffers, like Burns, was traveling fast and made the turn well, but just when straigbtening up on the Montgomery road the left steering knuckle arm broke, the wheel wobbled for a while, and then the car headed for the left side of the road.

Tbe little four-cylinder Cameron air-cooled car, with its 32-inch wire wheels, was the next car to drop out, which it did after reaching the grandstand on the fifth lap, when it pulled into the open space at the end of the pits and remained until the end of the race. Its trouble was due to burning out of the clutch. This little car made a most auspicious start, and while its first lap was a little slow, the next three were made in 11:10, 11:07, and 11:01, and everybody began to look for a duplication of its performance in the Sweepstakes, but were rudely disappointed a lap later wben it witbdrew. Although this car was very light, it held the course beautifully, and made the fastest getaway at the start of the race.

L. J. Bergdoll's No. 3 Chalmers-Detroit followed the Cameron withdrawal at the end of lap 11. This car was handicapped in that the car did not reach Savannah until Tuesday, the day before the race, and the 3.75-inch cylinders arrived a couple of days earlier. The regular 3.875-inch cylinders had to be removed, being too large for the race, and the smaller ones placed on. They were new and had to be worked in, and there was no time for this. As a result, the motor heated during the run, which caused a loss of time. Bergdoll also used bevel-seated valves, and it was with one of these that the trouble arose which put him out of the running. The valves are located in the cylinder heads and shearing the pin in one of the stems against which the washer for the valve-spring seating rested, allowed the valve to fall into the cylinder, and the piston was broken, putting the car out of racing commission. It was withdrawn and stood in the space at the end of the repair pits until the race was over. The car stopped at the end of lap 9 and withdrew at the end of lap 11.

The last car to drop out was No. 14 Buick, driven by Hugh Easter, which broke its rear axle when making the banked turn off Water's road onto the homestretch, which resulted in ditcbing the car over the outside of the banked turn and severely injuring Mechanician Thompson.

The rules allowed of using a four-cylinder motor with 3.75-inch bore and any stroke, and the three Chalmers-Detroits and four Buicks availed themselves of this measurement; the winning Lancia had a bore of 3.5 inches, the S. P. O. 3.75, the Cameron this limit also, and the Baby Isotta 2.43, being the baby of the lot. The mosquito fleet of four Maxwells comprised the only two-cylinder contestants, all of them having the conventional Maxwell motor with the two opposed cylinders mounted crosswise in front of the dash and in two sizes, Nos. 12 and 15, having 4.25-inch bore, and Nos. 9 and 17 with 5-inch bore, which was the maximum permitted in a two-cylinder machine.

Of the four-cylinder machines four, the three Chalmers-Detroits and the Isotta, used cylinders formed in one casting, the Isotta having the intake and exhaust valves in the cylinder beads with one rocker arm for each valve and an overhead camshaft which, witb the rocker arms and valve cages, entirely enclosed by an aluminum cap, which forms an oil-tight compartment within which a splash occasioned by tbe rocker arms is maintained for the cams and rocker arm parts. The Lancia, Buicks, and S. P. O. have cylinders cast in pairs, the Buicks with valves in the heads, and the other two with valves in the bottoms of chambers on one side of the cylinders. Remy magnetos were on the Cameron and Nos. 8 and 16 Buicks, the two latter with underslung frames, and on all of the other contestants were Bosch high-tension magnetos with a spare battery system carried on the majority of them. All of the Buicks were fitted with Schebler carbureters, the Chalmers-Detroits with Kingstons, the Cameron with a Breeze, the Maxwells with tbe stock Maxwell carbureter, and the Isotta, Lancia and S. P. O. with types of their own make. Tbere was a strong tendency shown toward three-quarter elliptic springs in the rear, five of the cars, the three Chalmers, S. P. O. and Lancia, being so fitted; the two 4.25-inch Maxwells used elliptic springs all around and the two 5-inch ones semi-elliptics; the two Buicks, with frames carried above the axles, used elliptics in the rear, and the two with underslung frames used a style of inverted semi-elliptics which resembled two very short inverted semi-elliptics placed end to end with a short uniting straight piece between them and whicb served for attaching to the axles tbrough the usual clips. The springs on the majority of the cars were well wrapped with tape and shock absorbers. Hartfords were fitted all around on the three foreign machines, Lancia, Isotta and S. P. O., whereas not an American car fitted an absorber of any nature other than rubber bumpers and leather rebound straps.

Nine of the fifteen cars carried Michelin tires; the four Maxwells carried Ajaxes; the S. P. O. was fitted with Pennsylvanias, and the Lancia with Continentals.

(*Story of the Grand Prize continued on Page 795.*)

BENEFITS DERIVED BY HEAT TREATING STEEL*

By THOMAS J. FAY, President Society of Automobile Engineers

METALLIC salts are superior to metals for heat baths in heat-treating work because higher temperatures are possible on one hand, and lower initial temperatures are possible on the other. It is one of the objects in heat-treatment work, to be able to raise the temperature of the parts slowly, from a low temperature to the ultimate temperature. This would not be possible in a metallic bath because the heat of the bath cannot be less than the temperature of the melting point of the metal. Tbe use of metals with a low melting point would not serve the purpose because with metals it is not feasible to keep on increasing the temperature to any extent.

Metallic salts on the other hand can be controlled within very wide limits, as for illustration, if it is desired to attain a maximum temperature of 1,000° C. from a very low initial temperature, it is only necessary to provide the metallic salts as follows:

1,000° C. METALLIC SALTS HEAT BATH.

(NaOH)	Sodium Hydrate	8%
(NaCl)	Sodium Chloride	91%
(KNO)	Potassium Nitrate	0.5%
(K_2CrO_4)	Potassium Chromate	0.5%

Up to 1,000° C. this bath will not vaporize, hence it is available for use in heat-treating work for the purpose of heating steel previous to quenching, for any temperature up to the maximum, as stated. If, on the other hand, a higher temperature than 1,000° C. is desired, then it is necessary to use:

Pure Crystalline Chloride of Barium.

The melting point of this material is about 950° C., hence in using it the materials must first be heated in a bath of such metallic salts as will melt at a lower temperature, if it is a fact that suddenly beating the steel at such a high point will affect the results adversely. The chloride of barium salts will allow of a temperature of 1,350° C.

If chloride of barium and chloride of potassium are mixed in the ratio of 3:2 the result will be a metallic salt bath that will give good results up to 950° C., with a melting point 670° C., but as before stated, if the melting point is to be lower, the 1,000° C. bath is the proper one to use. By varying the proportions of the salts it is possible to fix a variety of temperatures both initial and final. The advantages of the salt bath are obvious, since the immersed steel takes on the temperature of the bath and the steel is protected from contact with all else besides.

It has been found that the salts do not affect the steel in any way and in transferring the steel from the salt bath to the quenching bath the steel is protected from atmospheric contact, so that the steel remains clean and free from surface oxidation. This question has received much attention at the hands of Dr. Geo. W. Sargent, Metallurgist in Chief of the Carpenter Steel Co. in America, and while the salts gave trouble in a steel wire process by clinging to the wire (thus clogging the dies), it was not the claim of Dr. Sargent, in his discussion of the matter, that the salts imparted any bad qualities to the materials of which the wire was composed.

Methods of Using Metallic Salts.

In Germany, the method of heat treating with metallic salt baths, has been advanced to a high state of perfection, and it is believed there is no question of deterioriation of the steel, as a result of contact with the salts. The author is indebted to Dr. Sargent for much valuable information on the subject, and it is believed it was to him the introduction of said method of heating (in America) must be accredited.

NOTE.—The investtgatton of the metallte salts for thts purpose was conducted tn Germany by Mr. Joseph Schaeffers, M.E., Mem. S.A.E. and A.G.T. (Ger.) tn 1906-7, for the author.

*Continued from page 741, "The Automobile," tssue of Nov. 26.

The equipment may be regarded in substance as an electric heater. Tbe heater itself consists essentially of an iron container of suitable size, lined with asbestos brick faced with fire clay. The cavity within is then filled with the salts and the electrodes are so placed as to require the electrical current to traverse the salts to form a connection, in other words the circuit is completed by the salts between tbe electrodes. A pyrometer inserted in the molten salt bath shows the temperature of the bath and the steel immersed in the bath will take on the temperature of the same.

The electrodes are of iron (flat plates). The iron of the lowest carbon (soft Swedish iron) best serves the purpose. The electrical current is alternating about 50 periods, at about 190 volts electromotive force. It is at first necessary to melt the salts before the hardening process can be started and a path for the current (of lower resistance) must at first be provided. As soon as a molten streak is formed in the salts the process then proceeds without further difficulty.

"Atoms of chlorine and barium are set free at both electrodes, the chlorine combines with iron to form chloride of iron while the barium and free iron." The iron being heavier than the liquid salts, falls to the bottom of the heater, from whence the excesses may be removed at will, while tbe salts are molten. The iron is simply scooped out of the molten bath.

The heat regulation is very simple, since by raising or lowering the voltage of the electrical current the current strength will fluctuate accordingly. The electrical energy is accordingly changed to suit the occasion in the manner as follows:

$$W = E\,I = I^2Z = E^2/Z = \text{Energy in watts.}$$

In which:

I = The square root of mean square current in amperes.

E = The square root of mean square electromotive force in volts.

Z = The impedance of the circuit (salts) between the electrodes.

It will not be necessary to go into the question here of the phenomena of the alternating current circuit in metallic salts bath, because the problem from the point of view of the heat treatment of steel does not demand exact knowledge of the details of the alternating circuit.

That the impedance Z will change with the temperature is true, but the means for varying the voltage being at hand and adequate for the purpose renders it unnecessary to investigate this phase of the subject.

Witb the increasing impedance it will be necessary to increase the electromotive force at a somewhat higher rate, because with the increasing temperature, the heat losses will be more. The current strength should slightly increase then, and tbis will be at the expense of increasing voltage.

The heat equivalent of the electrical energy will be as follows:

$$H = I^2\,Z\,t\,0.24 = \text{small calories.}$$

In which:

t = time in seconds;

I and Z as before.

With means for ascertaining the heat equivalent of the electrical energy, it is just as feasible to use the electrical current for the purpose as it would be to use any other source of heat. The electrical means of heating is the more convenient, because the heat is delivered to every molocule of the salts with great uniformity and the conditions are perfectly satisfied.

The cost of the electrical energy is not high, in comparison with the service rendered. For a heater 6.25 x 6.25 x 7 inches the electrical energy consumption was reported as follows:

Temperature.	Energy in kilowatts.
880 degress C.	5.4 per hour
1,400 degrees C.	8.5 per hour
1,300 degrees C.	12.25 per hour

Besides the cost of the electrical energy, there is the replacement of the iron electrodes, which is but a small item; then there is the replacement of the salts as they are volatilized. This is not a large item, since the replacement will not exceed two pounds of barium salts per hour.

The inside of a heater, if it is a crucible, which would be very satisfactory (a clay pot) for the purpose, would last for an indefinitely long time, because, even if it were to split, the salts would seal the opening again and there is no other wear. The amount of hardening that can be done with an outfit of this sort will be very considerable, since the control is rapid and accurate. The pieces to be treated would quickly raise to the desired temperature in the bath, and to repeat the process would be a very simple thing to do.

Correct Temperature Observations.

Any suitable pyrometer will serve to take temperatures. That the galvanometer used for noting the strength of the current should be "dead beat" and accurate goes without saying. Such outfits as the Le Chatalier pyrometer would serve admirably the purpose, with the proviso that a master galvanometer be available for use in checking the working instruments. This would be true with any system, moreover; the check instrument should be available even in small plants.

The check galvanometer should be sent to a testing laboratory at regular intervals to be calibrated, and it should be mounted in a suitable place during the period of its service. There are various types of galvanometers among which the D'Arsonval, all of which can be provided with a scale to read temperature degrees instead of angular deflections or milli-amperes as the case may be. If the means for heating are to be quick and accurate, surely the provision should be something besides a tub of dirty water. The several quenching baths are as follows, named in the order of merit:

(I) mercury;
(II) acidulated water (ice cold);
(III) salt water (ice cold);
(IV) salt water (normal);
(V) water;
(VI) water and skim milk;
(VII) lime water;
(VIII) fish oil;
(IX) cod-liver oil;
(X) cotton-seed oil.

The mercury may not be used excepting for very small parts in view of the poisonous vapors it emits. The water quenches are more to make parts very hard, while the oils render parts tough and less hard. Double quenching is sometimes resorted to, the idea being to attain toughness and considerable hardness besides.

For quick work it is desirable to provide a means of maintaining the quenching baths at a constant temperature. There are diverse ways of accomplishing this feat, among which a pump to circulate the liquid and a cooler with a fan to abstract the heat from the same. The usual methods of cooling automobile motors would serve perfectly well.

There are various other ways of fitting up to accomplish the several ends. On the whole the idea has been to advocate even indirect heating, rather than to allow the parts to contact with the fire direct or for that matter with the heated products of combustion as in a muffle furnace. The muffle furnace is good, but the molten bath is better. The order of merit of the several methods then would seem to be as follows:

(I) molten salt bath (electric heater);
(II) muffle furnace (gas heater, or, oil);
(III) open forge (charcoal fire);
(IV) bunsen burner (direct flame).

The forge is better than the Bunsen burner because in the forge it is possible to cover the parts and to so urge the fire as to bring the parts up to the desired temperature slowly and more evenly than with the Bunsen burner. Both methods are very defective from the point of view of the best results.

The quenching equipment should serve for the purpose, no matter what may be the means of heating. The annealing methods on the other hand can be varied, to suit the occasion and the materials. A bed of lime does very well; ashes serve for some purposes; allowing the parts to cool in a muffled furnace is still another way.

Tempering at temperatures below 350° C. may well be done in oil. The parts may be placed in oil and the same can be gradually raised to the desired temperature; there to be held for the requisite period depending upon the mass and quality of the material. If higher temperatures are demanded, the parts can be transferred to the molten salt bath; there to be raised to the desired temperature.

Tempering is a matter not always fully understood. The mere raising the temperature to some predetermined point is not likely to be productive of the anticipated results. If a part is very thin, of no great mass, it is possible to temper (draw the temper) by virtue of the mere application of the heat requisite to raise the temperature of the mass to the predetermined point. If, on the other hand, the mass is considerable and the section is more or less the same in all planes, a time factor must be introduced.

The time required to temper a piece depends upon the mass and upon the state in which the piece happens to be. It is equally a fact that some grades of steel will be more persistent than others. Nature hard steel (steel that habitually resides in the hard state) will not so readily consort with softness, as the products of the character "normally soft" and difficult to render hard.

For tempering, the lead bath is sometimes used, or lead antimony may be employed. It is even possible to use alloys of the white metals to afford temperatures differing by quite small increments. In all such cases it is plain to be seen that to some extent, at any rate, the metal will adhere to the parts to be treated; thus becoming a nuisance.

MELTING POINT OF ALLOYS.

Lead.	Tin.	Bismuth.	Degrees Fahrenheit.	Degrees Centigrade.
1	1	1	250	121.1
2	2	2	292	144.4
3	3	1	310	154.4
4	4	1	320	160.0
6	1	0	381	193.8
1	2	0	441	227.2
1	3	0	482	250.0
1	5	0	511	266.1
1	10	0	541	282.7

These metal baths should be covered with charcoal powder else they will oxidize away very rapidly indeed. The exactness of the temperature depends upon the purity of the metal and the exactness of the proportions. The temperature will remain constant just so long as some of the metal is melting; temperature will raise after all is liquid, if heat is urged.

The melting point of the pure metals unalloyed would be as follows:

Lead.....618 degrees F. = 325.5 degrees C.
Tin.....446 degrees F. = 230.0 degrees C.
Bismuth.....507 degrees F. = 263.3 degrees C.

Zinc would serve for a somewhat higher temperature if it could be used at all, but it would cling to the metal to be tempered with great tenacity. Lead alone affords a good means for tempering parts to be tough but not file hard. Bismuth would, if used, result in considerable hardness of the quenched parts, in view of its comparatively low melting point. If the temperature of the molten metal is allowed to increase, after the metal is all dissolved, the poisonous vapors given off will be very detrimental to the health of the artificer, and it is a question if it is humane to allow work to be done regularly in this way.

At all events men who work around lead baths should be very careful not to inhale the fumes. The arrangement of the bath should be such as to have the fumes sucked up a "flue" or a

suitable fan of good design. It is quite general to attempt to judge temperatures by color, but, as it is quite well appreciated by mostly every one connected with the art, to judge correctly is a difficult, if not an impossible, undertaking. The susceptibility of the "retina" of the eye of the observer to light, would be a fair constant in a place of "constant illumination," or in the dark under well defined conditions, yet even so no two observers would reach the same conclusion. The generally accepted temperatures in relation to color may be set down as follows:

TEMPERATURES CORRESPONDING TO COLOR. (M. Poullett.)

High temperatures.	Degrees.
Incipient red heat	977 F. = 525 C.
Dull red heat	1,292 F. = 700 C.
Incipient cherry red	1,472 F. = 800 C.
Cherry red	1,652 F. = 900 C.
Clear cherry red	1,832 F. = 1,000 C.
Deep orange	2,022 F. = 1,105 C.
Clear orange	2,192 F. = 1,200 C.
White heat	2,372 F. = 1,300 C.
Bright white	2,252 F. = 1,400 C.
Dazzling white (maximum)	2,912 F. = 1,600 C.
Dazzling white (minimum)	2,732 F. = 1,500 C.

The melting point of steel depends upon the composition, as for illustration: The carbon has a marked effect upon the melting point. For each point of carbon in the steel the melting point is lowered *one degree centigrade*. On this account it is not possible to fix a definite temperature for the white heat bordering upon the melting point of the steel. The colors above set down are for products showing color due to high temperatures. Steel in the comparatively cold state will also show color consistent with its *temper*, and in tempering steel it is common practice to go by that color. It would be better, of course, to temper to a definite temperature by the pyrometer. The usual values accepted for the temper corresponding to color in comparatively cold steel may be set down as follows:

TEMPER COLORS.

Low temperatures.	Degrees.
Deep orange	421 F. = 216.1 C.
Orange	473 F. = 245 C.
Red	509 F. = 265 C.
Violet	531 F. = 277 C.
Indigo	550 F. = 288 C.
Blue	559 F. = 293 C.
Green	630 F. = 332 C.
Oxide gray	752 F. = 400 C.

The temperature in degrees C. is given in round numbers for convenience; the error is but slight. In noting the temper color is it necessary to polish a spot on the steel? Different observers will reach different conclusions. A fair conclusion is but the result of experience. Temper colors will not develop excepting in the presence of air; moreover, the parts have to be bright to show the colors clearly. The colors do not develop always at the same temperature, because the steel is not always of the same composition. If the color shows readily in a given specimen of steel it will be a fair inference that the steel quenches to great hardness

In some grades of steel the color will *rub off* readily. This will be in cases involving steel that does not quench to great hardness. The best temperature of quenching is the temperature that affords the requisite hardness. The lowest possible temperature should be taken in every case, allowing, of course, for the desired hardness. In tempering the reverse is generally true. The temper should be drawn at the highest temperature that will enable the steel to be used for the given purpose. In drawing the temper the mass of the pieces to be tempered must be taken into account. They must be left in the bath long enough to make sure that the steel is up to the temperature of the bath itself. Fixed instructions as to the time are not possible, because of the considerable differences in conditions.

For tempering, the bismuth bath affords the right temperature for a considerable variety of articles, as taps, dies, numerous tools of carbon, steel, and springs for some purposes. Certain animal oils serve the purpose also. In using the oil bath it is necessary to exclude the air or the oil will take fire. Burns from oil are particularly painful and even dangerous.

It might be well here to define what is meant by tempering. If by quenching we mean hardening, then by tempering we mean "drawing the temper," or, as they say, "letting down." On the other hand, it is not uncommon to say tempering is hardening (result of quenching), whence drawing the temper is the converse. The author argues that "temper" is a final condition, hence drawing the temper is in the act of tempering. Quenching, then, is not tempering, unless the parts are to remain as quenched. They never are left as quenched in practice, and it is not uncommon to say, "quenching and tempering," that is to say, "hardening and tempering," or hardening and subsequently annealing would amount to the same thing.

It is not the purpose of the author to struggle with the vagaries of the language used by mechanics more than to attempt clearness sufficient to render the meaning apparent and to avoid license, excepting when that same license will serve a useful end.

(*To be continued.*)

THE GENERAL ASPECTS OF AUTOGENOUS WELDING

THIS process of joining metals seems to offer a solution to many difficult problems, and in some respects is more favorably regarded than the better known electric welding process. The limit of application is a matter that will have to be settled in the future as the product of experience, and for the present it will suffice to confine discussion to the elimination of fallacies, as, for illustration, it is said that aluminum cannot be welded by the autogenous method, whereas the contrary is true. The autogeneous process consists essentially of uniting metals by intervening a molten mass of substantially the same material. The high heat (6300 degrees Fahrenheit) is so intense that the melting phenomenon is localized. To more clearly illustrate the process attention will be called to the old method by which lead is burned together through the good office of a hydrogen flame, in which the needle-like flame is directed against the faces to be joined and the metal on the faces melts, bridges across, and the whole operation is performed so quickly that the joint is made before much heat is imparted to the mass as a whole, hence the shape as a whole is not destroyed. Aluminum is a peculiar product with a comparatively low melting point, and the needle-like flame of the high temperature, as above set down, must be directed in obedience to the tactic movements of a person of some skill. Cast-iron offers no such difficulties, because its melting point is considerably higher and the autogenous process is especially efficient in connection with cast iron, particularly if we take into account its non-ductile character. With whatever metals to be welded, it is a fact that thickness more or less defeats the operation. If the parts to be welded are quite thick, the edges will have to be backed off in order that the flame can actually contact with the mid-section surfaces, since it is true of autogenous process that the flame must contact with every particle of metal that is required to flow. The indirect application of heat, if the autogenous process is considered, would result in the flow of the metal that contacts with the flame and would destroy the shape of the parts without actually producing a weld, since the metal in the weld flame would receive its heat by conduction, which would not be enough to cause the metal to flow. The high temperature of the autogenous process is, therefore, efficient in proportion to the skill of the operator, and inefficiency will run rampant in the absence of skill.

VALUE OF NITROGEN IN THE MIXTURE

IT HAS been pointed out that nitrogen is present in the "mixture" in gasoline motors to a very considerable extent, and, too, tbat the nitrogen is inert, bence of no fuel value. The same authorities reach the conclusion that the absence of direct fuel value in the nitrogen is conclusive proof that the nitrogen is detrimental, in diverse ways, as fostering an obnoxious smell, decreasing thermal efficiency, and augmenting ignition troubles.

This is equal to saying a telegrapb poll is of no value because it does not directly transmit the electrical impulses, and it does attract lighting, which is somewhat discommoding in various ways. Remove nitrogen from the mixture and the same will take on the degrees of an explosive. There is a distinction to be drawn as between an explosive and a quick burning mixture, in which the rate of flame propagation is with a time factor that bears a manageable relation to the moving mass. This time factor is quite as necessary as the gasoline. The fuel value is desirable, but the means of its use cannot well be done away with, if good results are to follow. It is easy enough to so increase the rate of flame propagation, as to have the energy break out througb the cylinder walls instead of as a desirable manifestation.

The Minimum Sufficient Amount of Air Required.

It is generally considered that the minimum sufficient amount of air required with one pound of gasoline will be slightly more than 15 pounds, in which some 12 pounds of nitrogen will be found. It is conceded, however, that this rich mixture is not so very valuable because the motor heats up and the combustion is incomplete. Increasing the air content improves the mixture and raises the thermodynamic efficiency. On the other hand, tbis same increase in the quantity of air increases the quantity of nitrogen. Is it not strange that the results should be better if nitrogen is a detriment?

The products of combustion will be not less tban,

$CO_2 = 2$ pounds
$N = 11.8$ pounds
$H_2O = 1.5$ pounds
} for one pound of gasoline and 15.3 pounds of air.

The water and the carbon dioxide are products of fuel combustion, while the nitrogen, in itself, of no fuel value, absorbs heat on the peak of the heat wave and "fattens" the curve by giving up the excess heat. It does more by way of affording a measure of time to the flame propagation. The nitrogen then stands to the fuel, just as springs are to the chassis, or better yet, it is a "shock absorber." Without nitrogen the flame propagation would be on the basis of a detonator and the shock would be felt since the mechanism would not be free to absorb the same.

Whenever anyone wants to know positively as to the value of nitrogen in the mixture, they can readily have the negative answer by trying nitro-glycerine instead. Concentrated fuel is another name for a detonator, and it positively is not what is wanted in automobile work. The piston must either recede ere the pressure builds up or the cylinder walls will protest. The piston does recede, with the mixtures diluted with nitrogen, fast enougb to so influence the wave of pressure as to keep the same at a safe maximum.

Mixtures of Atmospheric Air and Hydrocarbons.

The present mixtures of atmospheric air and hydrocarbons tben has many advantages, among which safety is capitalized. The oxygen abstracted from the air is free to all and the nitrogen (shock absorber) is equally inexpensive.

When carbureters are properly adjusted and the fuel is nicely balanced the relation between the point of self-ignition and maximum pressure is about all that cast iron cylinders can be expected to stand. It is the nitrogen that makes it possible even as it is. If, on the other hand, the results are not all that cast iron can stand, it is the carbureter that is crying for attention and not a case of "too much Johnson" (nitrogen) as some are wont to claim.

Comparing gasoline with alcohol it has been pointed out that the nitrogen is in less presence, and the alcoholic mixtures are claimed to be superior because of this fact. Let us scan the scenery a bit, and see wbat the purturbances really are. It is the fuel that must be paid for by "coin of the realm," hence any comparison must be made on a basis of the fuel. It will be all right, for the present, to disregard the pound price, on the ground that alcohol has no market; nor will it have, until the relative values are equalized. Taking one pound of alcohol and the same amount of gasoline, it is to find that the fuel value for each may be measured in pounds of CO_2 and H_2O in the products of combustion, under equal conditions of service. These values may be set down as follows:

One pound of fuel and minimum necessary air.

Alcohol.	Gasoline.
$CO_2 = 1.9$	$CO_2 = 3$
$H_2O = 1.2$	$H_2O = 1.5$
Total $= 3.1$	Total $= 4.5$

and $$\frac{3.1}{4.5} = .688$$

In other words, the products of fuel combustion will be 68 per cent. of what will obtain witb gasoline, for alcohol, per pound of liquid fuel used.

Gasoline Is More Effective than Alcohol.

The volume of products considering gasoline will be more, and more nitrogen will be present in consequence, since the weight of liquid fuel is the same for both fuels considered. But, if there is more nitrogen with gasoline there is also more energy in the fuel to spend upon the nitrogen, and the result is not the disadvantage one might be led to understand. In gasoline, the ratio of potential products to inert products is as follows:

$$\frac{15.3}{4.5} = 3.4$$

while with alcohol the ratio, on the same basis, is

$$\frac{9}{3.1} = 2.9$$

In other words, there is 3.4 times as much inert gas in the gasoline as there is potential products, while in alcohol the value shrinks to 2.9. As a result of this exposé, it is to predict that the rate of flame propagation will be faster, somewhat, for alcohol than for gasoline. On the other hand, it does not necessarily follow that an advantage will be directly due to this fact, since it is true that efficiency is dependent, not only upon the heat energy in the fuel, but the ability of the mechanism to utilize that energy efficiently. There is much energy in a cyclone, but windmills do not seem to cope with it, efficiently. The same idea dominates the motor and the fuel.

Incomplete Scavanging Has the Same Effect as Nitrogen.

There is such a thing as going too far in the direction of retarding the rate of flame propagation, and spent products of combustion are likely to be the cause. On the other hand, if a motor is not well scavanged, this fact does not constitute a good reason for claiming that nitrogen is as a detriment. Certainly a motor must be well scavanged if it is to do good work, and the more completely the process is, the more will be the nitrogen requirement. In the advance of the industry it may be that concentrated fuel will be available. This will be when materials of construction will allow of higher pressures, and when the cost of such fuel will be low enough to compete with gasoline. The turbine, and oxygen from some cheap source of supply, to mix with the fuel, will be something to take notice of.

LETTERS INTERESTING AND INSTRUCTIVE

SOME LOSSES IN TRANSMISSION DISCUSSED.

Editor THE AUTOMOBILE:

[1,654.]—In connection with an electrical vehical I am overhauling, I want to reduce the electrical losses as much as possible, and would be glad to have you favor me with a formula, such as would serve to fix upon the right sizes of wires for the work. The normal rate of discharge is 20 amperes of current at 80 volts, E. M. F.

New York City. HYSTERESIS.

There are two considerations, i.e., (a) the wire must be big enough to abort undue heating, no matter what the "drop" in volts may be; (b) after determining the "drop" in volts by the formula here given, find out if the wire (conductors) will overheat; if so, reduce the "drop" in volts still further by making the size of wire of that area in circular mills, which will conduct the current in amperes without overheating. Formula:

$$m^2 = \frac{F A\ 21.21}{V} = F A Y = \text{area of conductor in circular mills (copper);}$$

$$F = \frac{m^2\ V}{F\ 21.21} = \frac{m^2}{A Y} = \text{the distance in feet (one way) from this source of supply to the delivery, counting the resistance of both the + and — leads;}$$

$$A = \frac{m^2 V}{F\ 21.21} = \frac{m^2}{F Y} = \text{current in amperes;}$$

$$Y = \frac{21.21}{V} = \text{a constant for copper;}$$

$$V = \frac{F A\ 21.21}{m^2} = \text{the "drop" in volts.}$$

A circular mill is equal to the square of a mill; one mill is equal to 1/1000 inch. Hence, the diameter in mills squared equals the area in circular mills. The heat question is a matter involving some uncertainty in view of the fact that the "emisivity" is dependent upon numerous considerations as, the diameter over the insulation; the degree of exposure to air currents; the color of the surface of the wire, and the insulation, etc. In general it is to say the energy in watts dissipated will be as follows:

$$W = \frac{1}{223} \times \text{degrees } F \times s = \text{energy in watts dissipated;}$$

whence:

$$I = \sqrt{\frac{W}{R}} = \text{the current in amperes;}$$

and;

$$R = \frac{10.3 \times L}{m^2} = \text{the resistance in ohms, of the wire, per foot of length.}$$

The allowable increase in temperature in degrees Fahrenheit may be fixed as 60 deg. Fahrenheit, and the emissivity may be taken (in work of this sort) as equal to that which satisfies the formula for "*W*." The surface in square inches can be taken as the surface over the insulation. In the formulæ, s = surface in square inches and L = length of wire taken, = 1 foot, = 12 inches, to find the surface in square inches, to use in the formula. In wiring a car it is well worth while to reduce the losses as much as possible.

FIAT "CYCLONE" AND CHADWICK BRIARCLIFF.

Editor THE AUTOMOBILE:

[1,655.]—Was the Chadwick entry in the Vanderbilt Cup race a stock car? Was the Chadwick recently tried out at Bristol a stock car? What is the size and type of engine used in the Fiat Cyclone?

St. Paul, Minn. L. O. G.

The Chadwick cars were regarded as stock models. The Fiat *Cyclone* is 140x130 millimeters, bore and stroke respectively, valves on the top of the cylinders.

FACILITIES FOR A RESERVE GASOLINE SUPPLY.

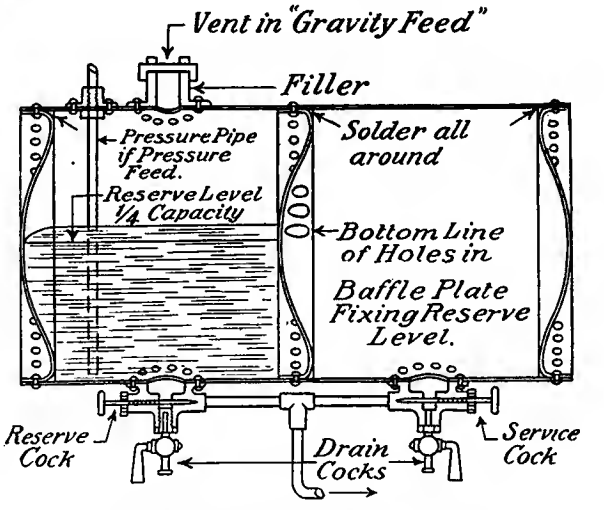
Editor THE AUTOMOBILE:

[1,656.]—I may be "an absent minded beggar," but the fact remains that I have, on more than one occasion, found myself without gasoline, at a distance from any possible source of replenishing the same. I dislike auxiliary tanks. How can I fix up a good scheme? P. A. B.

Nsw York City.

One way that might commend itself to you is here illustrated. The shell is of "20-ounce cornice copper." The heads, of 16-ounce, same material. The baffle plate is in the middle (of the same material as the heads), with holes to let the gasoline through above the horizontal center line.

This tank will hold in reserve one-quarter of the total capacity, which will be rendered at once available by opening the reserve cock. The service cock can be left open while the reserve is being used or it may be closed. In filling the tank, the filler is on the reserve side, so that the overflow goes to the service account.



Divided Gasoline Tank, Showing Reserve Supply.

If the gasoline is fed with pressure it must be observed that the pressure pipe is attached to the reserve side in order that the flame (if there is any) will be quenched in liquid fuel when the reserve fuel is all there is in the tank. It is assumed that the "pressure" will be led from the exhaust.

The "cocks" do not have to be in the "well" castings; they can be in the "make-up." The tank can be round, oval or any desired shape, suiting the space available in the car.

SOME TOURING CAR TIMING TROUBLE.

Editor THE AUTOMOBILE:

[1,657.]—I have a 1908 Reo touring car, Model A, and would like some information on timing the spark. My car has double-opposed engines, and the instructions say that the spark should fire on each cylinder at the same position on the flywheel. Now, I cannot get it to do this. The explosion will take place at the right place on one cylinder and on the other four inches late. Now, if you can give me the remedy, I will be greatly obliged.

I wish to ask you the cause of my exhaust pipes heating as they do. On coming home at night after a 14-mile run my exhaust and muffler will be red hot. H. B. ROBSON.

Anna, Miss.

The information afforded you in relation to the accuracy of timing, is beyond criticism. If you cannot locate the reason why the timing relation between the two cylinders resists your efforts, there is nothing for you to do but to call in the services

of someone who will locate the lost motion, or, difference in adjustment that is at the bottom of the undesirable result.

Exhaust pipes heat up because they are too small, unless it is that you are running on a retarded spark, or, using too much gasoline.

SOME VALVE SPRING TROUBLES DISCUSSED.

Editor THE AUTOMOBILE:

[1,668.]—I have had occasion to note that in some cars the valve springs seem to last as long as the car, while in other makes it is not uncommon to have to replace the springs at frequent intervals. Is it due to the quality of the steel, overwork, or what?

New York City. R. C. O.

Trouble could issue as a result of overwork, or, the quality of the springs might be at the bottom of some cases of failure. As a rule, it is to another circumstance that the "lazy" action will be traced.

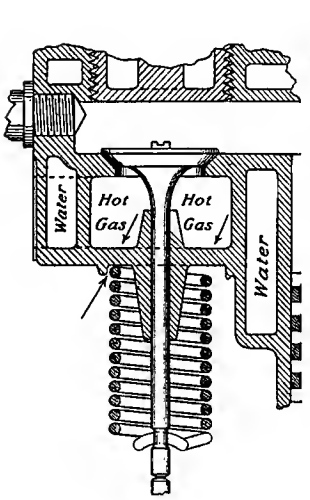


Fig. 1—Showing how the spring's temper is drawn by the heat.

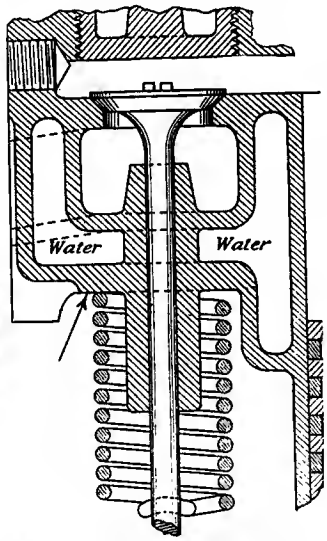

Fig. 2—Showing the spring protected from excess heat.

Fig. 1 shows a case in which this trouble would be eminent in view of the fact that the spring comes into intimate contact with the wall, on the other side of which the products of combustion are not separated by a water jacket.

Fig. 2 shows a better construction, in which the springs do not contact with "gas hot walls," it being the case that the water jacket intervenes. This is an example from one of the finest products with a high reputation for reliability, and the valve springs do not "wilt" if this idea is executed.

SPEED CHANGING BY TIMING DIFFERENTLY.

Editor THE AUTOMOBILE:

[1,659.]—From your recent articles on valve timing I do not get any clear idea of what possible changes I could adopt to make a car pull stronger on slow speed. I mean by this, of course, not changing the faces of the cams, simply by the meshing of the half-time gears. Would not a few remarks on this side of the subject be of interest to many readers? I have a car that has more speed than I care for on these roads, and I have been considering the purchase of a set of lower ratio final drive gears, but if it would be possible to set the valves to get more power at low speeds, it might be as well and cheaper. What influence might the change have on fuel consumption?

Let "Subscriber" (Letter No. 1, 601) look at his timing. It might be that one cylinder fires very much behind the others, which would make that cylinder very weak and jerky, but could not be so noticeable at higher speeds and lighter loads. KNOX.

Thomaston, Me.

It will not be inexpedient to try to change the gear ratio (effect) by so altering the timing as to make the motor go slower. Any change, such as this, will cause excess gasoline consumption, difficulty in starting and eccentricities in operation.

TEMPERATURE OF EBULITION OF LIQUID FUEL.

Editor THE AUTOMOBILE:

[1,660.]—Will you please insert this in "Letters Interesting and Instructive." I would like to know if any one has ever tried to generate gasoline into gas, for use in gasoline engines? If this can be done, would it not be better than the liquid in several ways? Perhaps you will say gasoline cannot be generated into gas without heating, which would be too dangerous and complicated and out of the question for use on an automobile. But I think it can. I have a device, which I have been testing for some time on a gasoline stove and it works fine. No liquid gets to the burner, nothing but the pure gas, very simple and perfectly safe, taking less than half the gasoline used for the ordinary stove for the same fire. Will soon test it on gasoline engines.

Would be pleased to hear from any one who has ever tried gas of any kind for engines and with what success. Will be glad to correspond with any one who is interested in this business.

Austin, Minn. F. E. KENDALL.

It is not uncommon to evolve gas (an explosive mixture) through the intermingling of gasoline with atmospheric air. The gasoline (hexane) when mixed with 15.3 pounds of atmospheric air, will become a homogenious gas at a constant temperature, and the 16.3 pounds of products of combustion will include 3 pounds of carbonic acid, 1 1-2 pounds of water and 11.8 pounds of nitrogen. In this combination you have the most complete combustion possible of attainment by any method whatsoever, and it takes into account the vaporization of the gasoline. You cannot accomplish more by any process, and the builders of gasoline automobiles are striving for this perfection.

WOULD TELEPHONE MAGNETO SERVE?

Editor THE AUTOMOBILE:

[1,661.]—Would you please tell me in your "Letters Interesting and Instructive" if an alternating current magneto, such as was used with the old-fashioned telephone bell, could be made to give, through an induction coil, sufficient spark for automobile use? Also, why is an alternating current magneto used with a vibrator coil? Why can't it be used with a step-up transformer, and thus get rid of the vibrator? L. C.

Brookline, Mass.

Very likely, it depends upon the windings on the armature of the magneto and the strength of the magnetic field. The magneto might be a little weak and better results would follow a more pretentious magneto, especially designed for the work.

Transformers are used in connection with magnetos, as you suggest.

INFLUENCE OF INFLATING GASES ON RUBBER.

Editor THE AUTOMOBILE:

[1,663.]—Upon receipt of a communication from Philip A. O'Neil, of 1020 Bedford avenue, New York City, in relation to the effect of tire inflating gases upon the rubber of the tires, and in view of the fact that Mr. O'Neil complained of the rapidity with which the tires deflated, the matter was taken up and investigated at some length. The investigation included the opinions of numerous of the tire makers and the result can be stated in no better language than that of one of them:

"Carbon dioxide is absolutely not injurious to rubber, and in that respect is slightly superior to ordinary air, which, in the absence of direct light, oxidizes rubber very, very slowly. For inflating purposes air is entirely satisfactory, since its rate of oxidation is so low as to be practically negligible except in the presence of direct light. Obviously the latter condition is not to be feared from any inflating medium. Carbon dioxide appears to be open to the objection that it diffuses more rapidly through rubber than air, and for that reason tires inflated with carbon dioxide must be inflated more frequently. We would not anticipate any difficulty whatever in satisfactorily carrying either air or carbon dioxide in pressure tanks and we certainly would not expect a formation of any nitric oxide or anything else which would injure either the rubber or the valves." THOS. J. FAY.

Brooklyn, N. Y.

Model XXX, the Four-Cylinder Stevens-Duryea for 1909.

BEGINNING in 1891, the Stevens-Duryea Company, of Chicopee Falls, Mass., introduced a pioneer automobile and from that day to this they have been building automobiles, advancing as their knowledge permitted, until to-day the Stevens-Duryea product is of world-wide fame. Instead of a hide-bound policy the Stevens-Duryea Company made such revisions from time to time as the exigencies of service indicated, and when they found that increasing the number of cylinders promised to them, more than increasing the diameter of a less number of cylinders, they took up the trail and blazoned the way that ultimately resulted in the six-cylinder motor, the flexibility of which is only equaled by the continuity of its overlapping torque. That they pursued a sane course, bounded by a certain conservatism, is evinced from the fact that the Stevens-Duryea product includes a six-cylinder car for the class of work demanding the same and a four-cylinder car in the specialized service for which the four is noted.

In this description, portraying the more recent products of the Stevens-Duryea Company, intending to include the Model XXX, four-cylinder motor, and the Model Y, six-cylinder motor, it will be possible to advance the discussion along common lines to a certain extent, because of the consistent practice of the designers in this case, who seem to hold to the impression that the three-point suspension, for instance, is good in connection with each of the models, if it is good in any case, as it certainly proved to be.

Utility of the Three-Point Suspension.—In connection with both of the power plants here to be discussed, the motor, clutch, and transmission are all within the confines of a common cylindrical case, the material of which is aluminum alloy, which case is suspended from two arms at the front end, and is supported on a rocker at the rear end. In this fashion the contortions of the chassis, following the interception of road inequalities, are not transmitted and taken up by the individual members of the power plant, for the simple reason that a unit suspended from three points only is incapable of participating in the transmission of moments of whatever character, if the moments, so called, are the product of outside potential forces. It is the claim of the makers in this case that the principle here enunciated is such as to preclude a chance of the disalignment of bearings, or the introduction of bending moments into the crankshaft, the clutch-spindle, or driving shaft, or, such other parts as make up the "train" in the trasmission of the motive power. By rendering the whole power plant, including its transmission devices as a single unit, they not only thwart outside influences but in the machining process means are afforded by which the alignment of the bearings is assured, and the mechanism *in toto* is protected as against forcign substances, while oiling becomes a simple matter. In this way the life of cars will be prolonged the greatest possible length of time.

Accessories Common to Both Types of Motors.—Admitting that there will be differences in point of linear dimensions as dictated by the ratings of the two types of motors, it is a fact, nevertheless, that in a broad sense this description will lose no force if it continues along lines common to both. Considering the ignition, for instance, it is to note that two independent systems of ignition are employed, comprising the Bosch high-tension magneto and a multiple coil. The gasoline system in connection with both models consists essentially of a new type of single-jet, float-feed carbureter in combination with a well placed piping system, and an adequate gasoline tank. The control takes into account both spark and throttle with levers and sectors on the steering wheels, so arranged, however, that the control levers do not rotate with the steering wheels. An auxiliary foot accelerator connects with the throttle in each case. Likewise the cooling system is by means of a cellular radiator, centrifugal pump, and belt-driven fan, in which the belt is wide and driven from the flywheel. The intake and exhaust manifolds, the piping and incidentals are equally worked out for the respective models, and the oiling, which is probably one of the most important accessories, is by means of a force-feed oiler located under the hood

Model Y, the Exponent of the Six-Cylinder Stevens-Duryea Idea.

and connected to lubricate the engine in each case. The steering gear, cardan shaft, and differentials are packed in grease, while the transmission gears run in oil, and the transmission bearings receive their supply from the splash.

Features of Clutch and Transmission.—The differences between the clutch and transmission in the two models here under discussion are of size and not of material or the principals involved. The clutches used are a "patented" multiple disc type, consisting of two sets of steel discs, one set being faced with asbestos; no oil is used. The transmission gear in each case provides three speeds and reverse, and an automatic position finder for the shifter. The drive is through bevel gears and direct on the high. From the bevel drive, the transmission passes through floating type rear axles, actuating wheels of the artillery type, the hubs of which are drop-forgings of an appropriate grade of steel. The woodwork in the wheels is of a high order, the design of which is such as to lend strength.

Chassis, Springs, Brakes and Detail.—In both models, the chassis frame is of chrome nickel steel, of correct design, and channel section. The latterals are suitably spaced, properly secured, and the fittings are of fine grades of material and securely fastened in such a way as to distribute the stresses. In both cases the chassis frames are suspended on semi-elliptical springs, excepting that for the Model Y there is a third semi-elliptical cross-member. In the Model XXX the front springs are 36 inches long, and the rear springs are 56 inches long. While in the Model Y the front springs are 36 inches long and the rear semi-elliptical springs are 48 inches long with a cross-spring 36 1-2 inches long. The spring shackles and other details of the spring suspension are of a high order of merit. Coming down to the brakes, it is to say there are two sets on the rear hubs, considering both types of cars. The external sets are contracting brakes, asbestos to metal, operated by foot levers. The internal sets are expanding brakes, metal to metal, operated by an emergency lever. In each case the brakes are extra wide of face and liberal for the work to be done.

Model XXX Power Plant.—The motor is with four cylinders, 4 3-4 by 4 1-2 inches, bore and stroke, respectively; they are cast in pairs with water jackets integral. Inlet and exhaust valves are located on the same side of the cylinders and are operated by one camshaft. The mounting is such that a clearance of 11 3-4 inches obtains for the flywheel, and the power of the motor is such that the speed of the car ranges between 50 and 55 miles per hour, depending upon the number of passengers in the car, it being the case that the Model XXX is equipped with a three-passenger body, and the lower speed mentioned will obtain if three passengers are seated. With a view to the utilization of the power available in such a way as to engender nice conditions of road performance, the wheelbase is 109 inches, with 56 inches tread, and the tires are 36 by 3 1-2 inches front and 36 by 4 inches rear. The center of gravity was given its due measure of attention, and considering a safe ground clearance as dictated by American roads, the machinery is set as low down as possible.

Model Y Power Plant.—The six-cylinder motor, 4 3-4 by 4 1-2 inches, bore and stroke, respectively, with water-cooled cylinders cast in pairs, jackets integral, in which the exhaust valves are located on the same side, operated by single camshafts, furnishes the power. If the unit power plant is desirable in general, it is particularly valuable in connection with this power plant, in which as a matter of necessity the overall length is something to take into account. In this plant the clearance under the flywheel is 12 inches, and 16 inches under the crank case. The least clearance is under the rear axle, which is 10 1-4 inches, while the clearance under the front axle is 12 inches. To consider the power plant without taking into account the relation it bears to the car as a whole would be to ignore not only important, but the essential of relations. In this case the wheelbase is 142 inches, the tread 56 inches, with 36 by 4-inch tires in front and 36 by 5-inch tires for the driving wheels. For a seven-passenger car, considering the power of the motor, and all the other conditions found in this product, the relation of the power to the chassis can be regarded in a very favorable light.

Commercial Considerations in Relation to Both Models.—In the Model XXX car, the equipment consists of lamps and a gas generator. The price is $2,850. In the Model Y car the equipment consists of full lamps and gas tank, while the price is $4,000. From the point of view of purchaser of automobiles in considering the price, it will not be out of place to take into account the presence of annular ball bearings throughout, excepting in the engines in each case, the absolutely standard body construction, the perfect carriage finish, rich upholstery, commodious space, and the period of years through which this product has evoluted.

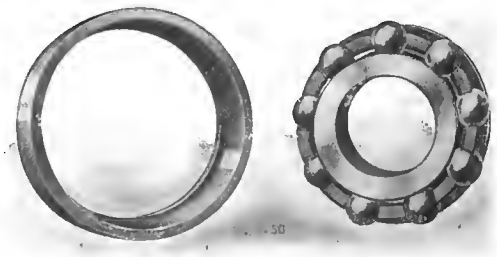
Finally, in relation to the respective models, it is to say the Model XXX car has a standard finish comprising English purple, lake body and frame, with primrose yellow for the running gear, but any special color will be provided at an additional cost of $50. The weight of this car complete is 2,400 pounds. For the Model Y the body is in English purple lake, the chassis in carmine, stripped, but it will be optional with the purchaser to select brewster green for the body and chassis, or any special color at the extra cost of $50. This car weighs 3,400 pounds.

A NEW MAGNETO BALL BEARING.

Thoroughly tested by a season's practical use, the Hess-Bright Manufacturing Company, of Philadelphia, as well the German DWF at Berlin, and the French DWF at Paris, are now offering for general use a new magneto bearing, which follows in the main the general annular type of which this company was the

Cross-section New Hess-Bright Magneto Bearing.

originator. The inner race is grooved in the usual way, but the outer race is grooved at one side only. The balls are held in a special short steel retainer. A dismembered group of the three elements, inner race, ball retainer with balls, and the outer race, is clearly shown in the illustration, as is a cross section of the



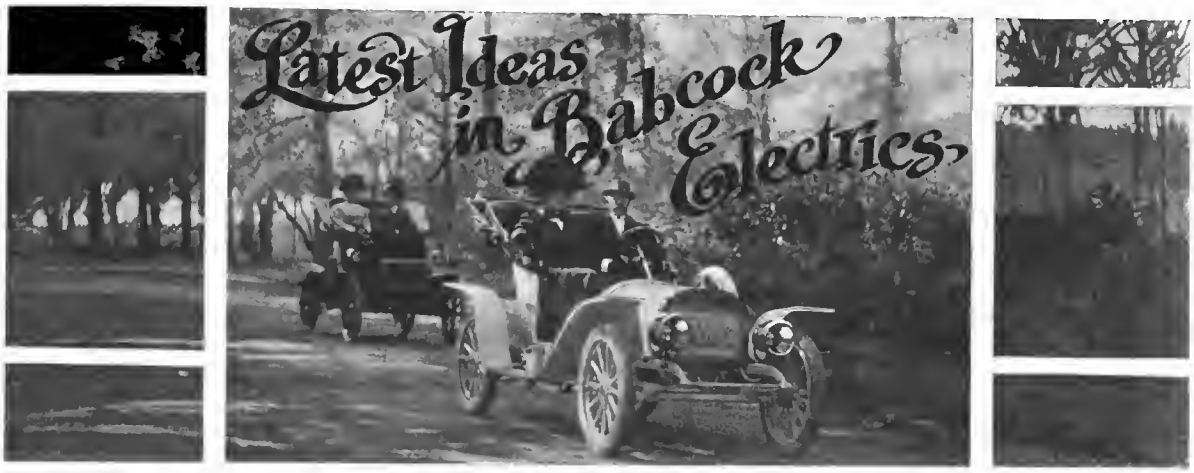
Group Showing Inner and Outer Races, Retainer and Balls.

bearing. At the present time three sizes are being regularly furnished, of the following dimensions:

	Bore.		Diameter.		Width.	
	MM.	Inches.	MM.	Inches.	MM.	Inches.
7882.....	10	.39370	28	1.10236	8	.31496
7802.....	15	.59055	35	1.37795	8	.31496
7778.....	17	.66929	44	1.73228	11	.43307

Other sizes are furnished on special demand, and will be added to the stock sizes as the demand indicates the advisability of carrying them.

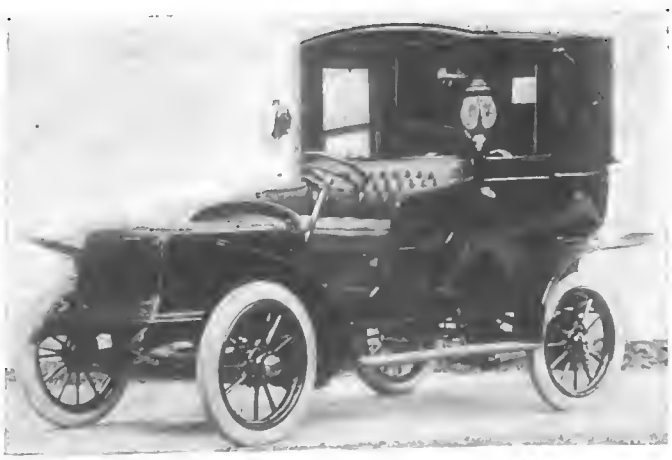
City of Mexico, Mex.—The Mexico City Cab and Omnibus Company has in operation on the streets of this city five automobile omnibuses and has placed orders for ten more. The 'buses are built on 35-horsepower Panhard chassis and are 25 feet long; they seat 30 passengers.



F. A. Babcock in the New Babcock Electric Roadster.

BUFFALO, Nov. 30.—"If you are going to try to imitate the lines of the gasoline car, why not go the whole thing and make a complete job of it while you are about it?" said F. A. Babcock, of the Babcock Electric Carriage Company, when speaking of the new model electric roadster which his company will feature for the coming season. And the result, as shown by the car itself, which is depicted in the accompanying photograph, indicates that the builder has had the courage of his convictions in this respect and has left nothing undone to perfect the deception. This likewise holds true where other essentials are concerned as well, for considering the legitimate field of the electric to be town work, the designer has installed the control on the left-hand side, despite the prevailing fashion, though the adoption of this feature by some of the taxicab builders strongly indicates that the necessities of the case will shortly rule supreme where this essential is concerned.

Starting with the armored wood frame, that has always been a characteristic feature of Babcock construction, it is easy to trace the same trend of design that has become familiar on these vehicles during the past several seasons, and which has doubtless been responsible for their continued success. The "power-plant" consists of 42 cells of the special Babcock battery, equally divided between the space under the hood and that under the rear deck, and a single motor rigidly attached to special supports directly under the footboard, or exactly in the center of the car, thus making for an ideal distribution of the weight. This motor is also a special Babcock design and is built to the specifications of the company by one of the large makers of electrical apparatus. By means of a Morse silent type of chain, it drives to a countershaft, from which the final drive to the rear wheels is taken through the usual standard type of double chain drive. Both front and rear axles are of tubular construction, thus giving lightness with strength, the wheelbase being 92 inches and the tread slightly narrower than the standard, or 52 inches. Flat semi-elliptic springs are used for suspension all round, thus carrying out prevailing gasoline car practice in this respect. The tire equipment consists of 32 by 3 1-2-inch pneumatics on all four wheels, a special electric type of tire being employed.



The New Babcock Electric Town Car or Taxicab.

One of the chief features of interest about the Babcock roadster, although it is an item of construction that applies to all the Babcock cars, is the special pedal control. The usual controller, giving five forward speeds and two reverse, is located beneath the foot board where it is readily accessible for inspection, and is operated by means of the small side lever ordinarily employed for this purpose. But in addition to this, there is a pedal by means of which the speed of the car may be controlled at will without disturbing the side lever, this making for a close approach to the method of clutch control usual on the gas car, in addition to simulating the appearance of the latter, in the case of the Babcock gentleman's roadster.

This pedal operates a graduated switch acting through a resistance and permits of the use of several steps in the supply of current to the motor, as limited by the position of the side lever. If the latter happens to be set for full speed ahead, the pace of the car may then be controlled from a stop to full speed, merely by using the pedal; if set at the third speed forward, then the pedal switch handles the amount of current that this position of the lever provides from the batteries, acting in the same manner with regard to any one of the lever positions, whether for forward or reverse speeds, a feature that is of great help in handling the car in heavy traffic, as the control may be by the two pedals alone, the foot switch and the brake, leaving the hands entirely free for the wheel.

The Babcock gentleman's roadster is geared for a maximum speed of 32 miles an hour, and under favorable conditions is good for 100 miles on a single charge of the battery, at an average speed of 17 to 18 miles an hour. Unlike its compeers in the gasoline field, its rumble will face aft, a special footboard being provided for the comfort of the occupant of that seat, whose view will accordingly not be confined to a vista of the rear of the top. Another new model that will be featured by the Babcock company for the coming season is a town car, which will also

be available for taxicab service, and in view of the experience that some companies have been undergoing in the shape of an excessive percentage of equipment constantly in the shop due to mechanical troubles, interest in electrics is again awakening.

The Babcock town car is also equipped with a 42-cell battery of 15-plates each, the weight being distributed in a similar manner, though where its control is concerned a departure has been made by substituting a second wheel just beneath the steering wheel for the side lever control, so that with the special pedal switch already described, the driver is never under the necessity of removing his hands from the steering wheel. The tire equipment in this case consists of 32 by 4 1-2-inch pneumatics all round. A feature that is employed on all Babcock cars is the safety switch which prevents tampering with the car when left standing at the curb. This consists of a Yale lock operated in the usual manner, but so connected up that unless the switch has been unlocked prior to inserting the starting plug, the use of the latter causes the usual warning bell to start ringing, which continues as long as the plug is left in with the lock in this condition.

The past season has proved an unusually profitable one for the Babcock factory and the Buffalo plant, which probably comes nearer to turning out a complete electric vehicle under its own roof than any other in the country, has been working to its full capacity for some time past with the prospect that this will be the case throughout the coming season. The demand from the Far West has been particularly encouraging and Salesmanager Pearly of the Babcock forces, who is now in Southern California, will devote his entire energies during the next two or three months to looking after the details of the business on the Pacific Coast. In that time, he will have an opportunity to make a thorough canvass of the field where the outlet for electric vehicles is concerned, and before returning East, he will organize the Babcock selling forces in that territory in accordance with the result of his investigations. Following this, agencies in other centers, such as Chicago, where quite a number of Babcock cars have been sold during the past season, will come in for attention, Mr. Pearly believing that 1909 is going to prove a banner year for the electric as well as for other classes of cars.

SOME RECENT RECORD-BREAKING AT BROOKLANDS

LONDON, Nov. 10.—Although the Brooklands season has come to an end as far as the public meetings are concerned, attempts at record are still the order of the day. Perhaps the most interesting of all was the performance of the little six-horsepower Sizaire-Naudin voiturette—the particular car which won the Coupe des Voiturettes last September.

In spite of the wind and rain of Wednesday, November 4, M. Naudin, accompanied by M. Sizaire, decided to make the attempt. From a flying start the first half mile was covered at a rate of 66 1-2 miles an hour, and, keeping up its speed with great regularity, the curious looking blue car passed the 50-mile mark in 45 minutes 54 seconds—an average of 65 1-2 miles an hour. In the hour 65 1-2 miles were covered, and finally the full hundred miles were completed in 1 hour 31 minutes 54 seconds, equal to 65 1-4 miles per hour. The bore of the single cylinder was officially measured up to be 3.93 inches, while the length of stroke is said to be 8.8 inches, or possibly even more.

A new name has been added to the record list by the performance of one of the Grand Prix Brasiers, driven by Bablot. This car just comes within the 60-horsepower classification and, as was anticipated, it made short work of the existing figures, which represented a speed average of just over 85 miles an hour. The flying half-mile was covered by the Brasier at 108 1-2 miles per hour, and the ten laps, which, taken from a standing start, constitute the second standard distance, showed an average of 101 3-4 miles for the 27 miles.

A second monster which helped to make this a day of note was the Napier *Sampson*—memorable from its contest with Nazarro's red *Mephistopheles*. Driven by Newton, the car raised the 90-horsepower half-mile record to an average of 114 3-4 miles per hour—somewhere near the limit of Brooklands' speed possibilities. The ten laps were soon reeled off at 102 1-4 miles per hour, but while this is a record, it is somewhat disappointing when compared with the Brasier speed.

Motorcyclists have not shown much interest in the track hitherto, but a fortnight ago C. Collier established a new world's record. Riding a seven-horsepower twin-cylinder Matchless machine of his own make, Collier covered 70 1-8 miles in the hour, easily passing the previous record of 63 miles set up by Guippone at Paris as far back as 1905.

THE AUTOMOBILE CALENDAR

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, General Manager, 29 West 42d St.

Jan. 5.....—New York City, Fourth Annual Meeting Society of Automobile Engineers. (Will adjourn until January 19 after opening session.)

Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. M. L. Downs, Secretary, 7 West 42d St., New York City.

Jan. 25-30.....—Detroit, Light Guard Armory. Seventh Annual Automobile Show, Tri-State Automobile Dealers' Association.

Jan. 27-Feb. 3..—Philadelphia, Second Regiment Armory, Eighth Annual Show, Philadelphia Automobile Trade Association.

Feb. 6-13.....—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York.

Feb. 15-20.....—St. Louis, Mo., Annual Show, St. Louis Dealers and Manufacturing Association.

Feb. 15-20.....—Detroit, Wayne Pavilion, Annual Show, Detroit Automobile Dealers' Association.

Feb. 15-20.....—Cleveland, First Regiment Armory, Annual Show, Cleveland Automobile Dealers' Company.

Mar. 6-13.....—Boston, Mechanics' Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. Chester I. Campbell, Manager, 5 Park Square.

Mar. 27-Apr. 3..—Pittsburg, Duquesne Garden, Automobile Show, Pittsburg Automobile Dealers' Association.

Races, Hill-Climbs, Etc.

Dec. 8.....—Worcester, Mass., 200-Mile Endurance Run of the Worcester Automobile Club.

Jan. 1-2.....—Philadelphia, Two-day New Year's Run of the Quaker City Motor Club.

FOREIGN.

Shows.

Nov. 28-Dec. 13.—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France (Pleasure Vehicles, etc.).

Dec. 20-28.....—London, Stanley Show, Agricultural Hall.

Dec. 22-29.....—Paris, Eleventh Annual Salon de l'Automobile. (Commercial Vehicles, etc.)

RAPID INCREASE OF AEROPLANES IN FRANCE

PARIS, Nov. 30.—It is not generally realized, even in France, to what an extent the aeroplane movement has already grown. On a moderate estimate there are under construction in Paris and its immediate neighborhood not less than 350 aeroplanes. The public hears little of them, for in most cases they are experimental machines, that the designer prefers to try out in peace before bringing before the attention of tbe world. There are fifty orders in hand for the Wright aeroplane, which will be in the hands of well-known sportsmen next season; in addition to this, such shops as those of Voisin, Antoinettc, Astra, etc., are busy on machines for French sportsmen. Many men, as, for instance, Louis Bleriot and Melvyn Vaniman, the engineer of the Wellman balloon expedition build quietly in their own shops, and it is not until the machine is brought out for flights that the public wakes up to the fact that something has been doing.

It is not surprising that there is so much activity when there is in Europe alone a sum of about $250,000 awaiting to be won for aeroplane performances. Experienced men, however, are lacking, for most of those building or buying machines are new to the game, and when they get their apparatus are unable to fly with it. To overcome this, one of the largest firms of aeroplane constructors is about to open a practical aeroplane school, in which they will be more concerned about teaching the practical handling of an aeroplane than the theories regarding its operation. Leon Delagrange, too, has turned teacher, and is prepared to show anyone how to fly on an aeroplane for the sum of $200. At the Auvours camp Wright is now completing the education of his three pupils, one of whom has already flown alone, and these three men, as soon as competent, will be used to teach the art to others.

Preparations to Build a Number of Wright Aeroplanes.

It is declared that next year the Chanticrs Navales de France will undertake the building of Wright aeroplanes in large series for the French committee. Already an order has been given a French firm for a large series of motors on similar models to the one used by Wilbur Wright. The first order given was for an exact duplicate of the Wright engine. The constructors objected that the motor was defective in several respects and asked to be allowed to make detail modifications. Wilbur Wright refused to listen to them, and the exact duplicate order was maintained. While working according to instructions, however, the firm built an improved engine, on the same general lines, but remedying the many small mistakes in the one used in America and Europe. On a test being made the improved motor was found to give so much more power that Wright was immediately convinced that he was mistaken, and accepted the changes. It is declared that the engine used for the most successful flights in Fracne barely develops 25 horsepower, which is a remarkable tribute to the efficiency of the aeroplane, for there are scores of machines with four timcs this power which fail to leave the ground.

Specially Designed Aeroplane to Cross English Channel.

One of the first machines specially built to cross the Channel from France to England is now nearing completion in the Voisin Frères shops. It is a monoplane ordered by Prince Bolatoff, a young Russian sportsman, who will equip it with a special light weight Panhard engine of 100 horsepower. It is practically certain that an attempt will be made during the early months of 1909 to cover thc twenty miles separating France from England, for apart from the various sportsmen who are desirous of accomplishing the task there are half a dozen firms of builders who would give much to have this powerful means of publicity. It is recognized that the sensational flight is not difficult on condition that an engine can be obtained which can be relied upon to run the necessary length of time without a falter. Up to the present it is the engine that is giving the greatest amount of trouble, few light weight engines being capable of running long without developing weaknesscs dangcrous to the aviator.

Practical Men's Opinions on the Types of the Future.

Generally European aeronauts are of the opinion that the flying machine will develop on sporting lines, in the same way as was done by the automobile, but that, owing to the more fascinating naturc of aerial navigation, it will have a greater success than the automobile, and less importance from a commercial standpoint.

Wilbur Wright is not of this opinion, and in a recent conversation with THE AUTOMOBILE correspondent declared:

"The flying machine is a military proposition. It will naturally attract a certain amount of attention as a sport, but its greatest future is for use with armies. I believe that owing to the intensely fascinating nature of flying a number of sportsmen will become interested in the flying machine, but their number will not be so great as to have any serious influence on the automobile. I have always been of the opinion that the future of the flying machine was in army work, where it will largely take the place of cavalry, and where it will be an instrument with which the enemy can be constantly harassed. In the immediate future hundreds of these machines will be attached to every regiment. As a commercial proposition there is little future for the aeroplane, for it can never compete with railroads and steamships.

"There is naturally a certain amount of danger with a flying machine, but it need not be any greater than on an automobile, and in my opinion it is more risky to be on the Paris streets than aloft. With my machine there is no danger from a passenger moving; as a matter of fact, I could sit on the tip of the wing and still balance the machine.

"Though of course it is useless to carry unnecessary weight, there is nothing to be gained by the search for extra light motors. Even if the gasoline engine had not come to the fore when we made our early experiments, it would have been possible to fly with a steam engine. To-day there are plenty of automobile engines that we could lift off a car, place on our aeroplane and fly without any change whatever. The aeroplane of the future will be fitted with an automobile engine with a little of the superfluous weight removed."

Asked whether he had succeeded in his experiments up to his expectations, Wilbur Wright declared:

"When we began work we believed that it would be 50 years before man would be able to fly; two years later my brother and I had flown together. It is impossible to say what is the greatest difficulty, for there are a thousand problems in one, and as soon as you settle one difficulty you are on the heels of another."

"During the next five years," declared Henry Farman, "pleasure flights will become exceedingly common, especially around all holiday resorts. There will be no attempt for a long time yet to fly over towns, or over mountain ranges, for journeys with two or three passengers and for distances up to 200 miles the aeroplane is the coming mode of locomotion. Trips across the English Channel are not likely to be undertaken just yet, for although greater distances than this have been covered. there is so much risk that the journey is not worth attempting. By reason of its development as a sport, the aeroplane is bound to have a very serious influence on the automobile. Certainly long-distance touring witb costly, high-powered cars will fall off in popularity at a very early date."

M. Levavasseur, designer of the Antoinette light-weight engine and builder of numcrous successful aeroplanes, has an entirely different vicw of the future of the flying machine.

"In five years there will be a new industry, which will be more important than the automobile industry at present. In this period the aeroplane will have reached its maximum of develop-

ment, and large passenger carrying machines will be common. The future is entirely with the large aeroplane; we are making a mistake at present by building light and small. Large machines will be much more successful than small ones; an eagle can fly in a gale, while butterflies and all small birds are obliged to seek shelter. Next year we shall have an eight-passenger aeroplane driven by a 200-horsepower engine, capable of traveling over 100 miles an hour. The success of the aeroplane is assured as a sporting proposition, and by reason of its success will cause the abandonment of the automobile."

Comte de la Vaulx, long-distance balloon champion: "It is along sporting lines that the aeroplane will be developed during the next five years. There is very little future for it from a military standpoint and practically none in the commercial field. Already the aeroplane is too fast to be of any use for military reconnaissance, the speed at which it travels making it impossible for any officer to obtain accurate information on the doings of the enemy. Its inability to go out in all weathers makes it impossible commercially, at any rate for the present."

Ernest Archdeacon, part donator of the Deutsch-Archdeacon $100,000 prize: "The two most important problems to be solved by the aeroplane are some means of starting without an initial run over the ground, and the provision for passengers. The successful aeroplane of the future will be the one that unites these two qualities, and has in addition the minimum displacement for the maximum bearing capacity. At present constructors persist in copying the bird, thus producing a machine of very great area and only handled with ease in open spaces. It is a mistake to follow nature, and the future aeroplane, in my opinion, will be not one large bird but several small birds joined together."

BELIEVE RACING AUTO WILL GIVE WAY TO AEROPLANE

PARIS, Nov. 289.—There had been a short, sharp skirmish for the control of aerial navigation in France, with the result that what at one time looked like a war for supremacy has been avoided by a satisfactory settlement. As it became daily more and more apparent that the aeroplane will attract an enormous amount of attention as a sport and industry, the Automobile Club of France decided to interest itself and get such a hold of the sport that it would in time control it as it now controls the automobile. The Aero Club of France, which has struggled with spherical balloons, dirigibles, and now seems likely to be important as the result of the arrival of the aeroplane, frowned upon this intrusion. The League Nationale Aerienne, a patriotic body which dreams of giving France the top notch in all matters of the air, also became jealous.

Finally a gathering of all three parties was arranged, with the result that it was decided to appoint a joint commission from all three bodies with sole power to draw up rules governing aerial competitions and generally govern the sport of flying. Each of the three bodies is left free to do its own work, and while the League and the Aero Club will continue as before, the Automobile Club will branch out in a series of experiments, competitions, and demonstrations for the flying machine.

Though an agreement has been arrived at, it is easy to see that there will be rivalry between the Aero and the Automobile clubs, for the latter realizes that as a sporting proposition the automobile will have to give place to the aeroplane at no distant date. It will be manifestly impossible to get crowds to watch automobiles run over roads at 70 miles an hour when aeroplanes can be seen traveling through the air at 100 miles an hour. Thus the one who secures hold of the aeroplane industry and sport has a permanent and profitable position.

All the various commissions of which the Automobile Club of France is composed, will in future occupy themselves with aeronautics. Already it is announced that the club committee has made arrangements for the purchase of an aerodome in the neighborhood of Paris, to be used as a training ground for its members, a place where new machines can be tried out, and for competitions. The touring commission has begun to get busy on two maps for aerial navigators, showing air line distances from one town to another in France. Later it is the intention of the committee to have fixed up over every village and town large distinctive signs composed of a group of letters of the alphabet and numbers, corresponding with similar groups marked on the map. The aeroplanist flying across country will read off the sign, turn up a list supplied with his map, and thus locate his position. Another idea is to arrange for electric searchlights at the outskirts of towns to serve towards aviators just the same as lighthouses now aid sailors.

It is declared that the technical committee will undertake serious work in the direction of organizing competitions and making researches in the direction of the most suitable motors for aeroplane work. It is generally admitted by aeronauts that as soon as a thoroughly reliable aeroplane motor is produced the aeroplane will make immense progress.

An indication of the serious manner in which the club is taking up the aeroplane question is shown by the fact that a very large portion of the industrial Salon, to open in Paris, December 24, is devoted to flying machines.

Indications are that there will be aeroplane races near Angers in connection with the Automobile Grand Prix next June or July. The local committee has taken up the matter and is anxious to hold a race from Angers to Saumur and return, distance about 60 miles. The prizes are a challenge cup, to be held for one year by the winning club, and a large sum in cash for the pilot of the successful machine. Much interest will result in this way and profit in the long run.

WILBUR WRIGHT'S WINNING OF FRENCH HEIGHT PRIZE

PARIS, Nov. 28.—Wilbur Wright's winning of the height prize of the Aero Club of France is likely to cost that body dearer than they expected. Farman made a try for the prize a few days ago, fulfilled all the conditions, but was not awarded the money on account of a technical objection. Farman protested, and has since been awarded the prize; but in the meantime Wright has flown to the necessary beigbt and is without doubt entitled to tbe prize also. The only solution is to double the prize, giving one to each aviator.

Wilbur Wright won the prize under difficult conditions, the regulations stipulating that he must start off under his own power. The American aeronaut refused to abandon his skates for wheels, but started from his wooden rail without the use of the falling weights. Before going away for the high fly be touched ground at two points indicated to the committee in advance, then, without stopping his engine, went up aloft. The line of small balloons 82 feet above the ground, was passed with a margin of about thirty feet, and a few seconds later the flyer was at its starting point.

A flight with Captain Girardville followed, and had been under way for about twenty minutes when, at a height of 15 to 20 feet from the ground, the chain driving the right-hand propeller suddenly snapped. Feeling that something had gone wrong, Wilbur Wright put up his hand and cut out the ignition, bringing the aeroplane to earth gently after describing a circle in descending. An hour later flights were resumed.

An Improved Roadway on Long Island that Intersects the Picturesque Northern Coast.

NEW ENGLAND GOVERNORS ON ROADS AND AUTOS

BOSTON, Nov. 30.—The conference of Governors, other officials, and prominent citizens of the six New England States on the conservation of the resources of this section of the country and uniform legislation, closed last Tuesday afternoon with a session devoted to highways and automobile laws. At the previous meetings forestry, fruit cultivation, and fisheries were considered, but the highway and automobile questions attracted the largest attendance in Tremont theater. There were three speakers on the general topic of "Highways and Their Use." These were Chairman Harold Parker, of the Massachusetts Highway Commission; Highway Commissioner James H. McDonald of Connecticut, president of the American Roadmakers' Association, and former Governor Nahum J. Bachelder of New Hampshire, master of the National Grange.

Commissioner Parker's sub-topic was "The Construction of Highways" and he told of the growth of the highway system in this country, how it first was started to connect centers, then was neglected for waterways and later for railroads, and how it has now again come to the front. The State of Massachusetts, he said, was one of the first to consider seriously the question of building its roads under the authority of trained men. The Legislature established the Highway Commission which has been in existence for fifteen years. In that time it has built nearly 800 miles of thoroughly well devised stone or gravel roads. It has taken charge of the construction of several hundred miles of town highways which have been built under its direction and supervision, hut which still remain town ways. In the course of his talk Mr. Parker said:

It is my belief that the macadam road as now built, with modifications such as different road builders adopt under different conditions, such as the use of only No. 1 stone, with a sand binder, filling the road completely during the process of rolling, where traffic is heavy, and other small changes, will not be materially changed, whatever damage may be caused by the use of automobiles on the highways. It may be, and undoubtedly will be, that a material will be found, if it has not already been found, which when placed upon the surface or embodied in the top course of a macadam road will offer a surface which will not be destroyed by the corroding action of automobile wheels. It may be proper to say here that this Commission has experimented for several years in the use of tar, pitch, asphalt and oil in surfacing and even building roads, and it is not yet prepared to say what material, if any of those experimented with, will become the material for a permanent road structure. That the automobile has introduced a wholly new condition is undoubtedly true. It is also undoubtedly true that it has caused the revolution of the theory of the macadam road.

Commissioner McDonald of Connecticut urged the importance of trunk line highways in New England. The only way to bring these about, be said, is to take the money out of the State treasuries. He said:

The roads are first for the business of the State and then for pleasure. When the automobile came, with its persistent and annihilating ways, it caused many sleepless nights to the various commissioners and some of them could not help saying, "O, Lord, how long, how long?" But we have realized that the automobile is a permanent institution and we are now trying to meet its demands as best we can. The single "cider-jug and hoe-handle road-building brigade" should go. I would substitute for the words "Democrat" and "Republican" the good roads platform and "a business administration."

Former Governor Bachelder, discussing "Automobiles and Their Regulation," said in part:

It is in regard to the regulations relating to the registration and identification of automobiles, and their equipment with lights, brakes, horns, etc., that there would seem to be the greatest

Making a Wayside Repair on One of the Straightaway Stretches of a Characteristic American Road.

Pennsylvania Scenery That Skirts the Highways.

need for uniformity. The present diversity of laws on these points makes it possible for an automobile owner who is duly registered in bis own State, and has complied with all the requirements of its laws, to be an unconscious lswbreaker in an adjoining State because of a misunderstanding as to the nature of tbe regulations covering certain minor details. This matter should be taken up promptiy by the Legislatures of these States so that an agresment can be reached as to a simpls code of regulations, providing for the public safety, but interfering as little as possible with the orderly and reasonable use of the automoblie.

Uniformity is also highly desirable in regard to the taxation and licensing of automobiles. As these vehicles are personal property, and presumably taxed by the district in which their ownsrs reside, a tax imposed by the State is double taxation, and therefors opposed to our principles of government. A reasonable license fee can properly be charged, but there would seem to be no justification for imposing taxes on this particular kind of property.

In this connection I may refer to the proposition for Federal registration of automobiles used in interstate travel, which has been advocated at ssveral sessions of Congress. It is not proposed that Congress should interfere with the power of the various States to prescribe regulations governing the safe operation of motor vehicles, but merely to provide for a system under which an automobile registered in the State of its owner's residencs and also by the Federal Govsrnment, shall bave the right to travel over the roads of all other States without the payment of any additional tax. It is urged by the advocates of this legislation that its snactment will not only do away with the present system under which the citizen of one State is subject to vexatious restrictions and taxes by ths various States through which he may wish to travel, but will tend to further the adoption of uniform and reasonable legislation.

In conclusion I would sumbit that there is urgent nesd for a concerted movement by the various automobile clubs and associations to bring their influence to bear on tbe owners of these vehicles, with a view to securing a faithful compliance with the spirit of the laws regulating their uss on the public highways. There is no question but that public sentiment is ths most effective factor in checking dangerous driving, and if automobilists will join in a campaign against reckless speeding, tbey will make it much easier to secure the enactment of fair and liberal legislation on this subject.

Among those who participated in the discussion, following the reading of the stated papers, were Colonel W. D. Sohier of the Massachusetts Highway Commission, who urged the necessity of curbing the reckless operator and putting a stop to driving by intoxicated persons, and Francis Hurtubis, Jr., of Boston.

On a Southern Road Used Where They Haul Cotton.

WHO HAS NEW YORK STATE'S NUMBER ONE?

In view of the fact that the registration in New York State is now close to the 65,000 mark and that much of it has been added in the past year or two, inferring that a very large percentage of the total number of cars represented by this unprecedented figure are still in actual use, more than the usual amount of interest attaches to the fate of the first thousand hangers, and particularly to the now historic Number 1. Who has "N. Y., No. 1?" Likewise, who has "N. Y., No. 13?" Seen going down Broadway either one of them would attract no small following and the speed of its carrier would probably not permit of its too ready escape from the curious. It would be interesting to learn whether the first 1,000 New York hangers are still doing duty in their legitimate field of activity, or whether the majority of them have not found honored places as wall decorations in the homes of their owners. If any of our subscribers happen to be the proud possessors of cars the registry of which was made sufficiently early to come within this limitation, or know of the existence of such cars that are still in active service with their original tags, we should be pleased to learn the make of the car and something of its record. Doubtless a very large proportion of that first thousand cars were of foreign manufacture, and nothing could tell the story of the success of the American manufacturer more strikingly than the changing character of the registration of New York State as it progressed into the thousands and tens of thousands.

GOOD ROADS WORK IN THE SOUTH.

ATHENS, Ga., Nov. 9.—To advance the good roads movement in the South, the State College of Agriculture proposes to hold a good roads school next January in this city. At this time a course of lectures and demonstrations will be givcn for the purpose of instructing those who attend in the best ways of accomplishing the much-needed road improvement in the South. Besides the men from the college, who will deliver lectures, many experts in road construction from all over the country will be here to aid in the good work. People in every section of the State are much interested in the movement, and from the present indications this first attempt will be a complete success.

RUBBER AS A MATERIAL IN PAVEMENT.

Asphalt, alone, as a material for pavement, has its limitations and the wearing qualities of rubber would seem to have value in this connection. This is especially so in view of the fact that a process—used in France—is such that the asphalt and the rubber enter into combination with each other—cold—which combination, on a concrete foundation, is proving to be far more durable than asphalt pavement in the absence of rubber. The asphaltum—reduced to powder—and the rubber, in acceptable form, are suitably combined and applied to the concrete, after a sizing coat, to the desired thickness and rammed.

HOW TO PASS OVER A WATER BREAK.

Water-breaks are still numerous in many parts of the country. If possible, take them straight, at a slow enough rate of speed that the jar is not too great. If they are taken at an angle, the frame will be racked and twisted, loosening things up more than hundreds of miles' running would do. To prove that the twisting of the frame affects the car, raise any wheel so that the tire is six inches off the floor. Then try and turn the motor over with the starting crank. It will be found almost impossible, the twisting of the frame affecting the engine base also and throwing pressure on bearings far in excess of what they should stand.

Some Things Mr. Miltoun Encountered En Route.

IF laws forbidding street obstructions were enforced with half the fervor with which the local bumbles all over the world put the screws on the automobilist for fancied sins of omission and commission there would be considerably more safety for chauffeurs. Not all of us are reckless drivers, nor are most of us heedless of the welfare of others. Sometimes, ofttimes, in fact, it is we—who pay by far the highest taxes ever known for the use of public (sic) highways—who get more than injustice meted out to us all along the line.

France is the land of automobile touring par excellence, as we all know; the land of good roads and good cooks; and how well the two go together only the touring automobilist in France really knows. The following recitals are selected at random from the notes of the writer made during sundry tens of thousands of kilometres of roving up and down la belle France during the past five years.

In The Charente, in the thickly populated west of France, at Pons, a tiny town not marked on every road map, on the direct road from Bordeaux to Paris, the great Route Nationale runs straight through the vaulted substructure of an old-time monastery. It is a safe enough road under most conditions; at other times it is not so safe, as, for instance, when one meets with a throng of peasant folk returning from market. Within the depths of this cavern, on one happy autumn Saturday, we came unawares upon a flock of sheep attended by two dogs and a small boy, three donkey carts and two calves attached by a cord to the hindermost. There was a horrible mix-up, too horrible for words to describe. Our radiator smelt of burnt wool for a long time after, and there was one sheep less in the world, a dog with a lamed paw and a badly scared crowd of donkeys, both of the human and animal genus. Whose fault?

It is a question as to which is the silliest, least responsible, most provoking thing of life, which obstructs the roads which should be free to wheeled traffic—the other kind as well as that which rolls on pneumatics.

Through a flock of half a hundred silly hens, running hither and thither over one of the most used portions of the great highway across Normandy, between Paris and Trouville, the writer caught only one. Again: Whose fault?

"A Valence le Midi commence," was a phrase we had learned by heart out of Daudet's masterpiece, "Tartarin of Tarascon." Valence is a hundred and fifty kilometres north of Tarascon, on the famous road by the Rhône, known of all automobile travelers between the north and the south of France.

We never changed our gears once during the traject, and with thoughts of a real Provençal déjeuner, with the wine of the Rhône, black olives, the "beurre de Provence" and all the rest at the Hotel des Empereurs, we plunged into the heart of Tartarin's birthplace, with no more than the usual care in entering a conventional French town of its class. Before we knew it we were in the midst of a half a hundred café tables and chairs, the occupants fleeing in a horrible fright in all directions.

Tarascon was en fête, and the proprietor of the Café de France in imbecilic fashion had extended his establishment out over the width of the street, almost to the opposite curb. No one was killed, but everybody got a scare—ourselves as bad a one as the rest. Before the dreamy Provençaux could gather themselves together we were off again. We did not eat déjeuner at Tarascon; the better part of valor was to make wheel tracks south and that as speedily as possible. No one was killed, but a score might have been though, through no fault of ours. Whose fault, then, this time, if you please?

The automobilist's mattress is not always made of roses. Moreover, the automobilist is not a murderer by choice—not even of hens and chickens, who are not road users at all; at least, they pay no taxes for the privileges which they so generously make use of. The rest of us do, and so long as the powers that be give us good roads for our money we are content; it is when the country bailiff puts it in his own pocket that we object.

FRANCIS MILTOUN.

THE AUTOMOBILE

AMERICA'S FOREIGN CAR RACE.

Judged from a spectacular point of view, and giving at the same time full credit for the very complete arrangements in its carrying out, the foreign car race at Savannah, known as the Grand Prize of America, was the best event of an automobile racing character ever seen in this country. Furthermore, one well known expert who has been at all the European contests is authority for the statement that he has never seen anything as good on the other side, where there may have been larger fields and greater financial returns, but less thoroughness in management and intensity in the struggle itself.

The event at Savannah was third in a series which began at Dieppe, was renewed at Bologna, and concluded on American soil. France lost to Germany in the first race, succumbed to Italy in the second, and now the Italians have again taken the honors in the third motor battle. Opinions differ as to whether the race at Savannah was either necessary or logical. It would not have taken place if the Automobile Club of France had not supported the Automobile Club of America in the latter's contention with the American Automobile Association. There were several speed races in Europe this year which did not observe the much mentioned Ostend rules. Apparently any substitution thereof for these rules was wrong in America. Might often is a deciding factor these days. The big club of France may be sorry now that it made Savannah possible.

However, Savannah rose to the occasion in grand style, and, profiting by the stock car racing of last March under A. A. A. auspices, it left absolutely nothing to be desired within its physical and road limitations in supplying a perfect course and as perfect guarding. All that remained for the A. C. A. was to bring on its show, and the talent included fourteen of the best foreign cars and drivers, with six American starters to complete the score demanded by Georgia's enterprising city. The race was costly both to the city and to the club, but Savannah considers that it received profitable advertising in plenty and the club preserved its "foreign prestige." And those present saw a magnificent racing spectacle.

In furthering the selling of cars, the value of the event is problematical, and whatever the amount in advertising, it will figure mostly in the "general results" column. The winning importer may "cash in" his outlay and some more besides. The others may say that racing does not pay.

The futility of American makers engaged in such racing, with hurried and inadequate preparation, was never more glaringly demonstrated. They injure themselves, and the American industry as a whole loses in reputation. If a thing is worth doing at all, it is worth doing well. If we will take the time and devote ourselves conscientiously to the task, we can hold our own and share the honors in racing. But let us hereafter remain beside the road when we have not the time to get fit.

* * *

SPIDER WEAVES HIS WEB TO NO PURPOSE.

When the ordinary grades of steel to be had for automobile construction failed to satisfy the needs of the occasion, the demand was for finer products, which the fabricators of the same promptly offered, not forgetting to charge a most unholy price. No sooner did they get used to the idea of the high price and the smell of quality necessary to accompany it than they were shocked at the lack of appreciation of automobile engineers, who promptly evolved a plan by means of which they were enabled to utilize the cheaper grades of steel, inducing in them at will the qualities required.

The heat treatment of steel is not new, nor did automobile engineers do more than bring it to the high state of perfection that now enables them to impart to the steel they use the several qualities demanded for the respective parts. By suitable manipulation it became possible to render the steel hard or soft, ductile or dynamic, and, in diverse ways, exactly in accord and with the most precise requirements.

The same method of bringing the structure of the steel up to the especial requirements, in view of the work to be encountered, possesses the virtue of lending itself to the plan, in that the heat treatment is an after process, so that the steel at first can be fashioned into the required shape (in its soft state), and it can then be rendered fit, even though the requirement is for glass hard surfaces over a highly kinetic core. Users of automobiles are benefited materially by the process, since they are afforded initially sound and serviceable parts at a low first cost. Better yet, the cost of replacement is very low indeed. The coming of the automobile was the signal for a display of the potentiality of mind over matter.

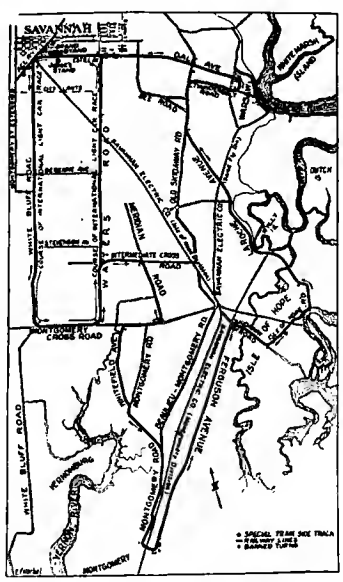
GOSSIP OF THE RACE

Fournier, the Well-Remembered Paris-Berlin Winner, Whose Itala Finished Just Outside the Prize Money.

Among Those Present.—The trade was generously represented at Savannah, and the list included the following: George P. Tangeman and C. H. Tangeman, of the Hol-Tan Company; Alfred Reeves, general manager of the A. M. C. M. A.; Paul LaCroix, Renault Frères branch; Lee Counselman and C. H. Page, Chalmers-Detroit Company; R. H. Johnston, Lewis S. Masuay and Secretary A. R. Warner, White Company; Benjamin Briscoe, F. D. Dorman, F. J. Tyler, Messrs. Monroe & Denzer, the Buffalo agents, Commodore McCloud and Gabriel Cheiro, the Detroit agent, Maxwell-Briscoe Motor Company; Horace DeLisser, Ajax-Grieb Tire Company; L. D. Rockwell, Standard Welding Company; E. V. Hartford, Hartford Suspension Company; Ned Broadwell, Fisk Tire Company; Guy Vaughan, F. B. Stearns Company; E. S. Partridge and A. W. Church, Wyckoff, Church & Partridge; H. A. Lozier, C. W. Mead, C. A. Emise, John G. Perrin, Lozier Motor Car Company; M. Hauvette-Michelin, nephew of M. Michelin, and J. C. Matlack, of the American Michelin factory, Milltown, N. J.; William Mitchell Lewis and James Gilson, Mitchell Motor Car Company; Alexander Dow, Dow Tire Company; J. Frank Eveland, New York agent of Stevens-Duryea; W. B. Hurlburt and C. R. Teaboldt, Garford Motor Car Company; Egbert Lillie, Itala Import Company; Clare M. Hamilton, Isotta Import Company; J. S. Josephs, Fiat Import Company; Andre De Magnin, Panhard & Levassor Import Company; William DuCros, Dunlop Tire Company.

A. C. A. Steamer Party.—The *City of Savannah*, of the Savannah Line, which had been chartered by the Automobile Club of America, had a memorable, happy, and some say hilarious voyage. The ship sailed from New York on Saturday evening and reached the entrance to the harbor early Tuesday morning, but did not dock until that afternoon, having been held up by fog at the mouth of the Savannah river. The following evening the clubmen gave a largely attended reception to Savannahians. The ship was trimmed with lanterns and the deck given over to dancing. A speech of welcome was made by Mayor Tiedeman, to which Winthrop E. Scarritt, a former president of the club, responded with appropriate eloquence. The *City of Savannah* sailed out of the river at 9 o'clock Saturday morning and docked in New York on Sunday at 2:45 P.M. The ship's hold was filled with touring cars belonging to the members aboard.

Maxwell-Briscoe Ladled Out Shrimp Soup.—Among the social functions of race week was a supper given to the newspaper men at the Casino, at Thunderbolt, by Carl W. Kelsey, manager of the Maxwell "mosquito fleet," in behalf of the Maxwell-Briscoe Motor Company. Shrimp soup, fried hominy, and other Southern dishes were forthcoming to tickle Northern palates. The souvenirs were miniature steins. Frank T. Battey, president of the Savannah Automobile Club, was by common consent installed as the guest of honor. He jollied and was jollied, you may rest assured, to beat the band. Kelsey modestly promised that the "mosquito fleet" would be running at the finish, and made good, and landed two of the little cars near enough to be timed before the race was closed.



Map of the Course.

Waldon Still Enjoys Racing.—While it is a fact that the Packard Motor Car Company hasn't been interested in racing for some time, S. D. Waldon, its sales manager, seldom misses a big contest, and, of course, he was present at Savannah. It may have been forgotten by many that once upon a time the Packard Company had a racing craft called the *Gray Wolf*, designed by Charles Schmidt, a former comrade of Fournier. This craft in the early days of the Ormond-Daytona racing journeyed to the Florida beach, where it accomplished a mile in 46 2-5, which at that time was only 2-5 of a second lower than the world's record held by Augieres with a Mors car over twice the horsepower of the *Gray Wolf*. Mr. Waldon was in charge of that record breaking expedition.

Winning Lancia Used Continentals.—In the light car race the Lancia was the only car equipped with Continental tires. According to one story that was current before the race, Hilliard sent for J. R. Cothran, the Continental representative at Savannah, and asked him to wire Joseph Gilbert, the American manager, asking that the arrangement for prizes be changed so that only one prize of $500 be given and that for first position. "I intend to win the race, not run second or third," said Hilliard. The request to New York was granted by Mr. Gilbert, and the result was that Hilliard received $200 more from the tire company than would have been the case under the original offer.

Special Trains to the Race.—Excursion trains were run from New York on several lines. Noteworthy among them was the "Wall Street Special," promoted by Mills & Moore, who, the passengers say, made good their promise that it should be a veritable "train de luxe." It left Savannah after the race and landed its passengers in New York early Friday evening. Its success was so pronounced that its promoters have announced their intention of running these trains de luxe to all big motoring functions, beginning with the proposed Cuban race in January.

"Van" Had a Narrow Escape.—The night before the light car race N. H. Van Sicklen, who did much to make the Savan-

nah races of March last a success, had a narrow escape at the hands of an amateur owner from Augusta. The latter crossed to the wrong side of the road at an "S" turn and there was a head-on collision with Van's Jackrabbit, which left the latter minus front wheels and with other marks of the encounter. Luckily no one was injured, though both cars were badly wrecked. The accident happened in the dusk of early evening.

Absence of "Herb" Lytle was Noted.—There were many inquiries for "Herb" Lytle, whose driving of the Apperson at the March meeting was well remembered. The information was current to the effect that the popular driver was suffering from typhoid fever, supposed to have been caused by a bad mess of oysters, eaten at a well-known New York hotel. Several others of the same party similarly became ill. The latest from Toledo, O., is that Lytle has had a relapse and is threatened with pneumonia, and that his condition is far from encouraging from the physician's point of view. He has the wishes of a host of friends for a speedy return to health.

Said the Savannah Press: "To each and every one of the thousands of strangers who are, and will be, within out gates to-day and to-morrow Savannah bids a hearty Welcome to Our City! Some of the visitors are distinguished and many more are not; some are rich, but the majority could not with propriety be placed into that category. But the welcome to everybody, without reference to Bradstreet rating, is sincere and hearty. Savannah is mightily pleased to have all of these people visit her, and she will do everything in her power to make their stay agreeable."

The Foreign Delegates.—Chevalier Coltelletti was the only real special delegate from abroad, and he represented the Automobile Club of Italy. George E. McQuesten, a Bostonian, who is a member of the Royal Automobile Club, figured as the British delegate. Charles Raoul Duval, who is connected with the importing of a French car, was the authorized delegate of the Automobile Club of France. Apparently, Pontus Lindstrom. the delegate from Sweden, did not appear on the scene, nor did any one come to represent Germany.

Big Betting with the "Bookies."—Betting on the race was frankly carried on in the De Soto lobby and on the grandstand. Tod Sloan, the jockey, and Kid McCoy, the pugilist; Fellowes & Company, and other bookmakers were on hand and made books well up in the thousands. The Fellowes book was in combination with another big book run at one of the prominent "Rialto" hotels. The Lancia was favorite for the light car race, and Hemery for the Grand Prize, Nazzaro and Wagner ruling as second choices at 4 to 1.

From New Orleans to Savannah.—There was a notable display of touring cars in the parking spaces at the grandstand. Several hundred cars were driven over the roads. The distinction of having driven the furthest and over the most difficult roads to attend the races belonged to R. D. Lambert, who drove in his 30-horsepower White steamer from New Orleans, a distance of 1,150 miles. Mr. Lambert was eight days on the road, and almost all of the journey being through deep sand or heavy clay roads for which the intervening distance is noted.

What the Michelin Man Says.—F. W. Libby, of the Michelin Tire Company, is quoted as follows: "In the light car race four out of the first five used Michelin tires. In the Grand Prize the first four cars used Michelins, as did seven out of the nine that finished. We are pleased, but not exalted. Our tires do their work. People learn that there must be a reason behind a tire that continually carries the greatest cars and drivers to victory in the world's greatest contests."

Henry Ford Still Keen on Racing.—Ever since he built the "999" Henry Ford has retained his interest in racing, though he says that it interferes sadly with the regular routine of a big establishment. "If we get caught up on orders," said he at Savannah, "we may yet build a racing car, despite the fact that it disarranges factory routine to an alarming degree."

Vanderbilt Winner Was An Onlooker.—One of the most interested observers of the race was George Robertson, who won this year's Vanderbilt race, driving the 120-horsepower Locomobile. Robertson was to have been in the light car contest, but, unfortunately, the Gregoire arrived in such condition as to make its starting impossible.

Banquetted at Café Martin.—Joseph S. Josephs, president, and E. Rand Hollander, general manager, of the Fiat Automobile Company, at the Café Martin gave a banquet last night to Wagner, Nazzaro and De Palma, who had the mounts on the Grand Prize Fiats. The other foreign drivers in town were also invited.

Lubricating the Lancia.—Nowadays the interest concerning a winning car seems to include almost everything connected with it. Therefore, the G. A. Hawes Company, makers of Panhard cylinder oil, are priding themselves upon the fact that the Lancia car used Panhard oil.

Chairman of the Vanderbilt Commission Was An Official.—Jefferson deMont Thompson, chairman of the A. A. A. Racing Board and Vanderbilt Cup Commission, was among those present, which also included Robert Graves, another well-known member of the commission.

Lubricating the Grand Prize Cars.—Seven of the nine cars, including the winning Fiat, that finished in the Grand Prize race used Monogram oil. Mr. Stow, a representative of the Columbia Lubricants Company, of New York, is the authority for the statistics.

Clubs Had Latch Keys Out.—The Oglethorpe, the Hussars and other clubs had their latch keys out for all visitors ready and eager at all times to give the Northerners a taste of Southern hospitality in most palatable and quenching form.

Donlin Made a Hit.—W. J. Donlin, secretary of the Chamber of Commerce, who was Savannah's press guardian, was on his job to such good purpose that he sent away every newspaper man an enthusiastic press agent for Savannah.

"Joe" Tracy Saw the Race.—One of the most interested spectators was Joe Tracy, the former Locomobile pilot of the 1906 Vanderbilt race.

How Jervis Puts It.—This is his comment: "At Savannah the trees are moss-grown, but the citizens appear very far from being moss-backs."

A. A. A. NOW HAS 187 CLUBS AND 20,000 MEMBERS

THE sixth annual meeting of the directors of the American Automobile Association was held at national headquarters, 437 Fifth avenue, New York, Monday. The morning session was of the outgoing directors, the afternoon, a preliminary meeting of the new board recently elected which took office Wednesday. Both sessions were largely attended, that in the afternoon being notable for the presence of nearly forty directors, representing as many clubs. Both sessions were presided over by President W. H. Hotchkiss. The annual reports of the officers were filed and considered and many detail matters disposed of.

The more important matters considered were those suggested by a conference of directors and State officers held at national headquarters November 20 and 21. At this conference there was also a large attendance, representatives being there from no less than twelve State associations and through such State associations, about 100 clubs. The more important matters suggested by this conference, the results of whose deliberations were quite generally approved by the board of directors, were the following:

No More Sanctioning of Racing on "Horse Tracks."

After two years of agitation within the Association, the following resolutions were emphatically and unanimously adopted:

Whereas, Automobile speed contests on circular tracks built for horse racing has ceased to serve any useful purpose; and

Whereas, Such contests do not have the approval of the general public or any considerable portion thereof; be it

Resolved, That speed contests by automobiles on circular tracks built for horse racing and of a mile or less in length be condemned by this association; and be it

Resolved, That hereafter this association have nothing whatever to do with such contests.

It was voted to begin as soon as possible the publication of a monthly official journal similar to those issued by corresponding bodies in other nations, and the publication of such journal was placed in the hands of a temporary committee.

The report filed by Secretary Elliott brought out some interesting statistics, particularly with regard to automobile contests and the spread of the national idea represented by the American Automobile Association. During the past year but twenty-four sanctions for track meets were granted by the Racing Board as against fifty-two in 1907; while on the other hand, twenty sanctions were granted for hill climbs as against five the year preceding.

Growth of the Membership.

In the matter of membership, the national body now has 25 State associations as against sixteen a year ago, and 187 clubs as against 132 then, while the official membership of its present clubs was then about 17,000 and is now upwards of 20,000.

Practically all of the Northern States, with the exception of Maine, New Hampshire, and Iowa are now federated into State associations; similar associations exist in California, Colorado, and Oklahoma, while movements looking to State bodies are already under way in Iowa, Arkansas, Montana, North and South Dakota, Washington, Oregon, Louisiana, and several of the other States. A notable fact is the growth of some of the more important clubs, that of Buffalo having increased from 1150 to 1501 members; the New Jersey Automobile & Motor Club of Newark from 640 to 1450; the Philadelphia Automobile Club from 400 to 800; the Automobile Club of Kansas City from 320 to 520; the Automobile Club of Southern California from 330 to over 500; the Automobile Club of Minneapolis from 400 to 580; and the Springfield (Mass.) A. C. from 150 to 300.

Included in the Report of President Hotchkiss.

In the course of his very interesting report, President Hotchkiss supplies the following information concerning the work of the association:

THE NATIONAL IDEA.—The notable feature of the year's work is the growth and strength of the national idea. During the first years of the association's history, the sport governing function was prominent, and, as most sporting events were in the neighborhood of New York and the association did little to stimulate the interest of clubs outside of that territory, the national idea was not brought out. It was not then fully appreciated that in the United States one club and one neighborhood could not control or dictate. This is now understood and appreciated even in the so-called metropolitan district. In the nature of things, national headquarters should, for a time, be located in New York, but any policy which recognizes conditions in New York as controlling upon the affairs of motordom in all of the States, territories and federal districts of the Union will inevitably fail. In this connection, I quote from the monthly bulletin for November of the Automobile Club of Philadelphia.

"A word now to the motor user: As an individual, you cannot bring about the result you want, nor yet as a local club, nor as a single State federation. You must combine nationally—the man into the local club, that club into a State body, and this, in turn, into a compact national organization. * * * The above tells you the reason for the existence of this club, the Pennsylvania Motor Federation and the American Automobile Association. No single club, local or State, can do this work in the American spirit; it must be a representative body, reflecting the will and action of the local movement everywhere." This is the national idea!

LEGISLATIVE BOARD.—The work of this board has been splendidly done, largely because of the efficient service of its chairman, Mr. Terry. Indeed, when federal registration shall have become an accomplished fact, to him will belong the credit. It is currently reported that the members of the Judiciary Committee at Washington frankly admitted that no bill was ever argued before them with more ability and cleverness than was the federal registration bill by Mr. Terry last March.

GOOD ROADS BOARD.—The work of this board was largely in connection with the convention at Buffalo. That it was well done cannot be questioned. It resulted in the appointment of a national committee, representing all the cooperating bodies, to which was committed the convention of next year. Such convention will thus be largely in our hands, through the good roads board. Work should be begun at once, and the convention held in the summer or fall. I cannot too strongly comment on the very efficient work of Chairman Hooper of this board.

The meeting was protracted and there was an animated discussion of many matters of vital interest to American motordom. This discussion will be continued at later meetings this week.

Hotchkiss Consents to Serve Again.

At the adjourned meeting of the board of directors, held Wednesday afternoon, the following officers were elected for the ensuing year: President, Wm. H. Hotchkiss, Buffalo, N. Y.; first vice-president, L. R. Speare, Boston, Mass.; second vice-president, Ira M. Cobe, Chicago, Ill.; third vice-president, Frank M. Joyce, Minneapolis, Minn.; treasurer, H. A. Bonnell, East Orange, N. J.; secretary, F. H. Elliott, New York.

President Hotchkiss immediately announced the appointment of the following chairmen of boards: Legislative, Charles T. Terry, New York; Good Roads, C. Gordon Neff, Cincinnati; Contest, Frank B. Hower, Buffalo; Touring Information Board, Powell C. Evans, Philadelphia. The Racing Board was abolished and its functions vested in the Contest Board.

The following executive committee, in addition to the president, first vice-president, secretary, treasurer, and board chairmen, was named: S. A. Miles, New York; H. O. Smith, Indianapolis, Ind.; Wm. E. Metzger, Detroit, Mich.; Oliver A. Quayle, Albany, N. Y.; Paul C. Wolff, Pittsburg, Pa.; W. C. Crosby, East Orange, N. J.; Jas. T. Drought, Milwaukee, Wis.; C. H. Gillette, Hartford, Conn.; Frank G. Webb, Brooklyn, N. Y.; Frank M. Joyce, Minneapolis, Minn.; J. P. Coghlin, Worcester, Mass.; L. E. Myers, Chicago, Ill.; Edwin S. George, Detroit, Mich.; John Bancroft, Wilmington, Del.; L. J. Powers, Jr., Springfield, Mass.; H. M. Rowe, Baltimore, Md.

The first three named were officially designated by the National Association of Automobile Manufacturers at its executive committee meeting held Wednesday to serve on the A. A. A. hereafter. This action on the part of the national body of manufacturers indicates co-operation between the two bodies that should have notable results.

O. P. Fritchie and His Long Distance Electric.

RECORD-BREAKING TRIP IN AN ELECTRIC.

In order to demonstrate what his electric car was capable of, Oliver P. Fritchie, president of the Fritchie Automobile and Battery Company, of Denver, Col., started from Lincoln, Neb., November 2, and reached New York City on Saturday last, having been but 28 days on the road. Of this period only 20 days were given up to traveling, the remainder of the time being spent in Chicago, Pittsburg and other towns along the route, so that the car averaged 90 miles a day for the 1,800-mile run, coming over the A. A. A. tour route from Pittsburg to Philadelphia and New York. On Wednesday last, Mr. Fritchie left New York for Washington, D. C., where he intends to establish an agency; he is also seeking to locate a factory site somewhere in the East. Later in the season he will drive the same car to Chicago for the show there.

The car in which the long trip was so successfully made is an electric victoria of the Fritchie company's make and is geared for a maximum speed of 19 miles an hour, while it is capable of traveling 100 miles on a single charge of the batteries, though its longest day's run was 125 miles, after leaving Toledo. The shortest day's run was in the blue clay mud of Iowa through which only 45 miles could be accomplished. The car was equipped with Goodyear tires and suffered no tire troubles on the run. Though the trip demonstrates the worth of the car, it is not to be inferred that the electric is a touring vehicle, for according to Mr. Fritchie only an electrician could make headway, as at many towns he had to do all the work himself. Mr. Fritchie was accompanied by Mr. Pfaff of his firm.

PACKARD ESTABLISHES AN AUTO SCHOOL.

DETROIT, Nov. 30.—In order to help local owners of Packards to a better understanding of the construction of their cars and the proper methods of handling and maintenance, the Packard Motor Car Company has established an owners' school which has now been holding weekly sessions each Tuesday night out at the plant. Last week the opportunity was taken of showing the pupils the working of a large automobile building plant at night, as the Packard factory has been running overtime full blast, employing its entire personnel of 3,100 men. The occasion was of considerable more interest under electric light than would have been the case in the daytime. Passing through each department, E. B. Finch, manager of the Technical department of the company, who is acting as instructor, gave his class impromptu lessons in construction and assembly, taking as his models the parts and cars in the various stages of completion as found in the different departments visited. The class has increased at each session and now includes two score of Detroit's most prominent citizens. The course includes a detailed description of the Packard car and its workings, with many digressions into other lines concerning the practical operation of automobiles.

DRAWING FOR THE BRESLIN SHOW SPACES.

Local branch managers and agents of cars to be exhibited at the Madison Square Garden and Grand Central Palace shows were entertained at the Hotel Breslin on Tuesday afternoon, incidental to the usual drawing for the privilege of placing a car on exhibition in the Breslin during each of the shows. Representatives of the A. L. A. M. and the A. M. C. M. A. cars both had a drawing. The former was won by E. W. Heddington, for the Haynes, and the latter by Emerson Brooks, for the Pennsylvania. Walter E. Hildreth, the Breslin manager, welcomed the guests. Brief speeches between courses were made by C. F. Clarkson, of the A. L. A. M.; Alfred Reeves, of the A. M. C. M. A.; Victor Breyer, of L'Auto; E. E. Schwarzkopf, president of the Flat Tire Club; R. B. Johnson, of the New York *Sun*, and A. G. Batchelder. John C. Wetmore acted as toastmaster.

These were the trade representatives present who participated in the drawings: A. B. Cordner and W. H. Flinn, Acme; E. W. Heddington, Haynes; W. K. Carrutbers, Mitchell; C. Trewin, Welch; H. U. Kibbe, Renault; Richard Newton, Stoddard-Dayton; A. J. Picard, Stearns; E. W. Nicholson, Midland; C. M. Hamilton, Isotta; Frank Eveland, Stevens-Duryea; H. R. Mallow, De Luxe; Harry Fosdick, Lancia; LeRoy Moody, Allen-Kingston; C. W. Bennett, White; W. J. Lasher, E-M-F; C. F. Redden, Studebaker; H. W. Nuckols, Columbia; Emerson Brooks, Quinby; Herbert Strong, Pennsylvania; C. H. Page, Chalmers; J. A. Clark, Peerless, and D. C. Fenner, Knox.

GARDEN DECORATIONS PROCEEDING APACE.

Under the direction of W. V. Knowles, architect in charge of the decorations that are to transform Madison Square Garden on the occasion of the Ninth Annual Automobile Show to be held there January 16-23, under the auspices of the Association of Licensed Automobile Manufacturers, the work on the huge triumphal arch is now being carried ahead rapidly. This enormous piece of staff construction is to have a span of 48 feet and will stand 87 feet high. It will be erected at the rear, or Fourth avenue end of the Garden, resting on four Roman-Corinthian capitals and will form the *piece dè resistance* of the decorative scheme. These columns measure 3 feet 6 inches in diameter, and one-fourth of them will be embedded in the arch itself, the remainder standing out in relief. Between the columns will be three bays, their arches being just beneath the cornice, while their bases will be at the balcony rail. In these bays will be massive plate glass mirrors, the center one measuring 20 feet in width, while the side glasses will be but one foot smaller. The arch will be a background for the Garden's decorative scheme.

Massive Triumphal Arch for Madison Squa

FRENCH SALON IS NOW OPEN.

PARIS, Nov. 28.—The Automobile Salon in tbe Grand Palais this morning was opened by President Fallières, which substantially indicated the continued great interest in the industry. In an interview, just after tbe opening of the show, the French expert, L. Auscher, expressed himself in glowing terms.

M. Auscher seems to be favorably impressed with "Knigbt" motor, the latest novelty in France, and he points out that in tbis motor the valves (of the conventional sort) are done away with. The valvegear is also out of the way, and there are no more springs, nor bolts, pusbing on stems. The noise of seating valves is done away with, and, in fine, the Frencb Knigbt motor is regarded by bim as something to take notice of. It is pointed out that there is yet the commercial try-out to be considered, and while the motor looks good, the practical demonstration may be relied upon to tell the tale. The "shaft drive" is much in evidence, and to the despair of "side-chains." The taxicab has assumed very great importance, and is now regarded as a regular product by all the makers of importance. Commercial automobiles are being exploited at some length, and the future of the commercial, in France, is most promising. Nearly every maker of any note has evolved a light type of car, and the future of the industry, in France, at any rate, will depend largely upon the success of the light automobile.

IMPORTERS WANT DUTY REDUCED.

WASHINGTON, Nov. 27.—Automobile importers sent Charles H Sherrill, lawyer, to lay some facts and arguments before the Ways and Means Committee to-day in favor of reducing the duty on automobiles from 45 to 30 per cent. The rate recommended was presumably to represent the difference in the wages of workingmen abroad and at home in the automobile factories.

The committee learned from Mr. Sherrill that only the skeletons of tbe running part of automobiles were imported, all tbe rest of the machine, including many of the castings, being made in this country. In this respect be thought automobile importers were different from all other importers, being indirectly large employers of American labor.

A machine used as an example was the Italian Fiat that sells here for $6,000. It costs $1,600 plus the duty laid down in New York, and the importers spend $2,600 on it here in getting it ready for the road. Fifteen per cent. of the selling price went to the sales agent and the difference was the gross profit of the importer. Mr. Sherrill started to give accounts of the importers expenses out of that when Mr. Clark interrupted to say:

"You better stop figuring or you will put the importer in a bole."

The profits of the American manufacturer were fixed by a trust, Mr. Sherrill said, and were unreasonable. All but three concerns wbich made cbeap cars belonged to the combine, which dictated the price of all parts and the price at which the machine should be sold at retail. He thought revenues would be greatly increased by decreasing tbe duty.

Chairman Payne announced that none of the manufacturers of automobiles had applied for a hearing.

INDIANA ROAD ENTHUSIASTS ORGANIZE.

INDIANAPOLIS, IND., Nov. 30.—At a mass meeting, attended by good roads enthusiasts from all parts of Indiana, a permanent organization of the Indiana Bureau for Good Roads was formed at the Board of Trade Building last Tuesday night. The following officers were elected: R. A. Brown, 614 Indiana Pythian Building, president; George C. Pyle, vice-president; J. C. Crabill, 1609 Bellefontaine street, secretary, and F. I. Willis, 115 West Market street, treasurer.

[ROYAL MOTOR CAR CO. RECEIVER DISMISSED.

CLEVELAND, Dec. 3.—Tbe receiver of the Royal Motor Car Company has been dismissed and a new organization has been effected, which will immediately get under way.

THE CHAUFFEURS OF WILKES-BARRE, PA.

WILKES-BARRE, Pa., Nov. 30.—About fifty of tbe regularly employed automobile drivers of Luzerne County left on one big "joy ride" last week when the Chauffeurs' Club of Wilkes-Barre was started out on a "test." The start was made from room 45 of the Simon Long Building, whicb has been elaborately furnished by the members, who bope some day to be in the hall of fame with Robertson, Strang, Haupt and the other notables.

When the chairman called the meeting to order, all the "cut outs" were ordered closed, and as a result everything operated quietly. After adopting a constitution and by-laws, George Kessler was elected to preside at the wbeel. William Miller, employed by F. M. Kirby, was selected as the first driver behind the pilot, and Ralph Wolfe was chosen as general mechanician, with orders to look after everything for a year. Archie Roberts was given care of the funds and from the amount collected at the outset it is not likely the members will have to journey on "flat tires." To see that the road is kept clear for at least a year, Edward Brown, Joseph Doty, and John Zorzi were selected as a board of governors, while Isaac La France, John Cavanaugh, and Harry Richards were chosen as a membership committee to look after the "entry list." In appreciation for his services in assisting with the organization, Arthur A. Casper, a local car owner, was made honorary president.

MICHELIN AT WAR WITH A. G. A.

PARIS, Nov. 30.—Michelin is at war again with the Association Generale Automobile. This offshoot of the Automobile Club of France sells tires, automobile sundries, etc., to its members at the price they are usually delivered to dealers. Michelin objects to this, declaring that the Association is robbing legitimate traders of business by giving to rich automobile owners a commisson that rightly belongs to the dealer. Further the Association pays no trading tax, and is therefore robbing the State as well as the supply man.

The case is now before tbe Tribunal de Commerce at Paris, Michelin claiming an injunction stopping the trading of the Association, an indemnity of $40,000, and insertions in the newspapers. The defense of the Association is that the Tribnnal is not competent to judge the case, for it has been recognized by the revenue authorities, after a thorough examination of their books, that they are not a trading body. They declare that they do not sell direct to their members, but transmit all orders received by them to an agent who, for special reasons, is able to give a discount of 5 per cent. on tbe Michelin product.

There is no doubt that a certain amount of harm is done to agents by the system of giving discounts to members as practised by the Association Generale and other bodies. The point is whether such discounts are legal, and herein lies the importance of the case. Judgment has not yet been pronounced.

EVENTS SCHEDULED FOR PALACE SHOW WEEK.

In connection with the Grand Palace show, opening New Year's eve, the American Motor Car Manufacturers' Association announces the following schedule of special nights and meetings:

Thursday, Decembsr 31—3 P.M.—Private view of automobile show; Meeting, Executive Committee, New York Automobile Trade Association, 8 P.M., "Gala Night"; 10 A.M. Meeting, Show Committee, A. M. C. M. A.

Friday, January 1.—Army and Navy night.

Saturday, January 2.—Studente' night; 10:30 P.M., Show smoker to visiting motorists and dealers at A. C. A. Clubhouse.

Mondsy, January 4—2 P.M.—Executive Committee meeting, American Automobile Association; "Engineers' Night."

Tuesday, January 5—10 A.M.—Executive Committee meeting, National Retail Automobile Dealers' Association; "Society Night"; 4 P.M., meeting Board of Governore, Automobile Club of America; 1 P.M., Show luncheon to exhibitors by A. M. C. M. A., Hotel Manhattan; meeting, Society of Automobile Engineers.

Wednesday, January 6—10 A.M.—Meeting of Committee of Management, A. M. C. M. A.; 8 P.M., meeting Board of Directors, Importers Automobile Salon; Executive Committee meeting, Motor and Accessory Manufacturers; "Merchants' Night."

Factories of the Ajax-Grieb Rubber Company, at Trenton, N. J.

Carriage Dealers Invited to Palace Show.—At the request of a number of prominent carriage dealers who are selling automobiles in connection with their horse-drawn vehicles, the show committee of the American Motor Car Manufacturers' Association has decided to send an invitation to a selected list of 2,200 carriage dealers, each having a capital of $50,000 or more, requesting their presence at the big exhibition, which will open at Grand Central Palace, New York City, on New Year's Eve. Upon presenting the invitation each dealer will be provided with a badge giving him all the privileges of the show. This preferred list of carriage dealers, numbering 2,200, all enjoying the wide acquaintance of a wealthy buying public, and with their salesrooms and repair shops, should make excellent agents for automobiles and accessories. They are taking up with the auto very fast, and it is believed that the decision of the show committee to give them the recognition they deserve will bring the largest number of dealers that has ever attended a motor car exhibition.

Life of an Automobile.—Sales Manager Charles B. Shanks, of the F. B. Stearns Company, of Cleveland, who is reputed somewhat of a statistician among his newspaper friends, has figured out that the average life of an automobile is just about five years. Possibly the Stearns hustler bases his computations from the public motor car statistics made up by the fatherland of automobiling—France—where they figure from 1903, when there were 12,984 registered motor cars in that country, and when 6,900 cars were manufactured and 350 imported. At the end of 1903, however, there were only 17,107 automobiles, against the 23,234 that there would have been had all of them remained in service. By taking similar comparisons for the following years the estimate of 4.99 years as the average period of usefulness for an automobile was evolved, a period that will probably lengthen as the industry advances.

Peerless to Have New York Branch Building.—The Peerless Motor Car Company is to join the ranks of the prominent automobile concerns doing business on upper Broadway, New York City. Title has been taken to an "L" shaped parcel of property with a frontage of 70 feet on Broadway abutting that of the Baptist Tabernacle of Fifty-sixth street, and 25 feet on Fifty-seventh street. An eight-story fireproof building will be erected thereon, and the building will be ready for occupancy in time to look after the Fall trade of 1909. E. H. Parkhurst, vice-president of the Peerless Motor Car Co., in speaking of the decision to build a branch on Broadway, said that the move had been made necessary by the great increase of Peerless business in the Metropolitan district.

Private Railway at Franklin Factory.—It takes three-quarters of a mile of industrial railway to provide for the quick and easy transportation of materials among the many buildings at the plant of the H. H. Franklin Mfg. Co., at Syracuse, N. Y. With a product of the bulk of automobiles, made up of so many parts, intra-factory transportation is a problem, but it has been solved by this railway, which has now been in use long enough to demonstrate its continued utility. Everywhere about the grounds and in and out of the buildings the cars run on narrow tracks. Convenient switches at intersections make trips between buildings possible without wide detours. The cars run so easily that they are pushed without difficulty by a workman.

Moon Tour of the Great Southwest.—Henry C. Merrill, touring salesman for the Moon Motor Car Company of St. Louis, who is making a two months' tour of the Southwest in a Moon car, has arrived at Oklahoma City. Besides many smaller cities on his way, he will pass through Dallas, Fort Worth, Galveston and Houston, Texas, and New Orleans. The tour is significant of the confidence of the makers of the Moon in its capabilities, as the territory in question presents many obstacles to automobile travel, the roads being little more than a name. As Mr. Merrill is calling on present and future agents, they will have it brought home to them by visible means what the car can do under adverse conditions.

Proposed National Organization of Chauffeurs.—During the time of the Chicago automobile show it is proposed to form a national organization of chauffeurs. The subject was broached by the Professional Chauffeurs' Association of Louisville, Ky., shortly before the last Chicago show, and has been simmering since. President James B. Smith, of the Professional Chauffeurs' Club of America, has been in correspondence with the National Association of Automobile Manufacturers, and the result has been a determination to call a convention during the Chicago show, the date selected being February 12. The meeting will be held in one of the rooms of the First Regiment Armory.

Fire Caused No Interruption.—Although the fire at the plant of the Syracuse Aluminum and Bronze Company, Syracuse, N. Y., November 17, at one time threatened the factory with total destruction, prompt action confined the loss entirely to the office. The foundry was running in the afternoon, and the next day the entire force was at work, and has been ever since. There was practically no interruption to the business except considerable inconvenience in the office, due to loss of records, etc. All the patterns were removed to a place of safety during the fire. It has been reported that the entire plant was burned to the ground, but this was certainly not the case.

Maxwells for the Foreign Markets.—The purpose of the European trip of J. D. Maxwell, vice-president of the Maxwell-Briscoe Motor Company, is reported to be that of studying foreign trade conditions with a view of exporting Maxwell cars during 1910. After making himself conversant with the requirements of the European market, Mr. Maxwell will proceed to Mexico and South American countries, where trade conditions are favorable. In connection with this report, the fact that the Maxwell-Briscoe Company contemplates the erection of a fourth factory near San Francisco, assumes an important aspect.

Packard at Top of List.—An interesting story is told by the registration of different makes of automobiles which have been driven by tourists stooping at Summer hotels in the mountain regions. There were 1,159 automobiles at the Mount Washington garage, Bretton Woods, N. H., during the past season. Eighty-six different makes were represented. Of all these cars, 231, or 20 per cent.. were Packards. The next greatest number of cars of any one make was 126. The result of the count last year was similar, the Packard being ahead of the next make of car at Bretton Woods during the 1907 season.

Racine Auto Body Plant Enlarged.—Increased volume in its limousine, taxicab, and coupé body business, in addition to its output of the regular open types, has made it necessary for the Racine Manufacturing Company to again enlarge its plant. Two large four-story brick buildings are oow ready for occupancy, and foundations are being laid for a third one. The company is purchasing available property adjacent to the factory, with a view of further increasing its manufacturing facilities.

General Bell Buys a White.—The White Company has sold to General J. Franklin Bell, chief of staff of the War Department, a 20-horsepower limousine White steamer. Several White steamers have been owned by the War Department since 1905, and General Bell has had at his disposal the official records covering the cost of up-keep and other features of operation. In view of General Bell's recent purchase, these records were undoubtedly satisfactory.

Splitdorf Display at Paris Salon.—Conspicuous among the many exhibits of accessories at the present Paris salon de l'Automobile is the large and complete display made by C. F. Splitdorf, of 261 Walton avenue, New York City. This is the only exhibit of American ignition apparatus at the French show, and is attracting much attention. J. S. Mack, manager of the Splitdorf Broadway branch, is in charge.

IN AND ABOUT THE AGENCIES.

Franklin Agency Appointments.—The H. H. Franklin Manufacturing Company, Syracuse, N. Y., announces the following new Franklin agencies: Sherman Dils, Parkersburg, Va.; Jordan Automobile Company, Minneapolis, Minn.; Ohnhaus Automobile Company, Fort Wayne, Ind.;

Harmon Automobile Company, Portland, Me.; Sid Black Company, Cincinnati; Winnipeg Garage Company, Winnipeg, Man.; Pendleton Automobile Company, Pendleton, Ore.; Northwest Automobile Supply Company, Spokane, Wash.; Swendeman Automobile Company, Helena, Mont.; Troy Automobile Exchange, Troy, N. Y.; G. W. Hanson, Griffin, Ga.; J. B. Moore, Laconia, N. H.; D. M. Jackson, Warren, Pa.; Butte Novelty Works, Butte, Mont.; Brunn Automobile Company, 1140 Main street, Buffalo, N. Y.

Firestone Tires, St. Louis.—F. O. Sawyer, 3910 Olive street, St. Louis, one of the veterans in the trade, has disposed of his entire business to the Firestone Tire & Rubber Company, and will in future devote his attention to outside interests. The new Firestone branch will be distributing headquarters for Missouri, Oklahoma, Arkansas, Indian Territory, Kansas and Texas.

Grout, Philadelphia.—Another branch bouse has been added to the long list already established in the Quaker City—that of the Grout Automobile Company, of Orange, Mass., who have opened at 1521-23 Spring street, with Wilson H. Stoyle as manager.

Spencer Power Air Pumps, New York City.—The Auto Pump Company, makers of the Spencer pump, has opened an office in the metropolis with the Breeze Carbureter Company, 101 West Sixty-sixth street. Philip O'Neill is manager.

Palmer-Singer, Pittsburg.—The newly organized Palmer-Singer and Simplex Sales Agency, of Pittsburg, with temporary offices in the Machinery building, will represent the Palmer-Singer and Simplex cars in Pittsburg and vicinity.

Stearns, Kansas City, Mo.—The Stearns car will be represented in Kansas City by George Tebeau, the owner of the Kansas City Blues, with salesrooms at 1716 Grand avenue.

Cadillac, Des Moines, Ia.—Earl V. Shue has been appointed agent for the Cadillac car, and expects to be installed in his new quarters at 916 Walnut street very soon.

Gyroscope, Detroit.—The C. B. Fear Automobile Company, with salesrooms at 844 Woodward avenue, have taken the Detroit agency for the Bloomstrom Gyroscope car.

Oakland, New York City.—Sheppard Brothers have been appointed general sales agents for the Oakland Automobile Company.

Locomobile, Kansas City, Mo.—The Dempster Machinery Company has been made agent for the Locomobile in Kansas City.

Oldsmobile, Lexington, Ky.—The Olds Motor Works has appointed L. Hamilton, of Lexington, as agent for the Oldsmobile cars.

Oakland, Boston.—Fred S. Smith, of Columbus avenue, Boston, has taken the agency for the Oakland car.

Oakland, Pittsburg.—The Oakland cars will be represented in Pittsburg by the Bellefield Motor Company.

Marmon, Wilkinsburg, Pa.—The Marmon car will be handled in Wilkinsburg by F. A. Hunter.

PERSONAL TRADE MENTION.

F. C. Lindoerfer has resigned his position with the Oscar Lear Automobile Company, Springfield, O., and has been appointed sales and advertising manager of the Auto-Car Equipment Company, of Buffalo, N. Y. Mr. Lindoerfer is well known to the public, having been, during the past eigbt years, associated with the former Haynes-Apperson Automobile Company, and more recently with the Elmore Manufacturing Company. During the past year he has been prominently identified with the sales and advertising department of the Oscar Lear Company.

Walter A. Wood, formerly with the Oldsmobile Company, and more recently general manager and treasurer of the Cleveland Motor Car Company, has just gone with the Mora Motor Car Company to become one of Manager Burke's aides at the New York branch. Mr. Wood's extended experience in automobile selling makes him a valuable acquisition to the Mora selling forces.

William J. Baughman has resigned as superintendent of the Stanley electric plant at Pittsfield, Mass., and goes with tbe General Vehicle Company, of Long Island City, N. Y., as selling agent. His territory will be east of Rochester and north of Poughkeepsie, in New York State, and western New England.

D. W. Gluck, for some years with the Packard Motor Car Co. of New York, as salesman, has accepted a position as sales manager of Fickling & Co., which has recently leased the large seven-story building at 304 and 306 West Forty-ninth street, where several new departments will be added.

W. B. Fewell, who recently associated himself with the Olds Motor Works, Lansing, Mich., has left the Ohio field to temporarily assist Mr. Stokes, the general sales manager. Mr. Fewell will probably cover the greater portion of the United States while on this special work.

Charles Clifton, treasurer of the George N. Pierce Company, of Buffalo, sailed for Europe last week on the *Kronprinzessin Cecilie.* While absent he will look over the new models exhibited at the Paris Salon by the European manufacturers.

J. Elmer Pratt, who has been identified with the automobile industry in this country since its inception, and prior to that time a leading manufacturer of bicycles, has been appointed sales manager of the George N. Pierce Company, Buffalo, makers of Pierce Arrow cars.

J. F. Singleton, who last spring relinquished the advertising management of the Firestone Tire & Rubber Company, of Akron, O., has returned to his duties after a prolonged tour of the Firestone branches and agencies, extending from coast to coast.

C. Royce Hough, formerly factory manager of the Pope Manufacturing Co., Indianapolis, and later sales manager of the Motor Car Co., Washington, D. C., has accepted position as general manager of Fickling & Co.

D. B. Price, formerly of the New England branch of the G. & J. Tire Company, has gone with the Firestone Tire & Rubber Company, as traveling representative for the Boston branch, at 145 Columbus avenue.

Harry G. Smith, who recently resigned from the staff of the Diamond Rubber Company, is now with the Pennsylvania Rubber & Supply Company, 2134 East Ninth street, Cleveland.

D. R. Olmsted, of Council Bluffs, Ia., the inventor of the air brake for trolley cars, has applied his invention to a similar device for use on automobiles.

F. L. Sandord, of Worcester, Mass., has joined the selling force of the Boston branch of Franklin people.

NEW TRADE PUBLICATIONS.

Hoyt Elsctric Instrument Works, Penscook, N. H.—The new bulletin of the Hoyt voltammeter system of ignition testing is now out, and is about double the size of the old one. The Hoyt voltammeter is intsnded to be mounted on the dash and left continuously in the battery circuit, giving a constant reading. Both the voltmeter and ammeter windings are so calculated that the instruments do not consume any appreciable amount of current. The moving parts rest on jeweled bearings, and are extremely sensitive to changes in tbe volume or pressure of the current, but at the same time are very dead beat in action. The scale markings are uniform and easily read. The object of tbe device, as expressed by the makers, is to give the driver the same knowledge of the condition of the ignition system during the whole time that the battery circuit is closed as tbe steam engineer has of his steam supply.

White Steamers, as employed by the government and a number of cities for ambulance service, patrol wagons and buses, are fully described in a new booklet which has just been published by the White Company of Cleveland. Considerable epace is devoted to the ambulances employed by the Army and Nnvy departments, together with a number of letters from government officials, giving their opinion of the Whites for this service. The various types of White buses, as used by different hotels and for livery service, are illustrated—as well as the White steam patrols used in this country and abroad.

Willard Storage Batteries.—The Willard Storage Battery Company, of Cleveland, hae issued its catalog announcement for 1909 containing a full deecription of the etorage battery field for automobile use as covered by this company after 16 years' experience in this kind of work. The company thinks that in the newer models it has overcome the usual difficulties met with in storage batteries for automobile work, i. e., corrosion, epilled solution, and sulphating. Explanations with diagrams are given, illustrating the many uses of the storage battery.

Apperson for 1909.—Tbe 1909 catalogue announcement from ths Apperson Bros., of Kokomo, Ind., is out showing seven different models for the coming year. The new models of smaller horsepower will employ the shaft drive, while those for the 60-65-horsepower motor used in the model K and Jackrabbit, double chain will be furnished unless the purchaser desires the shaft drive, which the makere are prepared to furnish. For ths first time this company is putting out a six-cylinder rated at 60-65-horsepower.

Davis Robe Company.—In preparation for the coming cold weather automobile owners, who contemplate using their car, would not make a mistake by spending five or ten minutes in reading the announcement of the Davie Robe Company, 126 State street, Chicago. The email booklet contains full descriptions of the partially enclosed robe and the arctic over-pants made by this company, with illustrations making clear their simplicity and usefulness in all weather.

Ford Motor Cars.—This is the title of an attractive booklet just issued by the Ford Motor Company, Detroit, and it gives the long-looked-for information concerning the mechanical details of the compiete line of new Ford models for 1909. Its contents are more in the form of a running story than in the usual catalogue style, making it that much easier reading, so that before ons is aware of it he bas read tbe pamphlet from cover to cover.

About the Stearns for 1909.—An attractively embossed cover bearing the white line radiator forms the foreword to the new Stearns catalogue, and it is appropriate in that this is the same introduction that one ueually gets to the Stearns on the road, the car being easily dietinguishable in this manner as far as it can be seen. The booklet is devoted to the Stearn'e achievements on the road, as well as to a description of the new models.

Another Glidden Booklst.—The latest story of the recent A. A. A. tour has just come out in a booklet published by the R. M. Owen & Company, New York City, general sales agents for the Reo, under the title of "Two Weeks." Besides the map showing the principal cities passed through, the story is intsrspereed with scenee along the route which help materially to give a lucid and interesting idea of this famous fifteen days' contest.

Johnson Friction Clutches.—The Carlyle Johnson Machine Company, of Hartford, Conn., manufacturers of the Johnson friction clutches, marine reversing gears, etc., are using the experience gained in producing clutches for commercial work in the new model clutches for cut-off couplings for use in connection with marine motors. Vol. XIX New York—Thursday, December 10, 1908—Chicago No. 24

THE AUTOMOBILE

PARIS SALON IS NOW IN SUCCESSFUL PROGRESS

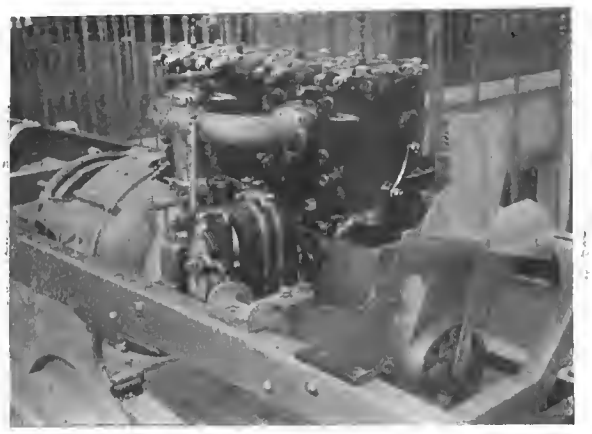
By W. F. BRADLEY.

PARIS, Nov. 28.—With the usual ceremonial, President Fallieres and his suite drove from the Elysee to the Grand Palais in an automobile, were received by a bowing group of automobile constructors responsible for the exhibition, declared the show open, and spent a couple of hours paying compliments in his hurried visit from stand to stand. It is a morning's formality that must be gone through as religiously as the morning devotion of the most pious Mohammedan, and serves to mark out the Salon from any of the common groups of exhibitions where horses or furniture or bric-à-brac are the center of attraction, and here in France precedent is much observed.

Nothing has been changed in the general lines of the exhibition, and to the newcomer it stands forth as a show of remarkable elegance and artistic design; but those who have followed up the increase of decoration, gold paint, flowers and pile carpets, at once miss that flood of electric light and that wealth of decoration that in previous years had caused the unsophisticated lady visitor to ask why they wanted cars there at all when there were so many other pretty things to be seen. Last year it was a gorgeous hall of electricity; this year it is an artistic automobile show. And it is expected that as much business will be done with a good deal less expense to those trying to do the business. Decorated stands are not essential now in selling cars.

There are nearly seven hundred exhibitors in the large hall on the banks of the Seine, which is a sufficiently high figure to prove that the boycott rumors were nothing more than rumors. The three or four firms that stood out against an annual display have as their only reward the knowledge that nobody misses them. France has more than the lion's share of the show, and naturally takes all the best positions, the locations being made by the

Arrival at the Grand Palais of the Many Exhibits for the Annual Paris Salon.



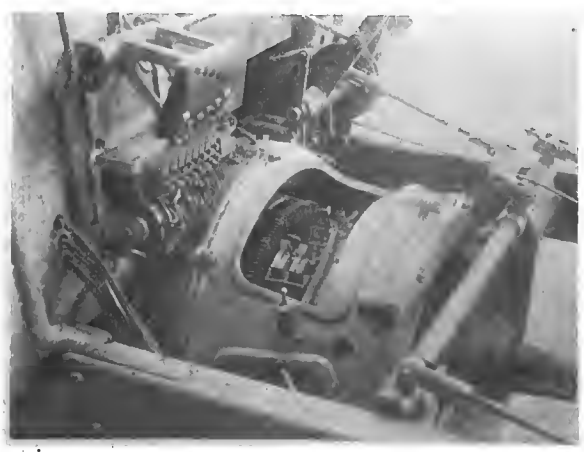
Much-Discussed Knight Engine in Gem Chassis.

drawing of lots with the important feature that only firms of a certain standing can take part in each drawing. The pioneers of the industry get the first positions; those who entered the trade later to make money out of automobiles are given a chance to draw lots according to their business standing. "It would not do to have a general drawing," declare the wise managers, for then some third-rate firm might get the center position and be unable to put up a stand that would harmonize with the decorations of the hall.

But the foreigners have not much reason to grumble at their positions, for near the center of the hall, and round the foot of the grand staircase, are grouped the gorgeous stands of Mercedes, Fiat, Benz, Minerva, Lancia, Wolseley, and Buick. The only other American automobile constructor to hold a position in the Salon is Ford, with a stand less centrally placed. In the gallery, where tires, and a thousand accessories have been given lodging room, Rushmore and Splitdorf are the two most important representatives from across the Atlantic. On the opening morning the American visitors observed around the hall were D. J. Post, of Post & Lester, Hartford, Conn; Howard E. Coffin, of the Chalmers-Detroit Company; Emile Crossman, president of the Motor Car Equipment Company; Russell Huff and H. D. Wilson, of the Packard Motor Car Company; and John L. Poole, representing the Buick interests. Those reported on the way are J. D. Maxwell, of the Maxwell-Briscoe Motor Car Company, and Roy Chapin, of the Chalmers-Detroit Company.

Nearly Every Builder Has Small Cars.

There are a few points in which the tendency of European design is noticeable from even the cursory examination of an



Generator and Control of Gem Petrol Electric.

opening-day visit. Lower-powered cars are everywhere in favor. With but an exception here and there, every constructor who has made a name in the big car class has gone into the small car field, the idea of a small car varying from a four-cylinder of 85 millimeters bore to a one-lunger of 100 millimeters. Without exception they are shaft-driven; where the cylinders are four in number they are, in nine case out of ten, cast in a single block, with valves on one side; ignition is invariably by high-tension magneto only; water circulation in most cases is by thermo-syphon, with a tendency to put the radiator on the dash—Renault fashion—when new models have been designed. On clutches and transmission there are a variety of designs; on suspension the prevailing mode is semi-elliptics in front, three-quarter elliptics in the rear, with a good deal of variety in the way of the rear springs are designed.

Low-tension ignition has received its death-blow. During an early morning run through the show not a single example of low-tension make and break could be found. It is true that a few of the cars had not got the covers off, for the President had not arrived and the doors had not been flung open to the public; but even among those hidden up were only a few of the very large models that had the simple low-tension magneto. Among the firms having changed some or all of their models from low to high-tension ignition are Brasier, Dietrich, Mercedes, Mors, Itala, Berliot and Fiat. Double ignition is very rarely seen, and in many cases no provision has been made on the engine for adding a second system as a standby.

Departures from Accepted Standards.

There are very few distinct departures from generally accepted standards of design, though of course plenty of diversity in detail methods of working out every part of the car. Air-cooling has one representative only, and even that one is not brought forth as a commercial proposition. The Henriot is an inventor's idea, and has its four cylinders with deep flanges cooled by a couple of fans placed on the right hand side of the engine and driven by bevel gear and upright spindle driven off the camshaft. The transmission is a planetary one contained within the flywheel. Another idea of the same firm was the substitution of the radiator by a dashboard tank into which a current of air was forced, circulation being by thermo-syphon.

Charles Y. Knight's patent, as modified by Panhard, Minerva and English Daimler, was undoubtedly the most attractive mechanical feature of the show, without, however, being the one that met with most praise. There are plenty of critics to point out that the engine is difficult to lubricate, that equal silence can be got with a poppet type of valve, and that its good points are obtained at the cost of complication.

Some of the most interesting mechanical work is expected in the aeroplane engine section, which will comprise a portion of the second show to be held in December.

Six-cylinder cars stand just where they were; there are a few new models, but there are some that have disappeared, and there are certain firms having found so little demand for this type of engine that they do not give it standing room this year. Single-cylinders, on the other hand, are being brought forward more and more prominently. In the majority of cases the engine is a De Dion or an Aster fitted to the builder's own chassis, though there are a few cases of large influential firms having produced a "mono," the most important being Bayard-Clement. The aim of the French constructor is to make his one-lunger look like a four-cylinder car, and with this object in view he carries his single vertical cylinder forward under a bonnet that would easily accommodate a four in two castings. In this particular feature the designer has succeeded, for it is impossible to say, from a mere outside examination, whether there are one or four power-producing units. To complete the illusion it is necessary that the exhaust should have the right sound, and though a few have cut down the noise to such an extent that the layman may be deceived, the spaced clap, clap, clap, generally betrays.

The larger firms prefer the two-cylinder model for their small-

est powers, and here are to be found Panhard, Renault, Darracq, Dietrich, Brasier, Charron, Berliet, and Bayard-Clement with two-cylinder vertical engines that in most cases can be run side by side with a four without any but an expert being able to tell, from the noise only, which is which.

About the Knight Engine.

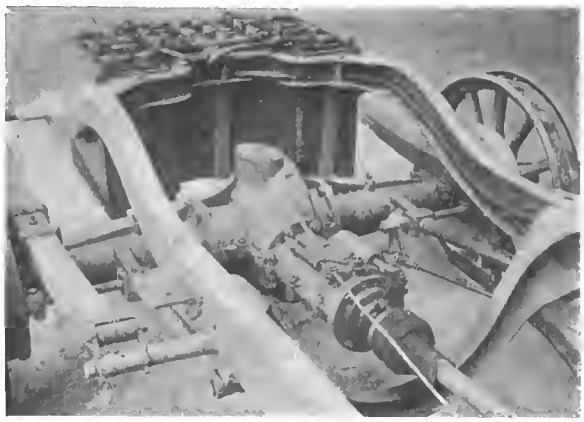
In the short space of three months Charles Y. Knight, of Chicago, has become one of the best-known figures in automobile Europe, and his special motor the most conspicuous feature of the industry. In England, where the motor has been adopted by the Daimler Company, the balance of opinion is that an excellent move has been made by securing the sliding valve engine from the West; but if the opinions were analyzed, it would doubtless be found that the satisfaction was the outcome of confidence in the wisdom of the Daimler engineers, rather than a personal conviction of the merits of the innovation.

Continental Europe is interested, but much less disturbed by the new motor, and never dreams, as is done by the Englishman, of a possible revolution of the motor industry by reason of the deal. In Belgium, Minerva has secured the rights and will adopt the motor, with their own modifications, to a certain number of their cars. Mercedes has secured the rights for Germany, but refuses to make any declaration regarding its adoption to their models. It would not be at all surprising if the patents were neglected next year. In France Panhard has the sole right to manufacture, but apparently did not consider the invention worth exclusive rates, for it is still open to a manufacturer in any other country to sell on the same territory. There will be a Panhard-Knight engine at the forthcoming Paris Salon, and in all probability a complete car—two or three have already been built for testing purposes—but it is exceedingly doubtful if any number will be put on the market. There is many an invention in the Panhard factory waiting to be fitted to cars, and it would be surprising if the American one could break down the French engineers' caution. In Italy Fiat may take over the invention, though nothing is yet definitely decided upon.

The first commercial application of the Knight engine in France is, curiously, not by Panhard, but by the Gem Company, a new corporation presided over by Leonce Girardot, one of the early French race drivers and a founder of the C. G. V. firm. Panhard having failed to secure exclusive rights, Gem has arranged with the English Daimler Company for the purchase of their engine built on the Knight patents, and will fit it to all their larger chassis during the coming season. The combination is rather an unusual one, for the Gem is a gasoline-electric of a special design, which up to the present has been driven by a standard type of gasoline motor. In view of the special claims put forth for the Knight on the grounds of silence and flexibility, and the peculiar advantages of electricity in these two respects, the Gem people believe they have secured a happy combination.

The Knight engine, with four cylinders in two groups, or nominally 38 horsepower, drives a continuous current dynamo occupying the position usually given to the flywheel. Transmission is through a magnetic clutch, and drive to the rear wheels by propeller shaft and rear live axle, a sliding gear combined with the differential housing, giving reverse. When the engine is running light the dynamo charges up the set of storage batteries carried in a special case at the rear of the chassis. When an extra effort is required from the motor, the storage batteries discharge into the dynamo, giving an additional force which may be valued at 10 horsepower for the large models.

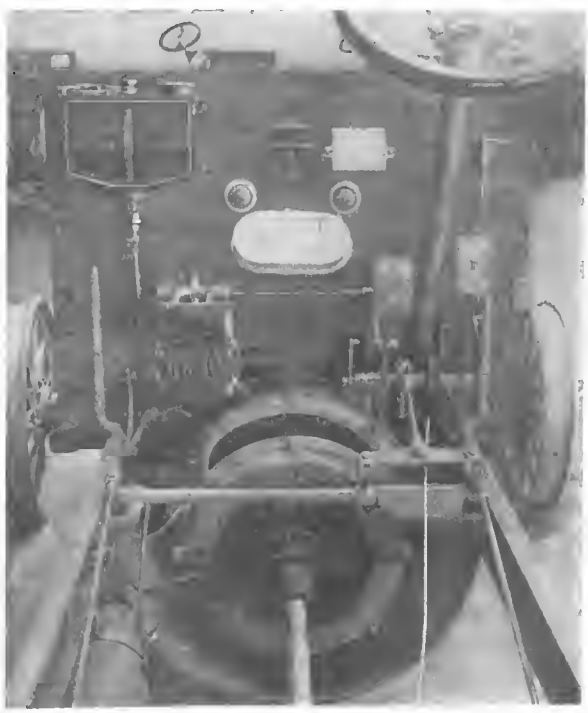
Ignition is by high-tension Bosch megneto, as on the Knight-Daimler engine. The carbureter is of a special type, entirely automatic, and magnetically controlled, the gas supply being increased as the storage batteries are brought into play, and automatically decreased when the dynamo discharges into the battery. Control therefore is as simple as that of a trolley car, and is indeed on the same principle. The left-hand lever on the steering wheel is used solely for starting the motor, by sending a current of electricity from the storage batteries into the dynamo.



Another View of Gem, Showing Batteries.

The primary set of brakes is magnetic, the reserve set being operated upon by foot pedal. All electric connections are contained in a double dashboard, in which position they are protected from damp and air. The gasoline tank, instead of being at the rear, as on the first models, is under the driver's seat, with a flow by gravity, this change having been made to give a better distribution of weight.

It is intended to put the new Gem-Knight chassis in service very shortly with the Paris General Omnibus Company, which has a monopoly of bus service in the French capital. The company is nearing the end of its lease, and whether it is renewed or given to a new body, mechanical service will be insisted upon by the city authorities. A large proportion of the horses have already given way to gasoline buses, but the company does not appear to be satisfied with the type adopted. A large company is offering to take over the entire service with a set of steamers, and those responsible for the Gem have similar intentions, believing that the combination of a flexible gasoline engine with an electric transmission will be ideal for crowded city service.



Dashboard and Dynamo of Gem Petrol Electric.

FIVE FRENCH FIRMS OUT OF GRAND PRIX?

PARIS, Dec. 3.—Paris wants to know if her crack constructors have got cold feet. There is report abroad in well-informed circles that five of the most important firms have agreed among themselves not to compete in the next Grand Prix. The matter would not be so very extraordinary were it not for the fact that the firms in question, which are declared to comprize Brasier, Renault, Panhard, and Dietrich, have each a representative on the Racing Board and are therefore boycotting their own event.

Just how much truth there is in the report it is impossible to say, but there is no doubt whatever that these firms have discussed among themselves the advisability of abstaining from racing next year. Paris is more than surprised at the move, and bluntly declares that the crack constructors have got cold feet at the idea of second-rate firms, having had long experience in the construction of small cars, coming forward and beating them at their own game. They could stand being beaten by Fiat and Mercedes, but when it is a question of Blank & Blank, voiturette builders, coming forth with a special 130 millimeter-bore racer and beating them, they would prefer to keep out of the game.

Undoubtedly next year a number of firms having never before tackled a special racer, will come forth with a Grand Prix car. There are at least half a dozen firms having specialized in 120- and 130-millimeter more touring cars who will use the knowledge gained in this line to build a trio of racers. Berliet, the winner of the Italian 130-millimeter race, will enter three cars for the first time in the French Grand Prix, the driver of one of them, in all probability, being Thery. The engines are already under construction, and are declared to have a stroke of 200 millimeters.

RULES FOR 1909 PRINCE HENRY TOUR.

BERLIN, Dec. 3.—In a conference at the Imperial Automobile Club, between the club and the industry, the regulations governing next year's contest were worked out and will be published in full during December. Of these the most important is the formula accepted by the meeting, in order to eliminate freak and racing vehicles as much as possible from the competition and give the normal touring car the chance it certainly did not enjoy in the first tour. The formula is as follows:

$N = 0.013.\ i.\ d^2\ {}^5\sqrt{s^2}.$

N being the horsepower, i the number of cylinders, d the bore in centimeters, and s the hub in centimeters. Beside this, all drivers who have neither won a cash nor art prize for themselves or the car-owner in any recognized contest (club arrangements excepted) will be credited with a certain number of points, in order to give them a more equal footing with professional drivers; this will, however, only have a bearing on the whole result, and the speed trials on the flat on the first and last days will be excluded.

The minimum weight for the weakest cars, with a capacity of 1.6 litres, is 750 kilogrammes, with a further kilogramme for each one-tenth of a litre more. The weight of the body may be less than fifteen per cent. of the whole.

At the same meeting it was decided to turn the proposed voiturette competition into an international event, only factories being allowed to enter with teams of three cars each. The date was fixed for August 29 to September 2, on the Berlin-Brunswick-Weimar-Würzburg-Heidelberg-Strasburg route.

BOSCH IGNITION FOR 1909 MERCEDES.

Editor THE AUTOMOBILE:

On page 670 of your November 12 issue, in discussing the proposed improvements on the Mercedes car for 1909, it is stated that "Ignition is by Eisemann high tension magneto."

As a result of inquiry, we have before us authentic information, proving this report printed in your publication as entirely void of foundation. We are assured that "Bosch Ignition" will, as in former years, be the standard equipment of the Mercedes 1909 car.

BOSCH MAGNETO COMPANY,
G. JAHN, Manager.

New York.

GETTING BACK AT NEW JERSEY.

NEWARK, N. J., Dec. 7.—The Newark Board of Trade and the New Jersey Automobile Trade Association have joined forces and will endeavor to combat, by means of suitable legislation, the boycott in all branches of automobile manufacturing against the State. This boycott has resulted from New Jersey's refusal to exchange courtesies with other States; that is, to recognize the licenses of all others recognizing the New Jersey license, except Pennsylvania, where a new law seems assured this Winter. Other incidental causes are the "correspondence" justices, arrests and trials before minor courts; and other annoying points of the motor law. It is asserted that this boycott is being felt throughout the State, parts manufactured to the amount of $8,000,000 being affected in Newark alone. Among the ways in which this is being felt is that car manufacturers are not placing contracts for parts in this State. Others who have existing contracts will not renew within the State. Thus, the high-handed methods are being brought home by a curtailment of business.

ANENT THE BRIARCLIFF TROPHY RACE.

NEW YORK, Dec. 7.—Several meetings have been held and several more may be necessary before the automobile manufacturers' committee will be able to agree on the plans for the stock car race which will be repeated this coming Spring. The point of discussion is the cylinder bore, each manufacturer seeming to have a different idea. The limits discussed varied from 5 inches up to 5 1-2 inches for four-cylinder motors. The advocates of the former figure had in mind barring the racers especially prepared for the international races, the rules for which limit four-cylinder motors to a bore of 5 1-8 inches. No decision has been reached, but it was decided to hold the race under the same name but at a later date, probably the first week in June. The place was not finally decided upon, for it was thought that inducements should be offered as in France. It is certain that the race will not go far from New York City.

CUBAN RACE PROJECT ALIVE AND KICKING.

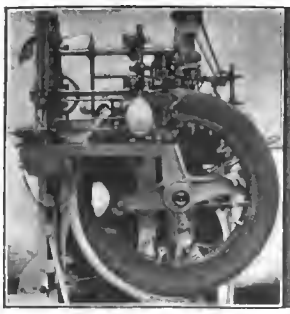
NEW YORK, Dec. 7.—The Board of Governors of the Automobile Club of America has definitely decided not to have any hand in the proposed week of speed tests near Havana, Cuba, whether these races be held or not, but prominent members may carry it through. The Cuban people are very strong for it, and the races will undoubtedly be held, not the first week in January as was originally planned, but later, possibly in March. To conduct the race, Harry T. Clinton and A. H. Whiting, of the Contest Committee, have both been secured for duties similar to what they had at Savannah.

EXPELLED THOMAS FOR RECKLESS SPEEDING.

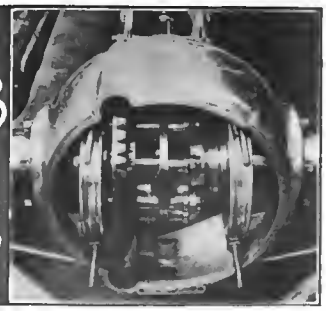
NEW YORK, Dec. 7.—At to-night's special session of the board of trustees of the New Jersey Automobile and Motor Club, E. R. Thomas, the New York banker, was summarily expelled as a result of his speeding at Long Branch on August 14 last. Testimony showed that at the time the accident happened Thomas was running his car at a rate of 80 to 90 miles per hour. Thomas was represented by counsel, who stated that he would be crippled for life as a result of the accident, but neither this fact nor counsel's strong plea for delay was given any weight. In addition to this, Thomas still has his trial on several counts by the State of New Jersey coming to him.

DAYTONA RACES SAID TO BE ASSURED.

NEW YORK, Dec. 7.—It has been finally decided that the Florida speed tests will be held next year, probably at Daytona during the last week in March. The later date was selected so as to obtain the most favorable conditions. The earlier experiences rather lead to the conclusion that this late date is wise.



Technical Observations at Olympia



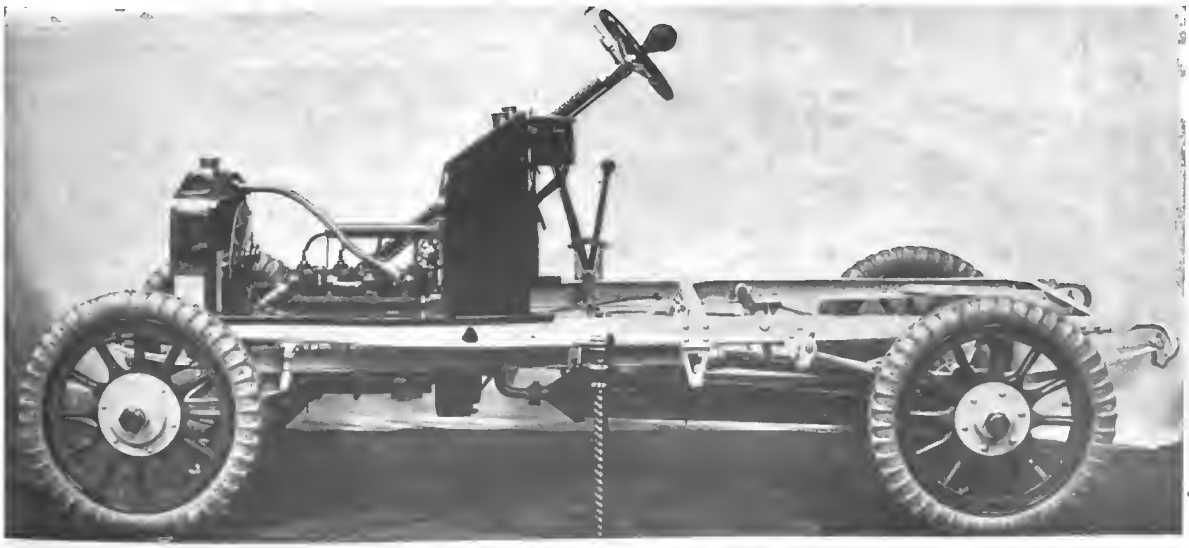
LONDON, Nov. 21.—That big section of the show which comprises the home countries' exhibits can this year fairly lay claim to showing greater extent and variety than the Continental section, which has in former years been classed first. The main feature which characterizes the British exhibits as a whole is the breaking away from the set groove of standard practice into which so many firms seemed fixed. This change has in great measure been caused by the fact that almost all the big manufacturers have now seriously taken up the medium-powered and light car, and the excellent designs which such firms have evolved have stimulated the smaller makers to fresh efforts. Not a few have succeeded in no small degree.

Some representative cars are described in detail below, but where one is mentioned there are a dozen others of equally good design, of which lack of space prevents mention.

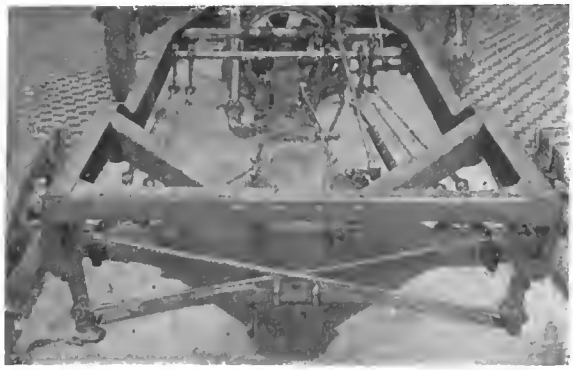
The Austin Product.—One of the most representative British stands is that of the Austin Company. Although this firm commenced operations less than three years ago, their cars have acquired a great reputation and have risen right into the first rank. The models exhibited range from 60-horsepower six-cylinder type, of which two standard chassis were run in the Grand Prix, down to the new 15-horsepower light car. The most popular vehicle—excluding the new 15-horsepower—is the 18-24-horsepower model, and of interest as showing the sound design of these cars, the particular show chassis of this power on view now appears for the third year in succession and yet is quite up to date in every detail. All the cars except the smallest have separate cylinders, and gas-engine practice is followed in that the liner is not joined on to the waterjacket at the top extremity and so is free to expand upward when the temperature is raised, while a small washer keeps the water from entering the cylinders. Bosch dual ignition is fitted, giving a special hand-operated magneto and coil for starting "on the switch" with ordinary high-tension magneto for running. A flat disc clutch conveys the power to a four-speed gearbox with direct drive on third and final transmission is by live axle, although on the big 60-horsepower car chain drive can be provided if specified.

A new form of rear suspension is fitted to the 40-horsepower and 60-horsepower cars, this permitting of the use of complete elliptic springs without the disadvantage of side play usually associated with this kind of spring. Lateral stability is obtained by taking the drive at the forward extremity of each spring and not in the center, while vertical flexibility is secured by shackling the springs together at the rear and by holding the top spring in a pivoted connection with the frame. As only the forward end of the spring is rigidly connected to the frame and the rear end is quite free, full up and down movement is allowed, while the central pivot reduces the side play to the same value as it would have been with a semi-elliptic spring of the usual form. An interesting feature of all these cars is that they are turned out from the works with full supply of tools and lamps, and even a speedometer and mileage recorder is included.

The 15-horsepower car is a new and popular type which is quite up to the level of the other Austin products. The four cylinders, size 3 1-2 by 4, are cast in one piece together with the top half of the crankcase, and the valves are on opposite sides. Natural circulation of the water is relied on, and a large honeycomb radiator being fitted, the fan belt of which is



The Unusual Nameless Chassis—New Kempshall Tires and Peculiar Muffler.



Humphris Compensating Cross Spring.

kept in tension by a controlling spring. Forced lubrication is provided, and ignition is, of course, by high-tension magneto. The leather clutch is of novel design and two failings of this type are cleverly obviated. The leather facing is divided into six loose segments, fitted on flat springs of slightly greater curvature than the cone of the flywheel. These segments can be inserted into place without disturbing the body of the clutch, the ends of the flat spring plates fitting into grooves on the circumference of the clutch casting and being secured in place by lock nuts. By having the segments in this shape easy engagement is insured, while the ease of detachment makes it a simple matter to remove the leather for occasional softening treatment. The engine and three-speed gearbox are mounted on a channel steel subframe, which is pivoted at the front to a cross girder of the main frame and fastened at the rear to another cross member by two bolts, thus giving simple three-point suspension. The gearbox is in one piece, and, instead of aluminum, cast iron of special grade is employed, the makers claiming that a stronger job can be provided with but small increase in weight. The final drive is by propellor shaft to the rear live axle and this is fitted with substantial torque rods. Ball bearings are used throughout the transmission and the brakes are of the expanding variety, exclosed from mud. The price of this car complete with five-seated body comes out at $1,750, which appears reasonable, judged by the early demand.

Talbot Has a New Clutch.—Mention of the clutch improvement on this Austin calls to mind the new cone clutch on the Talbot cars—productions which are noted on this side for high engine efficiency. These cars have a leather cone clutch in which the drive is transmitted from the coned portion to the clutch shaft by a claw coupling. When the pedal is depressed the clutch first comes out of engagement with the flywheel in the usual way, but further movement of the pedal separates the two portions of the clutch itself, so that the only revolving part which can cause scraping of the gears is the comparatively light

Rear End of the Humphris Chassis.

clutch shaft itself. On releasing the pedal, after the gears have been meshed, the reverse action takes place. In practice it is found that any gear can be meshed without the slightest noise or jar.

Napier Worm-Driven Small Cars.—This is the first year that Napiers have been seen in the light car section, new 10-horsepower and 15-horsepower models being staged. The 10-horsepower car is of the two-cylinder type and the 15-horsepower engine has four cylinders, but the other features, save as detailed below, follow standard Napier lines and the complete cars are covered by a three years' guarantee.

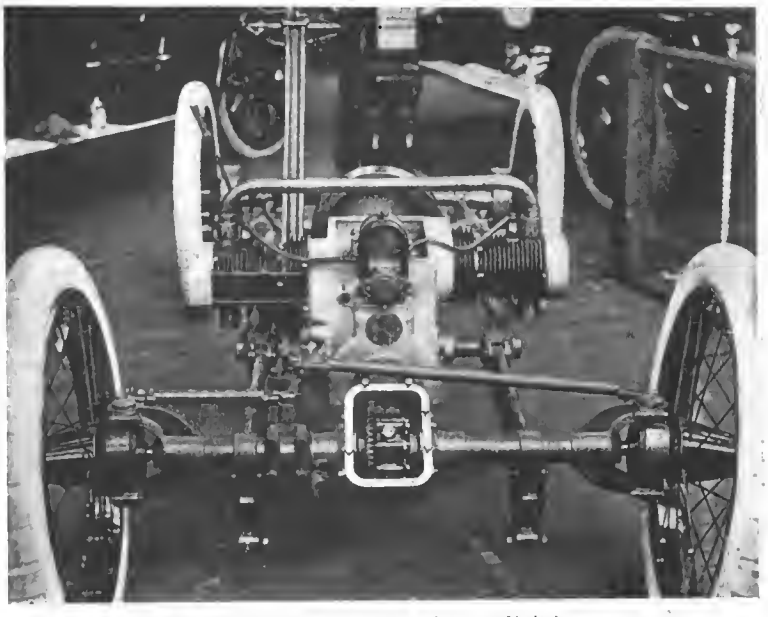
Both models have the cylinders cast in pairs, bore and stroke being 102 by 127 mm. The valves are all on one side and are enclosed from dirt by an aluminum cover plate. The ignition is effected by a Bosch high-tension magneto carried on a platform at the front of the engine. Below the magneto is the centrifugal water pump and below that again the gear oil pump. The carbureter is novel in that the mixing chamber is on top of the engine, separated by a long water heated pipe from the spray portion, which is at the level of the top of the crankcase. The reason for this construction is not altogether obvious, but the makers state that it has been found to give excellent results in practice. The disposal of the flywheel in front of the engine and the attachment of the gearbox directly to the rear of the crankcase is a step new to British—though perhaps less so to American—designers. The multiple disc clutch, with flat plates of tool steel, is enclosed in the gearbox, which gives three speeds with direct drive on top. A cast sleeve projects from the gear box to the outside of the frame and to this is bolted the gate in which the change speed lever works. Another projection at the rear of the gearbox almost completely encloses the foot brake and so protects this important part from dust and mud. Final drive is by propellor shaft and worm gearing, the driving shaft coming below the axle. This has the obvious disadvantage of reducing the road clearance so that in cars for foreign and colonial use a bevel drive is substituted. The chassis price of the 10-horsepower model is $1,475 and of the 15-horsepower $1,750. The six-cylinder engine of the same type appears in the 30-horsepower car, while above this other six-cylinder models range up to 90-horsepower.

Humber Firm Has a Full Line.—On the Humber stand all the cars are shown together without distinction of name as formerly, owing to the recent transfer of the Beeston Works to Coventry, where the firm has now the biggest motor factory in Europe. The cars shown range from the new 8-horsepower two-seater and the well-known 10-12-horsepower model, which has probably had a bigger sale than any other two European cars, to the 30-horsepower six-cylinder car. The two intermediate four-cylinder cars, the 22 and the 28-horsepower embody the results of the Tourist Trophy racing experience, as is shown by the bigger ratio of stroke to bore—90 by 140 in the first case and 100 by 150 for the other—and the large diameter of the valves, which gives very high engine speed without falling off of power. Features common to all Humber models are the absence of water pump, thermo-syphon circulation being relied on; the forced lubrication system with which is worked an indicating pointer on the dashboard, showing how much oil is circulating, and the well-designed short gearbox, in which the lay shaft and reverse pinion are idle when top direct gear is engaged.

A New Detachable Wheel.—The new 8-horsepower two-seater has engine with bore and stroke of 90 by 120, and duplicate ignition is fitted. A fan flywheel contains the flat disc clutch and the three-pced gearbox is operated by a gate change. Final drive is by propellor shaft and all brakes are of the enclosed internal expanding variety. The price of this model is $975. Examples are shown of the Humber detachable artillery wheel, which can be fitted to any of the new models. This wheel is similar to the popular Rudge Whitworth wire wheel in having an outer shell hub with slots engaging with feathers on

the inner or permanent hub attached to the axle. A neat spring locking cap, which can only be loosened by a special spanner, prevents any possibility of the wheel coming adrift.

The First English Two-Cycle Advocate.—A most interesting car is the Valveless, which has a special type of two-cycle engine. The two cylinders have a common combustion chamber and are placed so that their cranks are parallel. The two crankshafts are connected by gearing and are set so that both pistons rise and fall together. One of the crankshafts drives the magneto and the water and oil pumps, which are placed at the front of the engine, while the other crankshaft has a fly-wheel at the rear end and so transmits the power through a cone clutch to the three-speed gearbox. The final drive is by live axle and the remaining features are quite standard, excepting, perhaps, the silencer, which runs the whole length of the frame. This, the first British car with two-cycle engine, showed up well as regards fuel and petrol economy in a recent official Royal Automobile Club trial. It is somewhat interesting to note tbat at the last sbow the engine, although in action the same as now, was placed horizontally in tbe center of the frame with epicyclic gearing and single chain drive. This method of construction has had to be abandoned in deference to public opinion, which seems so hopelessly conservative where changes from standard practice are concerned. It is for the same reason that the Lancaster this year has wheel instead of its successful form of tiller steering and also that Cadillac has adopted the sliding gear.



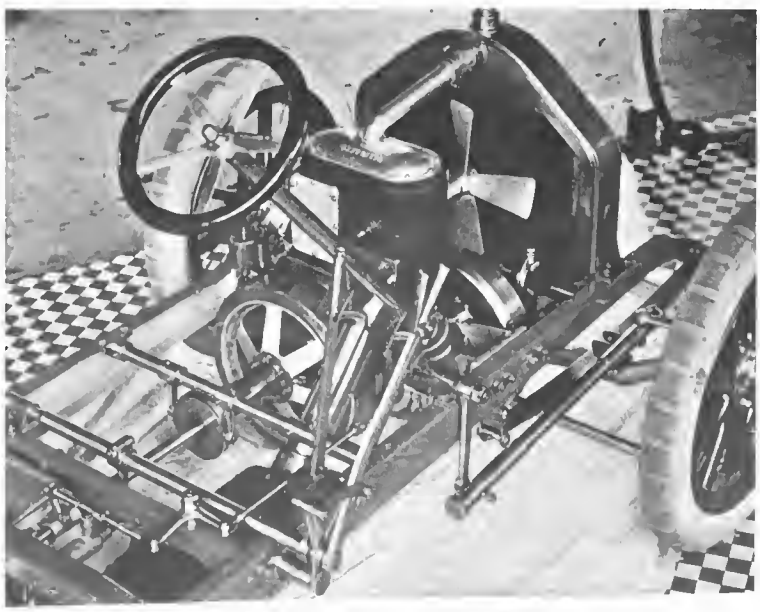
Pilgrim Front Drive, but Unlike the Christie.

All parts of the Valveless car are made to specification by a prominent engineering firm—D. Brown & Sons, of Huddersfield—and the Valveless Company has only to assemble the parts. This is an arrangement which would seem to offer big possibilities for the small maker.

The Lower-Priced Cars, the Phœnix.—Easily first in the cheapest class, which may be taken to include two-seaters listed at under $750, comes the Phœnix 8-horsepower car, which has three years' excellent performance in road trials to recommend it. The two-cylinder vertical engine, which has bore and stroke of 80 by 80 mm., is placed across the frame and has overhead inlet valves and magneto ignition. A multiple disc clutch is fitted in conjunction with a two-speed and reverse epicyclic gear running on ball bearings. From the gear the drive is taken by a single chain to tbe rear axle, which has spur type differential and full set of ball bearings. The frame is tubular, supported front and rear by semi-elliptic springs as usual. Brakes are fitted to the front wheels—and this is a point which is attracting growing attention from designers—and there are also band brakes on the rear hubs worked by a side lever.

Further refinements on this little car are the dust screen, which extends from front of the frame to the rear axle, and the provision of gauges to both petrol and oil tanks. The price for the two-seater, with tools complete, is $700.

New and Original Two-Cylinder Two-Seater.—Another interesting small car, a newcomer to the ranks, is the 8-10 Smeddle-Kennedy two-seater, which hails from Newcastle-on-Tyne. Right through the car the designers have ignored standard practice and have constructed every part with the object of simplicity and ease of adjustment by the novice. The engine has two 3 1-4-inch cylinders cast together, the piston stroke being 4 1-4 inches. The valves are of the overhead type fixed in cages and are all operated by a single overhead camshaft running in ball bearings and driven by bevel gearing from the crankshaft. This crankshaft is enclosed by a dustproof cover that can be detached, together with the camshaft gear, by undoing four wing nuts. To reset the timing it is only necessary to turn the flywheel till a mark on it lines with a pointer on the crankcase and then to see that the mark on the camshaft spindle coincides with a line on the casing. A well-designed automatic carbureter is bolted direct to the inlet ports without the use of an induction pipe. Ignition is by Nieuport high-tension magneto. In this engine, as in the Valveless, the crank



Valveless Engine, Which Attracted Attention.

K. T. Sectional Tire

throws are set so that the pistons rise and fall together, thus giving impulses at even intervals. This method is not common to British design, but should be an improvement if the balancing has due attention. The fan flywheel contains an expanding clutch and from here a long propeller shaft extends to the rear axle, a forward continuation of the latter containing the gearing which provides three speeds and reverse. The frame is of pressed steel and is stayed by four radius rods, two for each axle, which converge on a central bracket. The front of the frame is carried on an inverted elliptic spring, while at the rear are two inverted quarter elliptics, these being free to slide in boxes on the rear axle. With 760 by 90 tires and body complete, this excellent little car sells at $1,050.

The Ball-Bearing Pilgrim.—As a last example of the light cars the 9-horsepower Pilgrim may be cited. This is a very light car—700 pounds is the weight of the chassis—on new lines, which has been described as the nearest approach yet to the American buggyabout. The engine has two horizontal cylinders of size 86 by 72, with two speed epicyclic gear alongside, no separate clutch being fitted. The drive is transmitted to the front wheels through double universal joints. The engine has ball-bearing connecting rods and magneto ignition. Front wheel brakes are provided, these being operated by a foot pedal, while a side lever controls the back brakes. The price of this two-seater is $650.

The few cars here mentioned are only isolated examples of the many of all powers and types that are shown, but they may be taken as representative of the majority.

Continental Cars as Seen by British Eyes.

Reviewing some of the principal stands in order, that of the Renault is found to attract most attention, for to the average autoist these cars are representative of France, just as the Mercedes is of Germany, and as Daimler and Napier uphold the British name. No less than five four-cylinder models are made for the coming season, these being the 14 horsepower, 16 horsepower, 20 horsepower, 20-30 horsepower, and the 35-45 horsepower. Finally, the huge 50-60-horsepower six-cylinder chassis ends the list. All these, except the three smallest, are fitted with self-starting devices. The 35-45 and the 50-60 cars have the well-known Renault compressed-air system, while the others are operated from a foot pedal working through a chain and ratchet gear and so rotating the crankshaft. In all other points the cars follow 1908 design without alteration, even the cone clutch and the straight-through gear-change being the same as ever.

The most noticeable feature of the Panhard cars is the absence of chains, only the 25-35 horsepower model retaining this form of drive. The two-cylinder car with epicyclic gear has not made its appearance, but a 10-12 horsepower light car, with cylinders 80 by 120 mm., brings the Panhard firm into line with other famous constructors. In all engines the cylinders are cast separately and the crankshaft has five bearings, an elaborate force-pump lubrication system to all parts being used. A special type of magneto is fitted, in which the advance and retard positions are obtained by "rocking" the magneto. The disc type of clutch is contained in the forward part of the gearbox, which latter gives four speeds and reverse with direct drive on top. By employing smaller gear wheels of a special steel, the old humming noise which was such an inherent feature of former Panhards has been entirely overcome.

The adoption of the Knight valveless engine by this firm was not arranged sufficiently early for an example of this new type to be shown, but this will appear on the Panhard stand at the Paris show. There are, however, two Continental stands at this show—the Minerva and the De Luca Daimler—which stage cars fitted with this American invention.

The Mercedes cars remain substantially the same as for 1908 season, with the main exception that on all models the disc clutch replaces the old scroll type. The low-tension magneto works in conjunction with the special Bosch magnetic plugs, so dispensing with the moving tappets. A new multi-jet carbureter is fitted and the control levers now remain stationary, instead of moving with the wheel as before.

An Italian car, which, probably on account of its moderate price, has acquired a good popularity in this country, is the S. C. A. T. This car hails from Turin and derives its name from its designer, Ceirano, who is stated to have been responsible for the early Italian cars. The 22-horsepower model is the car which ran so consistently, although unplaced, in the Tourist Trophy race, the bore and stroke being 101 by 140. The valves are no less than 50 mm. in diameter, and as a result, very high engine speed is obtained. High-tension magneto ignition is standard, but the low-tension variety can be supplied optionally. The disc clutch four-speed gearbox and shaft drive follow customary Italian practice, the only additional feature of note being the compressed-air starting device, similar to that of the Renault. The price of this chassis is $1,750, and that of the 14-horsepower model, which has four cylinders 85 by 120, is $1,475.

The Rapid and the Bianchi cars on view follow the above standard lines almost exactly, the price, however, being higher.

Examination of the Hotchkiss exhibit reveals the fact that the famous gun firm has now given up the use of ball-bearings in the engine. The principal model is the 20-30 four-cylinder with bore and stroke of 110 by 130. The crankcase is not split in the usual way, but is in one piece, with big end plates to permit of the introduction of the crankshaft, which runs on three long phosphor bronze bearings. The carbureter is of the multi-jet type, and the float chamber is connected with the inlet pipe in such a way that the level of the liquid in the jet varies with the engine speed. The remaining details follow standard practice.

At the time of writing, toward the end of the show, which closes to-night, great satisfaction is being expressed on all sides at the good business which has been done—far exceeding expectations. Consequently, much optimism prevails.

Windham Interchangeable Body, a Taki

BENEFITS DERIVED BY HEAT TREATING STEEL*

By THOMAS J. FAY, President Society of Automobile Engineers

HARDENING through and surface hardening are quite different processes. For surface hardening the *"cementing"* process (sometimes called case-hardening) is called into play. In this process the primary consideration is that the steel shall be low in carbon. If the carbon is above 20 points, however, the results will not be satisfactory. The reason for this, as before stated, lies in the fact that the core (under the shell) will be hard and of a non-dynamic character.

Cementing can be done in the muffle furnace or in the metal salts bath; the results will be nearly the same in either case, because in cementing work the parts to be treated are placed in hermetically sealed iron boxes, completely buried in hardening powder. The result is the parts are not exposed to the uneven heat of the products of combustion in the muffle furnace, nor will sudden fluctuations of heat be imparted to the steel to be treated.

The softer the steel is (the lower the carbon) the better will be the core from the kinetic point of view. This will be especially true if the metalloids are low and the texture of the steel that is possible of attainment by the "acid" process. However soft the core may be, it will be toughened in the oil quenching and subsequent tempering process. The shell (originally, however soft the core) will take on the hardness due to cementing, and it is possible to impart to the surface of even dead soft iron, enough carbon to render the shell "glass hard."

The cementing temperature is about 900° C., as a rule, but higher temperatures will result in an increased depth of carbonizing while the hardness due to quenching will be greater for a greater difference as between the quenching bath and the temperature of the steel as it contacts with the quenching bath. Carbonizing should not be done at temperatures higher than the occasion would require and 1,000° C. would seem to be the maximum.

The time required to carbonize will depend upon the composition of the steel and the temperature. Swedish iron, very low in carbon (5 points is a fair figure) will take the longest and the highest temperature. Chrome nickel steel, with carbon at about 20 points, would probably take the least time in the carbonizing. In this latter case, too, the temperature should not go above 900° C.

The finest nickel steel products run about 10 points carbon for cementing work. With alloys the problem is one demanding more care, greater precision of temperature regulation, and finer steel. The *"hardening powder"* may be "Krupp hardening powder," for the grades of steel such as the Krupp Company, usually furnish for automobile work or the great variety of products for this purpose can be used with more or less success. One point is certain, however, the same materials should be used every time in any given shop because it is not possible to do uniform work and change the powder frequently. Of the various materials used for the purpose the following are a few:

Materials Used in Cementing Work.

If the electric furnace is available it will be a simple problem, since cyanide of potassium may be melted in the furnace and raised to the desired temperature. The pieces to be carbonized may be hung in the molten bath and left there for the requisite period of time, depending upon the composition of the steel. The formula of this compound is $K\ Cy = KCNO$. In this we have the carbon and nitrogen, the property of the latter being to increase the penetration of the carbon. It is for this reason the indiscriminate use of cyanide of potassium is not recommended by the author, in the manner as one can observe without traveling far. The steel must be low in carbon to warrant the use of this compound. Of cyanide of potassium the *"Materia Medica"* has to say as follows: "Characteristics.—White, opaque, deliquescent, crystalline mass, having the color of hydrocyanic acid, readily soluble in water, INTENSELY POISONOUS. (Semple.)—It is a matter of the greatest importance to remember the poisonous nature of this compound." The temperature of the molten bath can be about the same as for cementing with any hardening powder (or slightly less), while the time to grow the requisite depth of carbon will be a little less. The method is rapid since there will be no need to "pack" the parts to be hardened.

If bone products are to be used in the carbonizing process, they will rank, as regards their ability, in proportion to their fineness. The smaller the mesh through which the bone will go the more effective it will be as regards time shortening in the process. The coarser the bone is, the more space must be allowed around the parts in the box, for the bone, the actual weight of bone will be less since the per cent. of voids will be the greater for the coarse bone. For slower work, mixtures of bone and charcoal will serve the purpose while, to shorten the time, fine bone and charred leather will serve the purpose.

Experimenting Is Not Always Profitable.

Cyanide of potassium and common salt (sodium chloride) may be added if it is desired to increase the penetration, and the proportions of the component compounds can be varied over broad ranges. There is no need to risk experiments in a matter of this sort since very satisfactory results can be realized through the use of bone under suitable conditions. At all events, if a muffle furnace is to be used it is essential to pack the parts to be hardened in a box (cast iron) provided with a cover, so arranged as to permit of "luting" the cover with fire clay, to thoroughly seal the box. The box must be so roomy as to prevent the parts from contacting with the box.

The parts must be put in the box and the bone must be tamped in and around the parts tightly. Surfaces not to be carbonized must be protected by fire clay to an adequate depth. Warping must be aborted by avoiding any way by which the parts to be hardened will receive an uneven pressure. When all is ready the box can then go into the muffle furnace (the furnace can be up to heat) and the time of carbonizing will then count from the time that the contents of the box reaches the cementing temperature.

In the quenching of carbonized parts warping is very prone to follow, this is especially true if the metal is of a fine grain, but it is almost impossible to avoid it if the metal has been bruised in a previous forging process, or if the steel has been properly forged but not annealed before going into the cementing process. A medium grain uniform texture (not forged) steel will behave very well.

Warping is also due to unsymmetrical shapes and to the manner in which the parts are allowed to make contact with the quenching bath. Warping is also much to be dreaded in cases of high quenching temperature, and if the quenching bath is both cold and of high "specific heat," or if the property of disseminating heat is marked. Oil quenching from a low temperature then would be less likely to cause warping than water quenching from a high temperature. On the other hand, salt (sodium chloride) in the water would to a considerable extent abort the warping tendency.

Warping will generally follow if the parts to be hardened are not deftly lowered into the quenching bath, in a plane parallel to the greatest length. Tumbling the parts into the bath *en masse* is but to warp them. If the bath is of some media of a high boiling point (at the atmospheric pressure) the tendency to warping is somewhat less, since steam will not then insulate the hot surface unevenly.

Warping is due to the unequal distribution of the strains, and if the parts do not cool equally over all zones, strains will be

*Continued from page 781, "The Automobile," issue of Dec. 3.

set up in a manner unequal. Obviously, the thin portions will cool the first and the masses of metal last; any means of equalizing these tendencies will have a lasting benefit. Cam shafts, for illustration, are very prone to warp; they must go into the bath end on and quickly.

It is difficult to keep the bath from forming a layer of steam over the hot surfaces of the parts, and to avoid this the parts must be kept moving in the bath until the metal has cooled below the danger point. Gears, sprockets and other disc-like parts should be nested and clamped between soft iron plates in such a way as to perfectly expose the surfaces to be rendered hard, yet withal to prevent warping. Gears will curl if they are not thus nested, and in fine the nesting is desirable in that the number of gears that can be handled in a given time will be more.

Tempering Should Be Carefully Done.

In tempering (drawing the temper) there are two objects, viz.: (1) To render the steel dynamic (increase the kinetic ability); (2) equalize the internal strains. Even if the internal strains are below the ultimate strength of the steel (below the warping point) they will abound to a greater or less extent, at any rate, to the detriment of the parts, since from the ultimate strength must be subtracted the internal strains. This is a matter not usually well understood, but it is plain enough if it is given but a moment's thought. If the ultimate strength of the steel is equal to (a) and the internal strain in a zone is equal to (b), the remaining strength will be equal to $a-b=c$. Illuminating the internal strains will restore the original strength: $b+c=a$.

There are still a large number of points in relation to heat treatment that could, with profit, be discussed. Take for illustration the question of composition; to heat some products would be to ruin them. On one occasion the author ordered some nickel steel to be as follows:

	Per cent.	
Nickel	3.5 %	
Carbon	0.25%	
Silicon	0.20%	
Sulphur	0.04%	or within five points below.
Phosphorus	0.04%	
Manganese	0.40%	

The material came and was worked into the desired shape. The parts were then quenched from 900° C. and subsequently tempered at 250° C., with what result? It was a waste of time. It was not a waste of material, waste cannot be wasted, the parts were brittle as unannealed glass. Further investigation of the matter showed that the reliable (?) vendors of the product, furnished a *special heat* of a product that was to be better than the steel usually to be had on the open market, which special heat (when chemically investigated) proved to be as follows:

	Per cent.	
Nickel	3.05 %	
Carbon	0.42 %	
Silicon	0.28 %	far too high in nickel;
Sulphur	0.08 %	metulloids very high.
Phosphorus	1.05 %	
Manganese	0.55 %	

Why did we not subject the steel to an analysis before working it up? The requirement as the original specifications would indicate, was not the finest steel by any means; it was not supposed that any steel mill would fail to fill an order of steel of no more than moderate quality; at all events the steel would not stand for heat treatment, and that is the point.

Records of actual failures are, of course, more valuable than suggestions of how to succeed. On the other hand one does not like to brag about one's failures; the fact remains, to succeed with heat treatment it is necessary to select tbe steel, in view of the requirements. The best way, perhaps, would be to get acquainted with regular brands of steel and use them for the purpose for which they are supposed to offer advantages.

There is one other matter of the greatest importance to be mentioned ere this subject is closed out. It is known that chrome nickel steel, if it is forged after it is received from the mill, is rendered more or less hard and unmanageable. It is a fact that the vendors of the same steel can make forgings of the same material and they will be quite as soft as the round bars; why? It is a question that has puzzled most of us for many a day. We even went so far as to persuade ourselves that the mills bad a monopoly of brains.

What it looks like is a monopoly of *cupidity;* the mills do not deliver bar stock in the same shape or condition as the stock they, themselves, use in the forging process. The bars delivered are heat-treated; the stock they use is normal; result, they can make forgings that will be soft enough to machine. The effect of the heat treatment is to render the bar steel more presentable. The same treatment rends the stock of no value as forging stock.

For forging work it would be better to order steel in the normal state, and if it is to be heat treated, perform that operation upon the finished articles. It must be remembered, however, the forgings must be annealed before machining, for two reasons, viz.: (a) To render them soft for machining; (b) to abort warping in the subsequent heat treatment.

It would be possible to heat-treat with less of warping, if the parts were annealed again after machining, but this is an ultra refinement. In the annealing process, if the forgings are to be soft it will be necessary to proceed thus:

1. Apply the initial heat by means of a wood fire, to avoid any but a genteel heating of the steel until the metal is warmed up;
2. Then heat slowly and uniformly in a suitable furnace, up to the forging temperature;
3. Commence forging at once, do not allow the steel to "soak";
4. Forge continuously, until the steel reaches tbe low forging limit;
5. If tbe desired shape cannot be had by that time, heat again to the high forging limit in the same slow and even manner.
6. Continue to forge without allowing the steel to soak. Forge until the low forging limit is reached. (If necessary repeat.)
7. Allow the forgings to cool slowly in lime;
8. Anneal at temperatures between 870 and 1,000 degrees C., depending upon the composition of the steel (900° C. is the most used temperature);
9. Double anneal if the steel is persistent in its hardness.

Keep Within the Forging Limits.

The forging limits of heat will lie between 965 and 678 degrees C. The quality of the forgings will always depend upon the work put upon them. If they are not worked down to the low limit of forging the grain will be coarse and open. If the steel is heated to a point far above the high limit, the structure will tend to be crystalline. If the steel is heated unevenly and not through, the result will be a *bruised* fabric. Persistent hardness is to be dreaded, and it will follow if the steel is not properly forged. In that event, annealing will not accomplish the desired end. These fabrics are prone to hold to their habitual allotropic state and that is not the state, *alpha*. If the steel holds to the *beta* state of allotropy, it will be brittle; if, on the other hand, the *gamma allotropic* state obtains, the steel will be hard.

The higher the carbon the more is the likelihood of the steel to hold to its brittle or to its hard state. Alloy steel is the greatest offender in this connection. It is therefore a matter of skill in the light of knowledge, to succeed in rendering forgings soft to machine, after going through a forging process.

If, on the other hand, the steel is oil-treated at the mill before it is forged, there is no chance at all of being able to make the forgings soft enough to machine, commercially. If the user of steel demands the proporties of oil-treated chrome nickel steel, they must, of course, put up with the consequences. It is not then the fault of the fabricator of the same.

The normal chrome nickel steel will not look nearly so good as the same after heat treatment, and it is possible the fabricators were compelled to resort to treatment before delivery, in order to be able to sell the steel. It was not so long ago that

impossible values were demanded, (and advertised) values, in fact, only to be had if the steel was oil quenched and but partially "let down." Of course such products were difficult to machine, and if forged, even refused "*Novo Steel*" cutters, in the hands of men of much skill.

In conclusion of the subject, there is at least one other matter that should have some attention at least; that is to say, the variety of brands of steel should be limited in so far as it may be possible to do so.

If all parts of a car could be made of a single brand of steel the better would be the results, all things considered. The builders of the cars would be able to take a greater advantage of the influence of quantity in purchasing the steel; the artificers would attain a greater knowledge of the steel, and the user of the car, in each case, would have less trouble in his quest for suitable repairs.

Theoretically, it is possible to provide all the desired qualities in steel, using a single grade of the same. This is not to say the grade in question would have to be some fine and rare brand of steel; indeed, the product would have to be either a very near approach to "iron" or the ingredients placed to impart hardness would have to be anything but "carbon."

The absence of carbon, excepting as a necessity in production, (limited to a low point) would render the steel more nearly universal in its application than would be the case were the carbon present in any considerable amount. The steel could then be subjected to "heat treatment" to impart the several desired qualities, without danger of destroying the dynamic ability of the same.

In the absence of carbon it would be possible to consider alloying as a regular thing. This statement takes into account the fact that the carbon would have to be present in quantity sufficient to render the fabrication of the steel possible. The carbon could be limited to say, 0.10% (maximum), under which conditions nickel would impart excellent qualities, and chromium would be of exceeding value. Even vanadium might be an ingredient in what could be called a universal product. It will be understood, however, it is not well to have more than two alloying elements in any product on the ground that uniformity cannot be assured when the alloying process is complex. Even one alloying element is better than two, if with one element the desired qualities can be imparted to the steel.

In the long run it is the ultimate cost that limits quality. This ultimate cost takes into account the first cost of the steel, and the difficulty in manipulating and machining the same. True, it is never necessary to use steel better than the work demands, but experience so far has not rendered it possible to decide that the materials used in automobiles were better than they should be.

At all events it does look as if the end will be towards a class of steel that will lend itself to heat treatment, to impart the several desired qualities, and in this steel the chances are the carbon content will be very low indeed. It is not to the interests of the fabricators of steel to hasten this time, because the lower the carbon the quicker will the linings of the converters and the furnaces burn out, and the fabricators of steel will not advocate a process that ends in any extra cost to them. It might be argued they can charge for the extra cost, due to the high heat, in the absence of carbon; but on second thought, it is to say they cannot charge more than they do, unless the 'tariff" is increased, because they now charge on a basis of the cost of the imported article, which includes the tariff and the transportation.

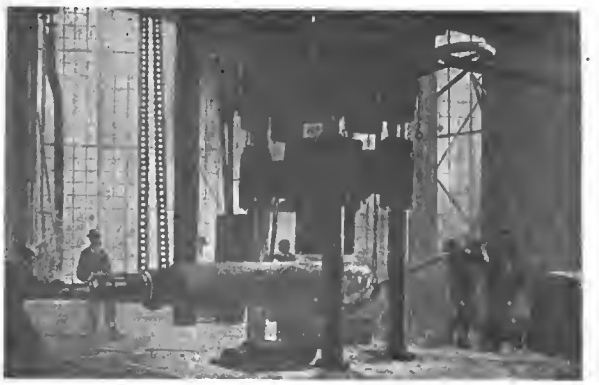


Fig. 1—Hammering process in the fabrication of steel.

Any increase in the cost would enable one to import the steel at a saving, and it goes without saying that users of steel would take advantage of a possible saving. At all events, if the builders of automobiles want steel with low carbon, they must decide for themselves as to the reasons. If low carbon is desirable, the steel so constituted can be had from abroad if not from the home mills. Since mild steel (steel with very low carbon) will stand even abuse in the heat treatment thereof, it is a good product to consider, even if alloying elements have to be introduced to impart the desired "tensility." It is the low carbon steel that has to be used if "cementing" is resorted to, and it is certainly possible to realize great dynamic ability in the absence of carbon. It is a question if dynamic ability is characteristic of any grade of steel, if the carbon content is pronounced, even though the steel be alloyed.

The claims of dynamic ability for vanadium steel, for illustration, do not hold at all, if the carbon is high; who will say it is not the absence of carbon rather than the presence of vanadium that imparts the so-called dynamic qualities? At all events, when the smoke of battle lifts, the author is of the opinion that the "old wagon maker" with his (very low carbon) iron, came very near to knowing what constituted the maximum endurance, the greatest ease of working and the uniformity so much to be desired in work of the sort under discussion.

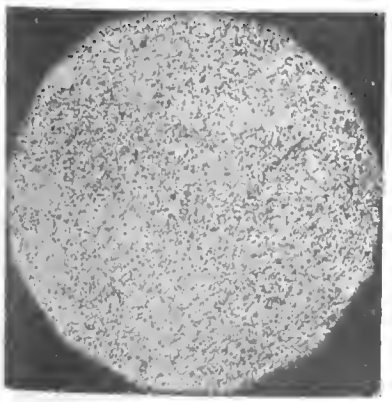

Fig. 2—Micro-photo of normal steel.

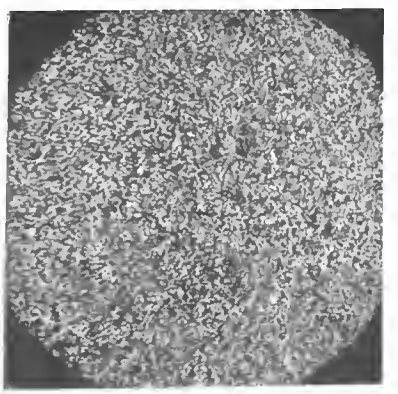

Fig. 3—Micro-photo of annealed steel.

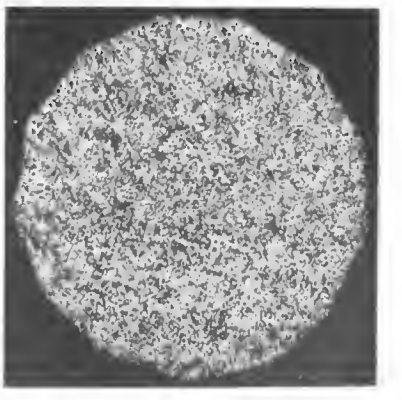

Fig. 4—Micro-photo of tempered steel.

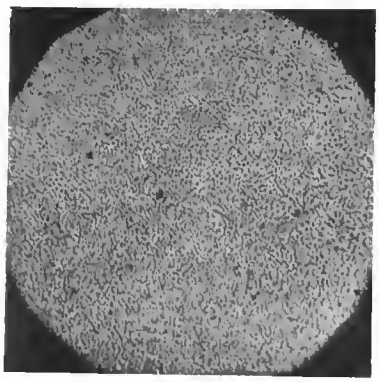

Fig. 5—Micro-photo of core of cemented steel.

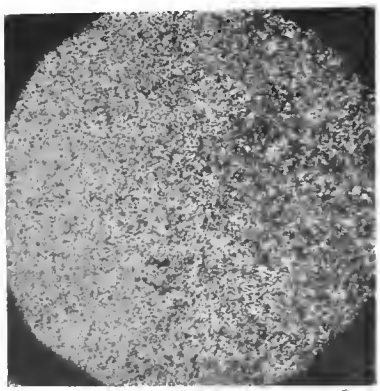

Fig. 6—Micro-photo of armor of cemented steel.

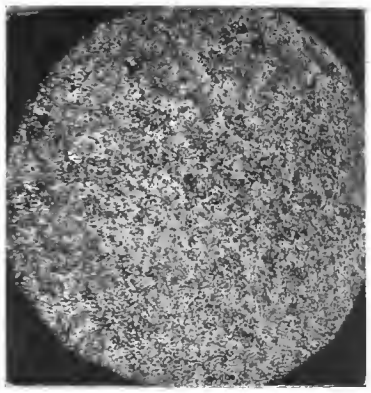

Fig. 7—Micro-photo of special treatment of steel.

The illustrations accompanying this article are micro-photographs of "Bishop" soft chrome nickel steel, and are offered with the idea of showing by means of micro-photographs that in beat treating steel does undergo structural changes, and it is reasonable to assume that the physical properties will be influenced by these changes. As a matter of fact there is a marked difference in the physical properties of the steel according as the structure is altered by the treatment, as the following tabulation will show:

Fig. 1. The properties of fabrication.

Fig. 2. Normal steel, the physical properties of which are as follows:

Tensile strength, 110,000 per square inch;
Elastic limit, 100,000 per square inch;
Elongation, 20 per cent. in 2 incbes;
Reduction of area, 60 per cent.

Fig. 3. Annealed steel, the physical properties of wbich are as follows:.

Tensile strength, 108,000 pounds per square inch;
Elastic limit, 104,000 pounds per square inch;
Elongation, 24 per cent. in 2 inches;
Reduction of area, 69 per cent.

Fig. 4. Tempered steel, the physical properties of which are as follows:

Tensile strength, 200,000 pounds per square inch;
Elastic limit, 164,000 pounds per square inch;
Elongation, 5 per cent. in 2 inches;
Reduction of arca, 25 per cent.

Fig. 5. Core of cemented steel, the physical properties of which are as follows:

Tensile strength, 222,000 pounds per square inch;
Elastic limit, 214,000 pounds per square inch;
Elongation, 12 per cent. in 2 inches;
Reduction of area, 56 per cent.

Fig. 6. Armor of cemented steel, the physical properties of which are as follows:

Tensile strength, 350,000 pounds per square inch;
Elastic limit, 290,000 pounds per square inch;
Elongation, 3 per cent. in 2 inches.
Reduction of area, nominal.

Fig. 7. Special treatment, the physical properties of which are as follows:

Tensile strength, 135,000 pounds per square inch;
Elastic limit, 120,000 pounds per square inch;
Elongation, 18 per cent. in 2 inches;
Reduction of area, 65 per cent.

Obviously this steel could only be worked in its annealed state and only then with machine tools of considerable rigidity, using high tungsten steel for the cutters. It is used for the most responsible parts in the absolutely high grade automobiles, and its presence to any considerable extent is the natural indication of high first cost.

RELATIVE ADVANTAGES OF MAGNETO AND COIL

WHILE a great deal is said about hot sparks, the "fat" kind and the other kinds, and while the claim is made that the magneto is the more efficient, the fact remains that the reasoning is generally defective. Tbe temperature of an electrical spark is fairly constant because it is the temperature due to the high resistance in the "gap" quite independent of the source of the electrical energy, be it from a battery or a magneto. The energy of the spark will depend upon the electromotive force, in the secondary circuit since,

$$W = E\,I \qquad (1)$$

in which

W = energy in watts;
E = electromotive force in volts;
I = intensity of the current in amperes.

The electromotive force can be just as high in the spark coil circuit as in the magneto circuit. It is not in tbis relation, then, that a differencc will be found in the efficiency of the methods. The actual heat dissipated in the gap at the spark plug will depend upon the actual dissipation of energy, and this in turn depends upon the length of the gaps in a given atmosphere and also the electromotive force; since the current in amperes:

$$I = \frac{E}{R} \qquad (2)$$

when,

R = resistance in ohms, or, the virtual equivalent;
I and E to be taken as in (1).

This heat, as above expressed, may be reduced to (small) calories as follows:

$$H = EIt \times 0.24 \qquad (3)$$
$$= I^2Rt \times 0.24 \qquad (4)$$

when

H = the heat equivalent in small calories:
t = time in seconds;
I, E and R to be taken as above.

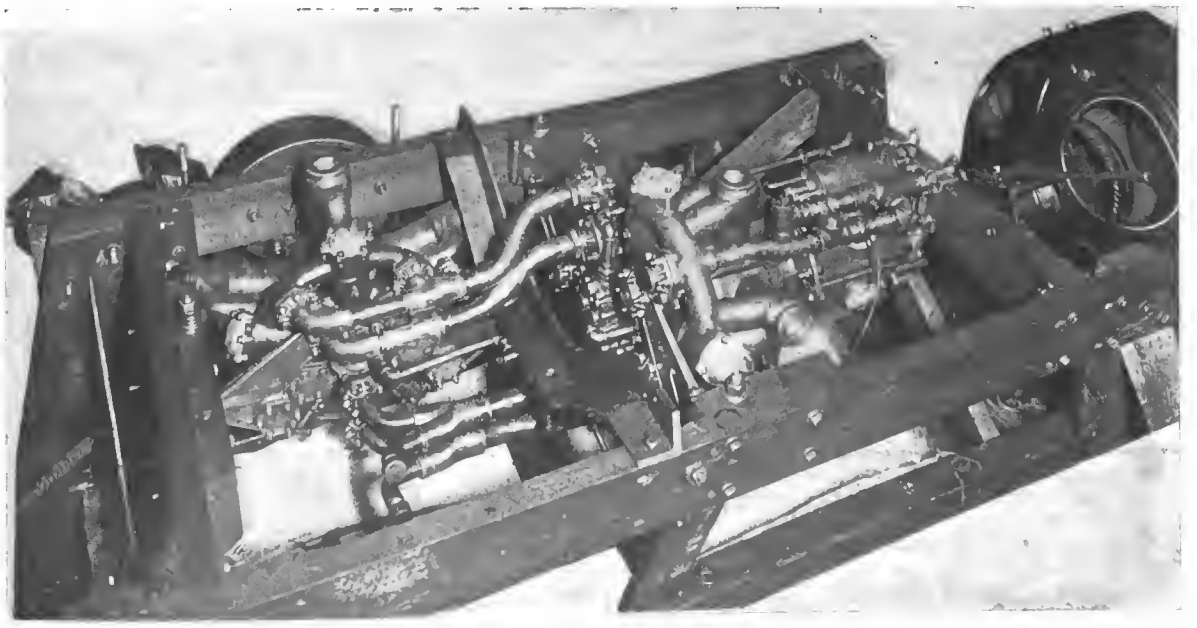
This expression is more comprehensive becausc it does take time into account, and it does deal with the heat directly, rather than the instantaneous value of the electrical energy in watts. At all events, irrespcctive of the mode of procedure, it is plain to be seen that no condition thus far shows any advantage in one mode of generating the electrical energy over the other. What is to be seen is that the spark is of equal competence.

MANLY HYDRAULIC VARIABLE SPEED TRANSMISSION

By THOS. J. FAY.

IN view of the incongruities in the sliding gear, and the limited number of speed changes in the planetary types, it is no wonder that inventors keep at it with a view to evolving some plan more in keeping with what they think ought to obtain for the purpose. The "Manly Drive," so called, belongs to the class of transmissions said to be more in keeping with the requirements, and that it is well worth looking at and pondering over is assured from its up-to-date performances. The Manly drive does work very nicely, and it does afford a most perfect control.

The system may seem to be complicated, as viewed by the novice, whereas the contrary is true. Fig. 1 shows the system as it appeared the other day when the writer was enabled to examine and run a test. Besides the test on an improved equipment of the kind, an earlier experimental type was examined in a truck where it has been doing good work for upwards of a year under a gross load of 8,500 pounds. Inventor Chas. M. Manly states the truck in question has been making the rounds in the streets of New York during this period.



Manly Hydraulic Transmission System, Showing Control and Motor.

The Reported Performance of the Truck.

Observation, during some 3,000 miles, led to the conclusion that a truck in which many speed variations could be effected would result in tire economy, and in the case in point the tires, which were 34 x 4 inches, front and rear, wore down less than 3-16 inch. The speeds available were all degrees from a slow crawl to the maximum possible in view of the highest power of the motor. In changing the speed there is no positive increment, since the result is due to the alteration in the volume of liquid (oil) that is actually pumped, or, circulated.

To change speed it is not necessary to alter the speed of the motor, and as a result the motor is allowed to run at its best power speed all the time. Power multiplied by speed is a constant, hence the ability of the power plant is not reduced under any conditions of operation. In other words, as the speed of the car is reduced, the torque of the transmission increases, if necessary, in the same ratio, and the motor is allowed to run at a constant speed. This is also true if a sliding gear is used, in so far as speed changes are taken advantage of. In the sliding gear, however, if the motor is run at a variable speed instead of sliding the gears, as is ofttimes the case, the motor ability will fall off, since the torque of a motor is not increasing with decreasing speed. The Manly drive has certain other novel features that are worth taking into account. To go into reverse, the liquid is circulated in reverse. To stop, the valves are thrown to neutral, and the system locks. Result, brakes are not necessary with this drive.

In this system the differential gear is not used at all, because two hydraulic motors are employed, one on each driving wheel, that is to say, connected therewith. The whole idea, then, consists of as many hydraulic motors as there are wheels to deliver power to and a valve system that regulates the flow of the fluid, which is ordinary mineral oil with a low congealing point and low viscosity. Plainly, the question of lubrication does not enter into the problem, and as to noise, there is very little or none, since the oil dampens all noise tendencies. The motive power is by way of an automobile motor of the internal combustion type (a gasoline motor) placed in front in the usual way, and in all respects conforming to regular standard practice. The control system consists of one lever, not counting the steering wheel for the car. The one control lever is conveniently located at the side, and by its movement all speed changes are made.

The Pressure of the Transmission Oil.

The lowest pressure is about 200 pounds per square inch, and as the speed is lowered the pressure increases. The highest pressure is about 2,400 pounds per square inch, and, as might be expected, the system of valves and the hydraulic motors which handle this wide range of pressures, must be very well designed and constructed. Fine grades of bronze are used throughout, and by an ingenious construction, as is shown in the illustration. Of leakage there seems to be very little, if any, and apparently the methods of packing are so simple and secure as to assure good performance, and no very considerable trouble from the high pressures that must, at times, obtain.

The indications thus far would seem to show an efficiency of about 85 per cent. (mechanical) of the power applied to the transmission, that per cent. being delivered to the wheels under the best conditions. This is something to take into account in slow-moving vehicle work, in which a double gear reduction would make inroads in the mechanical efficiency. If this system shows a high efficiency under the best conditions, it also does extremely well under more adverse conditions, since the liquids do not have to move so fast, and the friction losses of the liquid will be on the decrease as the other losses begin to mount up. In several ways there are compensating factors that seem to augur for good.

There is one other point to be considered before the subject is dropped, i. e., in electric automobiles it is a fact that the torque at low speeds is very high and favorable, as is generally recognized. In this system the same advantage is available, but to a more marked degree, since the motor will have a greater power rating than is usually available in electrical drives in view of the limits imposed by batteries. With motors of considerable power and the hydraulic transmission, in which the torque increases as the speed decreases, it is plain to be seen that the starting torque can be very high, indeed.

Some Factors for Commercial Success.

In commercial work it is generally well understood that the personal equation is a matter of considerable moment. "Foolproofness" has been the dream of those whose experience with commercial automobiles enables them to judge of the damage that can be inflicted on a machine by a man of just a little experience armed with a monkey-wrench and a screw-driver. In the hydraulic transmission system of the subject, the whole matter is reduced to its simplest form, in that the man (so armed) will be defeated, for he cannot find a use for the tools. Everything is housed in, the parts are simple and strong, and they cannot be the victims of dirt and grit, and they are profusely lubricated.

The Manly drive will be exploited by the Manly Drive Company, Whitehall building, New York City, and its future performance will be watched with considerable interest.

MICHIGAN'S PROGRESS IN ROADS BUILDING.

LANSING, MICH., Dec. 5.—The annual report of the Michigan Highway Commissioner, which will shortly be made to the Governor, will show that during the three and one-half years just passed, the period of the present incumbent's term of office, 326 miles of new road—macadam and gravel—have been built. This is believed to be a better showing than any other State in the Union can make. These roads have been inspected and their construction supervised by the highway department at a cost of less than 1 per cent. Of the total mileage completed, 153 miles are macadam roads, 140 miles gravel, 3.6 miles are of stone bottom with gravel top, 2.5 miles gravel bottom and stone top, and 1 mile of low-grade gravel road.

The commissioner states that the larger part of the applications that come in for State aid are for gravel roads instead of macadam. He states that he has been trying to induce road districts to put in gravel instead of macadam, as the former are not only cheaper, but are not worn so much by automobiles as are the macadem roads. The State has paid during this period $228,215 as awards in assisting in building new roads.

NEW ORLEANS TO HAVE TAXICABS.

NEW ORLEANS, Dec. 5.—New Orleans is to have taxicabs, being the first city in the South to have them. Announcement was recently made of the formation of the New Orleans Taxicab Company. Application has been made for a charter, and the company expects to be in full operation by January 1 with part of its taxicabs running by December 15.

The new company, which was organized by W. E. Woodward, of New York, and who is identified with similar companies in New York, Boston, and three other cities, is capitalized at $200,000. One hundred taxicabs will be operated.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, General Manager, 29 West 42d St.

Jan. 5.....—New York City, Fourth Annual Meeting Society of Automobile Engineers. (Will adjourn until January 19 after opening session.)

Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. M. L. Downs, Secretary, 7 West 42d St., New York City.

Jan. 25-30.....—Detroit, Light Guard Armory, Seventh Annual Automobile Show, Tri-State Automobile Dealers' Association.

Jan. 27-Feb. 3..—Philadelphia, Second Regiment Armory, Eighth Annual Show, Philadelphia Automobile Trade Association.

Feb. 6-13.....—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York.

Feb. 15-20.....—St. Louis, Mo., Annual Show, St. Louis Dealers and Manufacturing Association.

Feb. 15-20.....—Detroit, Wayne Pavilion, Annual Show, Detroit Automobile Dealers' Association.

Feb. 15-20.....—Cleveland, First Regiment Armory, Annual Show, Cleveland Automobile Dealers' Company.

Mar. 6-13.....—Boston, Mechanics Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. Chester I. Campbell, Manager, 5 Park Square.

Mar. 27-Apr. 3..—Pittsburg, Duquesne Garden, Automobile Show, Pittsburg Automobile Dealers' Association.

Races, Hill-Climbs, Etc.

Dec. 8.....—Worcester, Mass., 200-Mile Endurance Run of the Worcester Automobile Club.

Jan. 1-2.....—Philadelphia, Two-day New Year's Run of the Quaker City Motor Club.

FOREIGN.

Shows.

Nov. 28-Dec. 13.—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France (Pleasure Vehicles, etc.).

Dec. 20-28.....—London, Stanley Show, Agricultural Hall.

Dec. 22-29.....—Paris, Eleventh Annual Salon de l'Automobile. (Commercial Vehicles, etc.).

CARRIAGE CO. TO MAKE COMMERCIAL CARS.

YORK, PA., Dec. 5.—A new feature is in evidence for York's automobile industry. The Martin Carriage Company, one of the largest manufacturing establishments of the vehicle in the State, will in the near future begin the manufacture of gasoline commercial motor wagons. Such a move has long been contemplated, but never completely launched until recently, when by unanimous vote of the officers of the company the work was authorized. The new line will consist of all vehicles used in the commercial world for delivery and transfer purposes and will be equipped with engines made for the Martin company by another concern.

It is the opinion of the officers of the company that gasoline or electric motive power is destined to take the place of horses in the commercial world, especially in the larger cities. In expressing their views the officers stated that the automobile will not displace the horse in the country for a long time.

ANTI-AUTO LAW WILL STAND.

OTTAWA, Dec. 1.—According to the report of the committee of the Privy Council, approved by the Governor-General of Canada, the anti-automobile act passed at the last session of the Prince Edward Island Legislature has been declared within the power of the provincial Legislature to enact. A copy of the report has been sent to Lieut.-Gov. McKinnon at Charlottetown.

LETTERS INTERESTING AND INSTRUCTIVE

IMPORTANT DETAILS OF DESIGN IN CYLINDERS.

Editor THE AUTOMOBILE:

[1,664.]—Esing a subscriber, I would like to know the advantage claimed for cylinders cast in pairs ovsr cylinders cast singly, or in one block. Pleass explain the auxiliary exhaust. Also please state which is the best, a small compression space (that is, a high compression) or a larger compression space, or moderate compression. Ths reason I ask is that if ths compression is high, ths spark would jump with mors difficulty than under low compression. Also, if the compression is weaker, it would take less energy to again comprsss the gas. On ths other hand, a high compression is more powsrful; so please tell me and givs reason which is best.

Tiffin, Ohio. C. L.

If cylinders are cast in pairs the intake and exhaust manifolds will be more simple, and the crankshaft will be of the three-bearing kind. If the cylinders are cast *en bloc* a two-bearing crankshaft can be used, and the intake and exhaust manifolds will be the most simple. Auxiliary exhaust ports are by way of a better scavenging of the cylinders. In relation to the compression, it is better to have the same neither very high, nor especially low. Modern sparking equipment is capable of delivering a spark under the most severe conditions possible to impose, so that there is no trouble from that point of view. If the compression is too high, the motor will "knock" under certain conditions, as on a grade, if it is long. On the other hand, if the compression is low the power will be low as well; possibly the compression might be about 80 pounds per square inch absolute. Preignition will follow if the compression is in near proximity to 95 pounds per square inch. With a lower compression, when the cylinders become carbonized, if they do, preignition will be eminent. Within certain limits the power does not seem to be affected by changes in compression. In relation to this phase of the question, there is the speed to be considered: the higher the compression the faster will the motor run, all other conditions agreeable. In fine, it seems out of the question to arbitrarily settle the question, since the details of design will influence the situation.

METRIC THREADS FOR PLUGS GIVE TROUBLE.

Editor THE AUTOMOBILE:

[1,665.]—In ths course of work which I am doing I found it necessary to tap a cast iron bushing with a thread in ordsr to fit a metric spark plug. I started to do this work on a lathe, but found it was a peculiarly odd number of threads, and I could not definitely decide how many threads thers were to the inch. If you can, without inconvenience, give me this information; or, better yet, inform me where I can secure a tap for a day or so; I will be very much indebted to you.

Schenectady, N. Y. F. C. BARTON.

A millimeter thread gauge will enable you to ascertain the metric pitch of the threads in question. The metric pitch of threads is not one to be handled in English equivalents. If you consider that in the metric system you have a certain number of threads per centimeter, in your case, you can then proceed as follows:

As, 1 inch : 1 centimeter :: 1 : 0.393704;

With this information at hand, if you have a lathe such as will enable you to make the changes, reduce the motion of the screw to conform to the above proportion. If you can introduce into the screw-cutting train two gears, one of 50 teeth and the other of 127, it will be possible to do the work, for the reason that

As, .3937 : 1 :: 50 : 127;

There will be a slight error in the proportions as given, but it will cause no trouble at all. What you probably want is an 18 millimeter French tap for the work you have to do. If you cannot get one from your supply man, the next best thing will be to proceed as above. Perhaps one of the Metropolitan importers of foreign cars can help you.

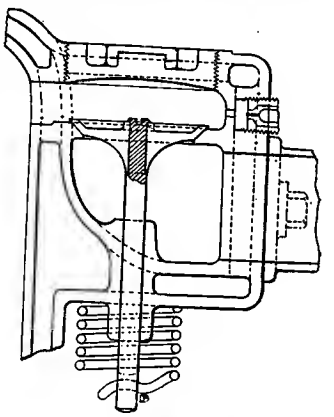
VALUE INTEGRAL STEMS OF MUSHROOM VALVES.

Editor THE AUTOMOBILE:

[1,666.]—I have a motor in which ths valves are mads of two parts, i. e., high nickel steel mushrooms with inssrted carbon steel stems. Evsrything seems to be all right excepting that occasionally a stem drops out of ths mushroom and ths consequences ars hardly necessary to describs. At all svents, I am curious to know why the stsms depart from the mushroom.

Nsw York City. XYZ.

In the majority of cases the troubles related are conspicuous for their absence. The process indicates a percentage of this sort of trouble, because the high temperature on the exhaust side at any rate, will introduce variable conditions of expansion, since the metal of the stem and of the head is not identical, and again, it is impossible for machinists to invariably attain the same degree of tightness of the fit. It is customary in this class of work to "rivet over" in the manner as shown in the illustration here given. The expectation from which may be briefly stated as follows: The static pull of the spring is, say, 42 pounds, which spring is made 2 inches in diameter and 5 wraps of a 3-16 inch diameter wire. If the shock imparted to the sheer section of the riveted over portion is equal to the static pull, then the shearing moment on the riveted over section will be 84 pounds. The riveted over section will stand 99 pounds in this particular case; if the work is as well done as the section drawing indicates, but the difference between 84 pounds initial shearing impetus and 99 pounds actual shearing ability is not sufficient to compensate for inequalities in degrees of perfection of the workmanship in practice.



Section Through Mushroom.

THE INVENTIVE MIND WORKS, ANYWAY.

Editor THE AUTOMOBILE:

[1,667.]—I am doing a lifs sentencs for murder—it has an ugly sound—but it was only a rude duel. I have been in prison sincs Octobsr 13, 1900, and during the whole time I have made automobils construction a study. Of the sevsral devices I have invented is one I send you, and hope you will find merit in it and do something by way of helping me procure a patent on the same. It is a ball and socket stsering hub.

Maclester, Okla. ORRIN DE LOSS.

Your communication shows a disposition on your part to try to do too many things at one time. You cannot be a success at automobiles, flying machines and other things besides. With so much time on your hands you should be able to make a success of some one thing.

SEVERAL FEATURES OF DESIGN TO CONSIDER.

Editor THE AUTOMOBILE:

[1,668.]—Any information you can give ms on the following will bs greatly appreciated:

1. What is ths rim insids diameter of a tirs 36 by 4 inches, and a tirs 34 by 4 inches?

2. Is there any reason for not making the front springs of a car level or flat? The only cars I can find with flat springs are the Thomas taxicabs and the 1909 Lozier. The makers who use front springs with the greatest curve make the rear ones flat, or very nearly so. Why? Are full elliptic springs with scroll at each end suitable for a touring car weighing about 3,000 pounds empty?

I have noticed that some makers attach full elliptics to the frame rigidly, while others use a kind of pivot. Which would you advise using?

3. Can you tell me whsre I can get a few small plunger pumps, cam operated? I have watched your advertising columns for nearly two months and have hsen unable to find any one who makes them.

4. Can you tell me the address of the MacAdamite Company, of Brooklyn, N. Y.? They make castings similar to aluminum.

5. Do you think that a multiple disc clutch having phosphor bronze discs with cork ineerts ksyed to the flywheel and steel discs keyed to the driven shaft, will work well? What would be the smallset diameter possible? Numher of discs? About what spring pressure for clutch of a 50-60-horsepower two-cycle motor? MORTON E. MYERS.

New York City.

(1) Depends upon the tires to be used; consult the tiremakers.

(2) Flat springs are more flexible. Some designers avoid flexibility in front; they can do so with safety since the load is nearly constant, consisting of the motor, etc. Rear springs, if flat, will be very flexible, and a preference for flexibility is expressed by many autoists. Full elliptic (scroll) springs seem to give very good satisfaction on the cars so provided; it is experience that counts. There is no objection to the rigid connection; 3,000 pounds would not be excessive for the springs made for the load. The rigid connection eliminates a joint; grit gets into joints.

(3) The makers of force-feed oil systems probably make the kind of pumps you want; the sizes might be too small. Try them.

(4) Address the United States McAdamite Metal Company, Rapelye street, Brooklyn, N. Y.

(5) It was not so long ago that the question of multiple disc clutches was discussed in THE AUTOMOBILE, and reference was made to "cork inserts." When it comes to specific designs, to consult the makers of clutches will be the safest way. See THE AUTOMOBILE, page 569, October 22, 1908. The spring pressure for a clutch to use on a 50-60-horsepower motor would have to be determined considering the clutch.

DOES NOT DEPEND SO MUCH ON DIMENSIONS.

Editor THE AUTOMOBILE:

[1,669.]—Which motor is the best, taking for granted they are the same, except the bore and stroke: One motor weighs 265 pounds, hore 4¼ inches, stroke 4½ inches, and claimed to develop 12-horsepower. Another one is 5-inch bore and 4-inch stroke, also claimed to develop 12-horsepower (both at 1,000 r. p. m.); weight 225 pounds. Inlet valvee 1¼ inch, exhaust 1½ inch on the first motor, and 1 11-16-inch inlet valves and 1 11-16-inch exhaust valvee on the last motor. Which do you consider the hest, and which will last the longer? SUBSCRIBER.

Galva, Ill.

Of two motors, the best will be the one of the most harmonious design, suitable materials and accuracy of construction. At a distance, these matters cannot be passed upon. In general, the largest piston displacement is the most likely to deliver the rated power, if the design is confined to relations within the known quantities. On the other hand, the motor with the largest bore, with, say, a crankshaft of inferior material, might be a very bad selection.

THE KNOCK IS IN ONE CYLINDER ONLY.

Editor THE AUTOMOBILE:

[1,670.]—In my Maxwell two-cylinder touring car there is a decided knock in the left cylinder only. All bearings and connections are in good shape. It has been suggested that a loose fitting piston may be the cause. Will you kindly suggest the proper remedy, if there is one short of replacement?

Spartanburg, S. C. W. B. W. HOWE, A.M.

If the timer is out of order the knock will be due to that fact. Possibly one cylinder has been fed an excess of lubricating oil and as a result a growth of carbon is there to make itself felt. If the knock was not always present, it is not likely that a loose piston is the answer. If the valve settings have become deranged, it is something to take into account. Then, again, it is just possible that the water circulation around the head of the knocking side is in bad shape.

CASTOR OIL ADVOCATES COME TO THE FRONT.

Editor THE AUTOMOBILE:

[1,671.]—On page 703 of your issue, Novemher 19, you havs a heading, "Castor Oil Lubrication Will Grow." Being from the "tall timher," I would like to get some information in regard to castor oil lubrication. If it is better than mineral oil, why is it hetter, cost not considered? OSMOND H. BARRINGER.

Charlotte, N. C.

Thus far castor oil has been limited in its use to the fastest racing cars abroad, from all accounts. Its excessive cost would bar it from general use.

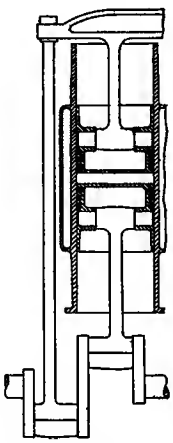
LOST MOTION IN SOLID BUSHINGS.

Editor THE AUTOMOBILE:

[1,672.]—Please tell me if hy cutting through the main hesrings of my crankshaft with a hack saw, and then introducing shims, to make up for the difference, would I not be making the hearings (nearly) as good as new? WOULD-BE SUBSCRIBER.

South Braintree, Mass.

Depends upon how well the work is done, and, further, upon the extent to which you scrape the surfaces to a fit.



Two-Piston Motor.

THE GOBRON-BRILLIE MOTOR.

Editor THE AUTOMOBILE:

[1,673.]—In your answer to the "Question Mark," letter No. 1,651, you have apparently confused the old Gohron-Brillie motor with some of the more recent creations which inventors are endeavoring to foist upon us. The Gohron-Brillie hae two separats pistons in each cylinder which work in opposite directions, the explosion taking place hetween them. The pistons are connected to cranks at 180 degrees to each other. Ths cylinders are cast in pairs, and the pistons in each pair work together; the upper piston connecting rods are joined together hy a beam across the top. The drawing shows the arrangement more plainly than any description. The advantage claimed for this construction is the more rapid expansion of ths gas, allowing a larger proportion of its energy to be utilized. G. H. GODLEY.

Cambridge, Mass.

Drawing in No. 1651 referred to illustrated the double piston as requested.

WELL-PUT RÉSUMÉ OF THE CHAIN SITUATION.

Editor THE AUTOMOBILE:

[1,674.]—I read with interest the remarks of Mr. Fergusson, quoted in The Automobile of November 26. He states: "Two tendencies in construction stand out prominently above all others. The first is the wide adoption of the shaft drive among the makers who have heretofore produced none but chain-drivsn cars * * *."

In discussing the general tendencies shown at the motor car show in London, the "Autocar" states: "The chain drive is still very far from dead, and now that eilent chains are hsing used, there is no doubt that much is yet to be said for it, particularly in the case of the large heavy bodied cars. This is, of course, on the assumption that the chains are properly enclossd in oil-tight chain cases, which, by the way, in some inetances, by means of their framework or otherwise, are made to do their duty as radius rods. Almost all the makers who have had long experience with chain and chainless cars still believe most emphatically in the chsin drive; at any rate, for the larger types, on account of its flexibility and the reduction of the unsprung load upon the rear tires."

I think that the above quotation shows clearly that thers has not heen a wide adoption of the shaft drive among maksrs who have heretofore produced none but chain-driven cars.

New York City. JOHN JAY IDE.

AN INVENTOR LOOKING FOR BACKING.

Editor THE AUTOMOBILE:

[1,675.]—I have invented improvements in automobiles which will revolutionize the industry. I have no capital. Can yon tell me how to realize for myself as well as for others, or shall I let them die a natural death? You know the old maxim: "A hurnt child dreade the fire." FRANK HUTCHISON.

Herndon, Va.

Death never yet overtook a principle. If you think you have something revolutionary, push it and generate a revolution.

The Leader of the Gaeth for '09 is Type XX, Illustration of which is Herewith Given.

RECOGNIZING the extent to which the automobile trade will flourish under the conditions at present reflected for the coming year, the Gaeth Automobile Company, of Cleveland, has completed preparations and routine such as will enable it to cope with the situation. Realizing the importance of the commercial situation, it has brought the delivery wagon question to a decided state of perfection, and the Gaeth line will therefore include four cars besides a delivery wagon; namely, Type XX, which is a modernization of the former Type XV; a new short couple body, the Gaeth tourabout, which replaces the Gaeth roadster of 1908 fame, and a limousine. The Gaeth products as above scheduled can very well be described as follows, in view of the standardized power plant and the conventional chassis of well and favorably known characteristics.

The Power Plant.—Referring to Fig. 1, it is to note the exhaust side of the motor, showing the magneto nested in an accessible position, taking its power from a housed-in driving shaft. The exhaust manifold of very liberal area, easy curves, and getatable holding bolts, is clearly shown. The aluminum crankcase flares out to the chassis frame, thus eliminating the need of an under pan, while at the same time adding strength to the crankcase itself. Fig. 2, of the other side of the motor, brings into view the carbureter, intake, valve motion, and the details of the air fan. In both illustrations of the motor, the water piping is shown of very liberal area, emanating from the top of the cylinders, and so designed as to positively eliminate steam pockets. The cylinders are cast in pairs, with integral water jackets of a selected grade of gray cast iron, and so designed as to facilitate cooling by the thermo-syphon system, in which a honeycomb type of radiator is employed. The cylinder flanging to the aluminum crankcase is of the most substantial sort, and provision has been made to assure the positive setting of cores, perfectly uniform wall thicknesses, and ease of cleaning, with a view to the complete removal of core, sand, etc.

Details of Ignition, Cam Shaft and Timing.—The low tension make and break system of ignition is used, which will permit of starting on the spark. It is a simple and efficient mechanism (Fig. 3), and displaces storage batteries, spark coils, commutators, and complicated wiring. The device consists of a single vertical shaft, rising up at right side of motor between the cylinders. Attached to the base of the shaft is a spiral gear, meshing into and driven by a similar gear attached to the intake valve cam shaft with a key, which admits of sliding the gear back and forth along the shaft. A two-piece bronze sleeve is fastened over the cam shaft and bears in a groove in the end of the sliding gear. This sleeve is connected with the spark lever on the steering wheel, and by a movement of the lever the sleeve and gear are slid along the shaft and produce the advancing or retarding spark by changing the relative rotation of the two shafts. To the top of the vertical shaft is attached a pair of small cranks, connected to which—in a horizontal posi-

Fig. 1.—Exhaust side of motor, showing magneto.

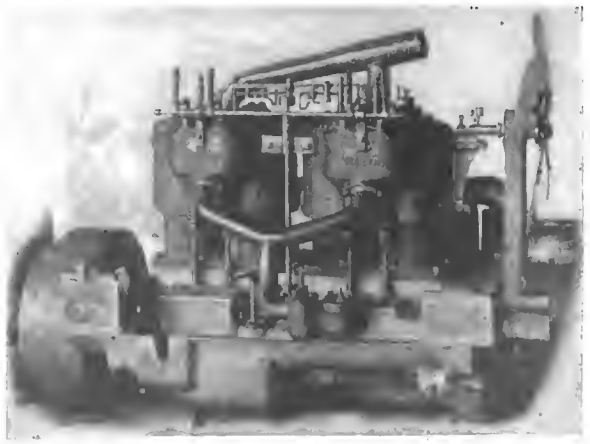


Fig. 2.—Carbureter side of the Gaeth motor.

Top of Motor, Showing Make and Break Ignition System.

tion—are four push rods, whose action trips the contact arm of the igniter. This tripping action, and thus the timing of the engine also, is regulated by means of four small eccentrics, against which the rods are held by springs. The igniter has a moving member or contact arm, which is brought into contact by means of the horizontal push rods, with a stationary insulated member connected with a Simms-Bosch magneto. Following the making of contact or closing of the circuit, a spring throws back the contact arm, and the circuit being thus broken, a heavy spark is induced between the special alloy points of each member.

Carbureter.—The Gaeth carbureter has a remarkably low fuel consumption and produces the highest efficiency of the motor. It has a three-fold control by a single movement of a one-piece throttle. The air entering from below, the gasoline entering, and the mixture passing to the motor are all controlled simultaneously by the lever on the steering wheel. The carbureter is of the separate float chamber style, and its mixing chamber is a vertical cylindrical space completely filled by a revolving needle valve and throttle. This throttle has in its base two radial "V"-shaped openings for regulating the air entrance. In its sides there is an opening of a peculiar shape for recovering the exit of the mixture. A part revolution of this throttle also effects a part movement of the needle in the nozzle, so that with a larger entrance there is a greater flow of gasoline. No auxiliary air valves are used, and it is possible to set the gasoline valve for a low running speed and go up to the highest speed without further regulating.

Features of Clutch and Transmission.—The Gaeth clutch is a study in simplicity, and belongs to the contracting band genera in which a flange cast integral with the flywheel affords the friction surface, over which the leather-faced band contracts in obedience to the pressure applied to a foot pedal. From the clutch to the sliding gear is a short and substantial drive, while the sliding gear itself affords three forward speeds and reverse, taking advantage of the progressive system. The speed change lever is fitted with an automatic position finder, and eliminates any chance of "shooting by." The gears are thus protected even in the hands of a clumsy operator. From the transmission gear to the live rear axle the propeller shaft is normally without angularity, and the universal joints are protected from dust. The rear axle itself is of the floating type, with ball-bearing wheels mounted on the axle casing.

Some Pertinent Chassis Features.—The chassis frame is a conventional channel section of pressed steel, adequate in point of strength, free from any offset. This frame is suspended on semi-elliptic springs, front and rear, of silico-manganese steel, taking advantage of the requisite number of comparatively thin leaves or plates, hence the springs are long, flat, and flexible. They are enormously strong for the work, and the periodicity of the body oscillations is fixed within the limits that assure easy riding qualities. The spring linkages and other chassis frame details are in accord with the refined design in general.

The steering gear is of the nut and screw type, designed to be irreversible. A dustproof housing is provided, and the working members are submerged in grease. The steering wheel is without lost motion, and after long service such lost motion as may be due to legitimate wear can be eliminated by the adjustments afforded.

The Gaeth Products Commercially.—The types of bodies as prevously mentioned are all the most appropriate, considering the respective classes of service for which they are intended. With a view to more clearly indicate the general appearance of the Gaeth the preceding illustration on page 819 shows among other things a large-diameter steering wheel in nice relation to the driver's seat. Also a utility wind shield, and mud guards that serve the purpose extremely well, indeed. It will be noticed that the cooler is on the center line of the front axle, and the acetylene lamps are set back sufficiently far to be protected. It will also be noticed that the side levers are straight, and in many other respects the appropriateness of the type stands out.

The road performance of the Gaeth chassis will be that due to 114-inch wheelbase and a 56-inch tread. The control of the power has been adequately enlarged upon, but mention should be made of very capable brakes of the external and internal characteristics, located on the rear wheels. The power losses are reduced to the minimum due to the fact that ball bearings are used at all points entitled to such consideration, including the front and rear wheels, so that the greater portion of the motor rated at 30 to 40 horsepower is delivered to the point of tire contact with the ground. That the motor is conservatively rated is borne out by the fact that the cylinders are 4 7-8 inches x 5 inches bore and stroke, respectively.

Type K Delivery Wagon.—In this case the body has a merchandise platform 44 inches wide and 67 inches long, with a clear head room of 56 inches. The wheelbase is 103 inches, thus assuring short turning radius in congested streets; a 56-inch tread will track in the street car tracks, and the front wheels are 34 inches, with 38-inch rear wheels, assuring good road performance. The single-cylinder motor is rated at 12 to 15 horsepower, belongs to the water-cooled thermo-syphon type, and is provided with a jump spark ignition, positive float feed carbureter, positive force feed oiling, and the transmission is by a planetary gear to a side chain drive. The capacity of this delivery wagon is 2,000 pounds. The frame is angle steel on semi-elliptical springs, and the equipment consists of oil side lamps and a tool sack.

WESTERN FARMERS ARE BUYING AUTOS.

According to the publicity department of the H. H. Franklin Manufacturing Company, the extent to which the automobile is being recognized as a necessity on the farms of the West is indicated by the fact that in central Kansas alone more than six hundred cars are owned by farmers. A dozen years ago the farmer in this region who owned an extra team and had a spring wagon had the standing of a man of means in his community. Now those who then looked covetously upon the spring wagon are driving about in automobiles. Orders for at least 100 of the gasoline vehicles for spring delivery have been placed in Kansas City and Topeka, it is estimated, and the tendency of the buyers, according to the Franklin spokesman, is to favor an air-cooled car, for the reason that the alkali in the water available acts as a destructive agent upon the metal with which it comes into contact in a water-cooled engine.

Kansas roadways are so level that they are a standing invitation to the automobilist, and this has contributed largely to the welcome given the automobile by those who live in the State. So keenly is the automobile felt to be an agricultural essential that agitation has been started both in Kansas and Missouri to have instruction given at the State agricultural colleges in the general uses and adaptabilities of the motor car. The agricultural school of Iowa at Amee has already decided to have a short winter course of instruction of this sort. The students will as a preliminary be taught the structure and operation of gasoline engines and will learn the many ways in which such an engine can be made use of to make farming easier and more profitable. Then they will be instructed in the dismantling, rebuilding and operation of motor cars so that they may become skilled operators of such vehicles, which, the State educational authorities are convinced, will perform a large part in the development of the farming interests in the next two decades.

NEW CORBIN MAKES ITS BOW FOR 1909

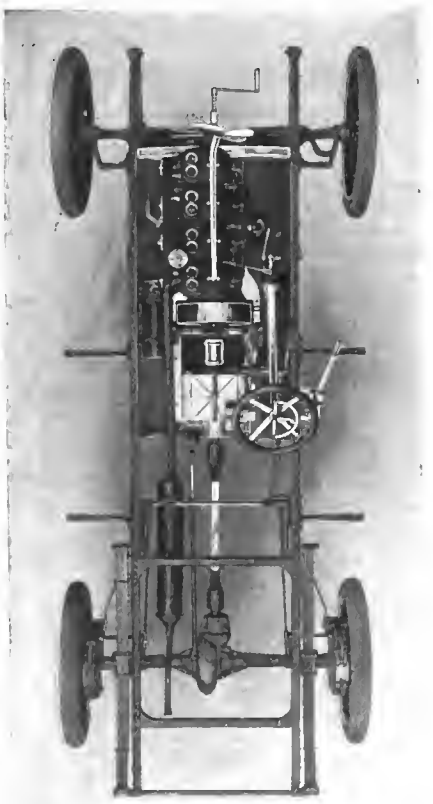
By CHARLES B. HAYWARD.

NEW BRITAIN, Conn., Dec. 7.—Things are humming at the Corbin factory these days, for the first series of the water-cooled representative of the Corbin line for the coming season are now coming through. This is known as Model K-2 30-horsepower Corbin and as a touring car, roadster, or with a baby tonneau, it will list at $2,500. It will also be made as a seven-passenger car with an increased wheelbase, and in limousine and landaulet types. When compared with its predecessor of a year ago, there is not a great deal of change in either the design or construction to be found, although in appearance the car is much better proportioned, and, to put it in more popular parlance, much more "snappy" than last year's model. At first sight, the motor appears to be substantially the same as that employed on last year's car, although an examination of its specifications reveals advances of importance in several particulars. The cylinder dimensions are 4 1-2-inch bore by 4 1-4-inch stroke, and the cylinders themselves are cast separately, the valves all being placed on the same side. The valve-operating mechanism is of the direct-thrust type, the cams bearing against roller end levers which are pivoted in outboard bearings, thus eliminating all side thrust in the valve action.

Some Striking Motor Details.—The timer projects above the tops of the cylinders and is perfectly easy of access; this is certainly a well-considered detail. The water piping is free from hose joints, yet, even so, the shape is such as to lend the desired "give." The exhaust manifold sweeps back with no decided bend at any point, hence heating, locally, will be entirely avoided. Moreover, the back pressure, due to bends, will be eliminated. The openings to the crankcase are large (really large enough to enable one to get at the bearings), and the means for securing the cover, while of the "quick detach" principle, lends security as well.

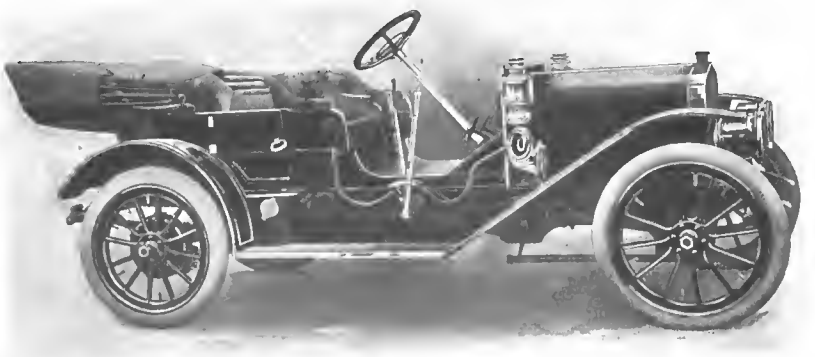
Drain cocks in the lower half are set at the right level, hence the amount of oil to put into the crankcase may be determined with certainty. The flywheel is marked to aid in correct timing; this is positively a good idea not always carried out. Indeed, there are a lot of good details on the Corbin, and the rope drive for the fan, for illustration, can be viewed with favor. It would be to overlook the things that autoists dream about to make no mention of the get-at-ableness of the holding bolts of the manifolds, cylinders, and the lock nuts everywhere provided. The motor arm supports are big enough and strong, thanks to the foresight of real designers, who seem to know where to put the metal.

A somewhat unusual practice is to be found in the method of supporting the crankshaft. The central main bearings, as well as those of the camshaft, are of the plain type, while the end bearings of the crankshaft are F. & S. annular ball bearings of liberal size. Another innovation consists of the adoption of a water-jacketed carbureter, this being of Schebler make, which is too familiar to require any extended description. The inlet manifold is led between two of the cylinders, the carbureter being placed on the non-operating side of the motor, thus making it much more accessible for examination and adjustment, at the same time keeping the valve side of the motor as free as possible. The ignition system consists of the usual four-unit coil equipment, mounted on the dash and relying upon a set of storage cells as the source of current supply, and this essential of the Corbin has been improved by the adoption of the new Connecticut timer, which is a considerable step in advance of former practice in this line. The timer is placed vertically between the third and fourth cylinders and is driven by bevel gearing from the camshaft.

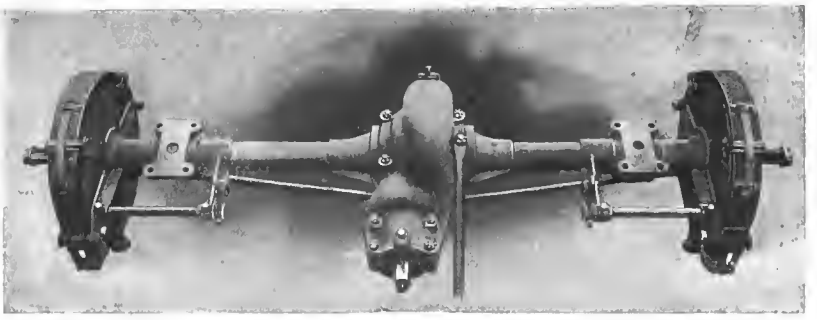


Looking Down on the Chassis.

Cooling and Other Considerations.—Cooling is by means of a gear-driven pump, circulating the water through a honey-comb type of radiator, which, while still of the same design as last year, has been somewhat enlarged, this tending to improve the general lines of the car, besides adding to the efficiency of the motor. A further improvement of the motor itself consists in the employment of an aluminum housing to protect the fiber and bronze half-time gears at the forward end, while the motor is further protected from beneath by the employment of the lower half of the crankcase as the bearing support, this being extended rearward to enclose the flywheel as well. Bolted directly to this light aluminum alloy casting is a second of similar material forming the lower half of the housing and bearing support of gear-set.



Control Side Showing Front of Cooler on Axle Center.



Rear Axle, Showing Means for Keeping Brakes from Dragging.

The design of the clutch has been improved with a view to decreasing the amount of leverage necessary to disengage it, and this has been achieved to an extent where the clutch is extremely free acting, thus making the car one that can easily be handled by a lady. Three engaging springs hold the clutch, while its thrust is taken on a ball-bearing. Springs have also been inserted under the leather facing to make the engagement easy and positive. Taken all in all, the Corbin clutch represents an excellent example of standard practice in the shape of the leather-faced cone, which is at once simple and very reliable. Due to the method of bolting, the motor base and the support of the gear-set together, making practically a unit power-plant, only an Oldham coupling is employed between the clutch and sliding gear. This is carried on a splined shaft, instead of the usual square section. F. & S. ball-bearings are employed on the ends of the clutch disengaging fork and contribute not a little to its easy action.

To return to the motor for a moment, it may be mentioned that, following what has come to be approved standard practice in this respect, nothing but the sight feeds of the lubricating system are now to be seen on the dash, the oiler itself being located to one side of the motor and well to the rear, almost under the footboards. The oil tank holds one gallon, and its contents are fed to a small positively-driven gear pump run off an extension of the water pump shaft, which raises the oil through a four-way header to the sight feeds on the dash, from which it is distributed to the main bearings. To further facilitate lubrication, the crankshaft is drilled.

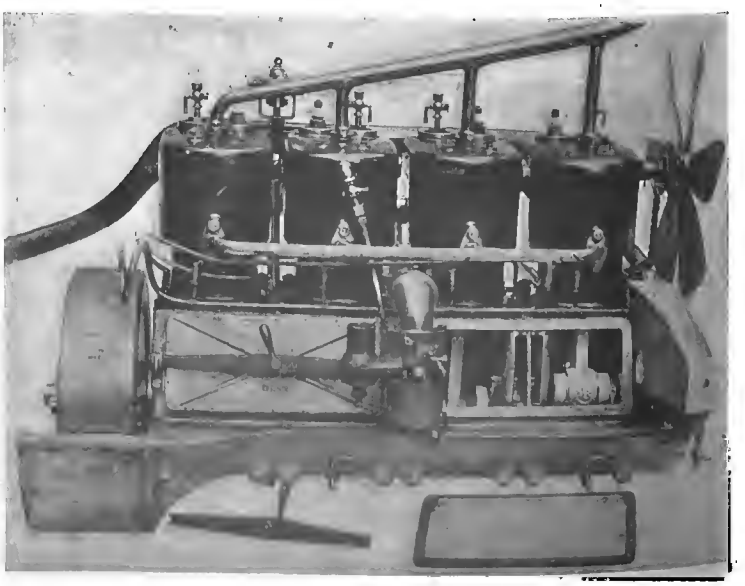
Transmission Gear Features.—The gear-set is of compact and light design and provides three forward speeds and reverse, selectively operated. All the gears are of high-grade steel, carefully case-hardened and ground. They are supported on F. & S. annular ball-bearings, the slide bars and their operating levers all being contained within the housing, thus protecting them and insuring ample lubrication. Final drive is by propeller shaft, two Hartford universals being employed, while the rear axle is of the semi-floating type with a spur gear differential. The driving shafts are made of nickel steel, heat-treated and are mounted directly upon annular ball-bearings, the thrust being taken by a special ball-bearing. The driving pinion itself is mounted on three annular bearings, one in front of it and two behind, a thrust bearing also being provided here as well. Instead of employing two sets of brakes of the internal expanding type, as in last year's model, the outer, or emergency brake, is now of the contracting band type.

While the brake drums are large and the faces of the bands ample, even so the detail of keeping the outside bands from dragging is looked after suitably. This improvement consists of three flat springs spaced equidistant around the periphery, held in rigid relations by arms, and so adjusted as to maintain the correct clearance at every point. The service brake is of the internal expanding type and is operated by cams; either is capable of locking the wheels without being set to anything like the limit of its capacity. The entire brake-operating mechanism is kept within the frame, both set of brakes being equalized by yokes. Castellated nuts locked by cotter pins are used throughout this part of the car, as well as on every other essential where a positive lock is required.

Things the Buyers Want to Know.—The wheel base of the car is 108 inches and the tread standard, in the case of the roadster, baby-tonneau, and five-passenger touring types, a 114-inch wheel base being employed on the seven-passenger touring car, the limousine and landaulet, or other closed cars of large size. The front axle is a one-piece drop-forging of I-beam section, and with the exception of the placing of the cross-steering rod to the rear, instead of before the axle as previously, has not been altered. The frame is of the usual channel section, pressed steel construction, and the steering gear is of the worm-and-sector type, neither of these having undergone any change. Suspension is by means of semi-elliptic springs all round.

The Model R air-cooled Corbin car will be continued for 1909 with practically no change whatever in the motor, which is the result of several years' study on the part of its designers, while where the chassis of the car itself is concerned, the same changes and improvement that have been recorded in the case of the Model K-2 will be carried out. The Corbin air-cooled motor is too familiar to call for any extended description.

In general, the Corbin line seems an advance on what has gone before, in spite of the previous high standard set by the designers of this product. Just what the advance means to purchasers of cars, is not so easy to put into dollars, since it is the aggregate of small things that in the long run end in the most annoyance. In the Corbin cars for 1909 the little things were brought up to a high state of perfection, and in many cases so simplified as to assure entire freedom from "mosquito" annoyances. While it is true that the main members in a car should be absolutely right, yet even so it is these members that are at first attended to. It is the little things, then, that will always stand further attention.



Carbureter Side of Engine, Showing Crankcase Openings.

THE art of driving an automobile is at once both easy and difficult, simple or complex, depending altogether from what standpoint the subject is looked upon. If driving means nothing more than steering and controlling the car on a smooth road bed the subject is certainly an easy one, quickly mastered.

But if the art of driving is taken in the full, clear sense of the word, there is much to learn, because in this latter definition is not only meant the actual guiding and control of the car, but the entire future up-keep or maintenance of the machine.

The automobile, with its delicate, sensitive, and finely adjusted mechanism, demands good care and constant attention to keep it in prime working condition, and, if neglected, we may be certain that trouble and annoyance will follow. Little things are often of greater importance than those of larger size, and as the automobile is a creature of many parts, it is the attention given to the "details" that spells success in motor handling.

It is not the writer's intention, however, to give in this article "a compendium of motor lore," but rather to mention some of the important points which ought to be considered by all autoists. Although these hints are written with the idea of helping the owner of a first car, it is possible that the more experienced "mile eater" may find at least something worth the reading.

"Cranking" with the Left Hand.

It has long been a mystery to the writer why autoists almost universally use the right hand for cranking the motor. As gasoline motors revolve like the hands of a watch—from right to left—there is always a possibility of injuring the hand or wrist should a back-fire occur when cranking with the right hand. And, again, the position which the body must assume when the right hand is used is awkward in the extreme and being twisted around that more force may be exerted, the balance of the body is not at all secure.

Back-pressure accidents may be averted by employing the left hand, and while makers of the Darracq and other cars have for several years advised the adoption of left-hand cranking, operators have always been slow to accept this good advice. The advantages of employing the left hand for starting purposes are many, and, once tried, will surely be adopted.

In left-hand cranking, the autoist stands squarely in front of his car, the right hand having a firm grip on the radiator or dumb iron. The handle is grasped firmly, but loosely, with the fingers of the left hand curved around the handle. As the feet are placed widely apart, a good balance of the body is assured, and, if a back-fire should occur, the elbow is not cramped, as is the case in the right-hand method, but the hand is thrown outward and upward, the loose grip permitting the fingers to fly open, and all risk of injury is done away with.

More force may also be given, as the right hand on the radiator materially assists the other member to turn the motor over quickly and without undue effort. Now that the low-tension system of ignition is becoming quite generally used, quick cranking is necessary for a start, and the use of the left hand will, after a single trial, convince any driver that it is the safest and easiest way to crank.

Attention to Clutch Lubrication.

It is astonishing how little care many operators give to the clutch operating mechanism, which gear is, for obvious reasons, one of the most important parts of the whole car. That the several parts of the clutch at all times should be well lubricated is self-evident, as this mechanism is in almost constant use in throwing in and out the speed gears. In some makes of cars using clutches of the multiple-disc type, the mechanism is enclosed in oil-tight cases, in which case the lubrication of the clutch collars and connecting lever is automatically performed.

But in many cars using the cone clutch, and in every case where the clutch does not run in an oil bath, oiling must be done by hand. In this case, the joints of the clutch pedal, its bearings and pins, clutch rack and pinion, clutch collar (where same slides on its shaft), brass shoe of collar and thrust bearings should be kept clean and well supplied with oil.

Concerning Grease Lubricators.

The matter of proper grease lubrication is not always given the careful and systematic attention which the subject deserves. In fact, many drivers who give regular and painstaking attention to the engine transmission and running gear, all too often neglect to give the grease cups the same careful and thorough consideration.

Grease lubricators do not, of course, require as frequent attention as other oiling points, but they should always receive their share of attention in proportion to the work such parts are called upon to perform.

Do not be content with a superficial glance or take for granted that because you screw down the cap, the grease must necessarily feed to the bearing it is intended to lubricate. This applies especially to the lubricators on the steering pins, which should not only be kept well filled and given a daily turn or two, but the autoist should know that these vital parts are well lubricated. Lubrication means much to an automobile.

It is always a good plan to refill and screw down the cup until the lubricant is seen to ooze out of the steering socket. In this case the autoist is positive that the steering gear is well taken care of and that no trouble will be caused by insufficient lubrication of these parts.

On most cars grease cups are used to supply the lubricant—light grease—to the following parts: steering knuckles, steering cross tube, steering reach rod, shaft of water pump, commutator shaft, clutch shifting collar, journal of transmission sleeve, front and back hubs.

Adjusting the Spark Coil.

To properly adjust the coil is not, as many suppose, a difficult matter, but, on the contrary, is a simple operation when once it

is understood. In most coils only two adjustments are necessary, and anyone should be able to make them in a comparatively short time.

To adjust a coil, shut off the gasoline and turn the motor over by hand until the timer makes a contact with the coil needing adjusting; then turn on the switch. Next loosen the set nut until the adjusting thumb screw can be turned with the thumb and finger, and with a fine-cut file—a thin manicure file is just the thing—remove any deposit that has collected on the platinum contact points. This done, turn the screw to the right until the vibrator commences to buzz, then lock it by means of the lock or set nut.

In case the adjustment is still imperfect, the trouble will likely be found in the vibrator spring. This spring may be adjusted by first loosening the lock nut, as before described, and turn the adjusting screw to the right, or until there is a space approximately one thirty-second of an inch between the platinum points, when the armature is pressed down and against the core. Lock in position by the set nut on adjusting screw (this lock nut has a right-hand thread). Now loosen the set nut on the vibrator block and turn the adjusting screw (the upper screw in both instances) until a light contact is established between the points—then lock in position.

A light tension between the platinum points is desirable, as a stiff tension not only renders the coil less responsive, but will exhaust the batteries quicker and often causes the contact points to become pitted.

The only secret of keeping a coil in the best condition is to fool with it as little as possible and to keep the vibrator points clean and smooth, and to adjust these points neither too tight nor loose, but at a medium tension. The vibrator spring should be fairly flexible and buzz at a moderately high pitch.

Once properly adjusted, the coil should require very little attention. Once a week the vibrator and coil plates should be cleaned with a small camel's hair brush.

Grinding the Inlet and Exhaust Valves.

No matter what make of car you may have, it will be found necessary to grind the inlet and exhaust valves occasionally, and just how often this should be done must largely depend upon the amount of running.

When the motor begins to lose power and falls off to a noticeable extent, it is a pretty good indication of three things: faulty carburetion, improper ignition or poor compression. The latter two causes are by far the most common, and if the electrical plant has been examined and found satisfactory, the trouble clearly points to bad compression.

In case the compression seems to decrease, it is probably due to the inlet or exhaust valves sticking or not properly seating themselves, hence the leakage. The cause is due to the lubricating oil carbonizing by the extreme heat generated within the cylinder, and the remedy is to remove this crust or sooty deposit.

To find out whether there is need of grinding, the valves should be lifted out, and if not bright—as they should be—but black, pitted, or streaked with soot, there is certainly a leakage of gas, and tbey must be ground.

That a thorough job may be done, it is best first to take off both inlet and exhaust pipes, which enables one to clean out the valve seats and openings, and also prevents the possibility of any particle of the grinding mixture being sucked into the cylinder.

To Insure an Excellent Job.

To prevent any of this from falling into the cylinder while grinding the valve, a small piece of waste is tied to a length of strong string and jammed into the cylinder. If any of the mixture should happen to fall off the valve, the waste catches it, and when the grinding is done may be drawn out with the waste by means of the string.

For grinding purposes, carborundum, ground glass, and emery are all quite commonly employed, my preference being for the latter. In any case, only a finely ground cutting medium should be used, as coarse emery will cut too deep and make the valve seats rough. Emery known as 120 is the most satisfactory for this purpose.

Don't make the mistake of using too much emery; only a very small quantity is required. A convenient way is to put a very small amount of emery in a small saucer and add a spoonful or two of kerosenc (don't use gasoline) to make a thin, watery paste. A few drops of lubricating oil sbould then be added to give the mixture a little more body.

Remember that a few grains of emery and plenty of kerosene and cylinder oil will not only do a smoother job, but do it much quicker than a thick emery paste. When the waste is in place, put a small quantity of the grinding mixture on the bevel face of the valve and by means of a screw-driver (blade in slot of valve) carefully grind the valve by rotating it in its own seat in the cylinder.

Don't turn the valve in one direction only, but lift it out of its seat frequently, and turn it first one way, then another. The reason for lifting it clear of the seat is to prevent any foreign substance which may get into the emery from injuring and scoring the seat or valve. No greater force than is necessary to rotate the valve in its seat need be used, and by frequently lifting the valve and reversing the grinding motion, the face and seat will be uniformly ground.

Ten minutes grinding should be sufficient to properly seat a valve which is in fair condition, but a badly pitted valve will need longer grinding to make it clean and bright. When completed the valve should be removed from the cylinder, thoroughly washed with kerosene, and the valve seat wiped out perfectly clean.

Keeping Cylinders Clean.

That your car may at all times run smoothly and powerfully, it is highly important to keep the inside of the cylinders clean. There is no excuse for letting this part of your motor become foul—it is rank negligence and nothing else—and if you allow the cylinder and piston-head to become encrusted with carbon, is it any wonder that your engine knocks and pounds and loses power?

The writer has overhauled many a car brought in because of lost power, repeated knocking, etc., and upon taking the engine down, the cylinders were invariably found to be in a foul condition. In some cases, the piston-heads were so choked with this deposit that it seemed incredible that any self-respecting motor would consent to run under such conditions.

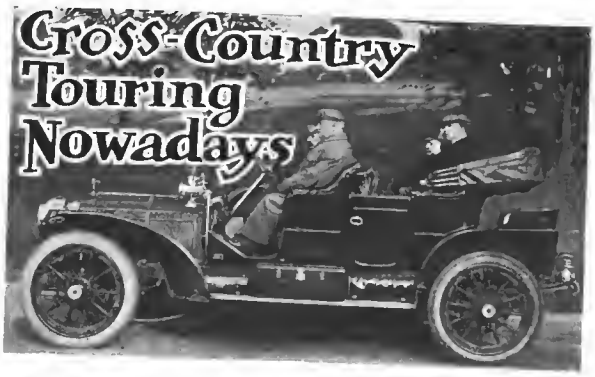
The cause of this sooty state is, of course, the oil used for lubricating the cylinders, and while all oils contain some carbon, those grades having a low fire test will obviously foul the cylinders much quicker. As the temperature within the cylinder is some 1,000 degrees Fahrenheit, it must be evident to all that a low-test oil will be entirely burned up and consumed before it can fulfill its mission of lubrication. It, therefore, stands to reason that only a high-grade gas-cylinder oil should be used in the cylinders, and such an oil will have a flash point of some 450 degrees Fahrenheit.

Never Neglect Cylinders for Extended Period.

The autoist should never allow the cylinders of his motor to become carbonized to any extent, but frequently flush them out. This may be easily done as follows:

Unscrew spark plugs, and place pistons at the outer end of the stroke, or at the outer dead center as per marks on your flywheel. Now fill the cylinders—through the spark plug holes—with kerosene and let it remain overnight. The next morning open the pet cocks in crankcase, or, better yet, unscrew them, and drain out the dirty kerosene. This done, replace pet cocks, start the motor, and open the pet cocks to blow out any deposit that may remain in the cylinders.

Cylinders should be cleaned in this manner at least twice a month—every week will be better—and if this is done often, no considerable deposit of carbonized oil will accumulate, and the car will always run at its best, smoothly, and at its rated power.



ONE of the recent Chicago to New York and return tourists was George T. Robie, of the Excelsior Supply Company, Chicago. The trip from Chicago to New York was comparatively uneventful, with roads in very fair condition.

The return trip began with a start from New York City at about noon and a leisurely run to Poughkeepsie for the night. Next day the Catskill country was enjoyed, with a luncheon stop at Saratoga, which was reached via Albany. The severe hills and the rough roads made the journey a trying one, but the Continental tires stood the test apparently without a scar, though, according to Mr. Robie, the day's run exacted harder service than would a thousand miles of ordinary travel. The Chicago to New York journey had been accomplished on a set of 1908 model Continentals that had already seen considerable service. Before starting the return a front tire was replaced with an AC type flat tread and both rear wheels were fitted with the new flat tread type course. The car was a close-coupled Packard.

Mr. Robie recites the remainder of the trip in these words: "After lunching at Saratoga, we continued our trip northward to Lake George, a distance of about thirty miles. Arriving there, we, like the youth who bore the banner with the strange device, were emphatically warned against attempting to proceed any further that night. We, however, continued, and though this warning was repeated at various points where we stopped to inquire the road, we added another twenty-five miles to the day's run, finally landing at Schroon Lake, a beautiful spot in the Adirondack Mountains. Here we put in for the night, after enjoying a feast of venison chops that left us too full for utterance. The next morning we returned to Saratoga and thence by way of Schenectady to Syracuse, arriving there at 6:30 P.M. A part of the next morning was spent visiting the University and at 10:00 A.M. we started for Buffalo by way of Auburn, Geneva, Canandaigua and Rochester. At Rochester we were held up between three and four hours by rain, but finally lighted our lamps and started for Buffalo, arriving at 9 P.M.

"Leaving Buffalo the next morning at 10:30 o'clock, we lunched at Ashtabula, and arrived at Cleveland at 5:30 P.M., where our friends evinced marked Missouri tendencies and we had to 'show them' that we had been able to cover the distance within seven hours. We left Cleveland next morning at 8:30, and traveled by way of Belleville to Kendalville, Ind. Kendalville was the one hoodoo town on the route, and here we experienced our first tire trouble of any sort whatsoever. We found that the valve of the remaining original tire, that is, the one not removed at New York, was leaking and the tire had gone flat. Being equipped with Continental demountable rims, it was easier to change tires than bother with the valve, so we removed this tire, replacing it with our spare.

"This was, however, not to be all of our troubles at Kendalville, as just as we were pulling out of there, the next morning for our run to Chicago, we enjoyed (?) our first puncture. This was soon remedied, and we started on the last lap of our trip with Chicago as the objective point. We left Kendallville at 8:00 A.M., lunched at South Bend, arriving there close to 12 o'clock, and reached Chicago at 4:10 P.M."

LATEST TYPE OF FRENCH TRACTOR.

PARIS, Dec. 1.—In the agricultural world the French motor constructor has allowed himself to be outdistanced by the more practical and more commercial American. There are only three or four successful agricultural tractors constructed in France, and not one of them can lay claim to anything like general application. Each one has its own distinctive features and may be regarded more in the light of inventors' experiments than the machine that the farmer will receive with open arms.

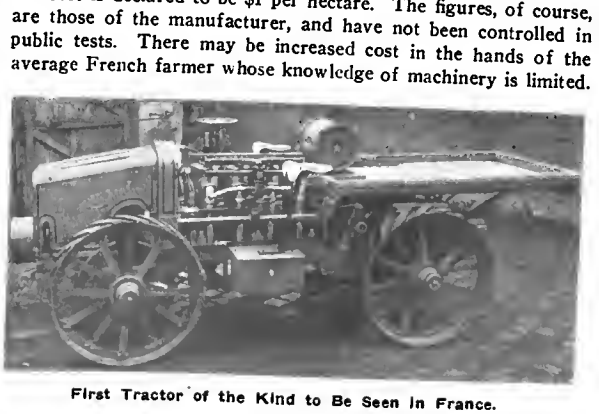
A newcomer to the small group has just been made in a four-wheel drive tractor, the first of its kind to be seen on this side of the Atlantic. The motor is a four-cylinder gasoline one with separate cylinders developing about 50 horsepower. The power plant is placed in the center of a robust pressed-steel frame, and transmits power forward to a gear box occupying the position usually reserved on an automobile to the engine. From the three-speed gear box a countershaft carries the drive by means of gearing to the front wheels. As the drive is through universal joints, the front wheels still retain their steering functions. From the left-hand side of the forward countershaft drive is carried rearward by means of bevel gear and propeller shaft running alongside the engine, to the rear countershaft, the final connection being by double side chains to the rear wheels.

In general design the engine has little that is distinctive. The four separate cylinders are water-jacketed, have valves on one side, high-tension ignition with current supplied from storage batteries, and gasoline supply by gravity from a tank immediately behind the driver's seat. There are two radiators, one immediately in front of the engine, and one at the fore end of the chassis. The rear one has immediately behind it a ventilator fan which drawns in a current of air from the bonnet, which, in this case, only serves as a covering for the gear box.

Drive is taken from the engine by means of a cone clutch at the fore end, transmitting the power to the gear box with three speeds forward and reverse. In this tractor all the work naturally comes on the transverse shaft carrying the universals and connecting up to a large pinion on each driving wheel; for, in addition to driving the front wheels, the shaft has to transmit power to the rear wheels by means of the bevels, propeller shaft, countershaft, and side chains. The engine is a slow-speed one, running at about 600 revolutions a minute, and naturally gearing is very low, though no information would be vouchsafed regarding ratios.

Both front and rear wheels, made entirely of steel, and of equal size, are ribbed to give traction on soft ground. At the fore end of the chassis is a broad metal pulley by means of which the tractor can be employed for driving stationary machinery with belt connection. Steering is by means of upright column and wheel, engine control is by separate levers, and gear control by the usual type of side levers.

It is declared by the makers that the machine will plow to a depth of 4 inches at an inclusive cost of $2.20 per hectare (2 2-5 acres); for a depth of 6 inches the cost is given at $4.20 per hectare; for 13 1-2 inches the price is $8. For operating a reaper the cost is declared to be $1 per hectare. The figures, of course, are those of the manufacturer, and have not been controlled in public tests. There may be increased cost in the hands of the average French farmer whose knowledge of machinery is limited.



First Tractor of the Kind to Be Seen in France.

THE AUTOMOBILE

EXPERIENCE AND SUCCESS BEGET COURAGE.

In the beginning the problem of the automobile was as an unsolved mechanical puzzle that cast a spell of gloom o'er financiers. Castings were cheap, dies were avoided, and temporary expedients reigned supreme. A little experience, a showing of success, and courage grew apace. It was never a question, as designers saw it, of the desirability of castings, or the uncertainty of forgings. It was simply a matter of courage on the part of designers to plan and of financiers to pay. The splendid crop of castingless automobiles to be seen at every hand to-day simply proves out the contention that an abstract idea is a tame cat in the absence of courage.

American automobile builders are forging to the fore, because they are possessors of enough courage to take advantage of quality, which, for the matter of that, is the twin brother of quantity, since the cost of correcting a mistake counts for little in the column of fixed charges in a big plant. The jigs, templates, gauges and dies, that in the abstract foot up to thousands of dollars, reduce to pennies per car, if the output is on a large scale, and duplication of parts so necessary in the long run becomes a reality in fact, instead of in theory, which can never be brought about in a shop in which cheap labor takes the place of tools of precision, and a perfected shop system.

The methods by which excesses of cheap labor whittle out cars—no two alike, from the point of view of the man with his instruments of precision in the inspection department of the big American shop—will scarcely keep pace with the more aggressive American process in which the personal equation is minimized. The fixed arguments advanced to lend color to hand-made products, at the cost of cheap labor, will scarcely hold water, no more than a market could be created for hand-hewed watchdogs, even though they could be fitted with a mechanical snarl.

* * *

LEFT HAND CONTROL FOR TOWN WORK.

Innovations in design or style that are in the least degree radical have seldom been undertaken in the automobile field without considerable preliminary delay, pending which the growth of the demand for the change made it easy to accede; except, of course, at the expense of makers rash enough to attempt to introduce something which was either a foreordained failure or which was in advance of its time. But, then, it would take a volume to record but a small part of the history of those "who guessed wrong" and went to the wall in consequence, or of those who tried to force engineering "ideals" upon the public and persisted in doing so until the receiver put an end to their well-meant but misguided efforts. Few things as has the automobile shown in such a striking manner what a costly and thankless job is the task of educating the public.

It is the general consensus of opinion that the left hand side of the car is the proper place of control for town work under American rules of the road, and while the subject has never here come in for the extended threshing out that our British cousins have given it not so very long ago, more than one American maker has decided to have the courage of his convictions by adopting it for his 1909 output. Instead of arguing the point pro and con through many reams and then letting the thing die a natural death, these American makers have acted first and will talk afterward. That the change is one involving numerous advantages is obvious, and it is, further, one that involves no fundamental departure in design or construction. The manner in which it is received should prove of interest, though its adoption should come much more easily through its compulsory use on the taxicab than might have been the case in earlier days.

* * *

A WINTER OF AUTOMOBILE LAW-MAKING.

Indications multiply that this Winter will see considerable activity in the making and unmaking of automobile laws in not a few State legislatures. The inconsiderate few are going to make it extremely hard for the representatives of the great majority to secure reasonable laws or to retain liberal restrictions which were secured at considerable effort. There is a growing sentiment that the drivers of all automobiles should pass some kind of an examination, and, furthermore, any criminal abuse of the roads should be punished by a revocation, temporary or permanent, of the guilty driver. The time has arrived when automobilists generally must lend both their aid and moral support in purging their ranks of the highwaymen of the roads.

AUTO MAKERS INTERESTED IN TARIFF REVISION

WASHINGTON, D. C., Dec. 7.—Contrary to expectations the hearing of the representatives of the automobile manufacturers before the Ways and Means committee, scheduled for today, did not materialize. A number of those prominent in the trade held a meeting in this city Sunday night and went over the situation very thoroughly. Recognizing the fact that they did not have sufficient data at their command at this time to lay before the committee, it was decided to ask the committee for an extension of time in which to file an elaborate brief and also to make an oral statement before the committee. When Chairman Payne called upon Mr. Briscoe this morning, the latter stated the situation to the committee and asked for two weeks' time in which to prepare the brief. The request was granted, Chairman Payne stating that the earlier the brief was filed the better it would be for the interests represented.

It was undestood that the automobile importers would again be heard by the committee this morning, but none of them appeared, and it is likely that any further arguments they wish to make will have to be submitted in the shape of a brief.

Later in the day the automobile men were interested spectators of the convening of the second session of the Sixtieth Congress, having seats in the reserved gallery.

The party included Thomas Henderson, president of the National Association of Automobile Manufacturers; E. P. Chalfant, general manager, and H. B. Joy, L. H. Kittredge, A. L. Riker, and G. H. Stilwell, of the Association of Licensed Automobile Manufacturers; Benjamin Briscoe, chairman, Alfred Reeves, general manager, and Job T. Hedges, counsel, of the American Motor Car Manufacturers' Association.

Viewed by General Manager Chalfant, A. L. A. M.

"The importers of foregn motor cars must surely feel that they were exposed to ridicule by the absurd statements of their representative before the Ways and Means committee, Friday, November 27," is the reply of E. P. Chalfant, the general manager of the Association of Licensed Automobile Manufacturers, when interviewed concerning the representations made by Chas. H. Sherrill in behalf of the Importers' Salon, who asked for a reduction in duty from 45 per cent. to 30 per cent. ad valorem.

"American automobile manufacturers have not made exorbitant profits, and a relatively small number of them have made profits at all. The manufacture of automobiles first began to assume the proportions of an important industry in 1902. Following is a table of the vital statistics of the trade:

Concerns in business in 1902	51
Started from 1902 to 1906 inclusive	270
Total	321
Discontinued during five years	155
In business December 31, 1906	166

"There are now listed 253 makers of automobiles in this country, of whom about 100 are turning out cars in fair quantity.

"It is safe to say that not 10 per cent. of the American automobile manufacturers are making money. A great deal of the manufacturers' money goes for experimentation. The large amount of capital required and the character of the business eat into the profit of the business very materially. Clearly the industry deserves proper protection from the normal production and the over-production of the European factories, with their cheap labor, low rate of taxes, and preferential rates on manufacturing machinery. In this country the cost of labor is two and one-half times what it is abroad. Materials abroad are cheaper, ground rent is less, the cost of living is less, the industry is taxed less, and all machinery imported for use in a new industry is admitted duty free or at a preferential tariff.

"When making the statement that 90 per cent. of the imported cars arrived in the shape of the naked chassis, it was apparently forgotten that just a little more than 40 per cent. of the cars imported during the last twelve months were complete with bodies, and that bodies for the remaining 60 per cent. (by no means all of them minus bodies) would not keep busy for more than a portion of the year even one of the two carriage makers whom Mr. Sherrill mentions as having been kept alive by the business of the importers, whereas all the carriage makers outside the metropolitan district probably do not collectively get a dozen bodies to manufacture in a year for imported cars.

"Tariff rates must afford ample protection to American made goods, and provide a customs duty on imports equal to the difference in cost of production here and abroad.

"It is needless to say that the statement that the Association of Licensed Automobile Manufacturers is a 'trust' is absurd. This Association, whose members conduct a strictly competitive business, is the most important thing in the country for the industry of motor vehicle building, for the dealer in automobiles and for the persons who purchase them. In a word, in 1903, certain representative automobile makers agreed to recognize the validity of the Selden patent and pay license fees thereon. In these days of strenuous and sometimes unfair competition it is refreshing to find that a friendly and cooperative spirit exists and a frank discussion of business proceedings taking place among men engaged in the same industry.

"Speaking advisedly for both the A. L. A. M. and the A. M. C. M. A., there is no trade agreement in the American automobile business regulating the price of machines. Each manufacturer is unrestrained and free to regulate his own prices, and does so. The division between the classes of manufacturers relates solely to the payment or non-payment of royalties under the Selden patent. The other regulations refer to questions of publicity, the dissemination of trade information and the standardization of manufacture.

"Naturally both Associations have given the matter of tariff revision adequate attention, and some time ago presented their views in writing to the Tariff Committee of Congress. As heretofore, we will fight our battles in the proper forums. All the two Associations want is a square deal; a duty imposed on foreign built machines equal to the difference in cost of production here and abroad—giving the user (consumer) all the benefit in reduced price possible from the best and improved methods of producing good machines.

"The American automobile industry can live and succeed under the present rate of duty, providing only it is collected on the honest wholesale value of the foreign merchandize."

What the Ford Protest Set Forth.

WASHINGTON, D. C., Dec. 5.—The Ford Motor Co. has filed with the Ways and Means Committee, which is now engaged in a series of hearings preparatory to a revision of the tariff law, a strong protest against an increase of the duty on automobiles. Their protest is in part as follows:

"Within the past few days it has come to our attention that a large number of manufacturers of automobiles in this country, being, no doubt, a majority of the members of what is known as the American Motor Car Manufacturers' Association and the Association of Licensed Automobile Manufacturers, have appointed committees to attend a hearing granted by your committee on the subject of the tariff on automobiles. The time was so short that we did not have an opportunity of bringing the matter before the associations above mentioned, but we have written to all of the members of this committee vigorously opposing the petition which they propose to present to your committee urging for an advance of the 45 per cent. ad valorem tax now imposed on automobiles to 60 per cent. ad valorem.

"We believe that this petition does not represent the position and attitude of all the members of the associations referred to.

We are unalterably opposed to any increase in this tariff. We believe that this so-called infant industry is fully protected all it should be, and, in fact, we believe the present tax is a greater protection than this industry should have. The industry bas progressed sufficiently far, we believe, not to be entitled to any greater protection than would be represented by tbe actual difference in the amount of labor paid to manufacture automobiles in this country and that which is paid to manufacture automobiles in Europe. This difference is very small, as the amount of labor on automobiles in proportion to the amount of material is almost insignificant. If the tariff must be revised, it should be reduced and under no circumstances raised."

DECORATIVE SCHEME FOR PALACE SHOW.

Altbough there have been automobile shows for many years and although each year the decorating committee promises something new, different, and better, thus far they have been able to make good each time. This year, however, the show committee of the A. M. C. M. A. not only wishes to surpass all previous American but all similar exhibitions. A glimpse of the scheme will sbow in part wbether this be possible. More than this only the decorations themselves can show. Europe and this country have been searched by the S. R. Ball Company, the decorating contractors, for ideas which might be used in the Palace affair to make it different from other shows. Tbe fact that all the foreign makers are to exhibit in the Palace only, making it an international exhibition, adds to the ideas embodied in the decorations. For this reason the show committee included a considerable amount of European suggestions in the decorating.

Thousands of lights, paintings, mirrors, statues, flags of nations represented, searchlights, and harmonious colors, will, in brief, cause the Palace show to be an event in automobile history.

The present entrance on Lexington avenue will be an attractive porte cochere, with statuary of Egyptian design supporting electric signs which will flash out a welcome. Large signs will cover the rear wall. Surmounting the columns will be a classic balustrade, urns filled with evergreens lending scenic effect to a painting representing an automobile, leaving a flaming trail of dust and light. The vestibule will be artistically draped with flags, while at the stairway approach will be two life size female figures resting on an eagle supporting a wheel, all finished in verdi antique. The ceiling of the entrance hall will be canopied in silk with light radiating from the center. The walls will be decorated with mural paintings by famous artists.

The main auditorium hall will be treated in early English style. The balconies are bidden by orange colored tiling, extending three feet outwards over the main hall, while meeting the tops of the present capitals will be a frieze depicting automobile contests, including the Glidden tour, tbe Vanderbilt, and the Savannah road races. The main auditorium will have its ceiling covered with a blue fabric, which, combined with lattice work, urns of flowers, and plants, will give a hanging garden effect. At the end of the ball, now the stage, a real garden will be formed of bay trees, evergreens, and flowers. By means of mirrors the room will appear twice as large as it is, while the decorations will be duplicated in many different forms.

Dividing the garden from the general exhibition hall will be a striking piece of statuary 15 feet in length and 6 feet high, with life-sized figures representing "Wisdom Instructing Youth in the Mysteries of Automobile Construction." Original statues of heroic size representing "The Spirit of Speed" are to stand on the balcony rails upholding flowers and streamers of electric light, which will lead to a ball in the center of the hall.

Another important improvement will be the installation of a café on the third floor. This year the café will be transformed into a reproduction of an old English inn. It was intended to build a German wine cellar, but in order to harmonize with the style of architecture, the management changed it into a room modeled after the interior of a famous Kentish Inn. A stone-wall effect will divide the room from the main exhibition hall, while old chandeliers, dishes and mugs will lend to the effect.

HOUPT TAKES ON THE HERRESHOFF.

Looking over the situation for 1909 develops new surprises every time the task is performed. The latest bit of information that should prove of more than passing interest to the supporters of the industry lies in the consummation of the deal by wbich Harry S. Houpt has taken over the entire output of the Herreshoff Motor Company for the coming year. The works of the Herreshoff company, at Detroit, will be devoted to the filling of Eastern orders during 1909, rather with the bope that in a year the capacity of the plant will be increased sufficiently to catch up to the general demand.

Lightness, strength, and absolutely up-to-date features are promised for the new Herreshoff cars, and widespread interest is aroused, especially in view of the moderate price that will go with the cars. It is proposed to furnish a bigh-class car, taking after the best European models, yet even so the design will be "Herreshoff" from tires to trim.

The Herreshoff will be shaft driven with a four-cylinder engine, water-cooled, four-cycle, and a self-contained power plant. The three point suspension will be embodied, and the transmission will be progressive, three speeds and reverse. The Herreshoff idea is that simplicity and the elimination of a multiplicity of small parts in and about the gear-set follow the adoption of the progressive type of gear. A tubular drive leads to a live rear axle, in which the compensating gear is of the bevel type, incorporating universal joints of a noteworthy design and means for lubricating and excluding grit. The rear (live) axle will be worthy of the rest of the design, and the wheels will be of a most advanced design fitted with 32 by 3 1-2 tires. Stress is laid on the design of the chassis of channel section, and of material the nature of which is reflected in the tests for physical properties, including a tensile strength of 135,000 pounds per square inch. Half-elliptic springs will be used, front and rear, and the front axle will be of the I section, nice proportions, and fine material; drop forged, of course.

The main attraction in the Herreshoff will be the motor, of the Herreshoff design, in whicb the speed possibilities lie between 200 and 2,400 revolutions per minute in actual service. Rated at 24-horsepower, and guaranteed to deliver the power, this motor, with large valves and a special carbureter, whicb largely influences the performance, will have a double system of ignition including a Bosch magneto. The flexibility of the motor has been favorably commented upon. The car weight will be 1,600 pounds, and the weight for power will therefore be such as to assure a "live" road performance.

The car will be on exhibition on or about January 1, though it is to be noted that it is Harry S. Houpt who "takes on" the Herreshoff—not the Harry S. Houpt Company, located at Broadway and Sixty-third street.

BENZ AGENCY ESTABLISHED IN AMERICA.

The presence of Herr Carl Neumaier, of the Benz firm, at the Grand Prize at Savannah, may have heralded to some few the news of an American agency for the Benz cars. So the announcement of the Times Square Automobile Company, of New York City, as holding company for the Benz Auto Import Company, with salesrooms at 1597 Broadway, will not be a complete surprise to those who have followed the success of this German car on the Continent.

September 1 the concern opened its new factory at Mannheim, Germany, which will allow it to branch out into foreign fields, something heretofore impossible because of the demand for these cars abroad. The shops now cover 13 acres, giving employment to 6,110 men. To those familiar with reliability and speed contests, the Benz is well known, having competed in many events during the last few years, both in America and abroad, and always showing among the leaders.

Tbe car driven by Hemery in both races will be on exhibition at the Broadway salesrooms until the opening of the Palace Show, where it will be shown along with three standard models.

WHAT CLUBS ARE DOING THE COUNTRY OVER

QUAKER CITY CLUB ENTERTAINS NOTABLES.

PHILADELPHIA, Dec. 7.—The Quaker City Motor Club made its initial plunge into society last Wednesday night, when upward of a hundred members and guests gathered around the festive board at the Hotel Walton, the occasion being the first annual banquet of the club. All the prominent local and State political lights were present, the only absentee of importance being Governor Stuart, who was called suddenly out of the city in the afternoon on official business. President P. D. Folwell occupied the chair, and G. Douglass Bartlett, the club's counsel and chairman of its enterprising legal committee, introduced the speakers in short speeches fairly bristling with wit.

His Honor Mayor Reyburn, after being liberally plastered with compliments by the toastmaster, reciprocated in kind, and handed the club a bouquet or two, especially complimenting it upon the management of the 200-mile road race in Fairmount Park, which wound up the Founders' Week festivities last October. The Mayor also expressed his appreciation of the work of the club in assisting tbe authorities in suppressing reckless driving on the city streets and in the suburbs and promised that as long as be remained at tbe head of the city administration he would aid in furthering every undertaking of the club. The Mayor is a most enthusiastic motorist, and the possibility of inducing the authorities to allow the club to run the Fairmount Park stock-car race as an annual fixture was discussed informally during the evening, the opinion being universal that the desired permission would be granted.

Director Henry Clay, of the Department of Public Safety, responded appreciatingly when his work in guarding the Fairmount Park course was lavishly praised by the toastmaster. The director lauded the automobile as an adjunct in municipal work and said the city is now negotiating with several manufacturers with a view of installing motor patrol wagons and ambulances and doing away entirely with the horse-drawn vehicles now used in those services.

The Philadelphia to Pittsburg highway was boosted in a neat speech by W. Hicks, of Tyrone, Pa., wbo put in a plea for the adoption of the Juniata Valley route when the route is finally decided upon. Edward Murphy, George Graham and A. Raymond Raff lent additional hilarity to the proceedings with witty speeches.

"Jack" Hiscock, a local newspaper man, struck a popular chord when he advocated legislation which would do away with the double license fees collected from Philadelphia outoists by the city and the State. His remarks, indeed, were so much to the point that a motion was carried instructing President Folwell to name a committee of the club to go to Harrisburg next January to urge the passage of legislation which shall do away with the necessity of local automobilists "coming up double."

NOW THE AUTOMOBILE CLUB OF ROCHESTER.

ROCHESTER, N. Y., Dec. 7.—The Rochester Automobile Club on account of conflict of initials with the Rochester Athletic Club has decided to change its name and will be known hereafter as the Automobile Club of Rochester. This flourishing club now has a membership of 538 and is working hard to attain the 600 mark.

Through the energy of the club signs have been placed on the road to Canandaigua by the new route. This road is reported in excellent condition and will be used next year while the Pittsford-Mendon road is being improved. The Churcbville road is still the best route to Batavia and Buffalo.

The club is working for the appointment of George C. Diehl, a member of the Buffalo club and of the Good Roads Board of the A. A. A., on the new Highway Commission.

BUFFALO CLUB LEADS IN ACTIVE MEMBERSHIP.

BUFFALO, Dec. 7.—The Automobile Club of Buffalo now has the largest active membership in the country, the additions made at the last regular meeting bringing the total number to 1,510. At the club's annual meeting and election of officers to be held Monday evening, December 21, in Concert Hall, just across the hallway from the clubrooms in the Teck Theatre Building, the following candidates will be voted upon: President, John M. Satterfield; vice-president, Laurens Enos; treasurer, Harry Thorp Vars; secretary, Dai H. Lewis; board of directors, Charles Clifton, E. R. Thomas, E. H. Butler, George C. Diehl, James N. Byers, Maurice M. Wall, and George P. Urban.

In case of the popular Mr. Lewis, this is a matter of re-election, he having held the position of secretary for several years. With Messrs. Satterfield and Enos, it is promotion, they having satisfactorily filled the positions of vice-president and treasurer respectively in the year just past. Frank B. Homer declined a reelection as president.

This vigorous club, it will be remembered, was the first in the country to oppose and defeat a city tax imposed on automobiles. Judge Hodson's opinions in this case will doubtless be an important factor to other clubs engaged in similar legislation.

NEW JERSEY CLUB HAS OVER 1,400 MEMBERS.

NEWARK, N. J., Dec. 10.—Two former United States Senators, a former governor of New Jersey, as well as a former mayor of the city of Newark, are among the many new members added to the roster of the New Jersey Automobile and Motor Club on Monday night. The list includes, besides ex-United States Senators, John F. Dryden and James Smith, Jr., ex-Governor Franklin Murphy and former Mayor Henry M. Doremus, of Newark, and also sixty prominent New Jerseyites who are prominent in political and financial circles. Aside from these, the list includes one woman member (making four women members of the club), as well as a batch of associate members. The New Jersey club is now pretty close to the Automobile Club of Buffalo with 1,400 active members in good standing. This does not include a large number of associate members, which swells the list materially.

WEBB NOW PRESIDENT OF LONG ISLAND CLUB.

BROOKLYN, N. Y., Dec. 7.—A record attendance was on hand for the annual election of the Long Island Automobile Club, Fulton and Cumberland streets. The reports of the various committees were read and plans for the winter discussed. The financial committee reported the club to be in exceptionally prosperous condition, the assets far exceeding the liabilities. A gain of over fifty members was shown for the past year, with the list constantly growing.

The election resulted as follows: President, Frank G. Webb; vice-president, William Schimpf; treasurer, C. C. Cluff; secretary, Herbert Andrews. The three new members of the board of governors are Alfred Wilmarth, Charles J. Edwards, and Dr. A. C. Howe.

HARTFORD CLUB AFTER SPEED MEMBERS.

HARTFORD, Conn., Dec. 7.—The past week has been a lively one in automobile club circles; Wednesday evening the governors of the Automobile Club of Hartford met to hear the cases of two members who had been summoned for violation of the speed law. The notification of violation of the law was forwarded by the club attorneys, Schutz & Edwards. One member who had been communicated with did not like the tone of the letter he received and forthwith tendered his resignation to the

board, which was not accepted. At the request of the club secretary the member in question appeared at the meeting and was represented by counsel. The case was thoroughly threshed out, and the member decided to withhold his resignation for another two weeks. In short, the first letter of the club attorney was not accepted in the spirit in which it was sent and this caused all the trouble. Another member who has been notorious for speed violations failed to appear and he was accordingly, by vote of the board, dropped from membership and so notified.

WILL WORK TO RETAIN CONNECTICUT LAW.

HARTFORD, Conn., Dec. 7.—The directors of the Connecticut Automobile Association met at the Allyn House Friday afternoon last. Colonel George Pope resigned as chairman of the legislative committee, and F. T. Staples of the Automobile Club of Bridgeport was elected his successor. Ralph D. Britton was elected chairman of the good roads committee. C. E. Whitney recommended that some provision be made for firms or individuals desiring to be associate members. Mayor George M. Landers of New Britain resigned as a director and chairman of the good roads committee. Objection was raised to the increase in the annual dues of the American Automobile Association from 25 to 50 cents for each member of the State organization. It was voted that the present law be commended to the State legislative committee, for the continuance of which everything should be done by the State body.

DENVER CLUB TO HAVE SHOW.

DENVER, COLO., Dec. 5.—The first annual automobile show of the Denver Motor Club will be held at the Auditorium, Denver, February 16, 17, 18, 1909. The show will be under the direct management of the show committee, consisting of Ralph W. Smith, chairman; C. P. Allen, Dr. E. F. Dean, George E. Turner, and Dr. W. H. Sharpley.

The committee will mail application blanks and floor plans December 1, and applications already on file will take up the major portion of the 16,000 square feet of available floor space. The main floor will be reserved for the exhibit fo complete automobiles. Two of the larger boxes will be reserved for the Denver Motor Club, which will hold open house for all show visitors. Special programs of an education and entertaining nature will be given each night. Excursion rates on all railroads during the week of the show is expected to aid materially in bringing people from all parts of the State.

A PENNSYLVANIA CLUB AFTER ROADS.

YORK, PA., Dec. 5.—Recommendations will be made to the City Council by the York County Automobile Association to have more streets in the city of York paved and rounded into better condition. This was the outgrowth of a meeting held last evening. A number of York merchants were present at the meeting and identified themselves with the new movement. Further plans relative to the improvement of county roads will be discussed and acted upon by the association at a meeting to be held some time this month.

NEW ORLEANS CLUB WANTS ROADS.

NEW ORLEANS, Dec. 5.—Things are humming in automobile circles in New Orleans. The recent races and the formation of the New Orleans Automobile Club and its affiliation with the A. A. A. have been eventful. All of the dealers report that business is getting brisker, and prospects are indeed encouraging.

A rousing big meeting of the New Orleans club was held last week, when the Louisiana Motor League affiliated with the new organization. The object of this club is for good roads, and from now on an active campaign will be waged in this direction. The first project taken up by the club is the building of a good shell road from this city to Chef Menteur, a famous hunting and fishing district, 22 miles from the city. The new road follows the lake and runs through some picturesque country. Several miles have already been built, and as the city, State and one of the railroads have promised aid, it looks as if it will be finished in short order. A clubhouse will be built at the end of the road.

The New Orleans Automobile Club has now several hundred members, and the aim is to get 1,000 members. President T. C. Campbell and Secretary-Treasurer Homer George have been among the leaders in this movement. Mr. George recently visited Birmingham and organized a new club there in place of the old one, which had died out. Two hundred members were secured in short order.

CLUB DOINGS IN GENERAL.

Alabama.—The Fulton County Automobile Club, through its attorney have filed application for letters of incorporation. This club is not organized for pecuniary gain, but to promote the best interests of automobile owners, there will be no capital stock, but it asks to be incorporated for fifty years. To accomplish its object this club proposes to establish club houses in the different sections of the county immediately, and take any further steps that will prove a benefit to the members.

TIRES FOR FIRE-FIGHTING APPARATUS.

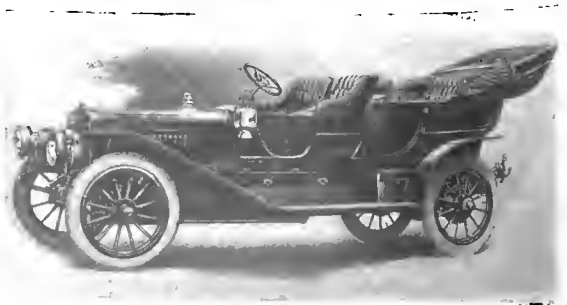
The recent increase in the use of self-propelled fire-fighting apparatus is very noticeable. Some of the far western cities have made remarkable progress in this branch. Thus the little town of Vancouver, B. C., now has no less than five pieces of fire apparatus which are motor driven, the latest to be received being two Seagrave combination wagons. This fire departmnet experimented with pneumatic tires, but owing to the heavy loads and high speeds required, these were not a success.

After trying out solid tires the doubt regarding their serviceability at these high speeds was soon dispelled, and the last two pieces of apparatus were consequently ordered with solid tires. These were specified of the cushion type, made by the Swinehart Clincher Tire & Rubber Company, of Akron, O. Considering that a guarantee of satisfactory service at a speed of 35 miles per hour was required, this order is gratifying to the company.

They attribute their success in this branch of service to the cushion effect produced by concaving the sides of the tire and also to the cross-wire type of fastening device. This fits into standard clincher rims, thus protecting the fastening and affords security against accident as well. This installation made after long tests and under such a strong guarantee will go far towards dispelling the mistaken idea that speeds of 12 to 18 miles per hour mark the limit of solid tires.

THE BIGGER OF THE TWO WINTON "SIXES."

The Winton factory for 1909 will concentrate on two six-cylinder classes, the smaller 45-horsepower and the larger 60-horsepower. These will be equipped with all forms of body, the cut below showing the neat lines of the 60-horsepower touring body. The air starting feature of these cars, so successful in the past, will be continued on both models.



Winton Six-Cylinder Touring Car of 60 Horsepower.

AN ATTRACTIVE PROPOSITION FOR 1909.

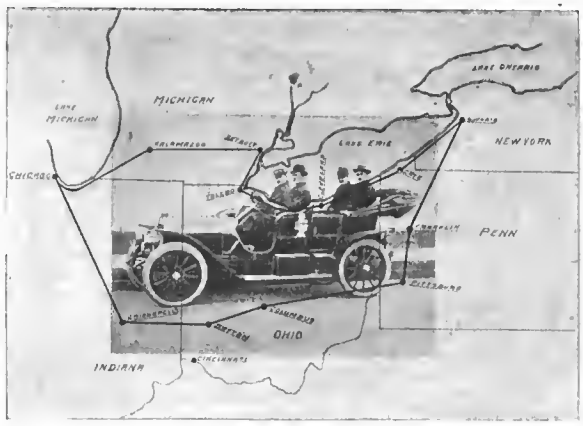
DETROIT, Dec. 7.—Low weight, low power, and low cost. High speed, high grade, and high art. Thus might a description of the "Hupp" be terminated. This car, made by the Hupp Motor Car Co., of Detroit, Mich., the general appearance of which is here illustrated, should be easily picked out in company, not so much because it is in any way at odds with the conventions, but for its rather strict conformity to the practices that are generally regarded as too costly to gain admittance to the haunts of the low-priced products. The average autoist seems to support a lingering suspicion that low price must carry with it a certain handicap by way of things that are not good enough to go into cars that are noted for their real qualities. Skeptics, with a penchant for riding in good automobiles, will have to revise themselves during the coming year, since the prices of cars do not always seem to be the gauge of quality.

The motor is of the water-cooled, four-cycle type, with four cylinders, and rated at 16-20 horsepower. Since the car weighs 1,100 pounds, the road performance will be that due to nearly 2 horsepower per hundred weight. Speed, of course, will assert itself under these conditions, and good road performance generally will be the natural sequence. From the motor to the transmission will be through a metal to metal cone clutch of suitable design and construction, and since the gear set is bolted to the motor case the system assumes unit power plant proportions.

One Attractive Proposition for 1909.

The engine is water-cooled, using a vertical tubed radiator, with straight "gills," and an adequate means of maintaining a vigorous circulation of the water. A Breeze carbureter is responsible for the mixture, and the gasoline system in general is up to the same standard of perfection. Considering the ignition, it is to call attention to the Bosch high-tension system to the entire exclusion of all other means besides.

These are some general features of the car: Frame of pressed steel, of the channel section, suitably braced laterally, is suspended on semi-elliptic springs in front, while the rear springs include "patented" lateral members. Since the car is of the shaft drive type, the radius rod details are in conformity, and the live rear axle is up to a fitting standard, with Hyatt roller bearings. Two sets of brakes are provided, both on the rear axle, and both of which are internal expanding. The service brakes are controlled by a foot lever, and the emergency brakes answer to the beck of a suitable side lever. Universal joints are used on the cardan shaft, and means are provided to exclude "grit," providing at the same time adequate oiling facilities. The steering post is at a desirable rake, and lost motion, so much to be avoided, is suitably guarded against. An appropriate runabout body, complete set of tools, oil lamps, and a dragon horn are included in the price. The illustration shows the appearance of the body, and the fuel tank will be seen back of the seat. The mud guards are worth taking a look at as well. The car as a whole should make its mark. The price is $750 F.O.B.



Inter-State Demonstration of a New Model.

DEMONSTRATION OF A NEW MODEL.

The illustration above is that of one of the Model 9-H, $1,500, Stoddard-Daytons while on the first demonstrating trip. This trip, as outlined by the map, covered a route taking in Indianapolis, Chicago, Kalamazoo, Detroit, Toledo, Cleveland, Erie, Buffalo, Franklin, Pittsburg, Columbus, and return to Dayton. The total mileage of this trip, including several demonstrations in each of the above towns, was 2,164 miles, in which it was estimated a total of 112 gallons of gasoline was consumed. This gives an average of 19.36 miles per gallon, which it must be understood includes the average consumption of any one month's driving of this model, as the car was gone from Dayton exactly one month, and the above was the total "gas" used.

A BRITISH COW-CATCHER FOR AUTOS.

Everybody likes to be up-to-date. There is no doubt about this particularly in this country, but it is doubtful if many of our rural automobile enthusiasts will follow the lead of an English car owner who has fitted the front of his car with a buffer of immense diameter and very strongly built. A better name to give this peculiar accessory might be "cow-catcher," for that is the peculiar purpose for which this was intended. The owner of the large car shown in the accompanying cut, as it appeared on the Strand, London, was greatly annoyed on his country trips by having to wait for cattle in the road to move aside. Not daring to ram them with the ordinary fragile front end, he conceived the idea illustrated. These cow-catchers, for there are two of them, are so strongly built and also so rigidly attached that cattle are unceremoniously pushed aside.

Here is a British "Cow-Catcher" for Autos.

N. A. A. M. SAYS A. A. A. SHOULD CONTROL.

That the control of automobile racing in this country should be retained by the American Automobile Association was the opinion expressed at the regular monthly meeting of the executive committee of the National Association of Automobile Manufacturers, held December 2, at the association headquarters in New York City.

The action, however, did not find any objection whatever with the recently adopted policy of the A. A. A. to decline hereafter to recognize races on half and mile circular horse tracks.

In conjunction with the general work of the A. A. A., as outlined by President William H. Hotchkiss, who addressed the meeting at considerable length, the executive committee promised substantial financial support. At the request of the A. A. A. a committee consisting of H. O. Smith, W. E. Metzger and S. A. Miles was appointed to serve on its executive committee. The same trio were designated a committee to confer with the Contest Board of the A. A. A. relative to the endurance tour of 1909.

The Waverley Company, of Indianapolis, was elected to membership.

C. G. Stoddard, of the Dayton Motor Car Company, Dayton, O., was elected to the executive committee.

The traffic department of the association has recently arranged important changes affecting the transportation of automobiles to the South and West. While in the West recently Mr. Marvin, manager of the department, held meetings with the traffic managers of the various factories in and near Indianapolis, Detroit, Chicago and Cleveland. In each place a permanent committee was formed, which committee will hold meetings at regular intervals to discuss traffic details and take suitable action in relation thereto. It is expected that uniformity of opinion and closer co-operation between the factories and the traffic department will result and that a great deal of benefit will be derived therefrom. Further meetings of these committees were held last week. In due course the traffic managers of Eastern factories will be similarly organized.

The annual meeting of the association will take place on Wednesday, January 20, 1909, probably at the Victoria Hotel.

CHALFANT NOW A.L.A.M. GENERAL MANAGER.

E. P. Chalfant is now the general manager of the Association of Licensed Automobile Manufacturers, he having been selected at the meeting of its board of managers held December 3. Mr. Chalfant for several months past has been acting as assistant general manager, and he succeeds M. J. Budlong, whose duties as manager of the New York branch of the Packard Motor Car Company prevented his continuance.

These were present at the meeting: Elmer Apperson, Apperson Bros. Auto Company; John S. Clarke, Autocar Company; W. C. Leland, Cadillac Motor Car Company; Roy D. Chapin and Lee Counselman, Chalmers-Detroit Motor Company; M. S. Hart, Corbin Motor Vehicle Corporation; J. H. Becker, Elmore Manufacturing Company; Wm. E. Metzger, Everitt-Metzger-Flanders Company; H. H. Franklin and G. H. Stillwell, H. H. Franklin Manufacturing Company; E. R. Hewitt, Hewitt Motor Company; A. N. Mayo, Knox Automobile Company; S. T. Davis, Jr., Locomobile Company of America; H. A. Lozier, Lozier Motor Company; C. W. Matheson, Matheson Motor Car Company; L. H. Kittredge, Peerless Motor Car Company; A. L. Pope, Pope Manufacturing Company; George Pope, Pope Motor Car Company; George J. Dunham, Royal Motor Car Company; G. E. Mitchell, Alden Sampson Manufacturing Company; R. H. Salmons, Selden Motor Vehicle Company; I. H. Page, Stevens-Duryea Company; E. S. Church, Waltham Manufacturing Company; Thomas Henderson, Winton Motor Carriage Company.

The above includes George J. Dunham, the new president of the reorganized Royal Motor Car Company, of Cleveland, O., which hereafter will be known as the Royal Tourist Car Company. Very recently the Ohio courts relieved the Royal company of its receivership.

DUNHAM HEADS ROYAL TOURIST CAR CO.

CLEVELAND, Dec. 7.—Free at last of the receiver, the Royal car is once more being made by an unencumbered company. The Royal Tourist Car Co., which succeeded the receiver, is now embarking upon an aggressive campaign, and appearances point to a successful season.

George J. Dunham, formerly the Royal and Corbin agent in Boston, is the president of the new company and will remain in this city in charge of the active management of the new concern. He has created a very good impression locally.

When taking up the duties Mr. Dunham expressed confidence in the new high water mark to be made in Royal Tourist progression. "Capital and experience will go hand in hand in future so far as our company is concerned," he said. "We start our fiscal year without a dollar of indebtedness and we are amply prepared for an aggressive campaign along lines of solid business merit.

"In many respects our new model, several of which have been completed and will very shortly be in the hands of our agents, embraces improvements and up-to-date refinements that stamp it as being in a distinct class. A larger motor with extra fuel saving carbureter, a change in transmission, a simplified rear axle, improved brakes and greater accessibility are noticeable features which we have striven for and the motoring public will soon have an opportunity to judge for itself as to the true quality of our product.

"Our factory facilities and general equipment in so far as the literal manufacturing of cars is concerned are unexcelled, and with the returning wave of confident prosperity to the country as a whole, my best efforts will go forth in the endeavor to place the Royal Tourist in a position of unassailable supremacy."

PHILADELPHIA TRADESMEN ELECT OFFICERS.

PHILADELPHIA, Dec. 7.—The annual meeting and election of the Philadelphia Automobile Trade Association was held last week at its offices in the Odd Fellows' Temple, a surprisingly large proportion of the membership being present. The report of Secretary J. Henry Beck showed 31 active and 14 associate members now on the roll, the former being automobile branch house managers and agents, the latter tire and accessories dealers. A loss of five members during the year was more than offset by the addition of twelve new members. The treasury was shown to be in a comfortable condition, a neat balance being reported. The prospects for the next show seemed to indicate that it would be the "best ever" in the history of the association.

The election resulted in the choice of the following officers to serve during the ensuing year: President, J. A. Wister, of Gawthrop & Wister (Elmore); vice-president, E. C. Vanderhoof, of Bergdoll Motor Car Company (Benz, American Locomotive, Chalmer-Detroit, and Oakland); secretary-treasurer, W. J. Foss, of the Foss-Hughes Company (Pierce and E-M-F "30"); the foregoing with A. E. Maltby, of the Winton Motor Carriage Company, and Louis Block, of the Ford Motor Company, to constitute the Board of Directors.

A luncheon was served after the meeting.

ACTIVITY IN IMPORTATION OF AUTOMOBILES.

For the ten months of 1908, ending November 1, the report of the importation of automobiles is as follows:

United Kingdom	$141,553
France	1,453,939
Germany	54,595
Italy	453,638
Other countries	45,651
	$2,636,867
Parts of automobiles	505,818
Grand total	$2,636,678

For the ten months of 1908, ending November 1, the report of the importation of steel is as follows:

Bar stock	$35,304,819
Shapes and forgings	4,425,125
Total	$39,819,944

1906 Franklin, U. S. Army, Mariano, Cuba.—Used by Army of Cuban Pacification.

Prefers Auto to Horse.—To-day in Cuba the United States has an army of pacification, and its commanding officer, although able to stand the riding test required by President Roosevelt, finds that the horse as a means of army transportation is almost as much out of place in the twentieth century as is the sword as a fighting weapon. Accordingly, it is in an automobile that he shoots about the island which only ten years ago was the stage setting for Colonel Roosevelt and his Rough Riders, with all their trappings of horsemanship. In a Franklin motor car he makes quick trips across and about the island, the car's speed making it a Government time saver. Since it has been attached to the headquarters of the army of pacification the automobile has covered 30,000 miles.

Another Triumph for Locomobile.—Among the cities which are rapidly replacing the horse may be noted the place that Pabst made famous, Milwaukee. This hustling municipality has just added one to its list of cars, making six. More than this, the latest rumor is that the present fire engines will be replaced by motor-propelled apparatus. Milwaukee's latest addition is a special police car. The list now reads like this: Fire chief, Mitchell car; Board of School Directors, Ramhler; Police Department, Meiselbach truck patrol wagon body; Chief of Police Department, Locomobile. The Board of Public Works is about to choose a car, while other departments also have cars. The success of these cars induced the Common Council to appropriate $4,600 for the police car. Chief Janssen used his influence in this direction to secure a Locomobile. In making this selection he was influenced by a car of this make winning each of the 24-hour contests held in Milwaukee, the first with 1,149 miles in 1907, and the second with 992 miles in 1908.

A British Compliment to the Locomobile.—In a racing chapter, English *Motor* prints the following: "The Vanderbilt Cup race was run this year under a weight limit, disregarding the Ostend regulations, and consequently will probably be the last road race in which the old big-engine racers were used. The fourth contest for the Cup was won by Robertson, driving a Locomobile, which had been built for the last Cup race. They were beautiful cars, and their workmanship excited the admiration of even the foreign drivers, so that the Locomobile Company are to be congratulated on their success at the eleventh hour, when their cars were practically useless for international racing."

Thomas Gets the Standard Cup.—The beautiful silver trophy put up by the Standard Roller Bearing Company, of Philadelphia, for the car with its bearings which made the best performance in the recent Vanderbilt Cup race, has been awarded to George S. Salzman, for his consistent handling of the 115-horsepower Thomas. This recognition of Salzman's ability as a driver came as a surprise both to the Thomas people and the driver himself. That his driving was consistent is shown plainly by the times for the ten laps, which varied but little up or down from 22:40 each.

Louisville Dealers Organize.—For the purpose of formulating some definite plans for the second annual automobile show next Spring, the automobile dealers of Louisville have formed the Louisville Automobile Dealers' Association, which will be incorporated under the laws of Kentucky. Although the association was first conceived to make the proposed show a success, it will continue to interest itself in all automobile doings and particularly the welfare of the trade.

Long Trip for Two-Cylinder.—Dr. E. E. Brown, of Fort Bragg, Cal., recently completed a long-distance trip with his two-cylinder Rambler, passing through eleven States and a good bit of Canada. Starting from Fort Bragg, he spent two months on the road to Winnipeg, covering in all 3,123 miles. The only trouble reported during the trip was the loss of the mud apron from beneath the car and the cut-out whistle, which happened in the sage-brush of Nevada.

Noted Author Now a Pierceite.—Robert W. Chambers, the novelist, has just purchased a four-cylinder 40-horsepower Pierce-Arrow car with a suburban body. With the possibilities for stories that may be suggested to Mr. Chambers by the use of his car it should not be regarded as at all unlikely that within the next few years some critic may feel called upon to indite a monograph on "The Influence of the Pierce-Arrow on American Literature."

"Old Glory Team 1908."—The Peerless Motor Car Company, of Cleveland, O., is issuing a neat little booklet entitled "Old Glory Team 1908," which tells briefly of the performance of the now famous red, white, and blue team in the Glidden tour. This is copiously illustrated by views taken all along the route, beginning with the start at Buffalo to the finish at Saratoga.

Correction in Oakland Advertising.—In the November 26 issue the advertisement of the Oakland car, on page 94, erroneously stated that the four-cylinder model would be equipped with 32-inch wheels. This was not fair to the makers of this light car, who are putting on very large wheels, 34 inches in diameter, with 34 by 4 inch tires all around.

Peerless to Build in New York.—The Peerless Motor Car Company makes the announcement that it has purchased property on Broadway, where it will erect a permanent home for the New York branch. The building will extend back far enough to make a right angle coming out on Fifty-seventh street.

Cost of Model D Franklin.—Attention is called to the fact that the price of the 1908 Model D Franklin touring car, as given in the advertisement in November 19 issue, was a typographical error. The figures given, viz., $2,700, should have been $2,800.

Both Winners Used Same Shock Absorbers.—In the big and little car races at Savannah the two winners were equipped with Truffault-Hartford shock absorbers. Incidentally, the first four cars in the Grand Prize were similarly equipped.

Burdick Motor Car Company.—The American Motor Car Company, of Eau Claire, Wis., has filed an application changing the name to the Burdick Motor Car Company and changing the number of directors from five to three.

PERSONAL TRADE MENTION.

Patrick J. Brophy was the winner of the second Chauffeurs' Economy contest, promoted by the Brazier Auto Garage, of Philadelphia. He wins a handsome gold watch for his record showing the smallest fuel consumption, repair bills and general upkeep of nearly a score of contestants.

C. Royce Hough, the former factory manager of the Pope Manufacturing Company's plant at Indianapolis, and later of the Motor Car Company, Washington, D. C., has accepted the position of general manager for Fickling & Company, of New York.

Herbert Harold, formerly of the Locomobile factory force, has taken charge of the mechanical department of the Schreiber Motor Company, Milwaukee, Wis. He succeeds "Bob" Drach, who piloted the "Locos" to victory in two 24-hour races at Milwaukee.

"Jack" Harkins, the driver of the Chadwick entry in the recent Founders' Day 200-mile race in Fairmount Park, Philadelphia, is now selling goods for the Harris Fire and Rubber Company, Broad and Race streets, in the same city.

R. J. Skilton, recently connected with the Philadelphia branch of the Chadwick Engineering Works, of Pottstown, Pa., was last week introduced into his new position as city sales manager of the Oldsmobile branch in the Quaker City.

E. P. De Gollier, wbo has been connected with the Cleveland branch of the Oldsmobile Company for some years, has allied himself with the Auto Shop Company, Cleveland agents for the Thomas and Selden cars.

R. V. Connerat, of Savannah, Ga., has been appointed general manager for the Buick territory in the South, witb headquarters at Atlanta, W. H. Connerat, Jr., managing the Savannah business

Alex. T. Segura, well known in theatrical and automobile trade circles, has allied himself witb the Astor Automobile Company, New York City, as manager of the sales department.

S. J. Wise, late of the Packard and Garford selling forces, has gone witb Carl H. Page & Company, New York City, Eastern selling agents for the Chalmers-Detroit.

Dave Henry is now the sales manager of the Interstate Automobile Company, of Muncie, Ind., which is not located in Chicago, as was previously stated in these columns.

Albert A. Lamb, formerly of the Michelin branch in Philadelphia, has been appointed general manager of the James S. Griffin Company, New York City.

D. W. Gluck, late of the Packard Motor Car Company, of New York, has been appointed sales manager for Fickling & Company, New York.

S. R. Iams, until recently agent for the Royal Tourist in Western Pennsylvania, is now witb the Winton branch on Beatty street, Pittsburg.

RECENT INCORPORATIONS.

The Bertschy Motor Company, of Council Bluffs, Ia., has been incorporated with capital stock of $50,000 for the purpose of manufacturing automobiles. Work has already started on a factory at Sixth street and Eleventh avenue. The officers of the company are: President, T. R. Children; vice-president and general manager, A. J. P. Bertscby; secretary, G. S. Wright; treasurer, E. E. Hard.

Gloversville Garage Company, of Gloversville, N. Y., has been incorporated by W. D. Hyde, Morrell Voorman and J. W. Sisson, witb a capital stock of $15,000. The company has options on three different sites for the building of a garage during the Winter.

Brick Church Automobile Company, of East Orange, N. J., bas been incorporated with capital stock of $100,000 to manufacture and repair automobiles.

Post Motor Company, New York, has been incorporated with capital stock of $30,000 for the purpose of manufacturing automobile engines, etc.

Cameron Motor Car Company, New York, with capital of $150,000. Incorporators: E. D. Alexander, R. R. Logan and Frank Hildebrandt.

Weldon & Bauer Company, Newark, N. J., has been incorporated with capital stock of $15,000, for tbe purpose of carrying on a garage.

Lozier Manufacturing Company, of Plattsburg, N. Y., has filed articles of incorporation with capital stock of $60,000.

Electric Speedometer and Dynamotor Mfg. Co., of Delaware, has been incorporated with capital stock of $50,000.

Long Beach Garage Company, New York, has been incorporated with capital stock of $50,000.

CONCERNING THE AGENCIES.

Franklin Agency Appointments.—The H. H. Franklin Company, of Syracuse, announces the following agencies: Robert Gugin, British Columbia; Wallace L. Wilcox, Fall River, Mass.; S. C. Low Supply Company, 22 Fourth street, New Bedford, Mass.; Mack-Brooks Company, 124 West Market street, Lima, O.; Orange Auto Garage, East Orange, N. J.; Alexander-Seewald Company, Atlanta, Ga.; Charles Bilz, Colorado Springs, Colo.; H. E. Hartman, Nashua, N. H.; Inland Automobile Company, Spokane street, Walla Walla, Wash.; O. C. Bosworth, Putnam, Conn.

Oldsmobile, New Jersey.—The Oldsmobile Company, of New York City, has completed arrangements whereby it secures the territory in Northern New Jersey, and bas at once started to open branches in the various counties. The New Jersey headquarters will probably be established at Newark.

Cadillac, Winston-Salem, N. C.—The Forsyth Sporting Goods Company, agents for the Cadillac in Winston-Salem and vicinity, bas leased tbe new building on Liberty street for the automobile department of its business, which has been placed in the charge of G. C. Thomas.

Auto-Gas Tanks, Philadelphia.—James L. Gibney & Son, Broad street, Philadelphia, have taken the agency for the Auto-Gas tanks made by the Avery Portable Lighting Company of Milwaukee.

Fisk Tires, San Francisco.—Pacific Coast manager for the Fisk Rubber Company, G. E. Ichnson, sends the news that the San Francisco branch bas moved into its new quarters at Golden Gate avenue and Larkin street.

Locomobile, Pittsburg.—I. N. Dill, manager for the Central Pennsylvania Automobile Company, of Pittsburg, announces that bis company has taken the agency for the Locomobile.

Maxwell, Baltimore.—The Lambert Automobile Company, of Baltimore, agent for the Maxwell cars, has moved from Roland Park to Chase street, near Cbarles.

Overland, Baltimore.—Charles S. Houghton has taken the agency for the Overland car in Baltimore and vicinity, with headquarters at 329 Calvert Building.

Corbin, Lexington, Ky.—Joseph Matson, for the Corbin Motor Car Company, has established an agency in Lexington, Ky., with Smith, Watkins & Company.

Lozier, Baltimore.—The Lozier will be represented in Baltimore by the Southern Auto Company, Mount Royal avenue and Dolphin street.

E-M-F, Baltimore.—The agency for the E-M-F in Baltimore has been taken by the Motor Car Company, Maryland and Mount Royal avenues.

Brush, Cleveland.—The Brush car will be handled in Cleveland by Harry S. Moore, who also has the agency for the Stoddard-Dayton cars.

Regal, Nashville.—J. O. Caldwell has established the Regal Motor Company in Nashville and will have salesrooms at 145 Third avenue.

Moon, Kansas City, Mo.—The Moon Car Company has been formed in Kansas City, with Charles B. Merrill as manager.

Apperson, Seattle.—The Apperson cars will be handled in Scattle by the Seattle Auto Company.

NEW TRADE PUBLICATIONS.

Matthews Boat Company.—In an extensive catalogue of over 70 very artistic pages, the Matthews Boat Company, of Port Clinton, O., has gone into the subject in a way that is new and original. Beginning with the statement that a reader and prospective buyer's intereet ie ueually limited to three queetione: "Who we are, What we have to offer, and What is the cost," they have anawered theee queetione very fully. The second part or "What we have to offer," of course, takes up the greater portion of the book, giving as it does photos of the three principal claeses of boats built by them. These are open launches, runabouts, including racing boats, and cabin cruisers. The merits of the type of construction are shown by means of sketches, which bring out clearly the points of superiority. In the back a collection of letters from satisfied owners all over the country testify to the fact that Matthews boats are making good. An excellent picture of the launching and christening of a small cabin cruiser occuplee a prominent place on the front cover.

Peerless Motor Car Company.—The Peerless catalogue for 1909 is issued in two parts, the general catalogue and the limousine book. The latter is devoted to the enclosed cars with photoe showing the refinements found on the Peerlees cars, together with wash drawings indicating the many and varied uees to which the limpusine may be put. The general catalogue, copiously illustrated with photoe of the various units, including engine, transmiselon, transmission parts, etc., shows that this company will produce but two chasses for the coming year, viz., the four-cylinder, nominally rated at 30-horsepower, and the "six" called 50-horsepower. From the details, it will be noted that very few changes have been mads. The wheelbase is increased to distribute the weight better; a new universal joint between clutch and transmission, and a new herringbone gear for the water pump are the only differences to be found.

Edmund & Jones Mfg. Co., Detroit, Mich.—The new circular of this year's oil side and tail lamps ehows that the company is still working towarde simplicity. The lamps are riveted together, no screws being used, thus they are easy to keep clean. The best ground mangin mirrors are ueed in the searchlights, which are made in two types and eix different models. They vary in eise and price from Model 365, 8-inch diameter, at $8 up to Model 8880, 10½-inch, at $18.50. A brand new feature is the condensation cup. This is to collect the condensed water in the gas line from generator to lamp. Three wood screws fasten this simple little trouble saver to the under side of the running board.

American Simplex.—Among the advocates of the two-cycle automobile engine is numbered the Simplex Motor Car Company, of Mishawaka, Ind. A brand new catalogue of these cars shows the single model to be produced for 1909 equipped with four different bodies, touring, close-coupled, roadster, and limousine. The details of the mechanism are given with an exposition of the two-cycle principle and some very convincing pictures of a trip made by Col. C. G. Conn, of Elkhart, Ind., from the factory to Los Angeles, in one of their stock cars.

White Steam Ambulances, etc.—Owing to the importance that commercial work has assumed where the White steamer is concerned, the company has just issued a folder illustrating eome of the numeroue ambulances, patrol wagons and busses that it has produced within the last year or so. These include the equipment of many well-known hospitals and municipalities besides the Army and Navy.

Gelzler Storage Battery.—The Geizler Brothers, of 514 West Fifty-seventh street, New York City, have just issued their catalog announcement for 1909 which contains a description of the non-sulphating battery manufactured by them with especial reference to its use in connection with the ignition systems for all gas or gasolene engines.

Winton Motor Carriage Company.—This veteran concern has juet issued its 1909 catalogue, which is published with 48 pages enclosed in an artistically designed cover with "straight-from-the-shoulder" talk on what at least one company thinks of the six-cylinder engine, besides the complete specifications for the 1909 product.

Multiple Spindle Drills.—The Pratt & Whitney Company, Hartford, Conn., manufacturers of small machine tools, are sending out a beautifully illustrated pamphlet showing some of the many different types of multiple drills they manufacture, many of which are especially adapted to the needs of automobile work.

INFORMATION FOR AUTO USERS.

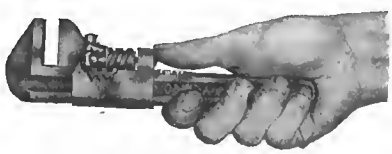
1909 Warner Auto-Meter.—It has been the consistent policy of the Warner Instrument Company, of Beloit, Wis., not only to put out a refined and beautiful speed indicating instrument, but an instrument that is calculated to give the best satisfaction under all conditions. The 1909 Warner Auto-Meter, which will be ready for delivery about the middle of the present month, and which is shown in the accompanying illustration, retains the principle of the speed indicating part of the 1908 instrument, but includes among other notable changes and improvements a new odometer with 100,000-mile season and 1,000-mile trip registers, and simple trip reset device. Another notable improvement consists of a new shaft and a new drive. In the new instrument the shaft will make one-half the number of revolutions of the old one.

WARNER AUTO-METER AND CLOCK.

In addition to the model shown in the cut, which is surmounted by the Warner Auto-Clock, another model, identical in design, but without the clock, is furnished. Each instrument will have an enclosed electric light, a valuable adjunct to the autoist after dusk.

As to the quality of the speed and distance recording instruments manufactured by the Warner Instrument Company, it is but fair to state that their construction is second to none. As an effective antidote to friction and wear, and to insure that every variation in the speed of the car, however minute, will be faithfully indicated on the speed dial, the dial rides in genuine sapphire jewel bearings. All driving parts are made of the best possible material, with absolute accuracy and longevity of wear as the chief ends in view. The new factory of the Warner Company is in keeping with the requirements of the high-class product it produces, its equipment throughout being of the highest efficiency.

Yemco Quick Acting Ball Bearing Wrench.—Smith & Hemenway, 108-110 Duane street, New York City, are offering to the trade a quick acting ball bearing type of monkey wrench, the especial feature of which will be understood by attaching the appellation "self-locking." The illustration here afforded will clearly show the details of interest, and the average mechanic will guess the rest. At all events, this self-locking idea is one to be appreciated, especially by autoists who experience trouble in keeping monkey wrench jaws adjusted, after a little lost motion creeps into the mechanism. The wrench is of convenient size, die forged of fine steel, and machined to a nicety. The "nickel" finish renders the wrench a fitting companion in the up-to-date tool kit.



YEMCO QUICK-ACTING WRENCH.

An Auto Duster That Absorbs Dust.—Sometimes it is the little things which go to make the maintenance of the car easy, and one of these conveniences has just been placed on the market by the Howard Duster Company, 164 Federal street, Boston, in the shape of a dustless duster, made of chemically treated cloth, which the makers assert not only removes the dust, but absorbs it, thus eliminating the dust particles which arise in the air, from being stirred up by the wiping, and action of the cloth. Not only will the Howard duster do the dusting, but it is useful for cleaning and polishing without scratching the finish.

Elmore Drop Forged Screwdrivers.—With the view of meeting the demand, not only of the makers of automobiles throughout the country, but dealers, garages and supply houses who have now adopted one certain type and style of screwdriver as being standard, and the one proven satisfactory for such heavy work, the Elmore Tool Manufacturing Co., of Hartford, Conn., has after exhaustive tests and experiments designed and perfected a screwdriver known as the "Elmore Drop Forged" to meet these requirements. The wood parts of the handles of these drivers are of the ribbed protection style on all sides, thus avoiding cracks caused by shrinkage. The entire driver, handle, and ferrule is drop forged from the best quality of steel, and the style and design is shown in the illustrations. The end of the driver is made very heavy and flat on the extreme end for hammering, and other unusual work sometimes necessary on automobiles, and the butt and ferrule end is constructed so as to prevent cracking the wood scales when used for such severe work. These screwdrivers are made not only with different styles and lengths of blades, but are made in several sizes of handles, from very small to very large, and with both round and square shanks. The capacity of the company's plant will enable it to manufacture tools of such type for the automobile trade in very large quantities.

TWO TYPES OF THE ELMORE DROP FORGED SCREW DRIVERS.

New Form of Primary Contact Maker.—The Monitor Manufacturing Company, of 1425 Washington street, Boston, Mass., has recently brought out an entirely new form of primary contact maker and is applying it to the already well known Bemus timer. By referring to the cut it will be noticed that a beveled roll is used for the primary brush. This roll is carried by a pin located off center relative to the axis, and designed to engage with steel balls. The boundaries of the balls touch on the beveled part of roll, causing the roll to turn on the pin and at the same time positively rotating the balls universally. This timer is supplied with a ground contact of special construction and designed so that the point of contact, which is a steel ball, will engage on the end of the roll. By this the best possible form of contact is made and the ground circuit is complete, without the fear of oil insulated joints or connections. In explanation of this it will be noticed that the current is brought in through binding post No. 16 on to roll No. 7, thence to ground contact connection, which is connected to battery, engine, or frame, thus avoiding the necessity of the current being obliged to travel through an oil insulated bearing. More timers fail to work because the ground circuit is not completed than from any other cause. All of the ball contacts are easily removed and cheaply renewed, being standard 3-8 inch steel balls. They may be obtained almost anywhere and the roll or primary brush can also easily be renewed at an expense of twenty-five cents or less, making an expenditure of not more than forty cents on a four-cylinder timer. This form of contact has been thoroughly tested and the results obtained are commendable. The timer has been run equivalent to 35,000 miles without its being necessary to renew either the roll or balls.

BEMUS TIMER DISSEMBLED.

Dover Tourist Oil and Gasoline Kit.—A neat, compact, and dust-proof device for carrying extra oil and gasoline when touring, that can be instantly attached or detached from the car, has just been placed on the market by the Dover Stamping & Manufacturing Company, of Cambridge, Mass. The illustrations show the form and relative size of the kit, which is 9 x 9 inches x 10 3-4 inches high, and consists of

TOURIST OIL AND GASOLINE KIT.

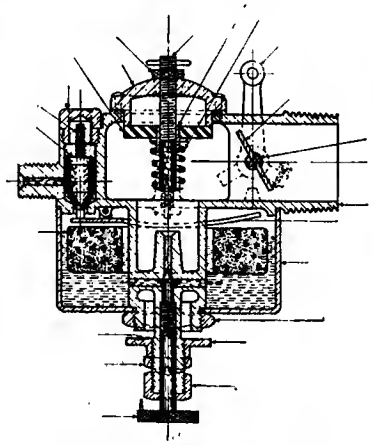
a black enameled steel case, which may be strapped instantly to the running board. It contains inside two enameled steel cans, having a capacity of over 1 1-2 gallons each, with special pouring spout and filler cap. One may be used for oil and the other for a reserve supply of gasoline, or both for oil, or one only may be used and the space occupied by the other be used for storage room. One special feature which the makers state ought to appeal to autoists is that it enables the tourist to carry a sufficient amount of his favorite brand of oil in a very convenient and compact form for quite an extended tour.

Neverout Gas Generator.—The illustration shows the Neverout patent air-cooled gas generator, made by the Rose Manufacturing Company, 910 Arch street, Philadelphia. Among the good things announced for this generator is a gas of intense whiteness and a flame that is perfectly steady, and as it employs the grate system with Neverout patent dome water feed, it is easy to clean, and can

NEVEROUT GAS GENERATOR.

be instantly and repeatedly lighted and turned off likewise, and without complications. The generator is made in two sizes, holding 2 and 3½ pounds of carbide respectively. The construction is strong, being made of drawn shells. The flame at the lamp jets is held constant because the generator supplies the requisite quantity of gas, free from impurities, at a constant pressure. The constant pressure is the product of a constant temperature of the dissolving carbide, and a suitable means by which the lime is shaken out. Patents have also been taken out in the principal foreign countries.

Oberdorfer Carbureter.—As will be apparent from the sectional illustration showing the details of its construction, the Oberdorfer is an extremely compact and well designed example of the concentric float type of carbureter, this advantage having been obtained in great measure by placing the auxiliary air valve directly over the spray nozzle, or in the mixing chamber. The gasoline supply enters at the left, dropping into the float chamber through the loaded valve shown in the cut, while the mixture leaves at the right as is indicated by the position of the throttle. The Oberdorfer carbureter was primarily designed for marine use and has been largely em-



SECTION VIEW OBERDORFER CARBURETER.

ployed on motor boats, which accounts for the design of the auxiliary air valve housing, this being intended to prevent the entrance of water. It has also been used to some extent on the automobile and both in tests and actual service had shown a high degree of efficiency as well as reliability in action, making an unusually uniform mixture at all speeds. Easy starting is one of its advantages, as when the carbureter is primed, the button not being shown in the illustration, a few drops of gasoline are caught in the cup of the adjusting screw of the needle valve located in the center of the main air intake, this insuring a supply of gas without delay.

It is being manufactured by the M. L. Oberdorfer Brass Company, Syracuse, N. Y., and as this firm has been turning out several thousand carbureters a year for the last two or three years, for well-known automobile manufacturers, they have excellent facilities for this class of work.

Air-Tight Steel Gasoline Tanks.—The economy of buying gasoline in large quantities is well recognized, but many automobilists are prevented from doing so by the trouble and danger of storing it in ordinary ways. The Air-Tight Steel Tank Company, of Pittsburg, Pa., has brought out a storage

AIR-TIGHT STEEL TANK IN USE.

tank especially designed for use by private automobile owners. The tank is simply buried in the ground in any convenient place, and the gasoline is forced out by air pressure instead of by a suction pump. The flow is always under perfect control. When sufficient has been drawn out, opening a valve on the air pump releases the pressure and allows the gasoline in the piping to flow back into the tank, where it is hermetically sealed.

New Model of Jones Speedometers.—The Jones Speedometer, Seventy-sixth street and Broadway, New York City, has placed upon the market four new models in order to meet the demand for a speedometer commensurate in price with cars of medium cost. For example, one can now purchase a Jones speedometer with a 50-mile speed scale for $15. This model brings a speed indicator of well-known quality within the reach of every autoist. Model 22 has Veeder season odometer 50-mile speed scale, and costs $5 more than Model 30. Model 27 indicates speed to 50 miles per hour and records season mileage with Jones enclosed odometer. Model 28 has the Jones trip odometer with its feature of recording cumulative mileage.

Improved Chauffeur's Truck.—The Grand Rapids Spring Company, of Grand Rapids, Mich., have just put on the market a small truck to be used by drivers and repairmen in general for getting at the under side of the car without coming in contact with the oily floor or the dirt. As shown by the accompanying cut the device is not bulky and may be easily handled.

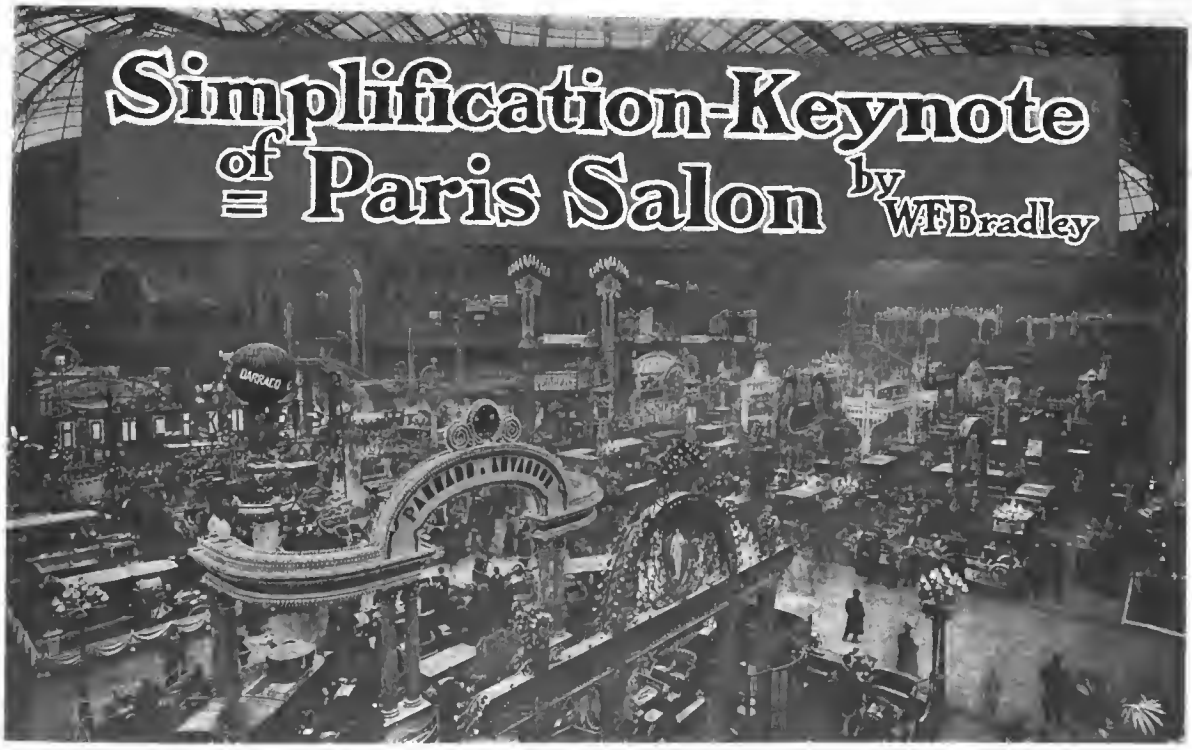
IMPROVED CHAUFFEUR'S TRUCK FOR GETTING UNDER A CAR.

VOL. XIX NEW YORK—THURSDAY, DECEMBER 17, 1908—CHICAGO No. 25

THE AUTOMOBILE

Simplification-Keynote of Paris Salon

by W. F. Bradley



PARIS, Dec. 10.—Simplification is the keynote of the eleventh annual Paris Salon. On the general lines of a design European constructors are pretty well of one opinion and there is no longer a discussion as to cone and disc clutches, shaft and chain drive, high and low tension ignition, selective and progressive gear change, thermo-syphon and pump-water circulation, pressed steel and armored wood frames, etc. While few constructors have made any remarkable changes in their chassis, all of them have sought to simplify them to the greatest possible degree. It is with a view to simplification that low-tension ignition has been abandoned by all the large constructors who up to the present have been its strong supporters. The change has not been made with the object of allowing a dual ignition to be fitted easily, for the simple reason that dual ignitions are very rare exceptions. Constructors are of the opinion that in the hands of an expert and for racing or demonstration purposes the low-tension system has advantages. But for the ordinary user, who is not an expert at tuning up a car, the high-tension magneto is the best system. This is further proved by the fact that such firms as Brasier, Berliet, Dietrich and Mercedes use the high-tension system for the small cars, likely to be handled by comparatively inexperienced men, and fit low tension to the powerful models generally driven by a skilled mechanic.

In the desire for simplification this year everything has been swept off the dashboard. The custom of

At the Michelin Exhibit the Bibendum Twins Reigned.

carrying a battery of sight feeds, a big lubricator, pumps, coil, oil, gas and water manometers, etc., in full view of the driver, has been gradually dying out, and it is now an exception to see anything more than a single sight feed and a switch. Panhard, for instance, who formerly made a dashboard display of a coil, lubricator and a few other articles, has simplified this portion of the car to a small sight feed and a switch. The coil is now under the bonnet and the lubricator is placed at the other side of the dashboard. On the new Berliet models there is not even the sight feeds, a plain glass tube oil level being let into the dash, and the two sight feeds for the rear axle and the gear box being under the bonnet. As this firm has abolished pressure-fed gas and oil tank and force feed-water circulation, the three indicators and the pump which were formerly necessary have been swept away.

On the Renault there is an interesting example of the stripping of the dashboard. No changes have been made in the system of lubrication, ignition or method of carrying gasoline tank, but instead of a large lubricator tank immediately in front of the driver there is now but a small sigh feed covered over with a glass plate flush with the dashboard, this being one of the neatest arrangements seen at the show. The oil-tank filler is immediately behind the radiator filler, the lubricator having simply been removed from the rear to the front of the board. It was noticed that of all the self starters which attracted so much attention at the show last year the only survivor was the one designed by Louis Renault, and shown on all the big cars of his make. The small self-starter, operated by the foot, was not in evidence.

A simplification of all piping, whether for oil, gas inlet or exhaust, was a notable feature. One of the most striking in this respect was seen on the new Charron two and four-cylinder cars. The float chamber, of the usual type, had its cover laid on the box by a flange only and held in position by a blade spring attached to a vertical spindle. The top of the box came off by merely lifting up the blade. Projecting from the float chamber was a tube the upturned end of which comprised the nozzle. Fitting over it was a plain copper tube with a bell-mouthed bottom, the upper end of which passed into the mixing chamber attached to the inlet manifold; thus the intake piping amounted to a six-inch length of copper tube held by a single screw. As the exhaust manifold was cast with the cylinders and the inlet and outlets for the circulating water were each cast in one piece connected up to the top and bottom of the dashboard radiator by a short length of hose, there was practically no piping on the car. With the magneto at the front of the engine and the four electric cables contained in a metal tube, the maximum of accessibility was obtained. It was noticed that each wire had a number attached to it, indicating the cylinder to which it led. This method of simplifying the water piping as shown on the Charron, was also to be found on a number of other new cars, a notable example being a Delaunay-Belleville six-cylinder with the water outlet in one piece screwed down to the cylinder bead and with a single connection to the top of the radiator.

Increased engine accessibility by mounting the radiator on the dashboard is no longer an exclusive Renault feature, several of the new cars having adopted it. A two-cylinder Berliet intended for taxicab and town work had been fitted in this way with a mass of plain copper tubes uniting an upper and lower tank on the dashboard. Several smaller firms had more or less slavishly copied the same idea. On the new Charron the dashboard radiator was formed of gilled tubes, uniting in an upper and lower tank, but instead of being carried right across the car, the central position, immediately behind the engine, was occupied by a fan driven by belt from the mainshaft. This arrangement added to the width of the radiator, causing it to be carried out to the full width of the side members, though at this point the frame had already been inswept to give the desired steering angle. The result was that the general lines of an otherwise handsome little car were slightly impaired.

Where the Bosch Magnetos Were Shown in Profusion.

Delahaye and Leon Bollee encased the valves by means of a sheet metal plate secured in each case by a single clip, the general arrangement being somewhat similar to that on the Winton car. When, as on the Delahaye, there was a single length of pipe only for the gas intake, the exhaust and the water inlet and exceptionally clean type of engine was obtained.

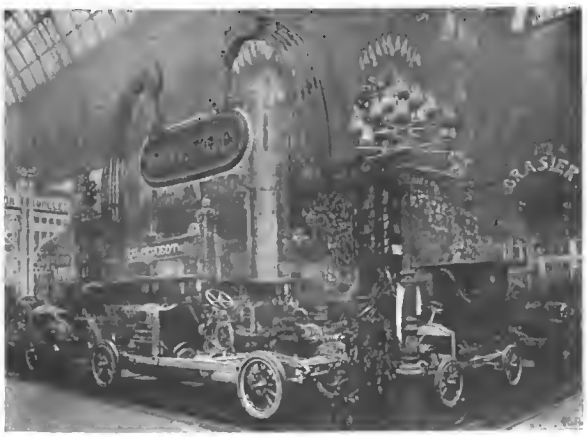
The influence of London police regulations on automobile design was shown on all the Darracq models. On the original taxicab model so well known in New York, the magneto was placed on the same side as the carbureter and carried in an

One of the Largest Displays Was of Continental Tires.

out-of-the-way position under the exhaust manifold. The London authorities, however, now refuse to pass any car for public service unless the carbureter is away from the magneto, with the result that the Darracq company has been obliged to put the magneto to the opposite side of the engine, carrying it on a special bracket cast with the crankcase and held down under a projecting arm from the cylinders. The improvement having to be made for the taxicab, the opportunity was taken of applying it to all models. As a number of French firms have obtained or are seeking the London taxicab business, magneto and carbureter on the same is an exception.

Shaft Drive Gains and Torque Rod Loses Ground.

Final drive by propeller shaft is more common than ever before, for the simple reason that more small cars are built, and European constructors are of the opinion that for low and moderate powers the shaft is preferable. For the highest powered cars, however, final drive by side chains maintains its position, the opinion being that at highest speeds and for heavy cars the chain is much more satisfactory than the cardan. It is an opinion that has grown as the result of racing experience. There is a tendency to get away from the use of a torque rod even on cars of comparatively high power. There was an example in one of the new Renault models, a car of 20-30 horsepower. On the other models from the Billancourt factory tubular torque stays were employed in place of the pressed steel one formerly



Artistic Showing Made by the Famous Renault Freres.

fitted. The only exception was the small runabout, which had no stay at all. A more general tendency was to strengthen the casing of the propeller shaft, letting it perform the functions of the torque stay. A neat arrangement on the shaft-driven Delahaye was the carrying of distance rods attached to the same hanger as the forward end of the rear spring.

Great Increase in Small Cars and Voiturettes.

Undoubtedly the most interesting work of the show was in the small car and voiturette classes. It is rather difficult to draw a distinct line of demarcation between what is a small car and what is a voiturette, but in the former would certainly be classed the new two and four-cylinder models from such firms as Renault, Brasier, Berliet, Dietrich, Charron, Delahaye, etc., while the voiturettes have as their chief examples such cars as the single-cylinder Sizaire-Naudin, Aries, Werner, Delage, etc. All the large firms, without an exception, have produced a little two-cylinder car of about 10 horsepower, capable of light taxicab work or for use as runabouts. Thus Panhard, in the old school, comes forth with a two-cylinder of this type, with the cylinders in one casting, and the engine forward bolted direct to the side members of the frame. Valves are all on one side, the oil tank is carried between the pair of arms on right-hand side of engine and the carbureter between the corresponding pair on the opposite side, the magneto—a Nilmelior high-tension—being in

The German Benz Had an Exhibit Complete and Unique.

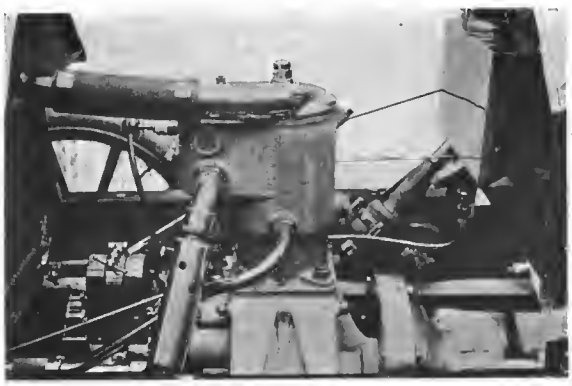
front. Water circulation is by thermo-syphon, with no fan behind the gilled tube radiator; lubrication is assured by a pump driven off the rear of the camshaft, the flow being through a sight feed on the dashboard. Engine control is entirely by pedal, there being no levers on the steering wheel. Cone clutch is provided; there are three sliding speeds and reverse and final drive by cardan shaft. Rear suspension is by three-quarter elliptics.

The Very Original Little Bayard-Clement.

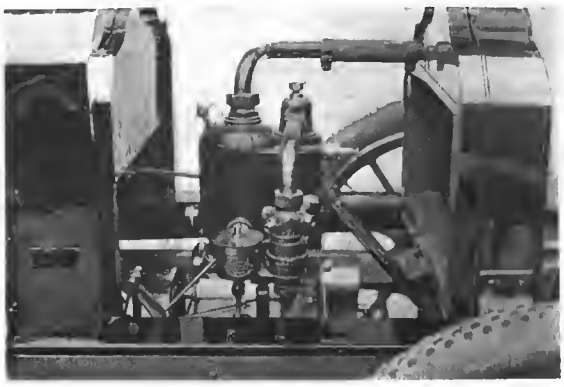
Bayard-Clement had one of the smallest and most original of four-cylinder cars, the cylinder measurements being only 65 by 100 bore and stroke (2.5 by 3.9). The four cylinders and engine base, together with exhaust and intake manifold, were a single casting, the crankshaft naturally being attached to upper portion, for no lower casting existed, and the oil pan being formed by a sheet metal casing band drawn tight by a single screw and nut. Valves were all on one side with spark plugs immediately over the inlet valves and magneto at the front of the engine. The mounting of the engine was somewhat original, there being a couple of radiating arms both front and rear, each one terminating in an eye hole, through which passed a steel tube with suitable flattened ends to allow of it being bolted to the side members of the frame. Cooling was by thermo-syphon with a special type of radiator consisting of about forty flat copper tubes uniting an upper and lower tank. The thin end of the tube was presented forward, and, in order to break up the current of air they were faced by a metal grating, giving the car the appearance of having a cellular radiator.

The same firm produced for the first time a single cylinder car pistons per cylinder, the combustion chamber being between metal base to the crankchamber. In both cases sliding gear

Harmonious Arrangement of the Display of Berliets.



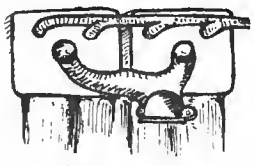
Corre One-Cylinder that Attracted Much Attention.



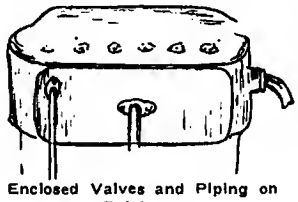
Another One-Cylinder French Car—The Truffault.

transmission of the straight through type was employed and final drive was by propeller shaft.

Motobloc showed the only single-cylinder engine with gearbox and crankcase in a single unit, the engine and transmission forming a single block, as on the larger cars by the same firm.



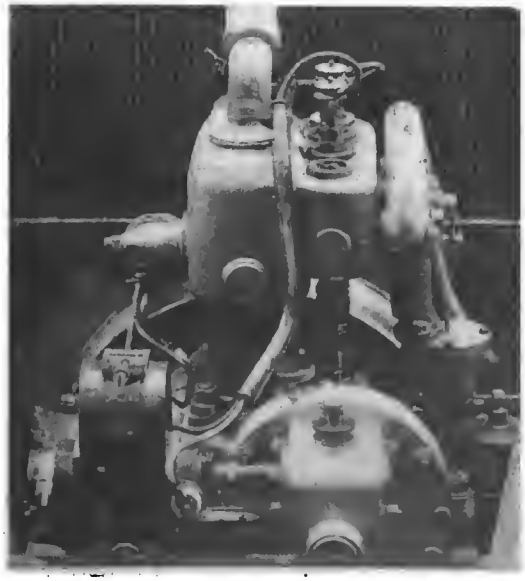
Top of Carbureter and Intake Pipe of Berliet.



Enclosed Valves and Piping on Delahaye.

A feature of the little car was the mounting of the honeycomb radiator in hinged bearings—with suitable oil-caps attached to prevent the straining of the tubes on a twisting of the frame.

In dealing with the voiturettes one enters to a certain extent the realm of the assembled car, for many of the firms in this class have not the resources necessary for producing an entire vehicle. In the majority of cases a De Dion or an Aster single-cylinder engine with high-tension magneto and thermo-syphon

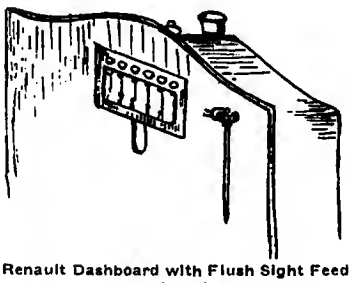


Power Plant of the New Renault Taxicab.

water circulation was employed. Such firms as Sizaire-Naudin and Chenard-Walcker produced a vehicle entirely of their own manufacturer. There is a disinclination on the part of all the voiturette builders to reduce the size of the bonnet in proportion to the size of the engine it covers with the result that there is a considerable amount of waste space. In several cases the unoccupied area between the front of the dashboard and the engine is taken advantage of to house the gasoline oil and water tank, and in one case to provide a chest for the most commonly used tools.

Air Cooling a Novelty in France.

The Henriot's company's stand supplied more of the distinct departures from standard design than any in the show. Among the novelties were a couple of air-cooled engines, each provided with a couple of fans on the valve side of the engine, driven in one case by bevel gear and upright spindle from the camshaft, and the other by belts from a pulley operated by means of bevel gear off the crankshaft. The single pulley, with a double-grooved face connected up by means of belts to transverse shafts, pass-



Renault Dashboard with Flush Sight Feed and Filler Cap.

Automatic Belt Tightener on Dietrich.

ing respectively between the first and second and third and fourth cylinders, the fan being attached to the opposite end of the shaft. A planetary transmission contained within the flywheel was attached to the same car. On the same stand was a four-cylinder water-cooled engine without radiator. On the front of the dashboard was a large water tank, through which the cooling water flowed by thermo-syphon circulation. An air pump, driven off the rear end of the camshaft, was connected up by suitable piping to the point at which the cold water entered the cylinders, and there discharged its jet of cold air, cooling the water and at the same time driving it into the jackets.

Knight Engine Not So Interesting to the French.

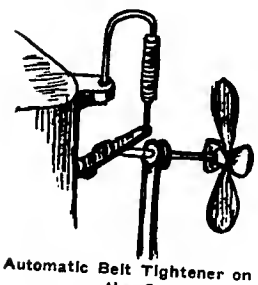
Knight's patent did not attract the same amount of attention here as at London, the Frenchmen evidently having less faith in its ultimate adoption than the Britishers. Minerva exhibited one

of these models, constructed in their Belgian factory, and the other was shown by Gem on a gasoline electric chassis, the motor being obtained from the English Daimler Company. Gasoline electric firms at the show were but two in number, the Gem and the V. A. T. E., the latter showing small cars with a single and two-cylinder engine driving a dynamo. Steam had not a single representative in the big hall.

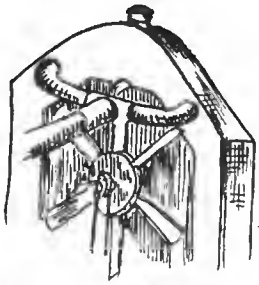
Aeronautical Influence Shown.

There was evidence that a large amount of serious work is being undertaken by European constructors toward the development of a light-weight engine for aeronautical work. The new Renault and the seven-cylinder Bayard-Clement were not shown, but will doubtless be brought forward for the second Salon, devoted to commercial vehicles and aerial navigation. Gobron displayed one of the most interesting of the light-weight engines with an eight-cylinder sixteen-piston developing 80-horsepower at 1,500 revolutions and weighing complete, with two magnetos, 460 pounds.

The cylinders form an X, each pair being placed in relation to its neighbor at an angle of 90 degrees. A two-throw crankshaft is employed, to one pin of which are connected up the eight pistons per cylinder, the combustion chamber being between the two. It is a principle that has been adopted to the maker's cars for years with very satisfactory results, the engine being regarded now as nothing more than a long stroke one. The cylinders are water cooled, circulation being assured by a pump working off the crankshaft and the water flowing through copper jackets surrounding the cylinders. Inlet valves are automatic, the exhaust mechanically operated by means of an oscillating arm for each pair of cylinders, there being no gears whatever for the valve mechanism. There are two magnetos, each one feeding four cylinders. This arrangement has been adopted in order to avoid the high speed which would be necessary for a single magneto supplying the eight cylinders of an engine revolving at 1,500 revolutions a minute and also as a measure of security. Should one magneto fail the engine could still run on the other with four cylinders sufficiently long to allow the aeroplane to be brought safety to earth. Lubrication, usually a difficult matter on engines of this type, is obtained by means of a pump on the outside of the engine feeding oil at the heads of the cylinders that are uppermost. The oil runs down to the base of the opposite cylinders, is there collected and again driven to the top. The carbureter is of the ordinary type.



Automatic Belt Tightener on the Gem.



Arrangement of Water Pipes on Berliet.

Darracq Method of Carrying Pet Dogs in Auto.

And Now Another Rotary Engine.

A light-weight rotary engine was shown by the Gnome company. The engine, which was constructed entirely of nickel steel, has four cylinders placed at equal intervals round a circular crankcase, fitted with radiating flanges and revolving round a fixed crankshaft, cooling being assured by their passage through the air. The crankshaft was hollow, carburetion

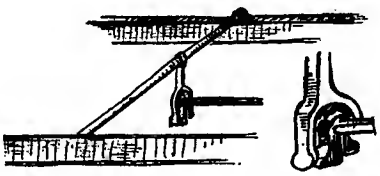
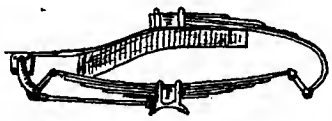
being through its center, and exhaust through mechanically operated valves in the cylinder heads. High-tension ignition was employed with a Bosch magneto.

Pipe, the Belgian firm, presented an eight-cylinder air-cooled engine of 3.9 bore and stroke, declared to develop 70 horsepower, and weighing complete 286 pounds. The mechanically operated valves were placed in the cylinder head and operated by overhead rocker arms from a single camshaft. Each valve performed both the functions of inlet and exhaust, the first position of the valve opening the inlet, the second position closing it by means of a sliding sleeve and opening the exhaust. Each line of



Gear Shifter on the Rochet-Schneider.

cylinders was surrounded by a sheet aluminum jacket with a bell bottom, a current of air being drawn in at the base of the cylinder passing upward to the head into a collector and outletting at the rear. The crankshaft was fitted with ball bearings at each end and the center; combustion chambers were hemispheric, ignition by high-tension magneto and ordinary type of



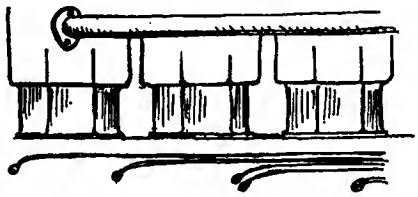
Distance Road and Spring on Same Hanger on Delahaye.

carbureter carried in the angle formed by the two lines of cylinders.

In the complete car class there were 66 six-cylinder engines shown by 38 different firms. The size of the cylinders varied from 5 1-2 inches bore and stroke on the Itala, to a 2 4-5 by 4 inches on a Delaunay Belleville. The most popular way of casting the cylinders was in groups of two, no fewer than 49 out of the 66 being designed in this way. There were but four with two groups of three cylinders and 12 with the cylinders cast separately. Delaunay Belleville had the only six-cylinder engine in a single casting. An interesting feature on the new Panhard was that though the cylinders were cast separately they were bolted up in such a way that they formed one group, the jacket of each cylinder slotting into that of its neighbor, and the whole being linked together by four bars passing through the water jackets longitudinally. This gave the advantage of six separate cylinders with the reduced area and absence of water piping of a single casting.

In a large number of cases it had been possible to put a group of six cylinders under the same sized bonnet as for an equal powdered car with four cylinders, manufacturers having sought, in a number of cases, to reduce the over-all length to a minimum. There were a few examples of very elongated bonnets, and in one case, the Mors, the rear cylinder had been carried under the footboard to gain space.

The popularity of high-tension magneto was fully demonstrated on the six-cylinder models, where of the 66 cars exposed 54 had high-tension and only 12 low-tension ignition. These latter comprised in all cases the most powerful cars and were presented by Mors, Mercedes, Itala, Brasier and Bollee. The



Method of Attaching Oil Heads on Bollee.

most general order of firing the cylinders on the six-cylinder models was 1 5 3 6 2 4, which was the method adopted on 41 of the total number of engines; in 9 cases the order was 1 3 5 6 4 2, the other methods being 1 4 2 6 3 5, 1 2 3 6 5 4 and 1 2 4 6 5 3, which were about equally divided.

There was but one example of an eight-cylinder engine on a car chassis, and even this one had been first designed for aeroplane work and slightly strengthened for automobile service. The cylinders, of 110 by 120 bore and storke, had copper jackets electrically welded on by a new process. Valves were all in pockets on one side of the engine, operated by a single camshaft and carburation and ignition followed standard lines. A distinctive feature was a variation of the timing by the sliding of the camshaft in its bearings at the will of the driver.

COMPONENTS SHOWN AT THE PARIS SALON.

Generally speaking, and this was probably on account of the plentitude of space in the galleries of the Salon, the components had a large department to themselves. Motors, frames, axles, gears, etc., made large displays, and the selection of tools was very extensive. This was a minor feature of the show, and the smaller road tools in particular were extraordinarily varied and compact.

President Fallieres Inspecting the Salon

A New England Reliability Run

Franklin

WORCESTER, MASS., Dec. 16.—An air-cooled Franklin, capably driven by C. S. Carris, evolved as the single winner of the 210-mile endurance and reliability run of the Worcester Automobile Club, held in and around Worcester county, Saturday, December 12. Fourteen cars started, of which two-thirds evolved with perfect road scores, but the Franklin was the only one surviving a searching examination of two hours on the part of the technical committee, which was finally forced to give up the task without even finding a screw or nut loose that would call for the slightest of penalties.

Carris, well known as a transcontinentalist, is a careful and experienced driver, and made no attempt to "burn up" the country roads, satisfying himself with getting into controls comfortably according to schedule. He has secured perfect Franklin scores in five endurance runs during the past season, including the annual A. A. A. tour for the Glidden trophy.

Second and tied in the honor roll are a Rambler, driven by B. A. Robinson, and a Cadillac, driven by H. J. Murch, both of which only suffered two points in penalization. Third is an American

Lozier

Cadillac

Knox—President Coghlin at Work

roadster, with five points charged; fourth, a Knox touring car, with six points away from perfection, and fifth is a Lozier runabout, with seven points loss.

Herewith is the official standing of the contestants examined:

1—Franklin, entered by Worcester Motor Car Co., Worcester; driver, C. S. Carris. 0

2—Rambler, entered by B. A. Robinson, Boston; driver, B. A. Robinson.

Loose petcock on pump	1
Loose pin on spark control	1
Total	2

3—Cadillac, entered by Murch & Hidden, Worcester; driver, H. J. Murch.

Loose terminal on dash	1
Loose bolt on rear end tie rod between radiator and dash.	1
Total	2

4—American Roadster, entered by American Car Co., New York; driver, D. F. Lloyd.

Bolt gone on engine pan	1
Nut loose on throttle bolt	1
Loose bolt in hood frame	1
Loose stuffing box on pump	1
Loose cup on steering knuckle	1
Total	5

5—Knox Touring, entered by Knox Automobile Co., Springfield; driver, Albert E. Dennison.

Loose nut on engine pan	1
2 loose spring clips	2
2 loose spring nuts	2
Loose adjusting collar on steering post	1
Total	6

6—Lozier Runabout, entered by Franklin Square Garage; driver, H. H. Cobe.

Loose screw in floor plate steering wheel	1
3 loose nuts in ignition coil	3
1 lost nut in ignition coil	1
Loose control head	1
Loose hose connection	1
Total	7

7—Premier, entered by Premier Depot Co., Boston; driver, Ray McNamara.

Loose nut on steering knuckle	15
Loose spring clip	1
Lose dash bolt	1
Small leak in radiator	5
Total	22

8—Berkshire, entered by Berkshire Motor Co., Pittsfield; driver, E. B. Belcher.

Loose radiator	4
Bolt lost from crank case cover	1
Bolt loose on crank case cover	1
3 loose spring clips	3
2 loose spring bolts	2
Packing gone from exhaust	1
Loose bolt on exhaust	1
Three men two minutes labor	12
Total	25

9—Studebaker, entered by Franklin Garage, Worcester; driver, J. Oswald.

Loose left mud guard	2
Left spring link upside down	5
2 loose bolts in left running board brace	2
3 engine frame bolts loose	3
Loose engine pan bolt	1
Loose steering gear joint	7½
3 spokes in rear wheel broken	15
Motor stopped 5 minutes	10
8½ minutes late at control	9
Total	54½

10—Lozier Touring, entered by H. C. & C. D. Castle, Boston; driver, E. F. Wilson.

10 spokes broken in left rear wheel	50
Loose nut on right spring clip	1
3 loose oil connections	3
3 loose nuts on coil box	3
Loose spring clip on rear spring	1
Loose terminal on magneto	1
2 loose spring clips	2
Loose left front bearing	1
Total	62

The examination was conducted Sunday at the Pilot garage, the cars having been in charge of a deputy sheriff over night. It required practically the entire day for the committee to complete its work. President J. P. Coghlin announced that it would not be until Tuesday before Referee A. E. Bliss, of Waltham, would be able to announce the official standing of the cars. The examination was one of the most thorough that has ever been made of cars in any contest in this country, and the committee was capable of doing its work with all fairness to every contestant, as not one of them was in any way connected with the trade, all being members of the staff of professors at the noted Worcester Polytechnic Institute.

The contest, as a whole, was one of the most exacting that could possibly have been planned. The cars and men were submitted to the severest of tests. That eight cars, more than half the starters should have come through with perfect road scores, speaks volumes in itself for motor car construction.

The six cars which failed to finish with perfect road scores suffered from accidents, in the main, and from other slight things wbich did not affect their structural features. For instance, the Studebaker car was penalized for being late at one of the controls simply because its operators had neglected to take the precaution to fill up the gasoline tank. The Berkshire operator forgot himself for a moment, when arriving at the city control upon the completion of the first run, and shut off his engine, thereby causing a penalty.

E. P. Blake, in the Jackson, smashed an axle owing to the slippery condition of the road, which caused his car to skid and make three complete revolutions, finally butting up against a woodpile and throwing out the four occupants, none of whom was injured.

Bourque, in the same Knox sportabout he drove in the Vanderbilt race, came to grief in Tatnuck. The American car ahead of him traveling at a great rate of speed began to skid, and Bourque, following closely behind, was in imminent danger of colliding. There was nothing for it, so he drove into a ditch at the risk of his life and the men witb bim, and broke the valve stem on his car. He withdrew rather than stand for 60 points penalization that making the repair would entail.

Dennison, also driving a Knox, had a close call on the fifth round. There was no way of seeing whether or not a train was coming in either direction at a grade crossing in Colebrook, and there was no flagman on the crossing. He was speeding along with three passengers and covered the crossing just a fraction of a second ahead of a fast express, which whizzed into sight and over the crossing.

Williams, in the Rambler, was unfortunate enough to have a key on one of the rear wheels shear off between Princeton and Quinapoxet and leave him helpless six miles from a telephone. He retired from the contest.

The White steamer, which had traveled some 20,000 miles this last season, and which up to the last control of the day, had been performing exceptionally well, met with slight difficulties and was penalized accordingly. The only other car to have double penalties was the Berkshire, which had to be pushed up a hill by the passengers on the last control of the day.

The contest started in a rain and snowstorm at 6 o'clock in the morning, which continued until noon. Then the sun came out, and the afternoon runs were truly enjoyable. The contest finished in darkness, about 6 o'clock. The contest was split up into five runs, each of about 20 miles out and 20 miles in. The snow of the day before made the going particularly hard out in the country. The starting and ending point for each control was in Worcester, so that the men and the cars were ever in touch with the base. This materially increased the interest in the run.

The rules called for some pretty severe work, and these rules were all carried out with the exception of the brake clutch and transmission tests.

Cobe started out on the first control to show what speed his Lozier had, and the others started in to follow suit. This quickly resulted in Police Chief D. A. Matthews sending a sergeant to notify President Coghlin that should the speed law be violated after the second control all drivers would be arrested and taken out of the contest. There were no arrests, the contestants slowing down while within the confines of the city.

President Coghlin Sunday night said be could state that no car had come through with a perfect score. This announcement came after the technical committee had handed in its report. The report was held up until Tuesday. Further than to say no car had come through with a perfect score, Mr. Coghlin would not then speak. Later he learned that there was one clean score car.

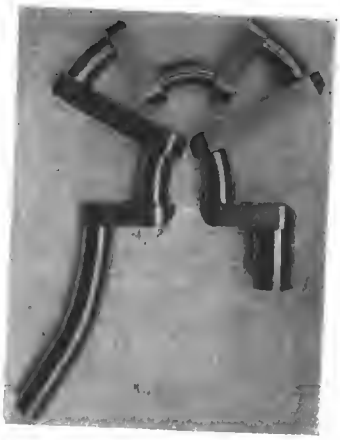
AUTOMOBILE MOTOR CRANKSHAFTS DISCUSSED

By THOS. J. FAY, President Society of Automobile Engineers.

IN the discussion of this subject the idea will be to favor the class of materials:

(a) susceptibility of die (drop) forging;
(b) easily fashioned;
(c) affording excellent bearing surfaces;
(d) of great rigidity;
(e) with notable kinetic ability;
(f) not impossible to procure;
(g) cost of the materials to be moderate.

It will not be considered proper, however, to assume that the materials as above outlined will be those of the common present practice since it cannot be shown that the common materials of the time are possessed of (d) great rigidity and (e) notable kinetic ability. This is not to say that the common crankshaft materials are without value for the purpose. The very service they render is an assurance of quality not to be attached to ordinary grades of steel. However good the run of steel may be, that is the steel advocated and used for crankshafts, the fact remains that there are a great many failures in the course of a year. Strange as it may seem the failures are not confined to low-priced steel; price alone does not seem to be the matter of moment.



Austrian Alloy Steel, After Undergoing Bending Test.

It is a monstrous iniquity to pay $150 for a crankshaft that will last no longer than a $30 member of the same order; this is not uncommon, and it leads one to believe that the $30 kind is, after all, the better of the two. Were a person to reach a conclusion as the result of noting one, two, or, ten failures of this description, 'twould be hasty; unfortunately, the number of such instances to be seen at every hand are too numerous.

The Two Points of View.

At all events there are two prime points of view of the crankshaft in the light of modern knowledge, i. e.:

(a) That involving the use of material so high in kinetic ability as to afford a long life even though the stresses result in deflections likely to end in disaster under the conditions involving the ordinary, or, even good grades of crankshaft steel. (b) The idea of materials so rigid in their initial status as to limit deflections under the most severe conditions to the purely nominal.

The first product, then, would be most pronounced in its kinetic ability, while the second product would be ambitious from the point of view of initial rigidity. This statement will be plain if we conceive of steel of a description such as will resist deformation to the maximum before deflecting, say, quenched tool steel, as compared with soft Swedish iron. These statements are not intended to convey the idea that the presence of pronounced kinetic ability would render it unnecessary to realize in the same steel a good showing of rigidity as well, nor would it be desirable to use extremely rigid steel in which kinetic qualities would be absent. The idea to be conveyed is one, taking into account rigid steel with kinetic ability as a secondary consideration, on the one hand, and highly kinetic steel with rigidity as a secondary consideration on the other hand.

To advance the theme a pace, the deflections resultant of service, considering a given extreme fiber strain, will not be of the same extent for all grades of steel, even though the unit stresses may be relatively the same, or, if the unit stresses are the same percentage of the elastic limit in the respective cases. For a given extreme fiber strain, then, the deflections may be more or less dependent upon the physical characteristics of the materials; to illustrate this point by resort to an example, which for clearness may involve the torsional shear, and the elastic resistance to torsion. To begin with, the polar moment of inertia is independent of the grade of the material, because the polar moment is equal to:

$$J = \frac{\pi d^4}{32} = \text{the polar moment of inertia;}$$

in which,

d = the diameter of the torsional member in inches.

For a 1-inch test piece, then, the polar moment of inertia would be of value as follows,

$$J = \frac{3.1416 \times 1^4}{32} = \frac{3.1416}{32} = 0.0981 =$$

the polar moment of inertia of a round section of the diameter given.

If the polar moment of inertia is a mere matter of dimensions rather than involving the qualities of the materials used, it follows that the differences to be elucidated must be on account of the qualities residing in the materials in such a way that the several materials can be compared using the one size, thus rendering the proof a comparatively simple matter.

Chrome Nickel and Carbon Steels Compared.

In further relation to this matter it is necessary to select the materials to be compared, having in mind the fact that they should be crankshaft materials, so fabricated as to lend stability to the class of work under discussion in a fitting manner.

CHROME NICKEL STEEL.

Physical Properties:

Tensile strength in pounds per square inch	150,000
Elastic limit in pounds per square inch	130,000
Elongation, per cent in 2 inches	12.
Reduction of area, per cent	33.

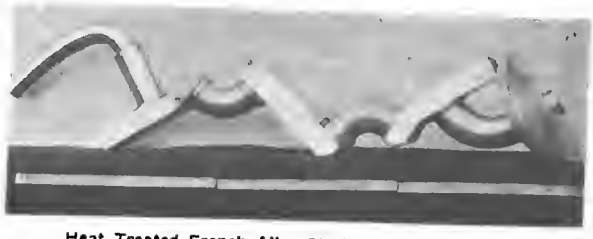
CARBON CRANKSHAFT STEEL.

Physical Properties:

Tensile strength in pounds per square inch	80,000
Elastic limit in pounds per square inch	40,000
Elongation, per cent in 2 inches	18.
Reduction of area, per cent	36.

Taking these representatives of crankshaft materials as showing good in their respective genera, proceed thus:

On a basis of 50 per cent of the elastic limit as the extreme

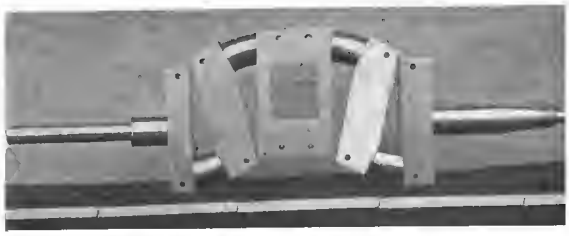


Heat Treated French Alloy Steel After Bending Test.

fiber strain in each case, and representing the same by the letter S, we have:

$S = 65{,}000$ for the chrome nickel steel;
$S = 20{,}000$ for the carbon steel.

The diameter being the same for both materials, viz., 1 inch, tbe value of c may be taken as $\frac{1}{2} \times d = 0.5$ inch, and with these



Balanced Two-Bearing Crankshaft After Test.

data it will be possible to fix upon tbe twisting moment in each case as follows:

Chrome nickel steel:

$$Pa = \frac{SJ}{c} = \frac{65{,}000 \times 0.0981}{0.5} = 12{,}753.$$

Carbon steel:

$$Pa = \frac{SJ}{c} = \frac{20{,}000 \times 0.0981}{0.5} = 3{,}924.$$

In the two cases we have the twisting moments that would follow were the two specimens stressed to the same percentage of the elastic limits of the respective specimens. It is not possible to stop here if anything is to be shown, since the results of these twisting moments were not disclosed. If we investigate the elastic resistance to torsion it is possible the consequences of the applications will be disclosed. Considering the elastic resistance to torsion it is necessary to assign a length to the specimens. Let us assume that the specimens will have a free length of 12 inches, and that the angle due to the torsions will suffice for the purpose.

We have, then,

l = length of proof = 12 inches.
d = diameter = 1 incb.
P = applied force in pounds at the distance a from the axis.
Pa = the torsional moment. Given before for each case.
Θ = angle through which the free end of the specimen is twisted, measured in arc of radius = l, or unity.
*G = torsional modulus of elasticity, taken as $2/5$ E, in which E = modulus of elasticity in tension.

Numerical Examples.

$$\Theta = \frac{32 \times Pa\,l}{\pi\, d^4\, G} = \text{torsional angle measured in arc of radius} = l$$

For chrome nickel steel:

$$\Theta = \frac{32 \times 12{,}753 \times 12}{3.1416 \times 1^4 \times 12{,}000{,}000} = 0.1299$$

For carbon steel:

$$\Theta = \frac{32 \times 3{,}924 \times 12}{3.1416 \times 1^4 \times 12{,}000{,}000} = 0.0399.$$

Having thus fixed the values of Θ, let us now find the angle of torsion α (alpha) for the respective specimens as follows:

$$\alpha = \frac{180 \times \Theta}{\pi} = \text{angle of torsion in degrees.}$$

*The modulus of elasticity for tension hae been assigned values ranging between 27,000,000 and 32,000,000 for steel, with 30,000,000 as a close approximation. The modulus of elasticity is regarded by the majority of steel men as the same for chrome nickel steel as it is for carbon steel; there is some doubt about this, but the proof of a difference is not at hand.

For chrome nickel steel:

$$\alpha = \frac{180 \times 0.1299}{3.1416} = 7^\circ\ 26'$$

For carbon steel:

$$\alpha = \frac{180 \times 0.0399}{3.1416} = 2^\circ\ 17'$$

What do we find? Probably what most of us failed to look for, in our endeavors to discriminate between the suitable products and those to be avoided. At all events, it is plain that the actual deflection in degrees of arc, considering a given percentage of the elastic limit of the respective materials, is greater as the quality of material is increased, if it is true that increasing the elastic limit of tbe material increases the quality, which it does, from certain viewpoints at any rate.

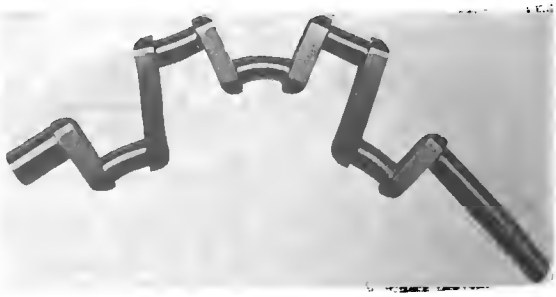
The actual deflection in degrees of arc was found to be (in a foot of length) seven degrees twenty-six and four-tenths minutes for the chrome nickel steel and only two degrees seventeen minutes in the case of carbon steel. To glance at the formulæ is but to discover that this is all that can happen if it be true that the modulus of elasticity is the same for both genera of steel, because, with proofs of the same dimensions, and the same percentage of elastic limit, wbat have we but a diminished deflection in the case of the steel for whicb the Pa value is the minimum?

If, on the other band, the extreme fiber strain were taken the same for the different products, tben the deflection would be the same in both cases. This is to say, the high-priced material would have to be used in the same profusion as the material costing considerably less money per pound to purchase, and a great deal more to fashion into the desired shape. If it is not feasible to take advantage of the increased elastic limit of material, because by doing so the torsional angle will increase, elastic limit over and above the needs would scarcely be a desirable commodity to pay anything extra for. So far, then, the discussion has led to a very unsatisfactory state of affairs with the idea uppermost that investigation would be profitable.

Let us add to the confusion by making the bald statement that there has in the past been a crop of crankshaft failures of the class using the finer grades of alloy steel; let it be understood, too, that the inferior carbon steel products are well represented in the land of failures. Wbat does it portray?

Deflection Proportional to Fiber Strain

We can begin by saying that if the modulus of elasticity is no better for alloy steel than it is for carbon steel, the deflection will be proportional to the extreme fiber strain, and the increased elastic limit of the one will be of no aid, providing it can be

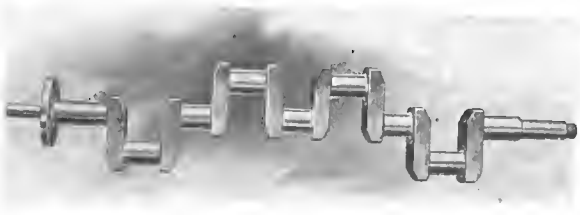


A Chrome Nickel Steel Crankshaft Tested Out.

said that it is the deflection magnitude that must be limited. It is desirable to investigate the several grades of steel and ascertain for sure if the modulus of elasticity is the same for all, or substantially so. Then, again, it would be desirable to know if deflection magnitude is the real measure of life, or can we say the deflection is a matter of no moment if the extreme fiber strain does not exceed a certain percentage of the actual elastic limit of the material used in any given case?

In the design of crankshafts, if deflection is the matter of moment, it is only necessary to remember that the deflection, under constant conditions, is inversely proportional to the fourth power of the diameter of the shaft; the formula may be written:

$$a^{\circ} = \frac{180 \times 32 \times Pa \times 1}{\pi^3 \times d^4 \times G} = \text{angle of torsion in degrees.}$$



A Good Example of Current American Practice.

This is to say, it would require but a very slight increase in the diameter of a member to reduce the torsion angle a very considerable amount. At all events, it is possible to explode a theory so oftentimes cited by designers of even "national" reputation, who are fond of saying, "If a crankshaft is made of very strong material it will not deflect and the tendency to deterioration will not even exist." What they mean to say is: no distortion, no deterioration. That it is their custom to use less of the high-priced material than they would of low-priced material, is an assured fact. Under such conditions as has been here shown they have deflections of considerable magnitude in excess of the deflections that will actually obtain in the cases of the inferior steel of a somewhat greater (or even the same) section. It may seem odd to say that the rigid, high-priced material is likely to deflect more than the comparatively weak, and, in a sense, inferior steel, but is it really so wonderful? How about spring steel? Is it not far better than steel castings? Who will say that a steel casting will so readily deflect as will spring steel?

The steel casting can be of exactly the same composition as the spring steel; what is the real difference? In the mode of fabrication, of course. As steel castings go, 'tis a fair statement to say, the composition that produces a sound casting of excellent quality, would result in a good spring; changing the mode of fabrication to suit.

In other words, good material makes good castings, or, good springs. The process must suit the ultimate ends in each case, which is another way for saying, crankshafts to be good, must be of the raw materials good for the purpose, suitably fabricated.

In a spring, we want high carbon, but, since a crankshaft is, to be sure, the reverse of a spring, do we want high carbon? Probably not; do we want low carbon? Very likely; why?

In the first instance, the absence of carbon renders the steel easy to work and difficult to injure during its manipulation. Certainly these are good points; they are not all.

The kinetic ability of steel is of the greatest importance if the steel is to be used for crankshafts, if it is true that the deflections may not be aborted. It is a moral certainty that the deflections do abound, irrespective of the grade of steel used in the count as herein before stated and for other reasons besides.

Low Carbon Content Desirable.

With the carbon content below, say, 16 points, it is quite out of the question to consider that the steel will be difficult to manipulate because of the carbon content. True, it would be desirable to depress the carbon content even more under certain conditions. That is to say, if the steel is alloyed, and the physical properties are buoyed up to the desired point without the aid of carbon, or, without having to consider the tendencies of the carbon content, the lower the carbon in the steel the better it will be from the kinetic point of view. If the deflections cannot be eliminated, the greater the kinetic ability, the longer will the crankshaft serve for the purpose, which is no license to increase the extreme fiber strain to any extent at all, even if the steel used has a high value of the elastic limit.

A Swedish iron crankshaft, in which the carbon might run as low as five points, would scarcely work in a manner satisfactory, primarily because the modulus of elasticity is considerably lower than that which should obtain, with the result that the section would have to be increased to a point beyond that possible in nine cases out of ten. If the section could be increased, the iron shaft might be the peer of them all. It is not necessary either to employ steel high in carbon, or iron so low in carbon as to affect the modulus of elasticity (if it is the absence of carbon in the iron that does account for the lowered modulus), since it is possible to so alloy steel as to render the same of considerable strength even though the carbon content may be under ten points, as it is in some of the finer grades of "cementing" nickel steel, and in some grades of alloy steel as used in crankshaft work, of the best examples.

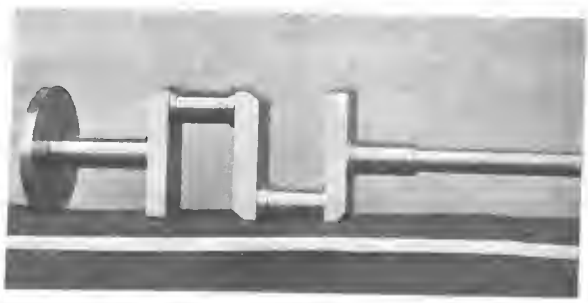
The dynamic life of steel is limited, of that there is now no question at all. Instead of the life as inversely proportional to the extreme fiber strain, the same life decreases much more rapidly. Under the circumstances it is a fallacy to fix the extreme fiber strain at a high level.

If a crankshaft would last forever were it large enough to resist all deformation tendencies, it would be too large to use, for the reason that the rest of the car would fail to last so long. On the other hand, if the metal of such a shaft were to show a value of, say, 1,500,000 alternate shocks under a stress of one-half the elastic limit, to so design the shaft as to have it work at that stress would assuredly be bad practice, since the death of the shaft would be too much to keep continuously in the mind's eye.

The Extreme Fiber Strain Should Be Low.

By designing such a shaft, so that the extreme fiber strain would be one-tenth instead of one-half of the elastic limit, the death of the shaft would be a remote contingency. The shaft would be one of the parts to fail last of all in a car; in view of its cost, and the damage done by a failing shaft, to make it the least likely to fail in service is to be right. In quest of high kinetic ability, which seems to be of the greatest importance, it is more than high elastic limit that is desired. If we say the utility of a product for the purpose depends upon the relations of the physical properties, we may be more or less right, since by so manipulating steel as to alter the relations of the physical properties we are able to increase or decrease the kinetic properties at will.

Obviously "burnt" steel stands the lowest in the scale of kinetic ability. The next in order is quenched steel. It will be observed



Balanced Double Opposed Crankshaft.

that as the elongation decreases the kinetic ability decreases; in what ratio, the author is not at the moment prepared to state. The elastic limit can hold at a constant value for two specimens to be compared, and the one of the two having the greatest elongation will be the one with the greatest kinetic ability. In this may be seen the great desirability of the maintenance of high elongation.

(To be continued.)

TWELVE YEARS' PROGRESS IN COMMERCIAL VEHICLES*

By E. SHRAPNELL SMITH, Treasurer of the Commercial Motor Users' Association.

THERE were, 12 years ago, no commercial motors in existence. The range of to-night's paper may, therefore, embrace every stage of evolution, and numerous instances of misapplication. One is reminded by the presence in the chair of Sir David Salomons, Bart., of the interesting demonstration which he organized 13 years ago, at Tunbridge Wells, on the 15th of October, 1895, when the De Dion-Bouton steam tractor presented for the first time the embryonic details of a system which might well have been more successsfully developed for commercial purposes. One year later, on the 26th of October, 1896, Sir David inaugurated the North of England branch of the Self-Propelled Traffic Association by the delivery of an address at the Liverpool Royal Institution. On that occasion he was unable to indicate a single vehicle for utility purposes, which fact is now quoted in confirmation of the opening sentence of this paper. Liverpool merchants and shipowners in September and October, 1896, were particularly anxious to obtain information about the prospects of this branch of motoring, but neither Mr. Sennett, who read a paper before the British Association meeting, nor Worby Beaumont, who addressed the Incorporated Chamber of Commerce, was able to adduce one example of practical application. Mr. Beaumont concluded his address with this statement: "Great as the premises are of motor vehicles for light work, I am satisfied that the commercial motor vehicle for heavy traffic has yet to be designed." A year later, when Mr. Beaumont, on the 26th of November, 1897, opened the second session at the Liverpool Royal Institution, he was able to describe early Coulthard, Leyland and Thornycroft vehicles, a petroleum spirit lorry by the Anglo-French Company, and a Serpollet type lorry which had been constructed by Messrs. Samuelson, of Banbury; he also spoke highly of the Scotte and De Dion-Bouton vehicles of 1897; yet there was meager evidence of advance.

The situation 11 years ago was, accordingly, one of non-application, but there had been efforts to encourage the construction of self-propelled vehicles of all kinds. The principal of these was essayed by the proprietors of the *Engineer*, which announced, on the 5th of July, 1895, an 1,100-guinea competition for motors of all classes. Two of the classes, in respect of which prizes (value £400) were offered, were open to commercial vehicles. One of these was for a vehicle which should be capable of carrying not more than one ton of goods, in addition to the driver, and of which the gross weight should not exceed two tons; the other was open to vehicles which were capable of carrying 5 cwt. of goods, in addition to the driver, and which did not weigh more than one ton gross. After a postponement, it was decided to carry out the tests at the end of May, 1897, with a practical run from London to Birmingham and back, in addition to others. From a total of 17 entries in the commercial sections, only one van was presented at the Crystal Palace, this being a steam-driven vehicle by the Liquid Fuel Engineering Company, Limited, of East Cowes. The entries by the Clarkson, Coulthard, Leyland, Merryweather and Thornycroft firms did not lead to the arrival of the vehicles themselves.

A second competition was announced in September, 1896, by the Royal Agricultural Society of England. Two classes were arranged: one for vehicles to take the place of light spring carts, and to carry loads "up to two tons"; the other for vehicles "capable of taking five tons." Three entries were received for the lighter class, and none for the heavier class, but only the Leyland van reached Crewe on the 10th of June, 1897, for tests at the hands of the judges. The practical collapse of these two competitions was very disconcerting to those who had a belief in the future of the commercial motor, but plenty of evidence was subsequently forthcoming to show that builders and designers, notwithstanding the tremendous difficulties by which they were confronted, were able to make headway.

It is not, of course, possible to include a complete historical retrospect in this paper, even were it desirable. The object is rather to put on record certain facts which must be held to support the contention that there has been a remarkable and satisfactory growth in the number of successful instances of use for commercial purposes. It is open to anybody who desires to make a closer study of successive developments to turn up a paper on the subject of "Heavy Motor Traffic," which was read in this room, under the chairmanship of Sir John I. Thornycroft, on November 5, 1903, since which date the opportunity for the wider employment of commercial motors, whether vehicles or or tractors, has been increased by reason of the less disadvantageous conditions of the heavy motor car order, 1904. Before that order came into force, on March 5, 1905, the unladen weight of any motor car might not legally exceed 2 tons 19 cwt. 27 lb., while any development of public-service vehicles was virtually prohibited by their falling within the speed limit of five miles an hour. To-day's legal position is not entirely satisfactory, but it is, none the less, one under which a large measure of advance has been rendered possible and has been achieved. It is not out of place, in these circumstances, to acknowledge the influences which brought about the issue of that order, and to congratulate this club, the Commercial Motor Users' Association and the Society of Motor Manufacturers and Traders upon the manner in which they harmoniously co-operated to secure the ends in view.

The Testimony of Public Trials.

There is a sharp division of opinion as to the continued value of road trials under independent observation. A debate on this subject took place a few weeks ago at a meeting of the Society of Road Traction Engineers, when a motion to the effect that their value is *nil* was defeated by a large majority. The accompanying table has been specially prepared, with the object of showing the improvement to which such open trials testify, and attention may more particularly be drawn to the column which

*Paper read before the members of the Royal Automobile Club, London, November 26, 1908.

PROGRESS OF THE COMMERCIAL VEHICLE—SUMMARY OF, AND LOST MILEAGE IN, CERTAIN COMPETITIONS.

Year	Organizing Body	Number of Machines				Motive Powers at "Finish"		Maximum Load Carried, Tons	Maximum Scheduled Mileage Per Vehicle	Percentage of Miles Lost	Prizes	
		Entered	Presented	Started	In at Finish	Steam Propelled	Internal Combust'n				Offered	Awarded
1897	*The Engineer*	17	1	*	*	..	..	..	..	..	£1155	Nil
1897	R.A.S.E.	3	1	1	1	1	..	0.5	100	†	£300	Silver Medal
1897	A.C.F.	15	12	10	7	5	2	5.5	192	22.4	None	None
1898	L.S.P.T.A.	10	4	4	4	4	..	4.7	143	14.7	£225	£225
1901	L.S.P.T.A.	13	11	9	8	6	2	6.3	168	12.0	Medals	Medals
1905	A.C.F.	65	57	57	50	2	48	7.1	555	9.5	"	"
1907	R.A.C.	60	59	56	50	11	39	5.0	1582	7.3	"	"

*Competition abandoned. †Judges reduced test run to one of 12 miles.

sets out the percentage of lost mileage. Not every competition is included, but there are sufficient for the purpose, and none of tbese bave been picked to suit the occasion. Tbey constitute a representative series, and examination of the figures must be held to establish a very good case for the utility motor. It will be observed that, going back eleven years, no less than 22.4 per cent. of the attempted mileage was not accomplisbed in tbe first "Poids Lourds" of the French Club; the first trials at Liverpool resulted in a loss of 14.7 per cent.; tbe third trials at Liverpool, in 1901, demonstrated an improvement to 12 per cent.; the big French trials of 1905 showed 9.5 per cent. of lost mileage; the largest commercial motor trials which the world has known, those which the Royal A. C. organized in the fall of 1907, gave the really splendid result of only 7.3 per cent. of lost mileage. No dispassionate man of business can afford to ignore these proofs of steady progress toward reliability. My own view is that necessity for such trials is over; they have admirably served tbe purposes and no more are wanted.

The Testimony of the Satisfied User.

It goes without saying that a not inconsiderable proportion of those who, during the years 1899 to 1902, purchased vans, lorries or other commercial motors were disappointed in the results which they obtained, and one may cut a long and somewhat painful story short by stating that every pioneer buyer passed through the most troublous of vicissitudes. One might cover pages with mechanical faults, inefficiency and financial loss which fell to tbe lot of those who bought a few years too soon. The memory is naturally unsavory, but it is shortsighted for any people with baulage interests to be influenced by old and out-of-date results. These references apply to occurrences wbich were experienced only from six to nine years ago, but it must be remembered that improvements in the heavy section of the industry have been not one whit behind those in connection with the lighter branches. In proof of this assertion, it is satisfactory to be able to produce evidence of the revulsion of feeling in favor of the business motor during the last few years.

By the courtesy of tbe proprietors of the *Commercial Motor*, I bave full access to a very complete list of owners. This list is subdivided into 16 classes, as follows: (1) Bakers and flour dealers; (2) brewers; (3) brickmakers; (4) building contractors; (5) cabinet makers, general furnishers and stores; (6) carriers and transport companies; (7) gas companies; (8) hotels (omnibuses); (9) laundries; (10) market gardeners and fruit growers; (11) millers; (12) mineral water manufacturers; (13) municipal and other local authorities; (14) provincial omnibus companies and proprietors of chars-à-bancs; (15) quarry owners, and (16) various manufacturing and other trades. Communications were addressed a few weeks ago to over 700 owners, and the figures in the second table controvert any suggestion tbat purchasers are not increasing the number of their motors or are becoming disgusted with the machines which they have acquired. The summary of the 342 replies is in structive and really conclusive. It is not suggested that these tabulated increases furnish a complete census of return, for many owners are either independent or indifferent when requests of this kind reach them. Some think it unnecessary to reply; others regard the data as peculiar to their own businesses and not to be divulged, and tbe names of a fair proportion are retained only by the clerks to the registration autborities. It is justifiable, notwithstanding the admitted deficiencies, to claim that the 342 replies in question are of a representative character, and in no sense selective, for nothing has been held back. Eight owners, and no more, gave adverse opinions.

Two correspondents who are large owners of vans and lorries, respectively, Messrs. James Shoolbred & Co. and the Eastern Motor Wagon Company, Limited, have given permission to me to quote their actual records of lost mileage for the last twelve months. Messrs. Sboolbred, for 30 vans in the four montbs ended February last, and for 31 vans in the eigbt months ended October last, lost a total of 562 van-days in a possible total of 9,446 van-days, or less than 6 per cent. No overtime work is done on tbese vans, and no mecbanical night staff is kept; further, "vans off the road" includes all accidents, all tire repairs, all time occupied in repainting and revarnishing the bodies, and all adjustments and maintenance of the chassis. The firm bas done its own overhauls, since January 1, 1907, and it keeps only one engineer, one junior and two mechanics, for the whole supervision and running of a total fleet of 37 vans; the six newest ones are purposely omitted from the foregoing analysis. The summary is that tbey have kept in 1 4-5 vans per day throughout the year, one of these being in for its regulation overhaul, and tbe average of 4-5 van being in for small repairs. This performance may be stated as less than one spare van for each 16 owned, and full work continuously from the rest of the fleet.

The Eastern Motor Wagon Company, Limited, now has twenty steam wagons in regular service throughout the metropolitan area. Half of these work on the basis of a fixed five days per week (about 70 hours of service) under contract, each Saturday being reserved for examinations, adjustments, cleaning and the like, and to give tbe drivers, some of whom average as much as 250 miles per week, a rest. The others work six days a week. The growth of this company's fleet bas taken place as follows: 1905, three wagons; 1906, eight wagons; 1907, twelve wagons; 1908, twenty wagons. Of these machines, nineteen carry five tons eacb wben used without a trailer, and haul tbree tons more when a trailer is used, which is generally the case. The other machine is a rubber-tired vehicle, for loads of about three tons, and it averages 300 miles a week. The company's experience sbows that the lost journeys are less than 5 per cent. of the maximum. This compares with about 10 per cent. in the years 1902-1903. The improvement is partly attributed to the progress in construction, but so reasonable a loss as 5 per cent. cannot be maintained, especially in contracting work, without capable administration, efficient mechanical supervision and proper facilities for the making of overhauls and adjustments.

Omnibuses for City and Country Uses.

The development of motor bus traffic in London, and generally in various parts of the country, has specifically occurred within the last four years. The totals of motor buses in the metropolis have been, at October 31 in eacb of the four periods of twelve months now ended: 1904, 15; 1905, 162; 1906, 754; 1907, 917, and 1908, 1089. The motor bus, as did the steam lorry and the one-ton van in earlier years, quickly gave rise to much trouble for those who became its pioneers. In London heavy losses have been incurred, and these are attributable to several causes, of which five may be quoted: Excess of traveling facilities over public demand; the cost of training drivers; tbe absence of experience on the part of the managements; the excessive working hours, and, in some cases, unsuitable material, incorrect gauging and bad fitting. It is unnecessary to labor any of these points, but it may be some consolation to shareholders to know that matters are now vastly improved, and that there is every reason to believe that the original estimate of an inclusive working cost of 10½d. (21c.) per mile will prove to be ample. Skidding and side-slipping difficulties have yet to be overcome, altbough improved driving has greatly reduced the incidence of claims, but this is still the largest uncertain factor wbicb attacbes to the business of motor bus operation at the present day.

The accumulator-driven omnibus has been on the streets of London for sixteen months and has proved that 2d. (4c.) per vehicle mile is ample for battery maintenance.

So far as country motor bus services are concerned, the most satisfactory reports are those from railway companies, and it has to be admitted that a number of smaller undertakings have come to grief. Against these cases of failure, however, it is only rigbt to note that others have paid moderately, and that the use of motor chars-à-bancs is on the increase for touring and pleasure parties. Such country services appear to require, in a number of cases, a fare basis of not less than 2d (4c.) per passenger-mile, but this is not excessive, baving regard to convenience.

There are not less than sixty motor vehicles now under contract for the conveyance of His Majesty's mails, as compared with two —in the parcel mail between Liverpool and Manchester—in the year 1902. This service is practically limited to the parcel mail, in respect of which the railway companies of this country charge an all-round rate of 0.55d. (6.1c.) per lb., station to station. It is obvious that the Crown is paying a rate which admits of huge economies, although the contention of the railway companies, that the rate does not pay them in the case of odd parcels which have to be conveyed between points at opposite ends of the United Kingdom, cannot be overlooked. There is, however, only a low percentage of "lean" work. In any event, the postal authorities are certainly not unwilling to pay as much as 1s. 3d. (31c.) per vehicle-mile for a two-ton van, but competition between the contractors has already witnessed a cutting of this rate to below 1s. (25c.), a state of affairs which can only be regarded as wholly unnecessary. No breach of confidence is being committed when it is put on record that the next few years will unquestionably witness a very large development of the motor mail, both in this country and in certain of our colonies, in conjunction with passenger conveyance. In the London-Brighton service, which is conducted by Thomas Tilling, Limited, only two journeys (119 miles) were lost out of a possible 1008, aggregating 59,976 miles, or a mileage loss of 0.198 per cent. On the London-Hastings and London-Cambridge routes, for which Milnes-Daimler, Limited, contracts, only 72 miles were lost out of a possible 46,264, or 0.155 per cent.

Few people realize that the motor cab has jumped into popularity in so short a period as twenty months, but this is a fact. It was only on March 21, 1907, that the General Motor Cab Company, Limited, gave an inaugural luncheon and immediately placed upon the streets of London the first seventy Renault cabs which marked the departure from haphazard and small-scale exploitation in favor of a big organization on a truly commercial scale. The motor cab, as a means of locomotion in London, is no new proposition. For example, one may recall the yellow-bodied electric cabs of 1897, which so quickly came to grief. Many critics in the summer of 1906, when only comparatively few of these mechanical hackney carriages were on the streets of the metropolis, expressed the view that the motor cab was not needed, in view of the convenience and speed of the motor bus. That estimate of the situation was a false one, and the privacy of the motor cab, apart from its greater speed and range, necessarily prevented the motor bus from being at any time a competitor. It may be of interest to quote the totals of mechanical hackney carriages for which licenses were in force in the metropolis at certain dates: December 31, 1903, 1; December 31, 1904; 2; December 31, 1905, 19; December 31, 1906, 96; September 30, 1907, 604; December 31, 1907, 723; March 31, 1908, 958; September 30, 1908, 2,273.

The practice in London is to pay the driver 25 per cent. of the registered takings, in addition to any gratuities which he may receive, out of which payments the driver has to pay for his own motor spirit. This revolutionary change in the habits and customs of the London cab is proceeding apace, and the men appear to have accommodated themselves to the alterations with remarkable quickness. The proportion of ex-horse cabbies in the employ of the General Motor Cab Company, Limited, is no less than 67 per cent. Prior to the advent of the motor cab these men used to pay jobmasters so much a day for the use of a vehicle and one or more horses, and to keep any balance of earnings for themselves.

Costs and Performance.

The undeniable progress of the last few years is measured by higher performance in relation to cost. The cost per vehicle-mile is uniformly less in each class for equal loads than it was even a couple of years ago, while lost earnings and disturbance of business generally are virtually disappearing factors in the problem. It was necessary, four or more years ago, for the purchaser to accept a great number of uncertainties. He paid a high price for the machine in the first instance, and he did not know what it was going to cost per annum. To-day the purchaser is in a happier position. He can, in many cases, obtain guarantees as to maintenance, whether of rubber tires or of the mechanical parts; he can obtain written assurances from users who have been employing vehicles of the same make; he can obtain drivers who have had experience on the road—a qualification which is certainly necessary for men who have to go far, and particularly for those who are in charge of steam wagons; he can associate himself with a powerful central organization, which now numbers upward of 320 members, in the shape of the Commercial Motor Users' Association, and that at the reasonable annual subscription of one guinea; he can obtain low and inclusive insurance rates, unless exceptional risks are involved. Briefly, he can take his choice, in the following classifications, with the knowledge that his total outgo per vehicle-mile will not exceed amounts indicated—one-ton van (petrol.), 5d. (10c.); two-ton vehicle (petrol.), 6½d. (13c.); three-ton lorry (petrol.), 8d. (16c.); five-ton tractor (steam), 8.5d. (17c.); five-ton tractor (steam), 9.5d. (19c.); five-ton wagon (steam), with trailer, 1s. (25c.).

In conclusion, I desire to emphasize two points upon which I feel very strongly. The first of these is that nothing has occurred to weaken my conviction that steam is the better power for loads in excess of three tons, except in circumstances where the higher speeds due to the use of rubber tires are of marked advantage; the second is that any contractor, who purchases one or more motor vehicles or tractors for the purposes of hire must, if he is to make any money and not to go bankrupt in a couple of years, obtain at least 60 per cent. more per mile under contract than is set forth in the preceding paragraph, where the typical costs are for owners who can find practically full work.

ANALYSIS OF 342 RETURNS FROM OWNERS OF COMMERCIAL MOTORS.

ABOUT THE AUTO'S INDISPENSABLE FOOTWEAR

WHILE much is made of tire troubles, too little is said or heard of the virtues of the automobile's indispensable footwear. With a little care and attention tires are capable of much better and more economical performance than they are generally credited with rendering.

The first precaution to be taken by the autoist is to keep his tires inflated at proper pressure, as nothing will wear them out as quickly as running on them half inflated. Roughly speaking, a tire is properly inflated when it will stand up full and round under the pressure of the loaded car.

Novices are always afraid of inflating their tires too much, with the result that they rarely inflate them enough. They are very much in the wrong, for an ill-flated tire rapidly wears out. Few hand pumps are capable of exercising a pressure of 100 pounds per square inch and good tires can stand a pressure at least equal to that, so there is slight danger of over-inflating.

But every autoist should have a pressure gauge so as to be able to determine the exact amount of pressure in his tire. Following is a table of approximate pressure for tires:

50 pounds in 3 inch tires.
60 pounds in 3 1-2 inch tires.
70 pounds in 4 inch tires.
80 pounds in 4 1-2 inch tires.
90 pounds in 5 inch tires.

The rear tire should be inflated 5 to 10 pounds higher than above table. Improper inflation is the commonest cause of rim-cutting. During the first ten days they are used tires should be frequently inflated, as the cover increases progressively in volume for the first ten days or so, and the air pressure is thus diminished. After this period, or when the cover has reached its full dimensions, it will be sufficient to pump your tires every ten days or three weeks. If more frequent pumping is necessary something is wrong; a leaky valve or a "slow" puncture.

Of course, a deflated tire should never be driven on, as there is not only the certainty of damaging both tube and casing beyond repair, but the danger of loss of control and serious accident if high speeds are indulged in. An entirely deflated tire is easily detected by the unusually sharp jars transmitted to the body of the car, but often a "slow" puncture is not detected until considerable damage has been done by rim-cutting. If the following is borne in mind the deflated tire may be detected before enough deflation has taken place to cause serious damage:

A deflated front tire will usually make itself known by the difference it causes in the sensitiveness of the steering apparatus. A deflated rear tire, especially if there be much weight in the rear of the car, often gives a peculiar "feel" to the steering wheel, as if the vehicle were traveling over a greasy road. The rear of the car swings about abnormally with a slight skidding tendency. When a driver feels this sensation on a good dry road he should think of his rear tires.

Care of Tires in the Garage.

Should the car be much in use it is preferable to leave the tires inflated, but if the car is not used for some months it is better, after having placed jacks under the axle, to partially deflate the tire. If this is done it will add greatly to the life of the tires, as they are then bearing only the pressure of the air with which they are inflated, which is very slight, whereas when supporting the weight of the car this is exerting a continual unnecessary strain on the walls of the cover and the pressure of the air in the tire also exerts more or less of a strain. By adopting this course it is estimated that the life of the tires will be increased by at least half the time the car stands idle. Never allow the car to stand with one or more tires deflated without jacking it up to relieve the pressure.

In winter it is best to remove the tires from the wheel, and after being sure that they are perfectly free from oil, water, etc., wrap them with a soft cotton cloth to keep out the light and store them in a place of moderate temperature. Or the tires may be deflated and left on the wheel and then wrapped in cloth and the car stored in a place of moderate temperature.

Be sure the size of the tires is equal to the weight of the car. The limit of weight which each size tire will stand is given by the makers of it. Improper attachment of a clincher tire to the rim is certain to result in trouble before many miles are covered, as the inner tube is pretty sure to be caught between the shoe and the rim, or between the shoe and a retaining stud, the result of which is the well-known "pinching." The portion of the tube near that which is caught is subjected to increased strains, while in a stretched condition, and the tube will soon burst or tear at the point of pinching. If the outer shoe is not caught properly between the rim and stud, great damage to the shoe may result, and in the case of many tires, the inner tube may blow out through the space between the shoe and the rim near the improperly set stud.

Natural Enemies of Rubber.

It should be kept in mind that tires have three natural enemies that are destructive to rubber; light, heat and oil, to which might also be added, water. Light and heat have a chemical effect upon rubber, causing very speedy deterioration. Oil, especially gasoline, is a ready solvent for rubber, and will rot the tire quicker than any other substance. Water tends to rot the canvas in the shoe, rust the rim, and destroy the rubber. It should be remembered that wet tires are cut very easily, so that it behooves one to be very careful while running a car on muddy or wet roads.

Heating of Tires While in Use.

It is well known that in a long run the tires become considerably heated, but the cause for this is not so well known. The heating is the direct result of the frictional action between the outer shoe and the inner tube. It can be in a large degree avoided by rubbing French chalk over the inner tube before it is inserted into the shoe; this acts as a lubricant and reduces the friction between the two surfaces to a minimum, and, consequently, diminishes the amount of heat generated and the amount of wear experienced.

Spare Tires and Their Care.—Extra Shoes.

An extra outer shoe should always be a part of an autoist's car equipment. But it should be thoroughly protected against light, heat, oil and dampness. Many a tire that has never been used is ruined by being carried on the car in such a way that water is collected in the tire every time the car is washed or run in a rain storm, and becomes soaked into the fabric of the tire. It is necessary to keep the extra outer shoe covered in some way, so that is may be protected against not only light, heat, oil and dampness, but against dust and chafing as well.

Several extra inner tubes should also always be part of an autoist's car equipment, and care should be taken to see that no deterioration takes place before they are put into use. To put an inner tube, uncovered, into a box full of loose tools, oil cans, etc., is only a little better than throwing it away. The tools will chafe and the oil will rot it, so that if it holds air at all when inflated, it may soon burst under the weight of the car.

Tire Repair Parts.

A tire sleeve is often of much value where a pit is occasionally in the casing, as it will give the tire external support and prevent the bursting through of the inner tube. In lieu of a tire sleeve it is possible to obtain the same results for a time by the use of a strap, which may be wound about the tire, but the

From a little book by C. A. Shaler Company, Waupun, Wis., makers of vulcanizers and tire repair materials in general. The information is so pertinent and so full of sound common sense that the temptation to give it wider circulation is irresistible.

leather sleeve is more substantial. The strap or the sleeve should not be applied with the air in the tire at a higher pressure than 15 pounds. After it has been put on, however, the tire requires to be pumped up again, and a strong well-made pump, even if it costs a little more than seems to the uninitiated to be a reasonable price for such an instrument, will soon pay for itself in the satisfaction it gives.

It should be kept in mind, however, that tire sleeves and the like are for temporary repairs only, and that the injured tire should be vulcanized at the earliest possible moment. To quote the manager of one of the largest tire factories in the world: "A tire sleeve does not perfectly conform to the shape of the tire; water and sand get into the injured portion of the cover and thereby rot the fabric, and eventually the cover will be made useless."

Another very valuable device for an emergency repair of a blow out in the blow out patch, composed of fabric and rubber, which can be placed between the tube and the casing to prevent the tube from blowing out through the hole in the casing. If a tire sleeve is placed over the hole, the repair is still further strengthened. Tire repair plasters made of fabric are also made to go between tube and casing, in the event of a small hole occurring in the casing. They are quite similar to the blow-out patches, but are much smaller. Another handy little device and one that is quite ingenious, is the tire repair plug; a mushroom shaped rubber plug which can be inserted into a pin-or-nail-puncture, and which will for a time prevent leakage without the use of cement.

Quick Repairs for Inner Tubes.

For the smallest puncture a patch two inches in diameter should be used. The surface of the tube should be thoroughly cleaned for a space at least one-half inch larger in diameter than the patch to be applied, by first rubbing hard with a bit of waste or cloth moistened with gasoline, until all traces of "bloom" or the French chalk on the tire have been removed, and then slightly ruffing up the surface of the rubber with very fine sand paper. It is best to use the prepared patches which are procurable from the tire makers, but if a patch be cut from an old inner tube, this should be carefully treated on the underside in the manner indicated above, and the edges bevelled. It is better to cut the patch in circular shape, as a square patch will start to come off comparatively easy at the corners. Cover the patch and the clean place on the tube with a thin coating of high grade heavy rubber cement (inferior grades are worse than useless) and allow it to dry thoroughly. Then apply a second coating. When the second coating has become "tacky" (i. e., not moist, but so that it will stick to the fingers when touched) the patch can be applied. Hammer it well with a bit of wood and allow it a minute or so in which to "set" before pumping air into the tube. If this is not done, failure is almost sure to issue. It is also very necessary to wait until the cement is quite dry and tacky before applying the patch. There is no cement for cementing rubber that will withstand any considerable degree of heat, so that nine times out of ten the cement patch will work loose while the car is running at a high rate of speed with great danger to the car and its occupants.

Quick Repairs for Outer Casings.

In the case of a nail puncture, the hole in the outer shoe should be covered by sticking on a bit of prepared canvas which the tire makers can supply, to the inside of the casing, in order to prevent sand, water, and dirt from working in between inner tube and outer casing. To do this the same rules must be followed as in the case of applying a patch to the inner tube.

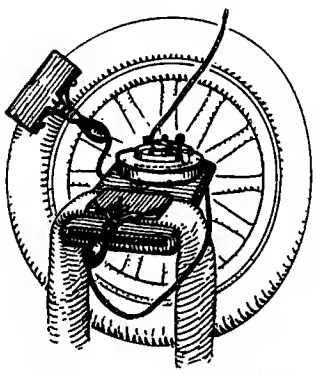
In event of cuts which extend through the outer shoe, a strip of canvas sufficiently wide to cover the cut completely and to extend beyond on each side, and long enough to catch between the shoulder and the outer rim, should be fitted on the inside of the shoe before the inner tube is inserted. This strip should fit closely to the inside of the shoe, and it is well to attach it for at least a part of its length by using cement. The object of this strip is to prevent the tube from blowing out through the cut, and it should, therefore, be drawn sufficiently tight when the tire is attached to the rim to form a supporting band about the tube. Of course, if one has the tire sleeve, or blow-out patch before mentioned, they should be used.

In replacing the tire, the inner tube should be rubbed well with French chalk and inserted, if possible, in such a manner that the patch on the tube will not come against the patch in the shoe, and care should be used that the loose ends of the canvas strip are securely caught between the shoulder of the tire and the edges of the rim. After a slight inflation the tire sleeve, previously described, should be placed tightly around the tire and rim at the point of injury. A make-shift for this tire sleeve is a piece of ordinary "duck," which can be wound about the injury and tightly fastened to hold it in place.

Most Important Tire Tool for the Autoist.

Every autoist should have a vulcanizer, not for a roadside repair kit, but for actual work in keeping his tires in absolutely as perfect condition and appearance as they were the day he bought them. By the use of a good vulcanizer any cut, puncture, tear, or slit in an inner tube can be mended in a very short time, so that the mended portion is even stronger than the balance of the tube. By the use of a good vulcanizer the autoist can save 75 per cent. of his tire repair bill, and get three times the wear that he ordinarily would get out of a set of tires. Think what this means. You can keep the stone cuts in your casing filled in and repaired so that both their strength and appearance is the same as when the tire was purchased. Keeping the casings filled in in this way will absolutely prevent sand pockets and will do away with practically all blow-outs, for it is very seldom that a blow-out takes place in a perfectly sound portion of the tire.

A blow-out invariably occurs where there has been a weakening of the fabric by the rubber having been cut, and sand, dirt, and water having been allowed to creep in, tear away the rubber, and rot the fabric. It will mean more to the autoist than any other thing he can do to go over his casings from time to time, say once a month, and repair each cut in the casing, no matter how small.



The Shaler Vulcanizer Shown In Service.

The tire does need to be removed from wheel, or wheel from car. The hole is cleaned with gasoline and sand paper, and a coating of vulcanizing cement smeared in and around the cut. The cement is allowed to dry and the hole is filled with crude rubber. The vulcanizer is then clamped onto the casing by means of a chain and bolts, after which the wheel is jacked up and enough air let out of the tire, so that when the vulcanizer is snugly bolted to the tire, it will conform exactly to the concave face of the vulcanizer. The vulcanizer is left in this position for thirty minutes at a temperature of 250 to 275 degrees Fahrenheit.

Tubes are repaired in much the same manner. The tube is cleaned, cemented, and pieces of crude rubber, as nearly as possible conforming in size and shape to the hole, placed in the hole, and a final piece one-eighth of an inch all around larger than the hole placed over all. The tube is then placed on a shelf, furnished with the vulcanizer, and the flat side of the vulcanizer clamped down on the tube. Vulcanization takes places on the tube in about fifteen minutes.

LETTERS INTERESTING AND INSTRUCTIVE

ONE MOTOR CAR CAN BE SLOWED QUICKLY.

Editor THE AUTOMOBILE:

[1,676.]—As I have been a constant reader of "The Automobile" for the past two years, I have noticed in your "Letters Interesting and Instructive" many useful and suggestive ideas, some of which have helped me out of many a difficulty, and many of which I have put to practical tests.

And, now, I take the liberty of asking a question myself. Why do some manufacturers and users of automobiles claim that the main shaft of an engine (the flywheel shaft) should not be hung on ball bearings, but should be on plain bearings? If the ball bearing idea is wrong, why do not more of them supported in this way give trouble?

Also, why can a two-cylinder motor double opposed be slowed down more than a four-cylinder under the hood with the same conditions governing? I mean by this, suppose you come to a street crossing where there is a rise and you brake your car without throttling it down.

I speak of no one car over another in this letter. It is simply a question which has arisen among men using and buying autos.

Peabody, Kan. C. E. DAVISON.

It is out of the question to reason for the various designers of automobiles. Since both kinds of bearings work, it is a mere matter of selection, just as is the color of the finish; some like "red" and a preference for "maroon" is not unknown. Buyers can find both kinds, and are not, therefore, compelled to go against their inclinations.

Why a double opposed motor can be slowed down more than a motor with four cylinders, is a matter depending upon a number of circumstances, in some cases of which what you say is true. If you mean that some motors will run slower than others, then the reply is that the flywheel in such cases favorably influences the situation. If the flywheel effect is great in proportion to the conditions that demand such effect, the motor can be run slow. With a light flywheel the reverse would be true.

TRANSCONTINENTALISTS AFTER INFORMATION.

Editor THE AUTOMOBILE:

[1,677.]—As a friend and myself are planning a transcontinental automobile trip for some time in the Summer, we would like to have your valuable assistance in the matter of picking a route. New York is the starting point and San Francisco the ultimate destination. Except for passing through Dayton, O., and Kansas City, our itinerary is immaterial. After studying various volumes of the Automobile Blue Book we have selected two possible routes for the eastern part of our journey, but we are undecided as to which one is preferable. The first is: New York, Syracuse, Buffalo, Cleveland, Columbus, Dayton, Indianapolis, St. Louis, Kansas City, Denver, Salt Lake City, to San Francisco. The other one, which is a trifle shorter, takes in New York, Philadelphia, Altoona, Pittsburg, Columbus, Dayton, and so on. Now, which of these would you recommend? It is not our intention to break any records, as we have plenty of time and want to enjoy the tour.

We are also somewhat in doubt as to which would be the better way across the Rocky Mountains from Denver—via the southern route or the northern. Any information you can give me through your columns will be greatly appreciated. DICK WILES.

New Haven, Conn.

The first route mentioned should serve your purpose very well, indeed. See Section No. 4, of "The Automobile Official Blue Book," for maps of the several routes already followed by transcontinentalists.

WIND SHIELD ON PRINCIPLE OF THE DODGER.

Editor THE AUTOMOBILE:

[1,678.]—Will you kindly tell me through your "Letters Interesting and Instructive," if there are any manufacturers who make automobile wind-shields on the principle of the "dodger" on a steamer's bridge, the material of canvas, celluloid or other light material? A glass shield is very heavy and more or less dangerous should an accident occur and it seems to me that a dodger could be made which coming to the operator's shoulders or even lower would carry the wind over the heads of the occupants of the car.

Saint John, N. B. KOYDEN THOMSON.

You probably can get just what you want from several makers of wind-shields.

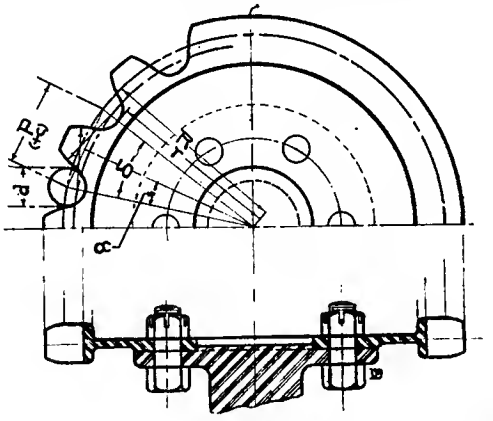
THE PRIME CAUSE OF NOISE IN CHAINS.

Editor THE AUTOMOBILE:

[1,679.]—I am a constant reader of your paper and have been wondering if, through "Letters Interesting and Instructive," you could not give me some light on a subject which has perplexed me for a long time. I have owned a number of cars, all of them chain driven, and aside from the other qualities of the cars, the efficiency of the respective chains as to wear, etc., but especially as to noise, has differed a great deal. This question of the noise has bothered me, and so far I have been unable to determine exactly why some chains are noisier than others. Can you throw any light on the subject? "NOISE."

New York.

Yours is a question of sprocket design, not the chain, which causes the trouble. It is a comparatively easy matter to get good chains, but even when they are used, the noise is still there in many cases. The critical point in sprocket design is the radius (r), of the base line circle as determined by the chain, and the gear ratio to be employed. When these have been selected, we have the pitch, or the distance between centers of the rollers, and the diameter of the rollers. By the use of the accompanying drawing it is easily seen how important it is that the



Sprocket Layout, Showing the Mode of Procedure in Designing.

value for "r" be accurately calculated so that when we have spaced the circumference for the correct number of teeth each roller will seat properly on the sprocket. Any error in the value of "r" is multiplied by 6.2832 in the circumference, so it is easy to see why some chains will not seat evenly without binding if mistakes are made in finding "r."

The following example may help to make this question clearer. Example:

Number of teeth = N = 14.

Distance between centers of rollers = pitch = P = 1.25 inches.

Diameter of rollers = d = ⅝ of an inch.

$\alpha = 180° \div N = 180° \div 14 = 12° 51' 25''$.

$$R = \text{radius of pitch circumference} = \frac{1}{2} \times \frac{P}{\sin \alpha}$$

$$= \frac{1}{2} \times \frac{1.25}{.22252} = 2.8087 \text{ inches.}$$

$r = R - \frac{1}{2}d = 2.08087 - .3125 = 2.4962$ inches. (This is the important dimension in designing sprockets.)

C = clearance.

There is one other matter that does not always receive its due measure of attention, i.e., the number of teeth should not be reduced below a certain minimum. It is not uncommon to see sprockets with 9 teeth, in designs in which the gear ratio cannot be arrived at in any other way. In such cases the

small number of teeth come as a necessary evil, yet even so sprockets with 14 teeth would be less noisy. One more point: increasing the diameter of the sprocket is equal to increasing the life as well. This is because the pressure on the teeth will be lessened, since,

$$P = \frac{H.P. \times 33{,}000}{2\pi R S}$$

In which,

P = pull in pounds;

R = pitch line radius in feet;

S = speed in revolutions per minute;

H.P. = horsepower to be transmitted.

In conclusion, then, it is to say, noise is the product of either badly designed sprockets or lack of attention in the maintenance of the chains. Certainly a chain is entitled to a little care; it has joints to hold grit, and, in time, lack of oiling and attention will do the trick.

CARE OF CARS FOR WINTER.

Editor THE AUTOMOBILE:

[1,680.]—It would, I think, prove very useful to many of your readers to have you give in detail suggestions as to the putting away of cars for the Winter. Too many owners of machines store their cars, observing necessary rules about draining the water off, blocking the wheels, etc., but do not know sufficiently well how to do it, or why it is done, and after a severa Winter are more than apt to find that their cars have suffered for want of adequate knowledge on their part in tha refinements of the art they have undertaken. I have known of cases where cylinders have cracked, despite the fact that the petcock in the radiator had been opened and the water supposedly had been drained off. Certainly the opinion of an expert upon the care of a car in winter storage, giving details as to how the engine, gears, brasses, etc., should ba left, would be both timely and widely welcomed. H. G.

Roslyn, N. Y.

Something of the sort will be taken up, in an early issue.

AMERICAN SITUATION IN RE BALL BEARINGS.

Editor THE AUTOMOBILE:

[1,681.]—Tbe use of ball bearings on crankehafts of gasoline motors is not a question of engineering possibility; that is settled by the fact that thousands of motore are successfully and satisfactorily equipped with and running on ball bearings. Such use ranges from motor cycles to torpedo boat motors. In tbe former case the load is one of a relatively few pounds. In the latter case the load per bearing runs up to 14 tons. The illustration is of a Frencb marine motor loaded with 10 tons per journal in regular service; the acceptance trial involved 14 hours run at 450 r. p. m. under a load per jonrnal of 14 tons.

But it is not engineering feasibility alone that is the determining feature. There is also the question of cost. That is beat considered in the light of the fact that the ball bearing crankshaft is the regular practice for a considerable number of years of many builders of automobiles.

With the feasibility from an engineering and from a cost standpoint thus proven by the best of all tests, practice, there is the question of durability. This again is definitely proven by the continued use, year after year, of the ball bearing crankshaft by the buildere of four and of eix-cylinder motors of from 15 to 50-horsepower as well as of the smaller motor cycla engines.

Remains the question of noisa! Every builder of anti-friction bearings knows and every candid and reputable one will tell his clientèle that the only absolutaly quiet bearing is a plain sliding journal well oiled. That doee not mean that the ball bearing is necessarily noisy; quite the contrary. We hava such bearings in use on organblowers where even the slight bum of the electric motor must be masked. What it does mean is that sounding box constructions and all sound magnifying constructions must be avoided. There is even a very decided indirect benefit sincc the most efficient mountings and mechanisms happen to be those that are without such sound magnifying or resonant affects. The cutting out of ball bearing noise has thus frequently resulted in the cutting out of noise producing elements generally. Some builders find ball bearings noisy in their motors, others do not so find them. The difference lies in the motors and usually in soma rather small and apparently unimportant structural details. The writer agrees to find the cause and remedy the matter for any motor whosa builder is sufficiently interested to send it to him for that purpose and to do that work free of all charges.

The ball bearing is in itself a new element of mechanism; possibly this should be modified into "relatively" new; relativa as compared with the antiquity of the plain journal, but absolutely new where knowledge of correct construction, material, workmanship and application is concerned. It is eo trite an experience as almost to require no etatement even that before any new thing is generally adopted there will be much trial, abandonment, retrial, finally, general adoption. The ball bearing is no exception.

In its various forms it is daily going into use by the many thousands—one form alone, that known as the Hees-Bright or DWF is supplied from one plant daily, thousands ranging from ¼ to 40-inch, and using balls from 1-16 inch to 4 inches diameter and costing from a few cents to several tbousand dollars per piece. It may therefore be conceded, notwithstanding its relative youtb, that the ball bearings has, as our French cousins would say, "arrived."

The crankshaft uee of the ball bearing is in an earlier stage, that of trial, success by many, failure by a few, retrial, and in many casee final adoption. The instances of definite failure are almost none. The cases of dissatisfaction because of failure to recognize, or unwillingness to properly adopt otber conditione to the requirements of the ball bearing are more numerous. In this connection a very general trait of humanity is interestingly brought out, since such trouble ie experienced by the better automobile builders, whose self-reliance prompts them to ignore the advice, aid, and experience of the ball bearing specialist. On the whole, tbough there are defections among the users of ball bearings for crankshafts, there are more accessions.

This communication is prompted by the receipt of a letter from The Pope Motor Car Company, from which I quote:

"On page 759 of 'The Automobile' of November 20, 1908, appears an interview in which it is said: 'The other ie the abandonment of ball bearinge for crankshafts in favor of plain bearings in notable instances.' Now, our (Pope) experience with ball bearings in tbe crankshaft has been that, by the use of these ball bearings, all bearing trouble in the crank has been eliminated. When we adopted this style of bearing it was with us more or less of an experiment and was watched with a great deal of interest, but we have yet to replace our firet ball bearing in a crankshaft. This is probably due to the peculiar construction which we employ and which construction ie patented, and that is, casting steel plates integral witb the engine base, so that when the steal yoke and engine base are machined to carry the bearings, the ball bearing is carried on a steel cradle or yoke which extends around its wbole diameter.

"If any of the foreign makers have had trouble with ball bearings in the crankcase, it must have been due to inferior bearings or inferior mountings, and we believe that in justice to the ball-bearing crankshaft and yourselves, you should take some extended notice of criticism and refute statements of facts as they exist in this country."

It was not my original intention to eay anything on this question of ball bearings for crankshafts. I know that the ball is rolling, and that though thare will be occasional halt and elowing down the essential desirability of the ball baaring crankshaft, coupled with the already fairly considerable and in every way satisfactory and successful use will give it an increasing momentum. The logic of events and not anything that I can do or eay will govern. But it did seem to me that the request of a pioneering user such as The Popa Manufacturing Company could not be ignored. The virtual command of a second letter: "We tbink that you ought to do for your own sake and for the sake of hundreds of other users of cars and also manufacturers who are using your bearings, is to come out with a strong statement," could not be ignored.

Philadelphia. HENRY HESS.

APPRECIATION FROM A EUROPEAN SOURCE.

Editor THE AUTOMOBILE:

[1,682.]—From a far away corner of Provence. let me assure you how much THE AUTOMOBILE is appreciated for news of the American automobile world. I infer that tbousands feel the same way, for through three different sources I have tried to obtain from your office an extra copy of the issue of August 10. My last effort was to apply to you direct, when I received the following response: "No copies of the issue are on hand, and none have been returned by the news companies." If your publication sheet is always cleaned up as well as this, no wonder you are able to produce so excellent a paper. Long may it live and continue to gatber readers as it goes!

As for its abounding interest for all interested in automobilism, I may say that I turn my copies each week over to tbe local garage proprietor, a Frenchman, who cannot read a word of English. He says ha can keep better informed of the trend of new idea in accessories, tires, and tbe like, by merely looking at the pictures in THE AUTOMOBILE than by the belated news which drifts to him through the French papers. "Vive l' Automobile; very good," he says every week, as I hand him over my copy.

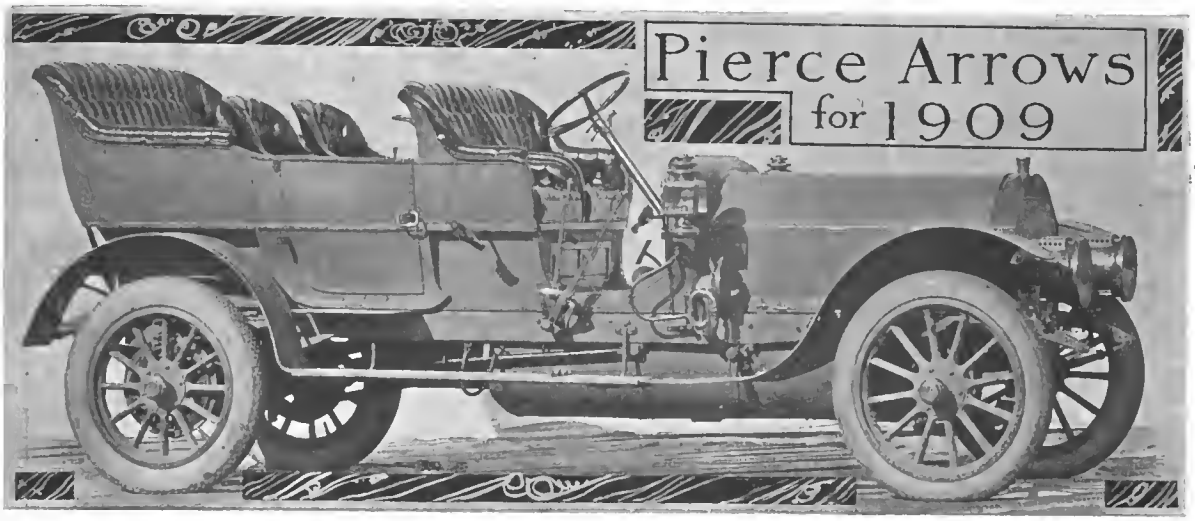
Cassis, B. du R., France. B. McMANUS.

A VERMONT CITY WANTS AUTO FOR POLICE.

Editor THE AUTOMOBILE:

[1,683.]—The Police Commissioners have been asked by the Board of Aldermen to investigate different gasoline police patrol automobiles. Will you advise us who makes such, or advise your advertisers through your columns?

Burlington, Vt. HAGAR BROTHERS.



Lines of the Pierce Great Arrow 6-60 Seven-Seated Touring Car for 1909.

By CHARLES B. HAYWARD.

BUFFALO, Dec. 14.—With no less than five different chassis of varying powers and numerous distinctive types of bodies, the Pierce offering for the coming season sets a high-water mark where the range of models ever offered by a single manufacturer is concerned, as there are 35 styles of Pierce cars now listed. To begin at the top, which is appropriate in the present instance, as the Pierce name has been more closely associated with the production of high-powered cars, such as the 40 and 60-horsepower Great Arrow models, there will be no less than three distinctive six-cylinder models, rated at 60, 48, and 36-horsepower, according to the A. L. A. M. formula. With the exception of a few minor improvements, the 60-horsepower machine is the Pierce Great Arrow of the present year's design that has done so much to uphold the builder's name in contests and in the hands of a large number of users, while the 48 and 36-horsepower types are entirely new models, the specifications of which were adopted by Designer Fergusson this Summer, not long before going abroad. Besides these three six-cylinder models, there are also listed under the Pierce name two fours, one of which is the four-cylinder 40-horsepower car that has long been familiar, and a new town car model rated at 24-horsepower, which is an entirely new creation, besides being the smallest Pierce turned out by the Buffalo factory in the past two or three years. Up to a short time ago efforts at the Pierce plant were centered upon the production of these two types and a large number has already been delivered; according to Colonel Clifton, probably the last four-cylinder car to be put out under the Pierce name will have left the works by the first of the year, as the company may devote its energies henceforth exclusively to the six-cylinder type.

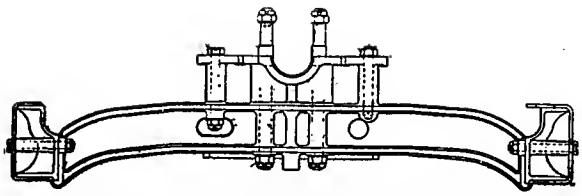
Series of all three models of the latter have been coming through in numbers together with the fours now being built, but despite the capacity of the big plant, deliveries have fallen considerably in arrears and a night shift of two or three hundred men has been continuously employed on machine work with the prospect that this will be necessary for some time to come in order to catch up; as the Pierce output of 1909 cars will doubtless be the largest in the history of the company's activities to date, owing to the unusual number of models listed.

Some of the Motor Details.—That painstaking attention to detail of design and construction that makes for the maximum degree of reliability and extended service finds its highest exemplification in the Pierce, and it is accordingly characterized by numerous features of interest that would ordinarily escape any but an experienced eye. In the design of the 36 and 48-horsepower six-cylinder types, a departure has been made from previous standards by the adoption of twin-cylinder castings, though the T-head, or outboard valve port type has been retained. The cylinder dimensions of these two motors are 3 15/16 by 4¾ inches, in the case of the smaller, and 4½ by 4¾ inches, bore and stroke, respectively, on the 48-horsepower model, the 60-horsepower six-cylinder car having 5 by 5½-inch cylinders. The valve operating mechanism has been improved by the substitution of an adjustable roller end at the cam in place of the solid plunger formerly used, while the use of a fiber block contact for the tappet tends to eliminate all noise from the operation of this part of the motor.

Mr. Fergusson is a strong believer in the use of aluminum where weight-saving or appearance are paramount, but will have none of it in positions of responsibility, so that while this material finds liberal employment in crankcase, gear-set housings, and body construction, the usual cast aluminum arms for the motor support are missing, two drop forgings of high-grade steel, attached to the crankcase by four through bolts, taking their place. These not only form a far more dependable, but also a much more elastic foundation for the motor. The forward frame brace is channeled to form a cradle for the radiator, its attachment relieving it of all torsional strains and making it very easily removable.

Lubrication is taken care of by the well-worked-out circulating system that has always distinguished the Pierce motors in this respect, and which makes for extreme simplicity and reliability on this all-important essential. A small gear pump attached directly to the side of the crankcase

Rear Springs and Brakes, Pierce 4-24 and 6-36 Models.



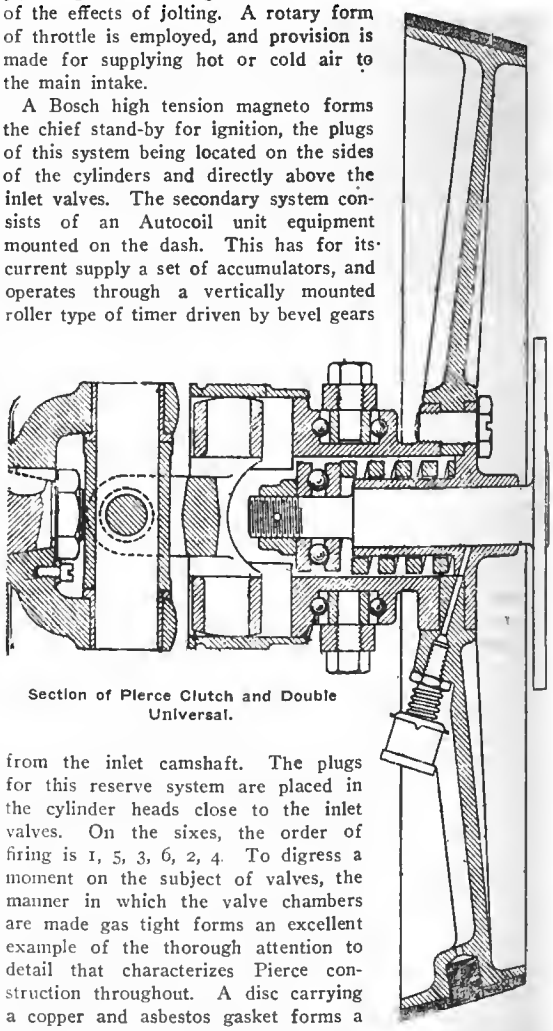
Drop-forged Motor Support and Crankcase Attachment.

and driven through a spiral gear on one of the camshafts, elevates oil from a well forming part of the crankcase oil pan, to a copper tank at the level of the cylinder heads. It is discharged into this tank through a double system of wire gauze filters, thus cleaning the oil every time it is circulated. From the tank it flows by gravity through 1/16-inch outlets to copper tubing of large bore to the seven main bearings of the six-cylinder motor, from which it is distributed by means of centrifugal force through the drilled crankshaft. A sight gauge conveniently located indicates the height of the supply in the reservoir. As the bearings are continually flooded with oil by this system, baffle plates are employed to prevent an excess being splashed on the piston. No oil rings have been found necessary and a liberal supply of lubricant is insured the wrist pin and small end bearing of the connecting rod by turning a wide shallow groove in the piston at the pin openings and by providing three recesses in the upper face of the bearing to retain some of the splash. The oil outlets of the tank are recessed to take washers with variable sized openings, so that the feed may be regulated in this manner. The other auxiliaries, such as the centrifugal circulating pump and the magneto, are driven from separate shafts on each side of the motor, the driving pinions being self-contained in the aluminum housing of the timing gears, thus greatly facilitating the assembly and dismounting of this part of the motor. Phosphor bronze bearings are used throughout, their alignment in the case of the crankshaft being perfected by reaming in place.

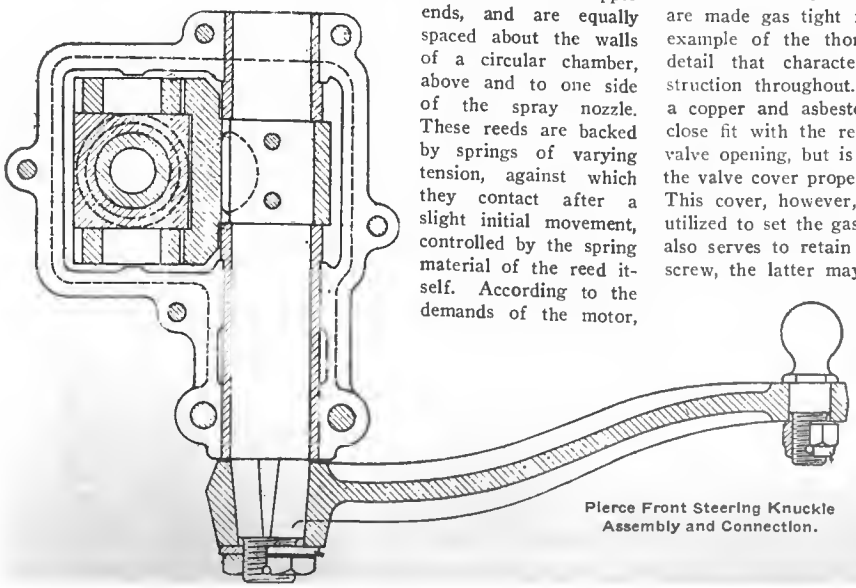
New Air Valve a Departure.

Particular interest attaches to the new type of auxiliary air valve on the carbureter, as the adoption of spring controlled reeds in place of the usual piston or diaphragm type, marks somewhat of a departure from current practice in this respect. On the carbureter for the smaller motor, there are two of these reeds, and on the larger, three. They are placed vertically, fastened at their upper ends, and are equally spaced about the walls of a circular chamber, above and to one side of the spray nozzle. These reeds are backed by springs of varying tension, against which they contact after a slight initial movement, controlled by the spring material of the reed itself. According to the demands of the motor, these reeds uncover their respective openings in the order of their increasing spring tension and insure an exceedingly gradual and uniform addition to the air supply, thus preventing any disturbance of the mixture proportions, regardless of the suddenness of the throttle opening. The mixing chamber, placed directly over the concentric float chamber, is waterjacketed. The float valve is spring-controlled, thus maintaining a uniform supply of gasoline through the elimination of the effects of jolting. A rotary form of throttle is employed, and provision is made for supplying hot or cold air to the main intake.

A Bosch high tension magneto forms the chief stand-by for ignition, the plugs of this system being located on the sides of the cylinders and directly above the inlet valves. The secondary system consists of an Autocoil unit equipment mounted on the dash. This has for its current supply a set of accumulators, and operates through a vertically mounted roller type of timer driven by bevel gears from the inlet camshaft. The plugs for this reserve system are placed in the cylinder heads close to the inlet valves. On the sixes, the order of firing is 1, 5, 3, 6, 2, 4. To digress a moment on the subject of valves, the manner in which the valve chambers are made gas tight forms an excellent example of the thorough attention to detail that characterizes Pierce construction throughout. A disc carrying a copper and asbestos gasket forms a close fit with the recessed seat of the valve opening, but is simply dropped into position. Above this the valve cover proper is loosely threaded into the port opening. This cover, however, carries a substantial set screw, which is utilized to set the gasket home, while the tension thus produced also serves to retain the threaded cover. On releasing the set screw, the latter may be turned out by hand.



Section of Pierce Clutch and Double Universal.

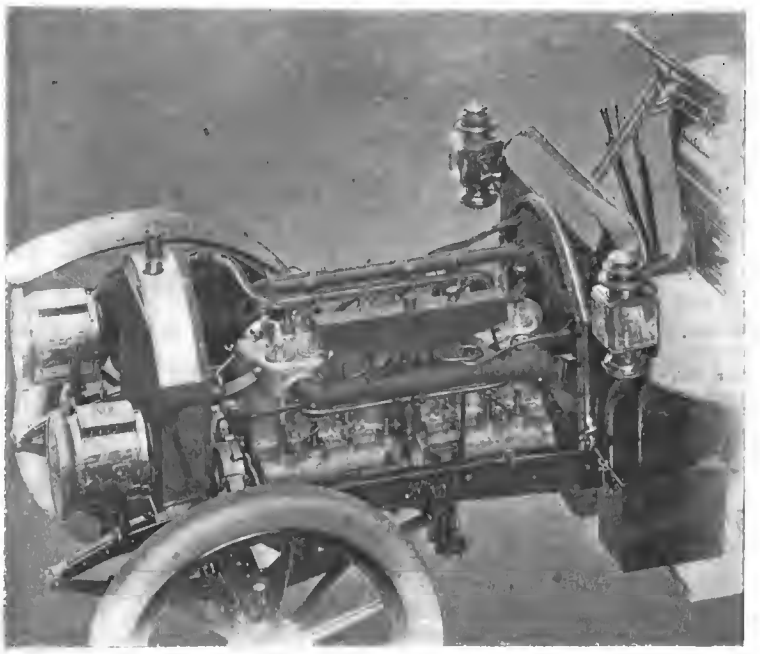


Pierce Front Steering Knuckle Assembly and Connection.

A feature of special interest is to be found in the new type of exhaust manifold recently adopted. It is a matter of common knowledge that no great amount of science has ever been lavished on this essential, though the room for improvement has been manifest. Experiment has shown that setting up an injector action in the flow of the gases from the different valve ports as they successively discharge into the manifold produced

a partial vacuum and was responsible for a greatly improved scavenging of the cylinders. The new Pierce manifold has accordingly been designed with this end in view, and experiments at the factory show an increase of fully 5 per cent. in the power of the 48-horsepower motor over its performance when run with an entirely free exhaust. Instead of being in a single piece, the new manifold is made with a gas-tight slip joint between each pair of cylinders to prevent disalignment of the cylinder castings, owing to the excessive expansion of the usual one-piece manifold, numerous tests proving this to be fully ⅛-inch under extreme conditions, as measured in the distortion of the twin cylinder castings from their true position.

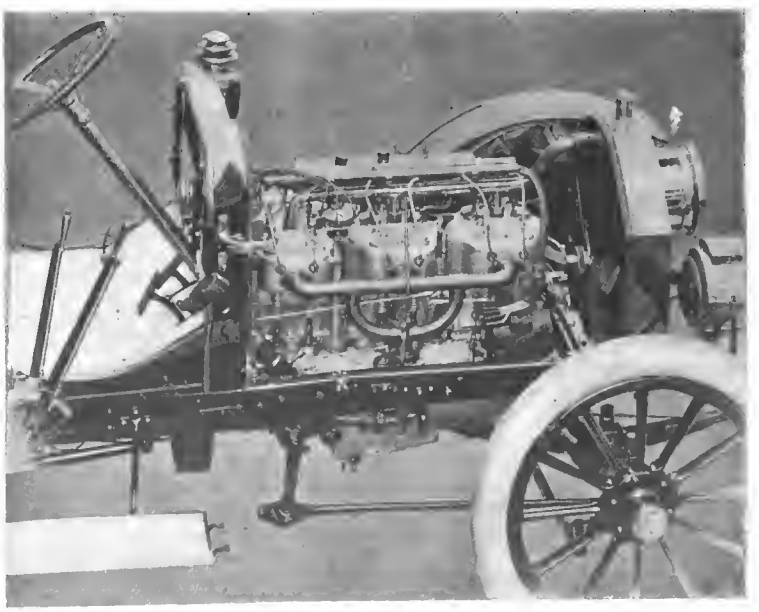
How the Power Is Handled.—Despite a more or less general tendency looking to the abandonment of the cone type of clutch in the past few years, this has been consistently adhered to in Pierce construction, and with the aid of a single row of cork inserts in the leather facing, and a carefully designed method of mounting, it has always proved exceptionally efficient and reliable, while having the further advantage of simplicity to recommend it. The spring is of the self-contained type, thus avoiding all thrust when the clutch is engaged, special ball thrust bearings being provided to take this when released. An unusually short full universal connects the clutch shaft and gear-set.



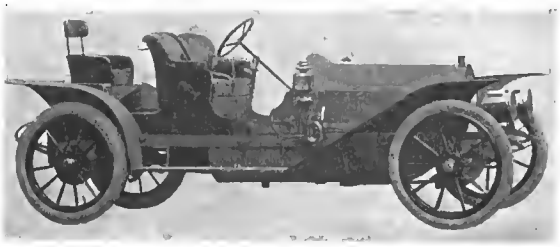
Oiler and Pump Side of the New Pierce Arrow 6-36 Model for 1909.

Announcement has already been made to the effect that henceforth the Pierce transmission system would no longer be distinguished by the retention of the progressive gear-set, and that a four-speed gear box operating on the selective plan with side lever actuation would be substituted, but a review of the specifications of this essential as now designed shows it to be the development of a long and careful study of the problem by Designer Fergusson. Krupp chrome nickel steel is employed for both shafts and gears, the moving members sliding on four heavy splines on the main shaft, while their corresponding pinions are bolted to flanges integral with the countershaft, thus avoiding distortion in heat-treating where integral. Both shafts are carried on Hess-Bright annular ball bearings, and the factor of safety recommended by the maker has been greatly exceeded by adopting much larger sizes than those ordinarily supplied for the same service. The usual H-gate is employed in connection with the side lever, but there are one or two features of operation that illustrate the thoroughness with which the design has been worked out. Current practice is followed in the spring-controlled ball dropping into recesses in the bars inside the housing, to determine the exact position of gear engagement, while an interlocking device consisting of a quadrant drilled with a series of holes into which a pin drops at the various engaged positions, prevents shifting without disengaging the clutch, and also serves to lock the gear-set in the neutral position. This is a feature of considerable merit, as it effectively prevents tampering with the gear-shifting lever when the car is standing unattended. It is necessary to disengage the clutch before the lever can be moved. The gear-set provides four forward speeds with the direct drive on the fourth, and the design has been developed with a view to meeting the necessities of the different models listed, thus avoiding confusion in manufacture by making it possible to equip all with the same gearbox. The prompt handling of such a number of models has been facilitated by standardizing parts wherever this has been found possible.

Final drive is by propeller shaft, a universal being employed at each end, the rear joint also being designed to telescope longitudinally. The rear axle driving unit is carried on Hess-Bright annular ball bearings, as are also the wheels, and while a live axle is employed, it is not of the floating type, the wheels being fastened directly to the ends of the axle with Woodruff keys instead of running on the tube, as in the usual construction. The driving shafts are of Krupp chrome nickel steel, having an elastic



Illustrating the Carbureter and Magneto Side of the Same Motor.

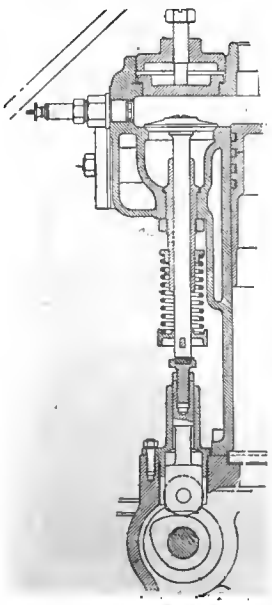


Lines of the Pierce Arrow 6-36 Three-Seater.

limit of 120,000 pounds, and are of tapered form, the increase in diameter toward the wheel end amounting to fully 25 per cent. over the inboard section. Large ball bearings are used, the inner one being mounted very close to the center line of the wheel, so that the bending moment is extremely small. This gives a somewhat lighter construction and the success of the design is manifest from the fact that in all the Pierce cars turned out none of the driving shafts have suffered from either torsion or shearing stresses. The rear hubs are drop forgings with cold drawn housings, while the front hubs are stamped complete.

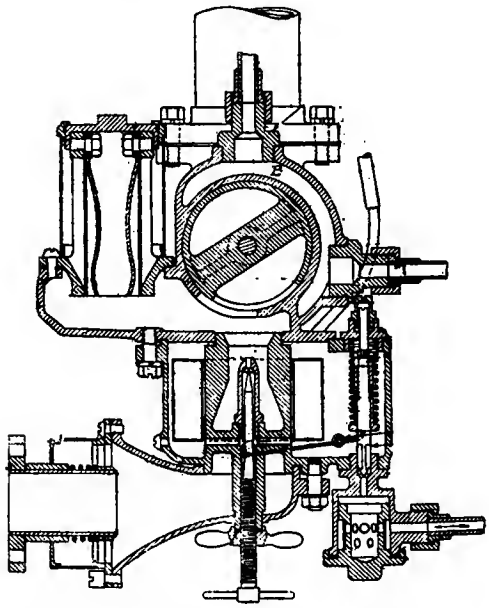
Instead of attaching the triangular torsion rod of seamless steel tubing rigidly to the differential housing as previously, the points of the base of the triangle are mounted on a large pin which permits of the rod as a whole being free to swivel on it. The usual spring mounting is retained at the forward end. Another departure is to be found in the rear axle strut rod, the construction of which eliminates the use of a turnbuckle. The two halves of the rod are right and lefthand threaded and screwed into the brake hanger and differential housing respectively, lock nuts being provided at the latter point. This is almost opposite one of the holding bolts of the substantial case.

On the six-cylinder 36-horsepower model and the four-cylinder town car, three-quarter elliptic springs are used on the rear, with the usual flat, semi-elliptics front, these being used all round on the other models. Instead of bolting the leaves together, this practice causing tbe spring to break where drilled, two bosses are stamped up out of the center of the leaf before heardening, each pair dropping into recesses formed by the punchings in the leaf below, thus effectively preventing any end motion, without tbe use of a rigid fastening. In the case of both the front and rear springs a revolvable mounting on the axle is employed, with a large groove turned in the seat for oil. These saddles are drop forgings and carry an extension bracket that forms the lower attachment of the Truffault-Hartford shock absorbers, which are part of the regular equipment of all Pierce cars.



Pierce Valve Assembly.

The front axle is a one-piece drop forging of simplified design, the yoke being made integral with the spindle instead of with the axle, a generous sized nickel-steel pin holding the two together and being locked in place on the axle by means of a set rcsew. An unusually large braking area is provided, Raybestos lining now being used in place of the bronze to steel contact formerly employed. The internal expanding or running brake is cam-operated and the emergency by direct pull, both acting on opposite faces of the same drum, and both being equalized. The emergency is not interconnected with the clutch, thus permitting the motor to be used as a brake, and its operation has been changed by making the lever pull up. A substantial sprag that may be instantly brought into action by the driver forms a standard part of the equipment of all the larger cars. The steering gear is of the screw and nut type, actuating a forked lever supported on a trunnion, making a practically irreversible gear, so that no road vibration is transmitted to the steering wheel. The Pierce standard tire equipment consists of



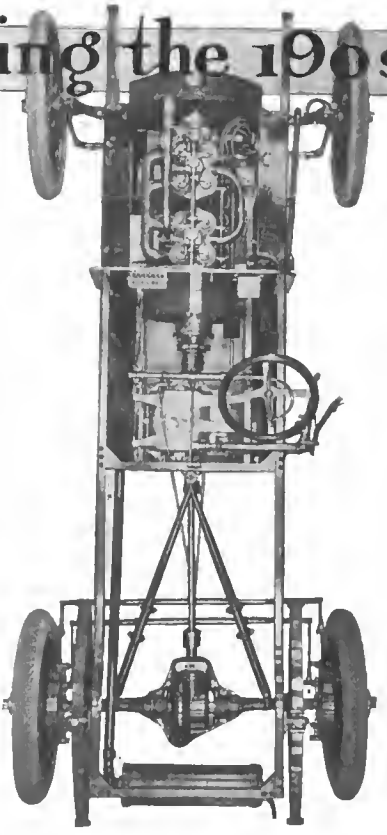
Sectional View of the Pierce Carbureter.

Goodrich quick detachables, 36 by 4 1-2 and 5 1-2-inch tires being used on the six-cylinder 60-horsepower car; 36 by 4 and 5-inch on the 48; these also being the sizes of the 40-horsepower four-cylinder model, and 34 by 4 and 4 1-2-inch on the six-cylinder 36. The wheelbase range from 112 to 135 inches.

With the exception of the features of the new Pierce cars that have been described in detail, their design and construction will be continued unaltered, and a review of the specifications of the different cars suffices to show that as a whole there has been little change, and what has been considered expedient has taken the form of improvement of the details. With the exception of the abandonment of the progressive type of change speed gearing with the operateing lever directly under the steering wheel, which has been a distinctive feature of Pierce design ever since the first car of this name has been on the market, there are few points by which the 1909 Pierces could be distinguished on the road from their predecessors of the preceding year's model. Probably the most noticeable of these is the adoption of the three-quarter elliptic type of spring for the rear suspension of the two smaller models, the 4-24 and the 6-36, it not being deemed advisable to carry out this idea on the bigher-powered cars owing to the danger of setting up a dangerous lateral movement of the body at high speeds, particularly when traveling over rough roads, which would be apt to bring this about even at ordinary speeds.

Starting with the five chassis as the foundations of the various models, it will be apparent thta on the average no less than seven body styles will be available to the purchaser in each power, but as matter of fact this is not tbe case, the range where the smaller cars are concerned not being so extensive. This is partly due to the fact that only the high-powered models will be made in the seven-passenger touring types, in addition to the usual enclosed models, such as the limousine and landaulet. Some special roadster types will be turned out, such as the Pierce 6-36, three-seater, shown by one of the photos, the design being a special creation for the 36-horsepower chassis.

Describing the 1909 Moons



THE two Moon models announced for the coming season will carry out the Moon ideas advanced and proven in previous years, among which are the four-cylinder motor with overhead valves, four-speed selective transmission, multiple disc clutch, etc. Among the newer ideas which will be featured are single ignition, using a high-tension magneto with special starting device, dropped frame, the drop amounting to 3 1-2 inches, which gives a very small angle to the driving shaft. Then, too, the water jacket space is unusually liberal, the gasoline tank is removed from the dangerous position at the rear of the chassis to the more accessible one under the front seat. A cambered rear axle of the full floating type is another feature that should find favor.

The 1909 Moon is distinctly neat in appearance, and differs mechanically from the commonplace in motor, ignition and rear-axle construction. The valves are in the head of the motor and are operated by a single camshaft for intake and exhaust. Ignition is by high-tension magneto without the use of batteries or vibrators, and to facilitate starting a simple but effective spring-actuated device is used to spin the magneto armature. The rear axle is particularly distinctive, being of the arched type, permitting the rear wheels to be cambered Two models are built for the present season, differing only in wheelbase and corresponding constructive strength. Model C has 112-inch wheelbase; Model D is the seven-seated car with a wheelbase of 121 inches. Interchangeable bodies of different typs are provided.

A Preference for Full Elliptic Springs.—The frame is of 3-16-inch cold pressed steel of 4-inch and 4 1-2-inch channel cross section. The rear of the frame has an upsweep of 3 1-2 inches, which permits the use of full elliptic springs in the rear and gives a low center of gravity without interfering with the road clearance. This has been a Moon feature for three years, and during this entire time there has never been a broken rear spring reported. A subframe carries the motor and transmission and insures perfect alignment under all conditions.

The front axle is of I-beam section drop forged steel and is located 5-8 inch in advance of the front of the radiator, which adds to the appearance of the car, as well as to the riding qualities, owing to the weight of the car being hung between the axles.

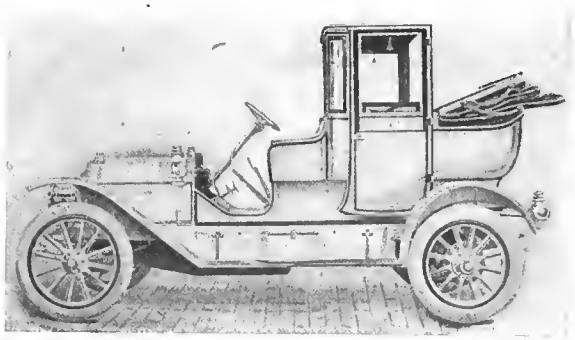
The rear axle is of the full floating type, special Moon design. It consists of heat-treated steel live axles, driving the hubs through four-fingered clutch plates. The weight is carried upon seamless steel tubing surrounding the live axles, which are in turn moulded to the steel differential housing. A 3-4-inch turnbuckle truss below axle preserves outward set. Between the differential and live axle are two small universal joints, which permit the rear wheels to be cambered at an angle of two degrees, giving an arched type of construction that is not only very strong but also is a great advantage for fast driving in that it holds the car to the road. Ball bearings are used, both in the front and rear axle.

The wheelbase of Model C has been lengthened two inches on the new model; the tread is 56 inches. On Model C, both touring and limousine cars, 34 x 3 1-2-inch tires are used in front and 34 x 4 1-2-inch on the rear. On the roadster and all Model D types, 36 x 3 1-2-inch tires are used in front and 36 x 4 1-2-inch on the rear. Four brakes of the equalizing type, acting on the rear wheel drums, are provided. The hand lever is for the internal expanding brake, and the foot, or service brake, the outside band. Raybestos is used as lining on all brakes.

Valves in the Head Type of Motor.—A four-cylinder, 4 1-2 x 4 1-2 motor has been a Moon feature for three years, and is only modified this season by minor refinements. The cylinders cast in pairs have the valves located in the head; all valves are interchangeable. A single camshaft driven by a vertical shaft has but four cams to operate the eight valves. At 1,600 revolutions the motor develops 32.2 horsepower and is capable of very low speeds under heavy loads. The half-time gears are enclosed in an aluminum housing. A copper intake pipe leads from the carbureter, which is of the single-jet auxiliary air valve type. The carbureter is water jacketed and is placed on the opposite side from the exhaust. The cylinders are bolted to an aluminum crankcase provided with four arms, which are in turn carried on the subframe. A large water pump of the centrifugal type is gear-driven from the vertical shaft. It is placed in a horizontal position in such a manner as to be readily removable. The crankshaft is made from a single piece of alloy steel, carefully heat-treated, accurately turned and ground. It is mounted on three white bronze bearings of large size. Eccentric oilers are provided in conjunction with the crankshaft system of lubrication. The connecting rods are one-piece drop-forged steel, with phosphor white bronze bushings. They are fitted into 6 1-2-inch pistons, provided with three piston rings, centered to prevent any tendency to rotate.

Lubrication is provided by a force-feed oiler directly connected to the end of the crankshaft and mounted on the dash. Visible sight feeds are provided. The oiler is of the eight-feed type; three lead to the main motor bearings, four to the cylinders themselves and one to the lower bearing of the vertical shaft. As an auxiliary, the splash system can also be used.

Ignition Follows European Practice.—European practice is followed in the ignition system. The Bosch high-tension magneto only being used, eliminates batteries, vibrating coil, distributor and an abundance of primary and secondary wiring. Four high-tension cables lead from the magneto to the plugs, and the connections are made with a neat system of knife switches. To more than counteract any disadvantages that may be attributed to this single system of ignition, a simple but effective starting device is employed. With this it is possible to start the motor from the seat without the use of any other outside agency than the magneto itself. A very simple device is used in disengaging the magneto from its driving gear and throwing the armature of the magneto to form a contact. After the first cylinder has been fired an impetus is given to the crankshaft, and the magneto automatically drops back into gear. This is an original design and is covered by patents. A genuine honeycomb radiator is used in the cooling system. Large water chambers are provided around cylinders and valves, and water spaces as well between



Model C, Brevette Landaulet Moon for 1909.

each pair of cylinders. Large containers are provided in the cylinder heads, and these jackets extend in between the valve chambers. Tbis method of cooling the valves insures perfect cooling of the motor at any speed. The only fan used is that which is cast in the flywheel. A circulating pump is located below the radiator, making the low part of the pump the lowest point in the entire cooling system. It is provided with a petcock and furnishes a simple means of draining all the water from the cylinders and the radiator.

The gasoline supply is carried in an 18-gallon copper tank located under the front seat. The gasoline flow is by gravity to the carbureter. The tank is so located that the flow is constant on the steepest grade.

Fifty-one Discs in Clutch.—A multiple-disc clutch is used consisting of 51 high carbon steel discs of special design. These operate in an oil bath enclosed in a brass housing. The clutch is provided with an automatic throw-out, which can be operated either by the foot pedal or the emergency brake lever. A universal coupling is used between the clutch and transmission. Large thrust bearings are used in connection with the releasing yoke.

The transmission is provided with four speeds forward and one reverse, and is of the selective type. The gears are enclosed in an oil-tight aluminum case, supported hy four arms on the subframe. The changing gears slide on a square shaft, which is hardened and ground. The same oil which lubricates the gears luhricates the bearings. All gears are heat-treated and are cut to a six-eight pitch and are pointed by an ingenious device to insure noiseless engagement. Parsons' white bronze bearings are used. A single hand lever operates all gears through the usual "H" type of quadrant. On the gearbox proper there is a simple locking system, whereby all gears except the one being engaged are held in a neutral position. Direct drive is on the fourth speed and tbe final drive is through a steel propellor shaft provided with two cardan joints. These joints are of liberal size, packed in grease and enclosed in a dust-proof case.

Other General Characteristics.—The steering gear is of the double internal worm type provided with ball bearings. The steering arm and spindle connection is located above the front axle, allowing the cross connecting rod to be located back of the axle, removing this member from any liability of contact with road obstacles. The spark and gas control levers are located on the steering wheel and operate through an inner sbaft and tube within the column. A mahogany dash is equipped with a kick switch and self-starting device button, which is located beside the oiler. Heavy brass-bound cork linoleum covers the floor boards; the toe boards are inclined at an angle of 30 degrees. The running boards, made of open grating steel, besides being exceedingly rigid furnish an excellent foot scraper to keep dirt out of the car. The front fenders extend well out beyond the front wheels, and, like the rear fenders, are provided with rigid splash aprons. Both fenders and hood are of aluminum-coated steel, which insures permanent retention of the paint and finishing varnish. The muffler is carried crosswise under the rear member of the frame. This distance of the muffler from the motor insures absence of back pressure and at the same time completely silences the noise of the explosions. All bodies are constructed of aluminum, touring bodies being of convex type.

The Model C, with a wheelbase of 112 inches, is made up in a five-passenger touring car, roadster and toy tonneau, wbile the Model D, with a 121-inch wheelbase, carries a seven-passenger body. Both models are equipped with enclosed bodies of different types, which are interchangeable with the touring bodies. The standard color is a dark blue body with French gray running gear. The touring cars are upholstered with hand-buffed hlack leather, water grained. The regular equipment includes five lamps, horn, gas tank and complete tool outfit.

Model D, Seven-Seated Moon Touring Car.

A NEW COMMERCIAL CAR CONCERN.

COLUMBUS, O., Dec. 14.—The Farmobile Manufacturing Company, an offshoot of the Oscar Lear Automobile Company, which holds the copyright on the name Farmobile, has just completed the fitting up of its plant at 580 Dublin avenue, and is now working on the first machines of a large order for the Pacific coast.

The officers of this company, which is capitalized at $200,000, are: President, C. J. Eastman, Los Angeles, Cal.; vice-president, W. J. Miller, former vice-president and general superintendent of the Oscar Lear Automohile Company; secretary, M. W. Kounds, president of the Ohio Manufacturing Company, and treasurer, James G. Stewart. These men, with David W. Jones, compose the board of directors.

The machine manufactured is used in all kinds of agricultural work, plowing, etc., the machine doing the work of a tractor. It will be equipped, it is said, with a rotary engine. It is well known that both Frayer and Miller have been working on the rotary valve problem for many years. The factory building is new and fitted with the best of new and up-to-date machinery. It is said that an order for 1,000 machines has been received.

NEW BASIS FOR POWER WAGON SALES A HIT.

DETROIT, Dec. 14.—The new scheme for selling its motor delivery cars which the Grabowsky Power Wagon Company bas inaugurated has made a hit in Detroit. The scheme in brief is a maintenance guarantee at a nominal charge, so the purchaser bas only the daily use of the car, with no other responsibility or worry. Among those who have taken up with this scheme is the firm of Peter Smith & Sons, groceries. This company once before tried out motor delivery in a very thorough manner and found it unsatisfactory.

Regarding the new proposition, Henry Smith expressed himself thus: "If we did not believe in the maintenance service we would not have placed the order, as our past experience was not satisfactory. But by this plan, which is guaranteed, we cannot lose. We realize the great benefits of motor delivery, and on the basis of this maintenance contract have ordered three cars for immediate use.

THIS YEAR GREATEST YET IN GOOD ROADS

WASHINGTON, D. C., Dec. 14.—The Secretary of Agriculture submitted his annual report to President Roosevelt to-day. It contains a great deal of information regarding the work of the office of Public Roads. Automobilists in general will be interested in the following excerpts from the report:

The Department, while endeavoring hy practical demonstration and scientific experiment to improve methode of construction and maintensnce, has lost no opportunity of awakening the public to a proper appreciation of the great economic importance of road improvement and the necessity for reform in the management of the puhlic roade.

Some conception may he had of the immensity of the task by considering the fact that there are 2,151,000 miles of road in the United States, a sufficient length to encircle the globe at the equator with 86 paralliel roads. The total expenditure upon the roads for 1904 was nearly $80,000,000. At that time about 38,600 miles had been surfaced with stone, 108,200 with gravel and 6,800 with special materials, making the whole mileage of improved roads only 7.14 per cent. of the total. An effort has heen made hy the engineers of the Department to estimate the miiesge of improved roads in 1908. Taking the 1904 figures as a basis, and assuming that the macadam roads have increased 12.5 per cent., the gravel 15 per cent., and those surfaced with special materials 25 per cent., we have 43,450 miles of macadam, 124,468 of gravel and 8,512 surfaced with special materials. The cost of the macadam has been estimsted at $4,500 per mile, of the gravel at $1,500 and of the other surfacing materiale at $1,000. There is ahout 1,975,000 miles of earth road, which it is estimated has cost for grading, culverts, bridges and all other items of expense an average of $500 per mile.

The destructive effects of automohile traffic on macadam roads have occasioned much uneasiness, as many million dollars have been expended in this form of construction. The enginsers of the department have, in common with others in this country and in France and England, conducted numerous experiments with a view to determining the exact cause of the deterioration of macadam roads and of devising methods of treatment or construction which would effectually meet existing conditions. Some measure of success has attended the work thus far, and it is hoped that much progress will be made within the next fsw years.

The relation of the puhlic roads to education is one which has largely heen overlooked. It is a more or less well-known fact that we have in all of our States a number of illiterates. While there is a numher of contrihutory causes to illiteracy, it is significant to note that in four States where the average percentage of improved roads is 30.35, the percentage of white illiterates is only 0.34 of 1 per cent. of the total population, and in four States, in which only 1.51 of the road mileage is improved, the per cent. of white illiterates is 4.76. It is prohahle that bad roads are partly a cause and partly an effect of ignorance, but it certainly appears that the two are closely related.

After describing the recent international good roads congress in Paris, and telling of the important part played in the congress by tbe American commission, all of whicb has heretofore been published in THE AUTOMOBILE, Secretary Wilson closes his report by saying:

"Considering the year as a whole, it is within the bounds of conservatism to say tbat far greater results have been accomplished than in any preceding year, and that the status of road work in general throughout the United States is more advanced and more promising for future development than in any year since the settlement of North America by tbe wbite man."

Lincoln Memorial Highway, Washington to Gettysburg.

WASHINGTON, D. C., Dec. 12.—An active campaign has been inaugurated to secure the appropriation of sufficient money by Congress to construct a Lincoln memorial highway from the White House to the Gettysburg battlefield. A balf a dozen measures with this object in view have been introduced in Congress and it is more than likely that one of them will receive favorable action before the one hundredth anniversary of Lincoln's birth in February next. Representative Lafean's bill provides that as a national tribute of affection toward Lincoln a great memorial highway not less than 150 feet wide be constructed from Wasbington to Gettysburg. His bill carries with it an appropriation of $3,000,000 to carry out the project.

MINNESOTA ROAD MAKERS BUSY THIS WEEK.

MINNEAPOLIS, MINN., Dec. 14.—The first annual meeting of the Minnesota Roadmakers' Association will be held in St. Paul for three days, commencing to-morrow. All persons interested in tbe betterment of Minnesota's roads will attend. Boards and county commissioners, city and village councils and other public bodies will send delegations and will take part in the discussions. County surveyors, road superintendents and road overseers are showing great interest. There will be a question box, and any one interested in any phase of road work or road building may communicate with the secretary, and later tbere will be an open discussion of all questions submitted. The program will include also a discussion of road drainage, construction and maintenance, bridge and culvert construction and legislation.

"THINGS ARE SELDOM WHAT THEY SEEM."

It is a long way from even good grades of steel to some of the fine brands that found their way into crankshaft construction some two or three years ago. The supposition was that the superior steel, with its undoubted kinetic life, would render the crankshafts capable of sustaining as long as the cars as a whole. What a shock it was when the new, and more expensive, crankshafts failed in service. Not all of them, to be sure, but so many as to indicate that the finer grades of steel could not be relied upon to abort the incidents of service which did more to give a "black eye" to automobiles than any other one thing. Crankshaft failures, in view of their cost, did not go unnoticed by the average autoist, and the high price of the alloy steel kind served as a further incentive for effort to improve.

Naturally enough, designers reached the conclusion that they could use less of a better material, and those who failed to look into the matter at some length did use a diminished amount of the superior grades of steel. Strange to relate, it was the American designers who did not dip into the tank of fallacies, due in no small measure to the fact that they merely duplicated the sizes of their carbon steel crankshafts when they changed over to the other kind. It is not an easy thing to do without designing a new motor, this reducing the size of a crankshaft; and few were the designers that undertook the task. Abroad, where alloy steel was to be had for structural purposes, and for members in machines, designers used the same on a basis of its conventional physical properties, and less of the steel (in the section) that they naturally would were carbon steel all to be had.

The result was a crop of failures in high priced cars, mostly of the imported kind, so that the repair shops, of New York City in particular, were kept busy for a long time without any loss of profit to them.

It is not the idea to claim that the alloy steel crankshafts would not serve the purpose so much as it is to point out that a smaller section of the alloy steel failed to supplant carbon steel and eliminate crankshaft failures in service. As a matter of fact, the high priced alloy steel was a failure from the point of view involving a saving in quantity used, hoping thereby to compensate, in some measure, for the higher pound price of the same. In quantity sufficient, it is fairly satisfactory from the life of the crankshaft point of view, but dearly so at that, since by way of insurance the premium is high. Alloy steel in crankshafts means high first cost and high cost of replacement as well. If, then, it does not stand for long life, it fails to stand for anything tangible.

* * *

DOUBTFUL OUTLOOK FOR HIGH SPEED RACING.

It would appear that the manufacturers of Europe are about to discard high speed racing as an asset of continued value in the advance of the automobile industry. While the facts are somewhat vague, and for the moment partake of uncertainty, it begins to look as though the most substantial supporters of racing had decided to be observers rather than participants in any big speed events for next year; in fact, before anything definite is done towards the 1909 Grand Prix in France there must be a guarantee of not less than 40 entries, which guarantee, it would appear, is not likely to be forthcoming.

On this side of the Atlantic, the American maker has been a spasmodic supporter of speed contests, and the majority have come to the conclusion that it is a waste of time and money and a detriment to factory organization to supply hastily constructed racing cars for the purpose of having them defeated by the carefully built and well tried out racers of their European rivals. Savannah was an illustration of the ineffectual manner in which the Americans have contended against their foreign opponents. True, there was a success for America in this year's Vanderbilt race, but even the most ardent enthusiast is forced to admit that the field was international only in a limited sense.

The limit of speed has gone far beyond the point of sanity, and it is a question if the cost of high speed racing is compensated for by the publicity secured and the spectacular though temporary interest enlisted from the public. There is no question whatever but that contests of various kinds, such as endurance tours, economy runs, and hill climbs, are still beneficial in various parts of the country, and it would be a mistake to remove from the calendar all kinds of competitions, even though high speed events are relegated to secondary consideration.

AMERICAN MAKERS CONFER ON TARIFF REVISION

IN New York City, Saturday, December 12, the special committee known as the Automobile Manufacturers' Tariff Committee, appointed by the several associations of automobile manufacturers, held a session for the purpose of completing the brief which will be submitted to the Ways and Means Committee of the House of Representatives at Washington. Present at the meeting were the following: H. B. Joy, Packard Motor Car Company; A. L. Riker, Locomobile Company of America; E. H. Parkhurst, Peerless Motor Car Company; Benjamin Briscoe, Maxwell-Briscoe Motor Company; Alfred Reeves, general manager, A. M. C. M. A., and E. P. Chalfant, general manager, A. L. A. M.

It was reported that certain statements had been made which might tend to give a false impression as to the attitude of the automobile builders of the country toward tariff revision. In this connection Mr. Briscoe filed a copy of a telegram sent to H. E. Miles, of the National Association of Automobile Manufacturers, reading as follows:

"Knowing that an adequate duty to protect wages of American workmen, as against the existing low rate of wages in European automobile factories (which is admitted to be less than 50 per cent. of the American rate), is in practically universal demand by the American automobile manufacturers, I insist that your statement before the Ways and Means Committee implying you had information that a considerable portion of the industry was favorable to a tariff reduction on automobiles, is unfair, because it is not in accordance with the facts, and you should know it.

"I challenge you to produce any and all telegrams you referred to, substantiating your representations. I cannot believe that you would deliberately distort the facts, or that you intend purposely to convey a wrong impression, and I, therefore, await with interest a statement from you that will be supported by facts."

In an interview subsequently, Mr. Briscoe stated that it was the desire of the committee to supply all needed data that would enable the committee of congress to understand the subject thoroughly and be in a position to rule on it fairly.

"The automobile makers," said Mr. Briscoe, "have no desire to ask for an unfair rate of tariff, or for any special treatment. While the figures of wages in this country and Europe indicate that 60 per cent. duty would be necessary for adequate protection in the matter of labor, they do not ask for anything more than the existing rate of 45 per cent. As automobiles have come into use since the passage of the Dingley bill, they now come in under the classification of manufactured metals, and it is our desire to have them properly classified under the heading of automobiles and parts thereof.

"It is our belief that the tariff on automobiles should be one to protect the American workman against the low wages paid abroad. This is in accordance with the principles actuating a protective tariff, and is consistent with the doctrine of the party now in power. There can be no dispute as to the meaning of these principles and this doctrine, as set forth in the platform of the Republican party, and voiced time and again by President-elect Taft, who said 'that the Republican party is unequivocally for a revision of the tariff by a special session of Congress immediately following the inauguration of the next President,' and laid it down as 'the true principle of protection that such duties be imposed as will equal the difference between the cost of production at home and abroad.' And, moreover, 'to establish maximum and minimum rates to be administered by the President under limitations fixed by law, the maximum to be available to meet discriminations by foreign countries against American goods entering their market, and the minimum to represent the normal measure of protection at home; the aim and purpose of the Republican policy being not only to preserve, without excessive duties, that security against foreign competition to which American manufacturers, farmers and producers are entitled, but also to maintain the high standard of living of wage earners of this country, who are the direct beneficiaries of the protective system.'"

As indicating how close the foreign markets are to American trade, Mr. Briscoe pointed to the statement made by the representative of the importers when he appeared before the Ways and Means Committee, in which he stated that even a 12 per cent. reduction from the present tariff would be entirely satisfactory to the foreign makers. This statement was taken to imply that this small reduction was all that was needed to give the foreigners absolute control of the American automobile market.

There can be no contradiction of the enormous difference in wages paid in this country. "Carefully compiled figures," said Mr. Briscoe, "show that 11,400 men in American factories, and 10,347 men in European factories, received an average yearly pay as follows:

	America.	Europe.
Workmen	$755.05	$306.00
Commercial Employees	876.07	529.00
Technical Employees	1202.41	602.50

"This shows that the workmen in American factories are paid two and one-half times, approximately, what they get for the same work in the same kind of factories in Europe. Technical employees in the American factories receive approximately twice what they do in Europe, and commercial employees receive about one and three-fifth times what they do in Europe."

E. R. Thomas on Tariff Reduction.

BUFFALO, Dec. 14.—According to figures supplied by the E. R. Thomas Motor Company, in the year 1900 it occupied one floor of a three-story building at the corner of Broadway and Elm street, and gave employment to 60 men, including the office force. The total disbursements for that year, including the salaries of the 60 employees, material, advertising, etc., were $40,000.

The year 1908 shows 1,400 employees, with an expenditure of $2,315,367.14 for salaries, material, advertising, etc. The output of automobiles the first year was 75, which gradually increased until the year 1908, when the output reached the total figures of 950 complete machines.

Asked concerning a reduction in tariff, Mr. Thomas stated:

"I do not favor a reduction or increase of the tariff on foreign automobiles on account of French and Italian labor ranging from 7 cents to 10 cents per hour as against 25 cents to 35 cents per hour for American labor. The present tariff will not prohibit the importation of the surplus product of foreign manufacturers wherever they so desire. On account of the newness of the industry, out of the whole 200 manufacturers a limited number are firmly established on a profit-making basis.

"In my opinion the industry has hardly started in this country. There are 2,000,000 horse-drawn vehicles made annually in the United States, and, contrary to public opinion, over 1,200,000 of them are for transportation of individuals, and if the industry is given further opportunity for development with a comparatively few years, instead of turning out 50,000 per annum, the country will absorb 250,000 automobiles per annum, if unretarded by reduction of tariff and permitting foreigners to compete for all classes of trade. It is not the tariff, but home competition that regulates the cost to the consumer, for the reason that the foreign manufacturer charges a much higher price than the American for the same quality and character of machine."

Roller Bearings Makers on Tariff Reduction.

WASHINGTON, D. C., Dec. 12.—The Ways and Means Committee has received a number of communications during the week from manufacturers of roller bearings regarding the duty on anti-friction ball bearings. The Standard Roller Bearing Company, of Philadelphia, filed a brief protesting against any reduction in the present duty, and filed in addition a long list of American automobile manufacturers who use foreign annular ball bearings. The Timken Roller Bearing Axle Company, of Canton, O., and the Excelsior Steel Ball Company, of Buffalo, also filed lengthy briefs along the same line.

The Timken Roller Bearing Axle Company said, in part, that there are at the present time a number of factories in this country devoted exclusively, or to a large extent, to the manufacture of anti-friction bearings, including ball and roller bearings, as well as the manufacture of steel balls. This industry is comparatively new, having been carried on to any extent only during the past five or six years. The early growth of the industry was very slow, but owing to the large number of automobiles manufactured within the past few years, the business of manufacturing roller bearings has considerably increased.

The foreign makers of roller bearings have been engaged in this business for a much longer time than American manufacturers, and but for the protection of this industry afforded by the Dingley tariff law this industry would not now be in existence, as it would not have been possible to compete with the foreign manufacturer. By far the greater portion of the expense of manufacturing roller bearings is the cost of labor, a very small proportion of the entire cost being represented by the raw material going into this product. A member of the Timken organization tells of visiting a plant in France, where 2,000 hands were employed, and he found skilled labor working on machines at an average price of $3.75 per week. On these same machines and for the same work the Timken people pay an average of $15 per week. The present duty is 45 per cent. ad valorem, and the committee has been asked to raise this to 65 per cent.

DEATH BY TYPHOID OF JOHN B. ROWLAND.

NEW YORK, Dec. 14.—John B. Rowland, of the J. B. Rowland Advertising Agency, succumbed to typhoid fever on Saturday last, and the news of his death brought to light the fact that he was but one of a quintette of sufferers who contracted the fever at the same time, as the result of partaking of raw oysters at a dinner eaten at a New York hotel the day following election. The others were: A. B. Elliott, vice-president of the Witherbee Igniter Company, who died Thanksgiving Day; Herbert Lytle, the well-known racing driver; Louis A. Hopkins, formerly sales manager for the American Mors; and Thomas G. Wetzel, representing the Bronn-Lipe Gear Company and other interests, the latter three of whom are still suffering.

Mr. Rowland was the first to be stricken, but his case was not considered very serious, and up to within a few days of his death it was thought that he stood a fair chance of recovery. He was born in Washington, D. C., 31 years ago, and was a graduate of Georgetown University. About three years ago he entered the advertising business in this city, and made a success of it from the start.

Mr. Elliott did not show any ill effects of his experience until a fortnight after Mr. Rowland had been taken sick, but his case was considered dangerous from the very outset, and his death after a very short period of suffering did not come as a surprise to his physicians and family. Of the remaining three, Herbert Lytle is still in a hospital at Toledo, Mr. Hopkins is confined to his home in New York, and Mr. Wetzel is in a sanitarium in the same city.

Dr. Herbert L. Constable, who attended Mr. Rowland, and Dr. Belmont D. Bogart, who was Mr. Hopkins' physician, held a consultation and agreed that the fact that every one of the members of the party being taken ill at about the same time made it reasonably certain that the oysters had been infected.

NO FORD PLANT AT CAPE MAY, N. J.

DETROIT, Dec. 14.—There is no idea on the part of the Ford Motor Company to erect another plant at Cape May, N. J. Henry Ford and James Couzens recently made a 400-acre land investment at the New Jersey seashore resort, thus expressing their confidence in the future population of the "Mosquito State," which, by the way, is said to be rapidly losing its mosquito inhabitants. The land bought is north of the head of the new Cape May Harbor. The Pennsylvania Railroad is considerably interested in the development of Cape May.

POPE PRACTICALLY REORGANIZED.

HARTFORD, CONN., Dec. 12.—The reorganization of the Pope Manufacturing Company was practically completed this morning, a meeting of the stockholders having been held at the office of the company in this city. The new company is incorporated under the laws of the State of Connecticut and within a few days will acquire the property of the old organization. The Pope-Hartford motor car and Columbia and kindred bicycles will be manufactured. In about ten days the receivers of the old company will pay the fourth dividend on the approved claims, as well as interest of 6 per cent. on all debts covered by the four dividends.

The incorporators of the new company are Albert L. Pope, Colonel George Pope, Charles E. Walker and Wilbur C. Walker; thus the "old guard" remains in control. The amount of capital stock named in the incorporation papers is $2,500,000 of preferred stock and $4,000,000 of common stock shares at $100 each, of which 30 shares have been subscribed for the purposes of incorporation. It is stated on good authority that the full amount of stock is practically taken.

The stockholders at this morning's meeting were the four incorporators and Lewis H. Freedman, of the law firm of Joline, Larkin & Rathbone, of New York, who, besides himself, represented Harry Bronner, August Heckscher, Frederick H. Ecker, Albert Stickney, Henry V. Poor, Arthur W. Pope, Milton Ferguson. Albert L. Pope presided. A draft of the proposed by-laws of the company was presented and adopted, after which directors were elected as follows: For one year—Harry Bronner, Frederick H. Ecker and August Heckscher; for two years—Lewis H. Freedman, Albert Stickney and A. W. Pope; for three years—Henry V. Poor, A. L. Pope and Milton Ferguson.

A meeting of the directors will be held in New York during the coming week, when the officers will be elected.

The receivers of the company have gradually sold off such of the plants and property as was not necessarily needed to successfully carry on the company's business. The Hartford factory is now running full time and the Westfield bicycle plant is busy.

INDIANAPOLIS TO HAVE MORE AUTOS.

INDIANAPOLIS, IND., Dec. 14.—After a successful experiment with automobiles in various departments during the last year, Mayor Charles A. Bookwalter and the heads of the various city departments have decided to displace horses in municipal use as rapidly as possible with motor vehicles.

The Board of Safety has just purchased a Coppock truck, to be used in the firealarm and telegraph system of the fire department and will cover the entire city in that work. An additional police patrol wagon will be purchased about January 1, making two patrol wagons, a steam touring car, a gasoline runabout and a motor cycle in use by the police.

Bids are being received by the city board of health through Dr. Eugene Buehler, secretary, for an ambulance to be used by the City Dispensary. The city has grown so rapidly that the two horse ambulance used for some years is inadequate. If this ambulance proves successful, another one will be purchased for the city hospital.

HOW THE AUTO OPENS UP COUNTRY.

ALBANY, N. Y., Dec. 14.—A movement is on foot for the opening of an automobile passenger service between Albany and Berne, or Thompson's Lake. Prominent citizens of Albany are behind the scheme, which includes the installation of several large motor buses with a capacity of twelve passengers and two tons of freight or baggage. The probable route will be from Albany to Berne over the Helderberg Mountains, touching at Warner's Lake, and returning for the present by the same route. Later, upon the completion of the Thompson's Lake road, the return route will be from Berne to the lake and then back to Albany, crossing the mountains at a different point. The whole trip will be about 50 miles in length.

EARLY WINTER DOINGS OF THE AUTO CLUBS

ANOTHER FOR NEW JERSEY ASSOCIATED CLUBS.

HACKENSACK, N. J., Dec. 14.—Realizing that it is necessary for every autoist and every automobiling organization in the State to cooperate, if the results in the way of improved legislation that every Jersey autoist is anxious for are to be brought about, the Bergen County Automobile Club unanimously decided to join the Associated Automobile Clubs of New Jersey. The club is headed by Courtlandt Linkroum, Mayor of Hackensack, and has a membership of about 60 progressive autoists, the other officers being, vice-president, George Brinkerhoff; treasurer, George W. Johnson, and secretary, Austin W. Fishbough. W. C. Crosby, J. H. Wood and George A. Post, of Paterson, and H. A. Bonnell, of Newark, State officers, attended the meeting and found the members enthusiastically in support of a universal lighting bill. It was the general consensus of opinion that a large proportion of the users of horse-drawn vehicles would favor the passing of such a law once they were shown that it involved no extra expense for them, in that every horse owner is the possessor of a lantern.

The club also placed itself on record as being against the non-reciprocal clause of the Jersey automobile law, which holds up everyone at its borders while Jersey autoists visit other States unmolested. The advisability of amending the Jersey law in this and other respects came in for considerable discussion.

DENVER CLUB WILL ATTEND CHICAGO SHOW.

DENVER, COLO., Dec. 14.—The Denver Motor Club at the annual election Monday, December 21, will vote upon the following officers: President, R. W. Smith; vice-president, William D. Nash; secretary, Frank England; treasurer, C. P. Allen; board of governors, S. D. Hopkins, J. Nicoll Vroom, W. H. Sharpley, George Tritch, E. F. Dean and R. L. Taylor.

Among the guests at the club the past week were Harry E. Field, vice-president Hartford Rubber Works; F. M. Hoblitt, sales manager American Locomotive Company, of New York; A. O. Berlitz, of Chicago, representing the Locomobile Company.

A new motor vehicle law, patterned after satisfactory Eastern laws, has been drafted for the club by Attorney Frank England and will be presented at the next meeting of the legislature.

The members of the club will charter a special car to attend the Chicago national show in February. This will leave Sunday, February 7, and return as soon as the show closes, arriving in Denver in time for the opening of the Denver show in the Auditorium, February 16. The club will conduct the show this year and will have its train to Chicago and back suitably decorated with advertising banners.

LOUISIANA LEAGUE WILL BUILD ROADS.

NEW ORLEANS, Dec. 14.—At the recent meeting of the Louisiana Motor League great enthusiasm was displayed, this manifesting itself mostly in the endorsement of new good roads projects, and particularly the so-called Chef Menteur road. The new officers were elected first. These were: President, P. M. Milner; first vice-president, Sam Weis; second vice-president, Dr. Albert Mayer; secretary, Albert Aschaffenburg; treasurer, Henry Breckinridge, and these additional directors: Capt. John Dilbert, W. P. Stewart, C. H. Ellis, Dr. M. J. Magruder, Homer George, Sam Stone and Theo. Grunewald. The new president, Mr. Milner, addressed the league briefly and emphatically on the subject of good roads, which he declared to be their greatest need.

Two of the 20 miles from New Orleans to Chef Menteur have already been started, and the league pledged itself for the remainder; $2,400 was subscribed at the meeting and more promised. The greater source of revenue, however, will be the 500 new members at $12 each.

CLUB WANTS SHOW; DEALERS INDIFFERENT.

BALTIMORE, Dec. 14.—The Automobile Club of Maryland has appointed a committee, headed by Dixon C. Walker, to ascertain the best time and location for an automobile show in Baltimore. The members of the club are anxious for such an exhibition which they plan to hold some time after the first of next year. They will not have the cooperation of the dealers in this undertaking from present indications. Most of those engaged in the trade express the opinion that the New York and Chicago shows are quite enough for them to see the new styles, etc.

The club members are now engaged in a membership campaign. A silver cup has been offered as a prize to the one who gets in the majority of new members by May 1, up until which time no membership fee will be charged. The club expects to have 500 names on the roll at that time, which means that two hundred more members must be gotten.

It has been decided to remain a member of the American Automobile Association. In consequence of the efforts of the national A. A. A. committee to secure a uniform road map for the entire country and to get the cooperation of Congress in passing legislation to create a signboard for universal use, the local club has discontinued the work of placing signs at various parts of the State.

"MARMON WING" GETS A BAY STATE PRIZE.

BOSTON, Dec. 14.—The touring committee of the Bay State Automobile Association, which late in September conducted a twenty-four-hour endurance run that later developed into a week's test and resulted in a tie of three cars, has announced the award of the prize offered for the most consistent work on the part of any driver in the contest. The delay in making this award was due to the inability of the committee to obtain the votes of the observers any earlier, one observer sending in his vote from Miami, Florida. The prize, which is a gold watch, is awarded to Frank E. Wing, driver of the Marmon, who received seven votes of the nineteen that were cast. His nearest competitor was Jones, driver of the Studebaker, who received four votes. Wing drove his car through the original run without penalty and participated in the run-off, being put out of the contest after he had covered 804 miles. The work of drivers in the run-off was not considered in making the award.

GRAND RAPIDS ELECTS GOOD ROADS MAN.

GRAND RAPIDS, MICH., Dec. 14.—The election of officers of the Grand Rapids Automobile Club resulted in the election of the following: President, J. R. Jackson; first vice-president, L. C. Parmenter; second vice-president, G. L. Henzelmara; secretary, Dr. F. C. Warmshius; treasurer, Dr. Wm. Burleson, and Dr. D. E. Welsh and A. A. Barber on the board of directors. The new president is prominent in the good roads movement, vice-president of the Michigan State Automobile Association and a member of the A. A. A. Touring Board.

The club is in a prosperous condition, with a big membership and has a plan on foot for a new clubhouse to replace the loss of the Cascade clubhouse.

CHICAGO MOTOR CLUB'S ANNUAL ELECTION.

CHICAGO, Dec. 12.—At the recent election of the Chicago Motor Club the following candidates were victorious: President, F. C. Donald; first vice-president, Charles P. Root; second vice-president, David Beecroft; secretary-treasurer, Frank H. Trego; directors, H. B. Branstetter, F. C. Edwards, Paul Picard, Louis Geyler, J. V. Lawrence; auditing committee, Frank Martin, G. G. Temme and N. H. VanSicklen, Jr. President Donald in a short address disposed of all talk of a consolidation with the Chicago

Automobile Club, predicted the biggest year in membership and prestige for 1909, and promised the members an aggressive administration. The treasury has a very substantial balance.

CONNECTICUT AGREEABLE TO HIGHER DUES.

HARTFORD, CONN., Dec. 14.—The following is an extract from a letter written by C. H. Gillette, secretary of the Connecticut State Automobile Association, to F. H. Elliott, secretary of the A. A. A., under date of December 12:

"I have your letter of December 11 and regret to note that our State association has been reported as opposing the increase in dues in the A. A. A. As a matter of fact, at our last meeting of directors, held December 4, one of the directors opened an argument on this matter by questioning the increase. But the reason for it was very clearly set forth, and the board went on record as accepting the increase unanimously, and even went to the extent of passing a resolution pledging loyalty and support to the A. A. A. This resolution was the one adopted:

"Voted, That the treasurer be, and hereby is, authorized to pay, at the proper times, the dues of this association in the A. A. A. at the rate of fifty cents per year per member; and, further, that the secretary be, and hereby is, instructed to express to the president and officers of the A. A. A. the loyalty and support of this body.

"From the above you will note that the report that we are dissatisfied is entirely unwarranted, and in order to counteract any effect which the publicity of this report may have had, you are at liberty to give such publicity as you see fit to the above resolution and our confidence in the A. A. A."

PROCEEDING AGAINST MOTORPHOBE JUDGE.

POUGHKEEPSIE, N. Y., Dec. 14.—From the present appearance of the campaign which the Hudson Valley Automobile Club, of this city, backed by the New York State Automobile Association, are making against Justice of the Peace Hoppe, of Arlington, N. Y., it begins to look as if the judge will get all that is coming to him. It is said that he and his deputies have been overzealous in their arrests the past Summer, and the victims have organized, retained local and Albany counsel, and will proceed against him. It is stated further that plentiful resources are available to fight this contest out to a finish, and all persons arrested by Justice Hoppe during the past season are urged to communicate with the club secretary, E. O. Bartlett, Jr.

HARRISBURG RELIABILITY TO BE NOTABLE.

HARRISBURG, PA., Dec. 14.—It being generally understood that next year's Glidden tour will proceed westward from Chicago, the Harrisburg Motor Club will aim to make its annual reliability run the important Eastern tour of the year. This will be a four-day contest, held the first week in May, starting or finishing at Harrisburg, and visiting among other cities New York and Philadelphia.

The rules will provide for a schedule well up to the legal limit, with checking stations and observers, a technical examination at the finish, the exact number of points for each defect being specified, and in addition to these an actual tire record, which will be a contest for the tire manufacturers.

In past contests an efficient contest committee has been developed, and this tour will doubtless receive proper support, other clubs having been asked to co-operate.

ANNUAL DINNER OF THE LONG ISLAND A. C.

BROOKLYN, N. Y., Dec. 10.—The annual dinner of the Long Island Automobile Club was held to-night at the club rooms in Cumberland Street and was the most successful affair of the kind ever held by the organization. The welcome change from the customary course banquet was a beefsteak dinner, which was eaten with a hearty relish and undisguised appreciation by nearly two hundred members and guests. Charles Jerome Edwards, the retiring president, was in his usual excellent form as a toastmaster and graciously gave way at the conclusion of the speechmaking to the newly elected president, Frank G. Webb, who began his second term of office as the head of the club.

At the speakers' table were included Oliver A. Quayle, president of the New York State Automobile Association; Frederick H. Elliott, secretary of the A. A. A.; S. M. Butler, secretary of the Automobile Club of America; F. J. Wagner, the well-known race starter; Victor Breyer, of Paris; A. R. Pardington, general manager of the Long Island Motor Parkway, and A. G. Batchelder. These were duly introduced and made short addresses, that of Mr. Breyer being particularly well received.

Following the usual presentation of the annual cups came a vaudeville entertainment, arranged by Edwin Melvin, chairman of the house and entertainment committee. The new officials include William Schimpf as vice-president; Charles C. Cluff, treasurer, and Herbert G. Andrews, secretary.

How Long Islanders Looked as They Enjoyed Annual Banquet, Which Was a Substantial Beefsteak Dinner

HOW DETROIT WILL BUILD 50,000 AUTOS IN 1909

By CHARLES B. HAYWARD.

DETROIT, Dec. 14.—During the first half decade of the automobile industry in this country, assuming that the industry can really be said to have existed as early as 1900, statistics would be generous in placing the total output at half a hundred thousand machines, regardless of type. Before the next twelvemonth has passed, the manufacturers of Detroit alone confidently expect that they will have produced that many automobiles.

Owing to the unprecedented figures of the production planned by several of the leading makers and recently made public, a general impression has gone abroad that Detroit interests have enlisted the services of a skilled press agent and are talking "big," mainly for purposes of publication, and that the reality is bound to fall far short of the predictions. It is only natural that considerable difficulty should be found in accomplishing the task that some have set themselves—that the stretch from a few thousand to many thousand machines should present a gap that the majority will find it next to impossible to completely bridge, despite their most strenuous efforts in the line of multiple production on a basis of standardization.

Though many of the automobile surprises that have had sufficient stamina to outlive the limelight of their first uncovering at a show have emanated from Detroit, and the city has been able to lay undisputed claim to being the center of the American industry for the past three years or more, its ability to make such a jump as that contemplated naturally comes in question. How is it going to be done? Nothing but a look over the ground suffices to provide an adequate answer to the query.

According to statements published early in the season, Ford planned to turn out 25,000 cars; E-M-F, 12,000; Cadillac, 10,000; Gyroscope, 5,000; Chalmers-Detroit, 3,000; Brush, 3,000; Regal, 2,000; Packard, 1,500, while smaller makers who fall below the thousand mark, such as the new Herreshoff, may be combined as good for an additional 1,000, and one or two makers who are to blossom forth in Detroit within the next month or so will serve to further swell the total production. Taking the above figures as those decided upon by the various makers in question, early in the saeson, *i.e.* August or September last, it will be interesting to note what effect subsequent developments have had upon them. The conclusion arrived at by those outside of Detroit would naturally be that the majority of these estimates had suffered considerably in the interim and that the evaporation of some of the surplus moisture out of them would tend to bring the total very much nearer to a point that could reasonably be regarded as nothing more than the effect of a year's healthy growth under normal conditions.

Aggregate Production Will Be Increased.

It goes without saying that some of the estimates given above have suffered to a greater or less extent; not merely because their creators put them up originally with the sole purpose in mind of knocking them down at their convenience later, but simply because circumstances entirely beyond their control have made it impossible for the men who made the calculations to carry them out to the letter. On the other hand, some of the estimates have actually been increased by substantial percentages, while in others their formulators have seen no reason to lose faith in their ability to produce the machines in sufficient numbers to uphold their predictions. One of these is Henry Ford, who firmly believes that his company will be able to turn out 25,000 of the new model Fords between January 1, 1909, and the same date, a year later. But Mr. Ford's belief is based almost wholly upon his ability to get the new Ford plant in shape by February 1 at the latest. No matter how small it is, those who have had experience along this line, know that the task of building a factory and installing the machinery in it is one that is practically never accomplished according to schedule, and when the vast dimensions of the new Ford building are taken into account, together with the tremendous amount of equipment that it necessitates, it will be evident that, as is the case with most of the others, the cause of the Ford shrinkage will be delay in getting the manufacturing facilities in shape.

How the Figures and Reality Compare.

But to get back to the matter of predictions and actualities, as already realized by what Detroit's makers have accomplished in the time intervening between the publication of the above figures, the following tabular comparison of the advance estimates, and the opinion of an authority in a position to know what the various plants are capable of, makes two interesting parallel columns:

	Maker's Plans.	Estimated Production.
Ford	25,000	20,000
E-M-F	12,000	8,000
Cadillac	10,000	9,000
Blomstrom (Gyroscope)	5,000	2,500
Chalmers-Detroit	3,000	3,050
Brush	3,000	3,750
Packard	1,500	2,000
Regal	2,000	1,000
*Herreshoff	500	350

It will be noticed that in at least three instances, there are increases noted in the right hand column, instead of the shrinkage that might naturally be expected. From the dollars and cents point of view, the most substantial increase is that of the Packard, and while these conservative authorities will inform the inquirer upon application that the Packard total output will probably be in the neighborhood of 1,800, there are those who think it is far more apt to reach the figure given above. This year there are two Packards, the Packard "Thirty," and the Packard "Eighteen," though it takes a sharp eye to tell them apart, despite the smaller dimensions of the newcomer. It is expected that the Packard production will be divided between the two in about the ratio of three of the "Thirties" to two of the "Eigbteens." But in attempting to set a figure on how many new Packards will see the light before the end of the automobile year, it must be borne in mind that every machine turned out must go through the same prescribed routine as if it were the sole and only end of the efforts of its creators. In other words, production is closely limited by the thorough-going methods that have made Packard a word for excellence and under such conditions production cannot be advanced, except by a disproportionate increase in the facilities for manufacture. But these are now being supplied in the shape of a large steel and concrete structure in course of erection directly across the street from the Packard administration building, and which will form a notable addition to a plant already famous for its extent and equipment. Work will be carried forward on this new building regardless of weather conditions, and its completion at an early date should provide sufficient increase in the Packard facilities to bring the figures up to those given. There appears to be little doubt that Sales-manager Waldon will need more, even at that.

The Chalmers-Detroit is another instance in which an increase is to be found, the additional fifty cars being Chalmers-Detroit "Forties"—an excess of this amount over the original estimate of 500, the remaining 2,500 comprising the output of Chalmers-Detroit "Thirties." According to Mr. Chapin, one-third of this entire output has already left the factory, from which it will be evident that there will be a further increase over the estimate, if that is possible.

One Small Car Maker to Increase.

The growth of the Brush runabout figures as shown by the two columns is to be accounted for by the fact that plans have recently been made to add 750 of the Brush delivery wagons to the 3,000 pleasure runabouts previously contemplated, and as the machine tool equipment has already been installed in the new plant and things are running full force, results will doubtless more than suffice to fulfill the predictions made.

As is the case in figuring increase of speed with added power, it must be borne in mind that twice the machinery and

*The Herreshoff estimate is based upon six months' production.

twice the number of machinists does not necessarily mean a corresponding increase in the production possible the first year. Rapid and economical production has as its basis a well-perfected organization—something that cannot be built up over night. Automobile manufacturers have doubtless placed larger orders for machine tool equipment during the past year than has any other single industry, and men are being taken on as fast as they can be assimilated, but building up a smooth-running organization takes time and meanwhile production increases slowly—a fact that accounts for some of the shrinkages to be noted in the table. Take the case of the E-M-F as an instance. Salesmanager Metzger has given up quoting exact figures. "We are going to do the very best we can," he said. "Our minimum will be close to 7,000, for we must turn out that many cars to fill our orders, and we are going to build as many more as we can."

A trip through the part now running full blast gives some idea of how the task is to be accomplished, and also affords an inkling to the initiated observer of the prodigious amount of preparatory work that was necessary to bring things to their present stage of development, as everything has been planned from the very start with an extensive production in mind. Jigs, templates and other means of accurately duplicating the production of parts with the minimum expenditure for time and labor, have been perfected, and it is easy to see that this alone has involved the outlay of a great deal of capital, all of which had to be invested long before so much as the manufacture of the smallest part of the first car was undertaken. As an instance of the manner in which multiple production is being carried out, the milling of all three faces of eight of the twin-cylinder castings at a single operation may be cited, each of the castings being clamped in a jig that renders absolute accuracy of machining possible in every case. In a similar manner, machining of such parts as the aluminum engine bed, which have hitherto required several distinct operations, usually involving the use of a different machine tool for each, is now accomplished with the aid of a single jig and a single machine. Only one who is familiar with production as carried out on a small scale, and in the manner just described, can appreciate the tremendous saving of time and expense brought about by the heavy preliminary expense for jigs, the cost of which figures down to cents per car with quantities such as are now under consideration. But the accuracy thus made possible has not been taken advantage of in the case of the E-M-F to slight finishing processes, and every E-M-F motor is run on the stand in exactly the same manner as is customary with high-priced motors, before going to the test block to be run under its own power.

Ford Production Depends Upon New Plant.

Henry Ford is always bubbling over with optimism and enthusiasm, and he says "We are going to build 25,000 Fords" with the same easy assurance that he would tell you the new car is larger and better than its predecessor. And he means it, too. If it depended entirely upon Mr. Ford's efforts, there is no doubt but that the 25,000 machines would be forthcoming in the usual course of manufacture, but there are so many things entirely beyond the control of even the most ardent hustler and so many others—outsiders of course—who are not concerned whether Ford builds 25,000 or 25, so long as their part of the contract is fulfilled, that the task is far too much for one man to be expected to get away with and still survive. But Henry Ford and James Couzens have shown what can be accomplished and it will certainly be no fault of theirs if the reality falls short of the plans. Whether it is overrating their ability to concede that they can complete a new factory, move into it and still complete 20,000 cars in a year, remains to be seen. The four-story concrete, steel and glass building measuring 75 by 885 feet is to be ready for occupancy on February 1, and work will immediately be started on the new series of 15,000—if the building contractors toe the mark—there's the hitch. Everything is to be combined under one roof in the new plant, and it is to have a capacity of 300 cars a day—more than the total yearly production of many a maker not long ago. After an interview with Henry Ford, one expects to see automobiles as common as paving blocks upon getting out into the street, and in the vicinity of the Ford plant this expectation comes near being realized.

There can be no doubt, especially when viewed in the light of past achievements, that once the Ford organization becomes settled in its new home, Henry Ford's statement that 300 cars a day will be turned out should not fall so very far short of realization. When it is recalled that under the extremely congested conditions prevailing at the old plant, on Piquette avenue, it was possible to average 79 to 82 cars a day for weeks at a time during the rush season, and as many as 101 Ford runabout were completed and shipped in the course of a single working day, it will be seen that this prophecy is backed up by something considerably more substantial than mere opinion. Detroit's new figures of production are so startling that one immediately resorts to figuring to learn just how many cars a day must be completed to make them possible, and as 25,000 cars in a year means close to 2,100 machines a month, or practically an average of 70 complete automobiles a day for every day in the year, it will be evident that precedents are valueless.

Cadillac "Thirties" Coming Through Fast.

At the Cadillac plant, everything has been reduced to such a fine system, down to the very last detail of production, that if General Manager Henry M. Leland announced that he would built 50,000 cars in a year, anyone familiar with Cadillac methods would realize at once that the manufacture of every screw and nut necessary for that number of cars had been calculated upon long in advance and that the announcement was based entirely upon an intimate knowledge of just what the Cadillac facilities are capable of. And every one of those cars would be produced with the degree of accuracy that has made American methods of standardization in production famous the world over. There is probably no one at the head of an automobile factory in this country to-day who has a more lengthy experience in manufacturing and shop methods back of him than Mr. Leland, and there is doubtless no plant in the world where the machine tool equipment is kept so closely abreast of modern developments in this line. Instead of running a machine to a point where its value as a producer has dropped so far below modern standards as to make its immediate replacement imperative and its relegation to the scrap heap the only alternative, it is the Cadillac policy to dispose of all tools at second hand the moment their value has been depreciated by the advent of an improved type, even though the increased output be so small as to ordinarily warrant the retention of the old machine for many years. Multiple drills are prominent among the time savers in the Cadillac plant, there being one of 24 spindles, and a number of smaller sizes.

In refiguring the original estimate of 10,000 cars over, a cut of 10 per cent. was made, bringing the number of Cadillacs to be turned out down to 9,000 cars, and just how closely the production of these machines has been calculated will be evident from the manner in which deliveries have coincided with the original plans. Up to December 1, the schedule called for 300 cars, all of which left the plant by that date; from that time on the figure was 15 cars a day, and that has been averaged without variation right along. For January the production has been set at 20 cars a day, and the same figure will be adhered to during February, while for March it will be increased by 50 per cent., making the average daily production 30 cars. But by that time the capacity for producing will have been brought up to 35 cars a day, and ultimately the number turned out every working day will exceed 40 machines.

How great a force is necessary to make this possible may be gauged from the fact that at present there are 2,500 men working in the Cadillac factory in the day shift, and between four and five hundred at night, bringing the total close to 3,000 men. The night force is being added to as fast as the organization can absorb them, and by the end of the next month or two, it is planned to make the number on night work equal to half that of the normal day force, or a total of 4,000 men. This is but one plant and shows what the industry means to Detroit.

IS EUROPEAN AUTOMOBILE RACING AT AN END?

PARIS, Dec. 10.—Now that all details as to how, when, and where the 1909 races may be run, it only remains to be decided whether there shall be any races at all. The Automobile Club of France has a Grand Prix on its program for July, 1909; Italy bas the intention of holding races at Bologna; Belgium is preparing for another Ardennes meet.

But constructors all over Europe are signing an agreement not to race at all. It is somewhat ludicrous that wbile the racing board of the A. C. F., composed entirely of French constructors, and of those constructors who are most interested in racing, should be settling such details as the number of bridges over the Anjou course or the height of the barricades, their own factories are signing a declaration against any races in 1909. From a mere group the movement has now spread to practically all the large European factories, those having promised not to race in 1909, under a penalty of 100,000 francs, comprising Panhard, Renault, Brasier, Bayard-Clement, Darracq, Peugeot, Mercedes, Benz, Itala and Fiat. No mention of this boycott of racing was made at the international meeting, notwithstanding that hundreds of interested persons are asking what will be done next year, and automobile Europe is burning to know wbether tbis is the end of the racing game.

It is now announced that unless forty entries are obtained the Grand Prix will not be run in the Anjou district.

De Knyff Doubts if Forty Entries Are Made.

M. de Knyff, chairman of the sporting committee, is quoted as follows in the Paris *Herald:* "The situation is quite clear. All the leading houses of France do not desire to race next year, but if sufficient makers come forward before tbe end of the month the sporting committee is quite willing to organize the race. Personally I very much doubt whether forty machines will be entered."

Louis Renault said: "The decision is not astonishing. The sporting committee was face to face with a simple problem and dealt with it in a simple manner. If the requisite number of machines are engaged by the end of the year the race will be held. Firms which are anxious to race have only to come forward and the contest will be arranged."

Can Change Wheels Entire Next Year.

In next year's international races tbere will be full liberty to change tires in any way that appeals to the driver. He may pull them over a fixed rim in the old way, he may dismount the rim and tire together, or he may take off the entire wheel, in the manner dear to S. F. Edge, providing, of course, that the wbeel bearing is not interfered with. The decision has just been arrived at by the International Association of Recognized Automobile Clubs.

Resolutions were adopted which will make obligatory the use of Colonel Holden's electric timing machine in 1910. The machine, which has been in use at Brooklands track for several months, and is so sensitive that it will automatically register the passage of the front and rear wheels of a car traveling at 120 miles an bour, was brougbt before the International Association at its last meeting, and has since then been under observation in France. The decision was come to that where it is desired to have records recognized as international this machine must be used. It is impossible to put it into use everywhere for the coming season, and its adoption has been fixed for 1910.

FRENCH MAKERS DON'T WANT BUT MAY HAVE TO HOLD SHOW.

PARIS, Dec. 11.—A definite form has been given to the anti-show movement, and at the present moment fourteen automobile firms and two tire constructors have signed an agreement by which they guarantee to take no part in any exhibition in the city of Paris or surrounding neighborhood before May, 1910. An infringement of this rule will entail a penalty of $10,000, to be divided equally among the firms remaining true to the agreement. The step was decided upon at a secret meeting held in Paris durlng the Salon, those signing the agreement being Bollee, Brasier, Charron, Bayard-Clement, Darracq, Delaunay-Belleville, Dietrich, Gladiator, Gobron Brillie, Mercedes, Panhard-Levassor, Peugeot Company and Freres, Renault Freres, and the two tire companies, Michelin and Continental.

With this document in hand a deputation from the sixteen firms are about to wait on M. Gustave Rives and urge on him not to organize a show in 1909, and in future to leave a space of not less than two years between all Parisian automobile exhibits. If the authorities refuse to accede to the request, it will be the duty of the deputation to inform them that these sixteen firms, representing the cream of the French automobile industry, will refuse to take any part in the Salon. Everything is perfectly conceived for putting an end to the annual costly Paris exhibition, all details regarding penalties and the method of exacting them being worked out in the signed agreement. The body is sufficiently imposing, too, for the only large French constructor refusing to sign the document is De Dion Bouton.

A loophole, however, has been provided, and a loophole of such dimensions that the whole group can walk through without any difficulty. A clause hidden away in the agreement stipulates that the document sball not be binding, if, after negotiations, it is found that the Englisb constructors will not agree to abandon their show every other year. Further, it only requires a vote of three-quarters of those having signed the agreement to annul the entire movement. The Britisher has no objection whatever to the Frenchman signing his abdication, and will doubtless have ready sympathy when the deputation brings forth its objections against costly demonstrations. But to ask John Bull to sign away a show that costs little and brings much business, that is but seven hours' journey from Paris, and that is being promoted annually with the idea of transplanting the automobile market from Paris to London—to put such a proposition does not bespeak much sagacity on the part of the Frenchmen. The only conclusion is that as soon as it is realized by the French constructor that England has no intention of going into the bankruptcy court to please even the cream of the French automobile trade, it will be necessary to burn the mysterious papers on non-participation and forget that it was ever proposed to impose a fine on the firm seeking to increase its business by means of public shows.

It is easy to understand that the whole movement has thrown the automobile world into commotion, and accessory men, small car builders and cycle dealers are anxious about the future. The cycle men have already put it on record that if the official show is not held they will organize one of their own; the accessory men are favorable to an annual exhibition, and now the voiturette constructors, who really form a class by themselves, have decided to call a meeting to consider the question.

The Automobile Club of South Africa, with headquarters at Cape Town, is a very active organization. The membersbip includes all the prominent autoists in Cape Colony, and tbe club is very energetic in improving the roads.

PRESENTATION OF GRAND PRIZE CUP.

New York, Dec. 15.—Noted Savannahians have been in New York City this week as a result of the formal presentation of the Grand Prize cup to the Fiat Automobile Company, which entered the winning car driven by Wagner. The function took place Tuesday night at the Automobile Club of America, on West Fifty-fourth street, with Mayor George W. Tiedeman, of Savannah; F. C. Battey, president of the Savannah Automobile Club; W. B. Stillwell, its treasurer, and Harvey Granger, of the race committee, among those present. In the absence of Judge E. H. Gary, Vice-President Sanderson presided. Chairman Robert Lee Morrell made the presentation speech, and E. R. Hollander responded for the Fiat company. Chairman Morrell then presented medals to Louis Strang, of the Renault, and Joe Seymour, of the Simplex, whose cars were still running when the race was officially concluded.

Prior to the presentation ceremonies, moving pictures were exhibited and explained by Orrel A. Parker, chairman of the club's entertainment committee. A supper followed.

The Savannah visitors were entertained in the afternoon by a ride over the Long Island Motor Parkway. Incidentally, Harvey Granger was so well pleased with the Lancia roadster in which he rode that he completed arrangements for its purchase with Harry Fosdick before returning to the city.

SAVANNAH ESTIMATES ITS PROFITS $15,000.

Savannah, Ga., Dec. 14.—With the Grand Prize race over more than three weeks, the officials are beginning to check the profits made from the race. Several members of the committee are out of the city, and for this reason the exact amount cannot be given out until far in the new year. The sale of tickets for the grandstand will amount to over $18,000, while there were many tickets sold by railroads and steamship companies that have not been turned in yet.

It has been stated by some of the officials that no less than $15,000 will be cleared from the races when all the returns have been made. This money will be turned over to the advertising of Savannah all over the country.

The last of the men who were injured while speeding in the racing cars week before last are fast rounding into condition at the Savannah Hospital. Grinnon, who was hurt in Robert Burman's No. 8 Buick, and Thompson, who was with Hugh Easter in the No. 16 Buick, are the only ones left that have not fully recovered. Both of these men sat up at the hospital for the first time Monday evening, and seem to be in cheerful spirits. Both hope to be able to leave for New York soon. Mr. Easter is still in Savannah, looking after the injured.

LIVERYMEN ARE ALIVE TO SITUATION.

Chicago, Dec. 14.—Straws show which way the wind blows, and, similarly, little things show the tendency of the times. Looked at in this light, small facts assume large proportions. Thus in Chicago recently a liveryman named Daute, at the head of the Lakeside Livery, operating 40 horse-drawn rigs, and in business for the past sixteen years, announced his intention of disposing of horses in favor of taxicabs. The cars employed will be of the Thomas make.

Other livery men on the South Side are rapidly falling in line. Bain, at Indiana avenue and Twenty-third street; the White Livery Company, at Forty-seventh street and Champlain, and Emery, at Twenty-fourth and Michigan avenue, are among those who have been won over. The last, Emery, is rapidly disposing of his 35 horses, and now has four Studebaker and three Thomas cars. Others will fall in line as soon as the market for horses improves. as winter is a very poor time to sell. Many of these plan to buy second-hand cars, while still others propose to purchase the chassis only, utilizing the old cab bodies. This is not a small matter, either, as many of these bodies cost $1,000 apiece and would save the liverymen that much per car.

ADOPTS NEW RULES FOR 1909 BRIARCLIFF.

New York, Dec. 16.—According to information obtainable today, it is nnderstood that the committee in charge has definitely adopted rules to govern the entries for the 1909 Briarcliff stock car race. The chief features of these regulations are the exacting of a minimum weight figure of 2,600 pounds, while the minimum wheelbase is to be 110 inches. Where the size of the motor is concerned, a maximum for the 'oore has been adopted, this being 133 mm., or the approximate equivalent of 5¼ inches, there being no limit whatever placed on the length of the stroke. The limit in this year's Grand Prix race of the A. C. F. was 155 mm.

The special committee of ten appointed to manage the race held meetings on Monday and Tuesday, and it is understood that the foregoing represents the result of their consideration of the subject. This committee is headed by C. F. Wyckoff, of Wyckoff, Church & Partridge; the remaining members being Paul Lacroix, of the Renault Freres selling agency; H. A. Lozier, Lozier Motor Car Company; Harry S. Houpt, Harry S. Houpt Company; E. R. Hollander, Fiat Automobile Company; C. H. Tangeman, the Hol-Tan Company; Claire Hamilton, the Isotta Import Company; Walter Allen, the De Dietrich Import Company; H. U. Palmer, of the Palmer & Singer Manufacturing Company, and Percy Owen, of the Carl H. Page Company.

SHOW COMMITTEE ENTERTAINS GARDEN STAFF.

At a Hotel Breslin luncheon, Tuesday last, the show committee of the Association of Licensed Automobile Manufacturers was host to the staff of Madison Square Garden. This included James C. Young, secretary of the Garden company; T. J. Reynolds, superintendent; C. M. Schroeder, business manager; Antoni Pelligrini, in charge of the ticket selling; J. S. Stewart, electrician; W. J. Paxson, chief engineer; and a dozen more in charge of various departments, as follows: P. Christenson, F. Froelich, W. Schroeder, F. W. Fenn, W. J. Brennan, D. S. Houghton, J. Ostrander, Enos Josephs, Charles Specht, J. Smith, M. J. Pike, T. Jones, G. Fisher, J. A. Smith and J. Weil.

These men are only departmental heads, each having a staff of greater or lesser proportions under him. The perfection of the organization was revealed when the men talked about their work in connection with the show, and the suggestion was impressive that it must require a great deal of money to keep the machinery of such an organization running smoothly. E. P. Chalfant, general manager of the Licensed Association, presided at the luncheon, and others present besides those named were: Merle L. Downs, Coker F. Clarkson, Arthur N. Jervis, Montgomery Hallowell, W. W. Knowles, S. R. Ball, J. M. Carples, W. H. McDonald, H. M. Stevens, F. M. Stevens, A. F. Stevens, William Yeager and Charles H. Gresslee.

A NEW YORK CORONER SUGGESTS SPEED LAW.

New York, Dec. 14.—One of the best jokes sprung lately is the suggestion of the coroner who probably thinks to reduce his own work by this method. He suggested, and had Alderman Levine introduce, two ordinances, one to limit the speed of automobiles in the city to six miles per hour, and the other the speed at crossings and turns to one-third the legal limit, which would figure out to two mlles per hour. At these rates of speed people might as well walk and the automobile would die a natural death. Perhaps that is what the coroner wants.

AND WHEELING WILL HAVE TAXICABS.

Wheeling, W. Va., Dec. 14.—Not to be outdone by larger cities, Wheeling will have a taxicab service before the close of the year. A party of local business men interested in automobiles have formed a strong company and will at once put a conple of cars into service, others being added at short intervals as the service warrants.

POOR ROADS RETARD SELLING IN SOUTH.

CHICAGO, Dec. 14.—Among the large party of business men from Chicago which recently toured the South was W. Hildreth. Upon their return addresses were made before the Chicago Association of Commerce, and Mr. Hildreth, who is vice-president and manager of the Holsman Automobile Company, was among those who spoke. Being an automobile manufacturer, naturally his talk was mostly along the lines of automobiles and good roads. He found that the most universal obstacle to the auto in the South was the poor roads. Lack of prosperity was urged as a cause of backwardness in the use of motor cars, but Mr. Hildreth learned that this was not wholly true. Thus, the cities visited have shown a greater advancement in the past eight years than in any previous decade. Another fact was that where roads were good, machines were plentiful, and in the region of bad roads they were as scarce as the proverbial hen's teeth.

As a result of this trip he advised manufacturers that the only immediate and profitable market at present lay in the sections having good roads, and that money or energy spent elsewhere would be wasted. However, he advocated a campaign of education in the poor road districts as a source of future sales.

NEWS MADE IN GERMANY.

BERLIN, Dec. 8.—There is huge activity in aeroplaning circles in Germany, and besides all the apparatus known of, news of three new additions to their ranks has just come to hand. The military authorities are building the third airship under Major Parseval's guidance, while the Airship Battalion is about to start work on an entirely new system of aeroplanes, designed by Major von Gross, which is said to differ from all others. Added to this is the information that despite all denials, the electrical firm of Siemens-Schuckert has commenced carrying out tests with a new aeroplane of which great things are promised. Germany fully determines to be in the very front ranks.

Heated motor taximeters are being run on the streets of Berlin and are cutting out their chillier rivals to such an extent that all the cab-owners are thinking of fitting up their vehicles in a like fashion.

E. H. Gary, president of the Automobile Club of America, has been made an honorary member of the Imperial Automobile Club, Berlin, while its new women members include Mrs. O. S. Kerr, of New York, and Mrs. James Deering, Chicago.

MANUFACTURERS TRY OUT NEW TIRES.

NEW YORK, Dec. 14.—The marked progress being made by the tire manufacturers in the improvement of their product is well illustrated by a recital of the methods employed for testing out new models. Thus J. M. Gilbert and James Patterson, of the Continental Caoutchouc Company, of this city, left on December 12 on a trip to Buffalo and return, which will exceed 1,000 miles, for the purpose of testing out the new TC and AC flat tread tires. They drove a Lozier Briarcliff model equipped with these tires and measuring instruments for testing the heat created at various speeds, the expansion of the tires under service, the amount of air lost by road contact and other technical weaknesses.

OLDS AND A. L. A. M. PART COMPANY.

NEW YORK, Dec. 14.—The Olds Motor Works, of Lansing, Mich., and the A. L. A. M. have finally severed all connections. At the recent meeting of the A. L. A. M. board of managers the matter came up for discussion and was finally disposed of with the above result. The outcome will bring about some complications. One immediate result will be to involve agents who handle licensed cars in addition to the Olds. The Greene Motor Car Company, of Newark, N. J., for instance, has for this reason given up their Oldsmobile agency and will devote themselves exclusively to the Locomobile. The New York Olds agents will take care of this territory until a new agency is opened.

TO DISCOURAGE "TOURING" ACROSS CANADA.

SANDWICH, Ont., Dec. 14.—The Essex County Council has adopted a resolution asking the Ontario Legislature for an act permitting each county to regulate and license automobile traffic through its territory. This action is directed particularly against automobilists from outside passing through Essex County, and especially those touring from Detroit to Buffalo, many of whom have made nuisances of themselves.

As first introduced by Warden O'Neil, the resolution asked authority to charge a license fee of $25 on each automobile passing through the county. It was pointed out that, if adopted in each county, say between Detroit and Niagara River, this would make touring prohibitive, and the cost between Detroit and Buffalo would be about $300 in license fees. The resolution was finally adopted without naming a specific amount.

SPOERER CARS LATEST IN BALTIMORE.

BALTIMORE, Dec. 14.—Spoerer cars are the latest to be made in Baltimore. The firm making these cars is the Carl Spoerer's Sons Company, which has just recently entered the manufacturing business. The firm is making at present a four-cylinder car of two models, a tourabout and a 5 or 7-passenger Pullman body car. The car has not as yet been placed on the market, being put through a severe test on the local streets. The firm also contemplates manufacturing automobile trucks and automobile engines within the next year.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, General Manager, 29 West 42d St.

Jan. 5.....—New York City, Fourth Annual Meeting Society of Automobile Engineers. (Will adjourn until January 19 after opening session.)

Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. M. L. Downs, Secretary, 7 West 42d St., New York City.

Jan. 27-Feb. 3..—Philadelphia, Second Regiment Armory, Eighth Annual Show, Philadelphia Automobile Trade Association.

Feb. 6-13.....—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York

Feb. 15-20.....—St. Louis, New Coliseum Building, Third Annual Show, St. Louis Automobile Manufacturers' and Dealers' Association. Lloyd Ricksrt, Manager.

Feb. 15-20.....—Detroit, Wayne Pavilion, Annual Show, Detroit Automobile Dealers' Association. E. LeRoy Pelistier, Manager.

Feb. 15-20.....—Cleveland, First Regiment Armory, Annual Show, Cleveland Automobile Dealers' Company.

Feb. 16-18.....—Denver, Col., Auditorium, First Annual Automobile Show, Denver Motor Club.

Feb. 18-25.....—Toronto, St. Lawrence Arena, Third Annual National Automobile, Motor Boat and Sportsmen's Exhibition. Ontario Motor League. R. M. Jaffray, Manager.

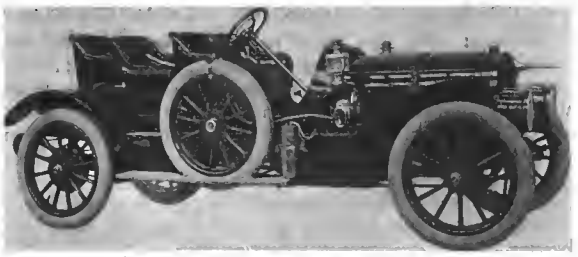
Mar. 1-6.....—Buffalo, Convention Hall, Seventh Annual Automobile Show. Buffalo Automobile Trade Association.

Mar. 6-13.....—Boston, Mechanics Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. Chester I. Campbell, Manager, 5 Park Square.

Mar. 27-Apr. 3..—Pittsburg, Duquesne Garden, Automobile Show, Pittsburg Automobile Dealers' Association.

Races, Hill-Climbs, Etc.

Jan. 1-2.....—Philadelphia, Two-day New Year's Run of the Quaker City Motor Club.



New Four-Passenger 45-Horsepower Rambler for 1909.

THE LATEST RAMBLER MODEL.

A new Rambler model just announced by Thomas B. Jeffery & Company, which will be first shown and demonstrated at the New York branch, 38-40 West Sixty-second street, during the period of the New York automobile shows, is a 45-horsepower car with four-passenger or close coupled body and Rambler spare wheel as a part of the equipment.

Its lines are quite exclusive, as is also the color combination—dark Brewster green, black effect, striped in orange, with orange wheels. The spare wheel, locked on the side, adds individuality. The npholstery is highly finished smooth leather wbich contrasts strongly with the bright orange of the wheels. In short, this Rambler is just a little different from any other car and to use a slang term, it is quite entitled to be described as "sporty." That the combination of a very light four-passenger body of this type with the 45-horsepower Rambler chassis is both unusually speedy and powerful scarcely calls for mention, as that fact is quite evident upon a glance at the above picture.

A HOUSEBOAT ON WHEELS.

One of the newest things in convertible bodies is that built by a Florida man, N. H. La Grand, of Jacksonville. This is in substance a houseboat on a Franklin cbassis. The bouseboat part of the outfit La Grand built himself, taking balf of each day from his business to work on it. Working at it thus he took fifteen months to build it and spent $3,700.

This strange vehicle is used by the owner, both as a place of business and a residence, the interior, of mahogany, being so arranged tbat it may in less than a minute be converted to a working, a dining, a sleeping or a touring car. Despite this the car weighs but 2,300 pounds and is very fast.

The Sharp Edge, as La Grand calls it, thus indicating his business, a dealer in razors, has plate glass windows, silk curtains, electric lights and other modern conveniences tbat one would not expect to find in a home-made product of this sort. Tbe cut shows this unnsual body.

"The Sharp Edge"—A Florida Man's Practical Idea.

NEW ONE-TON TRUCK MAKES APPEARANCE.

BUFFALO, Dec. 14.—To meet the requirements for a truck lighter than their three-ton machine, the Autocar Equipment Company, of Buffalo, builders of commercial vehicles exclusively, have brought out the one-ton truck, of which the cut shows one of the six delivered to a transportation company. This follows standard light truck lines in having the motor forward under a bonnet, selective type of transmission, chain drive, etc. The motor is a four-cylinder 25-horsepower unit, with individually cast cylinders, and is an excellent piece of work. Transmission of power then is to a sliding gear transmission, giving three speeds and reverse. The final drive is by double roller chain (Baldwin) from sprockets on the jackshaft to the rear wheels. The latter are fitted with large internal expanding emergency brakes, operating on the toggle principle and lined with hard fiber. The service brakes are of tbe band type and work on a pair of brake drums located on the jackshaft.

The wheels are of the artillery type of seasoned second growth hickory, with 14 1 3-4 spokes, and are equipped with 36 by 3 1-2-inch solid rubber tires all around. These wheels run on plain bearings on the axles, which are both of the square section forged steel, 1 3-4 by 1 3-4 inches. Tbe springs are of the best quality

New One-Ton Truck of the Auto Car Equipment Company.

of spring steel, 2 1-2 inches wide, witb 1-4-inch leaves, the number varying for front and rear, according to the load to be carried.

This firm is one of the few committed to the armored wood frame. They use on this car ash sills 1 3-4 inches thick by 5 inches high, reinforced by a 3-16-inch plate of sheet steel on the outside. This frame is narrowed at the front to take the engine without a sub-frame and also to increase the steering lock. The steering is accomplished by means of an irreversible steering gear of the worm and sector type, with wood steering wheel on an aluminum spider. This carries also the spark and throttle control levers.

A gear pump circulates the water through the cooling system, the principal feature of which is a square tube honeycomb type of radiator. Ignition is by jump spark, two sources of current being provided, storage battery and dry cells. A roller type of timer is used.

The body, painting and trimming vary with each job, the car shown having a comparatively small body, about 4 feet by 8 feet, back of the driver, and being painted very plainly in black, with a dark green stripe and light running gear. The tailboard as shown is hinged and may be used to carry stuff, or it may be made removable for hauling lengthy merchandise. The car is fitted with storm curtains of a heavy black duck.

This firm also has under construction a lighter car of a capacity of 1,000 pounds, which will follow along the same general lines as the one just described. The details of this car are not yet available, tbough it is stated that a light gasoline motor will form the power plant.

How a Philadelphia Merchant Used His Elmore to Cut Fodder.

Frank Hardart, of Horn & Hardart, Philadelphia, has put into practical uee an idea that occurred to him when he needed some fodder cut on his farm a few milee outside the city. He backed up his Elmore into position in line with the fodder cutter, jacked up one of the rear wheels, and run a belt from it to the pulley on the cutter. The work required to get the machine into operation wae practically nothing and the result all that could poesibly be desired by the experimenter.

Ran a Steamer Cheaply.—A letter from Leon T. Bunnell, of Terryville, Conn., gives some figures for running a steamer which figure out very advantageously to that form of motive power. Mr. Bunnell with a Locomobile steam runabout, having a special 14-inch kerosene burner (F. W. Ofeldt & Sons, manufacturers), ran 4,500 miles last Summer at a total expense as follows:

Fuel—250 gallone kerosene at 9c.	$22.50
Repairs	25.00
Tiree, oil, waste, etc.	60.00
	$107.50

This figures out an average cost per mile of 2.4 cents. As nearly all of this driving was over New England hills, some very steep and rough, with two passengers all of the time and sometimes three, this is an excellent record. The mileage it will be noticed works out to 18 miles per gallon, which is another record that will stand a whole lot of beating.

Many Packard Tours Abroad.—The past has been a lean year for the hotel men and others in France who make their living off the tourists. For this reason the Frenchmen feel kindly towards the Packard car, as more owners of these cars have toured the Continent than any other this season, no fewer than 175 Packard parties having been registered at the Paris headquarters. Consequently, the well known slogan, "Ask the man who owns one," translated *"Interroges l'homme qui en possede,"* has become equally familiar over there. These tours have ranged from 2,000 to 8,000 miles over all the popular and some unusual routes. But even as a result of these long tours, the repair shop affiliated with the Paris office has complained that they did not get any work to do, for there was no need of repairs. From this, the Frenchman in charge,, L. Bousquet, draws the interesting conclusion that they must be well built.

New Lease of Life.—The Auto Parts Mfg. Co., of Muncie, Ind., formerly the Muncie Auto Parts Company, has bought a number of new patents for automobile parts which have never been included in a mannfacturer's list before. The plant has been overhauled thoroughly, a number of new machines installed, and a lot of workmen added to the already large force. The original company was one of Muncie's infant industries, and at one time the big plant on South Elliott street, north of the L. E. and W. R. R., was operated day and night. A new lease of life, with an infusion of new blood, among whom is Dave Henry, sales manager, will undoubtedly revive this once flourishing concern.

A Bold Robbery in the Metropolis.—T. P. C. Forbes, Jr., of 1657 Broadway, New York City, is mourning the loss of his 40-horsepower American roadster, which was stolen from the curb at Sixth avenue and Thirty-eighth street last Friday. The car had the regular underhung body and was painted a dark Brewster green. The number on the engine is 402, and the license tag 48,578. The car had 36-inch wheels with 4-inch rear tires and 3½-inch tires on the front. At the rear of the car the tire holder was fastened on the trunk rack. Mr. Forbes would appreciate the receipt of any information regarding the whereabouts of the car.

Auto Makes Progress in Far West.—A story from Fresno, Cal., vouched for as true, tells that in one of the local agencies a bunch of salesmen were sitting around smoking when a sheep inspector with more whiskers than most anything else blew up in a one-lunger Cadillac and asked to have lamps and generator put on right away. He was politely told that on account of the pressure of work it couldn't be done.

"Well, what am I going to do," he inquired, "I've got to tend to my business." Some one suggested hiring a horse and buggy. "Oh ——" said the disgruntled sheep inspector, "I can't depend on a horse." Just for that they fixed him up.

Had to Build an Addition.—The New Process Raw Hide Company, Syracuse, N. Y., after operating its plant nights for several months and having the largest payroll in its history, has been obliged to build a large addition to its present factory. This will be a modern steel construction with cement floors, two stories and basement, 60 by 80, adding 14,000 square feet of floor space to the east end of the present factory. They have contracted for some $12,000 worth of new machinery, principally automatic machines, gear planes, and grinders. A hardening furnace for transmission and driving gears will be one of the features. It is expected that the new building will be ready for occupancy by February 1 or thereabouts.

Harriman's Faith in Motor Cars.—As an instance of the belief of E. H. Harriman in gasoline or other liquid fuel for railroad use, it may be noted that within the coming months he will spend a small fortune in experiments at the Omaha, Neb., motor car shops. He expects to excel in speed and economy of operation anything that has yet been produced. What this will result in is hard to say, for M. C. No. 8 has a 6-cylinder 12 by 14-inch motor, rated at 230-horsepower and travels at a speed of 65 miles on .45 gallon of gasoline per mile, carrying 75 passengers

Many Motor Patrol Wagons.—Not to be outdone by the larger cities, like Chicago, which has just received its third motor-patrol wagon and ordered number four, the town of Richmond, Va., has ordered a patrol wagon. The contract was recently awarded to the American Locomotive Company. The decision to have the motor-propelled rig, made after due deliberation by a body of conservative men, shows plainly that the commercial vehicle is gaining advocates daily, purely on its merits.

Matheson Increases Capital.—The Matheson Automobile Company, of Wilkes-Barre, Pa., announce that they have recently increased their working capital by $350,000, thus enabling it to more than double the previous factory output. By thus increasing production, the concern is able to make the astonishing cut of $1,000 in the price of their 50-horsepower car and to do this without any sacrifice in the quality. The guarantee for one year will be continued, despite this great reduction.

Actors Beating the Pullman Company.—The Walter Hale Company, now on tour with "The Wolf," are trying a new stunt of going from city to city by automobiles. After playing in New Haven, Conn., recently, they made the trip to Poughkeepsie, N. Y., in four hours in a 40-horsepower Studebaker. The trunks, scenery, and lesser lights traveled by railroad, while the leading players made their own schedules and beat the poor Pullman Company out of their hard-earned cash

Grout Behaved Perfectly.—W. J. Gould, sales manager of the Grout Automobile Company, Orange, Mass., has just returned from a demonstrating trip with the 1909 model of shaft-drive car, calling on the several agents from Boston to Philadelphia, covering in all, including demonstrations, 2,200 miles. The car behaved so perfectly that every agent called upon placed his contract for 1909, requiring the hiring of more help at the factory.

Price of the Corbin Baby Tonneau.—In stating the prices of the new Corbin models for 1909 in connection with the description given of this car in THE AUTOMOBILE, December 10, it was made to appear that all three listed at the same figure, *i.e.*, $2,500. While this is true of the touring car and the roadster type, the price of the baby tonneau model should have been given as $2,650.

Professional Automobile Engineers Elect.—At the recent annual election in New York City of the Society of Professional Automobile Engineers, these officers were elected: President, Ed. Traphagen; first vice-president, Robert J. Dobson; second vice-president, John McClarity; secretary, George Strobridge; treasurer, Eugene Nassoy; chairman examinating board, Otto Zinamerellis.

Fire Chiefs Will Use White Steamers.—Two White Steamers will be used by Chief Horton and his deputy of the Baltimore fire department in responding to fires, according to specifications just given out.

The department will also be provided with two ambulances, one to hurry injured firemen to the hospitals and the other to remove injured horses to a veterinarian.

Airships.—The American representative of the Clement-Bayard, Sidney B. Bowman, has just returned from Europe and has announced that the Automobile Company has gone into the commercial manufacture of airships. The S. B. Bowman Company will act as the foreign agent for these airships, and, in fact, is now promising delivery in three months.

Baltimore to Have Locomobile Police Patrol.—A 60-horsepower Locomobile police patrol has been ordered for the Baltimore Police Department from Callahan, Atkinson & Company, agents for the Locomobile. The car will cost $5,500 and have a seating capacity for 12. It will be used in the Central district, and a garage will be built for its storage.

Maxwell Dealers to Meet at New York.—The annual convention of Maxwell dealers, a regular institution in connection with the A. M. C. M. A. show, will be held Tuesday, January 5, at the Hotel Manhattan. The most important item in the discussions will be the new and unusual sales organization, inaugurated by Benjamin Briscoe.

A Question of Accuracy.—The accuracy of the automobile to-day and the interchangeability of its parts are directly due to the use of fine tools. As a sample, it might be noted that the Cadillac Motor Car Company have just placed an order with Brown & Sharpe for $6,000 worth of snap gauges, a total of 1,500 of them being required.

Not a Moment's Trouble.—F. M. Sinclaire, of Schenley, Pa., after driving a Winton "six" 8,000 miles, says: "I have not touched anything under the bonnet, and have had no trouble with engine or ignition. The engine has not missed once, and the original spark plugs are still untouched."

Another Girl in the Auto Business.—The Ajax-Grieb Rubber Company, of Trenton, N. J., are sending out to the trade a handsome large lithographic hanger. This represents another of the Ajax girls and is the prettiest one of the bunch.

IN AND ABOUT THE AGENCIES.

Locomobile's New Boston Home.—The Locombile Company of America, which was obliged to vacate its branch house and garage at 400 Newbury street because of a court order, has established new Boston headquarters at 589 Boylston street in Copley square, and there K. M. Blake, the Boston manager, will be found for the present. The new salesroom is in an excellent location. The reason for giving up the new garage and salesrooms on Newbury street was because adjoining land owners secured judgment against the owner of the garage on their claim that in building such a structure the owner violated restrictions upon the land.

Franklin, Philadelphia.—Since the Automobile Sales Corporation succeeded the Quaker City Automobile Company some months ago, former agents of the Franklin, that car has been unrepresented in the Quaker City. A deal was put through last week whereby James Sweeten, Jr., and H. G. Clark, under the firm name of the Franklin Motor Car Company, will handle the Franklin in the Philadelphia district, with temporary quarters at Thirty-seventh and Spruce streets, opposite the University of Pennsylvania. Ground will be broken for a permanent steel-and-concrete building at Thirty-fourth and Chestnut streets within a few weeks.

Some New Franklin Agencies.—The Franklin Mfg. Company will be represented in the following cities in 1909, in addition to others previously mentioned: Bloomsburg, Pa., C. W. Funston; Lancaster, Pa., Lancaster Auto Company; Geneva, N. Y., Geneva Automobile Company; New Haven, Conn., Holcomb Company; Bridgeport, Conn., Blue Ribbon Garage, 283 Fairfield avenue; Canton, O., Diebold Motor Car Company; Washington, D. C., Cook & Stoddard Company; Waterloo, Ia., Moore Auto Company; Jamestown, N. D., Lenz-Land & Loan Company; Salt Lake City, Utah, Consolidated Wagon & Machine Company.

Great Western, Peru, Ind.—The Model Automobile Company, of Peru, Ind., manufacturers of the Great Western car, has secured a number of new agencies for 1909, among whom one is made prominent by her sex; viz., Mary E. Carlton, who will handle this car in Rochester, N. Y. The others are all "mere" men as follows: Alden, N. Y., Bennet Manufacturing Company; Newfane, N. Y., W. H. Collins; Freeport, Ill., William Ott; Waterloo, Ia., A. Burhyte; Kansas City, Mo., B. L. Colaw; Goltry, Okla., J. H. Santee; Calgary, Alberta, Canada, T. H. Graswick.

Benz, America.—The Benz car, that famous product of the Benz Company, at Mannheim, Germany, which has produced such a stir lately, will be actively pushed in America from now on. The exclusive agency and sole sales right has been given to Jesse Froehlich, known in the trade as managing director and treasurer of the Times Square Automobile Company, of New York and Chicago. Mr. Froehlich now has the Benz racer driven at Savannah by Hemery on exhibition at the salesroom, 1599 Broadway, New York City.

Mitchell, Jacksonville, Fla.—This town is very much elated over the rumor that the Mitchell Motor Car Company, of Racine, Wis., will soon establish a distributing house here to supply all of the Southeastern territory, as well as the West Indies. This rumor was started by the trip of J. Mitchell Lewis, president, and J. W. Gilson, sales manager, to Jacksonville upon the completion of the week of racing at Savannah.

Post & Lester, Boston.—Beginning January 1 Post & Lester will conduct a wholesale as well as a retail branch in Boston. The old quarters in Boylston street will be given up and new addresses will be: Wholesale, 288-290 Devonshire street; retail, Park Square. Mr. Thompson will continue as manager with charge of both places, while Russell Green will be chief of staff of the retail department.

Hardy Moves to Larger Quarters.—The R. E. Hardy Company, manufacturers of the Sta-Rite plugs and other accessories, have been obliged to increase their factory space. This has now been tripled and their office and factory address changed to 201 Thirty-seventh street, Brooklyn, the New York office at 25 West Forty-second street being continued.

Jewel.—The Forest City Motor Car Company, of Massillon, O., manufacturers of the Jewel, has added these agencies to their list: Rhodes Implement Company, Kansas City, Mo., and W. M. Kidwell, Savannah, Ga. The former will have the territory of Western Missouri, Kansas and Oklahoma, while the latter will look after Savannah and vicinity.

New Agencies for Goodrich Tires.—The B. F. Goodrich Company, of Akron, O., has established agencies at Kansas City, Minneapolis, Atlanta, and Pittsburg. The Atlanta office is located at 64 South Pryor street, and will be managed by E. V. Wilkinson. The Pittsburg branch is at 5900 Penn avenue, and will be in charge of H. L. Banker.

Mitchell, Philadelphia.—In pursuance of its plans to offer every facility to Mitchell owners, not alone in Philadelphia, but in the nearby towns as well, the Penn Motor Car Company, agents in the Quaker City, has just opened a branch in Media, Delaware county, and placed it under the charge of J. H. Fleming.

Motor Truck Company Expands.—William H. Murphy, of Ithaca, has acquired a quarter interest in the Chase Motor Wagon Company, of Syracuse, N. Y., which has recently been reorganized with an increased capital stock. Mr. Murphy, who has been appointed secretary and a director of the company, will have charge of the sales department.

Pennsylvania and Gyroscope, Boston.—Among the new companies in Boston, is the Auto Motor Company, who have just opened a salesroom at 12 Park Square. The company will handle the Pennsylvania, and George H. Lowe, of the company, will personally handle the Gyroscope.

Reo, Southern States.—After December 1, the Reo will be represented in Tennessee, West Virginia, Kentucky, and Southern Indiana by the Renners Automobile Company, of Louisville, Ky. This company will also have the Louisville agency for the Haynes.

Oldsmobile, Kentucky.—The Oldsmobile Company, of Louisville, Ky., is now a branch of the factory and has established agencies at Nashville, Chattanooga, Memphis, and Knoxville, Tenn., and also at Birmingham and Mobile, Ala.

Oldsmobile, Du Bois and Johnson, Pa.—The Du Bois Repair Company will represent the Olds Motor Works in Du Bois, Pa., and the Johnstown Automobile Company will handle the same product in Johnstown, Pa.

Sultan Company Moves.—The Sultan Motor Company is now located in new and larger quarters at 249-251 West Sixty-fourth street, New York City.

PERSONAL TRADE MENTION.

George Ostendorf, well known in the automobile trade and for the past two years a traveling salesman for the H. H. Franklin Mfg. Company, of Syracuse, has left that company to become secretary and general manager in charge of sales of the Brunn Automobile Company, of Buffalo. This company as the Brunn Carriage & Manufacturing Company has a long-established carriage trade. They have recently branched out into motor cars and will handle the Franklin in 1909. While with the Franklin Company, Mr. Ostendorf traveled in New York and Pennsylvania.

F. C. Gilbert, sales manager of the Pope Motor Car Company at Toledo, O., who used his efforts toward the re-establishment of the business during the period of receivership, has decided to resign from the company, severing his connection therewith early in January next. Mr. Gilbert has not decided upon his future plans, and at present is located at 2268 Parkwood avenue, Toledo.

Bertram Bailey has accepted a position as engineer with the Four Traction Automobile Company, of Mankato, Minn., manufacturers of four-wheel drive touring and commercial cars. Mr. Bailey was formerly with the Bailey Automobile Company, of Springfield, Mass., turning out two-cycle cars.

Herbert Bingham.—The G-L Economizer Company, of 1412 Times building, New York City, announces to the trade that Herbert Bingham has severed his connection with said company, having resigned as secretary and general manager of the same.

R. J. Skelton, who was formerly with the Chadwick Engineering Works, at Pottstown, Pa., has now assumed the position of city sales manager of the Philadelphia Olds Motor Works branch.

Albert A. Lamb has accepted the position of general manager of the J. S. Griffen Company, of New York City. Mr. Lamb leaves the Michelin Tire agency at Newark to take up this new work.

M. B. Hatch, the Buffalo agent for the Chalmers-Detroit, has added another good man to his list in the person of Harry C. Bacon, formerly with the Buick agency.

OBITUARY.

Mrs. W. McK. White, wife of the well-known automobile editor of the Philadelphia *Times,* died in Philadelphia recently of pneumonia after a two weeks' illness. Mrs. White apparently was out of danger, but suffered a relapse, which terminated fatally. Mr. White has the sympathy of many friends in the industry.

R. Lindsay Coleman.—One of the pioneers in the automobile world, and formerly a leading figure in the bicycle industry, died recently at his home in Somerset, Va. Until its comparatively recent failure, he was at the head of the National Battery Company, of Buffalo, N. Y.

TAXICABS AND TRANSIT.

St. Louis.—The Mississippi Valley Automobile Corporation, of St. Louis, Mo., according to J. H. Phillips, vice-president, will start this coming week an up-to-date line of taxicabs. The present plans include the immediate use of five cars, the remainder of a lot of 25 being put into service as they arrive. The cars will be equipped with the Popp taxameter and the fares charged will be the same as in New York and Chicago. The company have taken a large shop on Olive street in the heart of the automobile district.

Denver.—A taxicab company is to be started in Denver, Colo., on or about January 1. The new company has elected these officers: President, F. A. Austin; vice-president, E. W. Reynolds; secretary, treasurer, and general manager, B. J. Reynolds.

Bridgeton, N. J.—The citizens of Bridgeton are interested in the formation of a motor 'bus line between that town and Salem.

GARAGE NEWS OF ALL KINDS.

Pittsburg, Pa.—A. H. McKellit and R. E. Dinger have bought the garage and business of the Central Automobile Company at 5909 Centre avenue, East End. Fred D. Rathbun, a well-known automobile salesman for the Columbia Company, of Hartford, will be in charge. The retiring partners, C. L. Seeley and C. D. Messenger, will go into other business.

Sag Harbor, N. Y.—William Blacklock, Sag Harbor, Long Island, has purchased three lots on lower Main Street, near the railroad terminal and will start work on a new hrick garage and machine shop.

Cincinnati, O.—Among the latest to announce a new building is the Cincinnati Automobile Company, agents for the Peerless, Pope, Hartford, and Oldsmobile cars.

Baltimore, Md.—The Zell Motor Car Company, of Baltimore, Md., is having plans prepared for a three-story 50 by 100 garage on Mt. Royal avenue.

Redondo, Cal.—Work has been commenced on the erection of a new garage for the Pacific Motor & Automobile Company, of Redondo, Cal.

Des Moines, Ia.—The Capital Automobile Company, Grand avenue and Eighth street, has just commenced work on a new building.

BUSINESS DIFFICULTIES.

New York City.—Schedules in bankruptcy of Max Wineburgh as the American Automart, supplies and a garage at 1621 Broadway, New York City, show liabilities of $14,181 and nominal assets of stock, etc., totaling $6,950. Outstanding accounts cannot be figured, because the firm's books were stolen.

Charlotte, Mich.—The Dolson automobile plant and real estate will be sold at auction by Receiver Hathaway. It is probable that the Charlotte banks, the heaviest creditors, will bid in the property. Liabilities amount to approximately $140,000.

Hartford, Conn.—A petition in bankruptcy has been filed against the Auto Body & Top Mfg. Company, of Hartford. Liabilities $4,641, assets $9,513.

THOMAS AGENCIES FOR 1909.

Among the concerns which have announced the dealers who will push their product for next year is the E. R. Thomas Motor Company, of Buffalo, who swing into line with no less than 75 authorized agents. These are: Albany, N. Y., Auto Storage & Trading Company; Akron, O., Union Auto Garage Company; Austin, Tex., Ewell Nalle; Atlanta, Ga., F. C. Steinhauer; Boston, Whitten-Gilmore Company; Baltimore, Motor Car Company; Binghamton, N. Y., L. R. Clinton; Brattleboro, Vt., Manly Bros.; Beatrice, Neb., Wm. Steffen; Boise, Ia., Randall Dodd Auto Company; Chicago, W. W. Shaw Company; Cleveland, Auto Sbop Company; Chattanooga, Tenn., F. G. Joyce Auto Company; Denver, Colo., Matbewson Auto Company; Davenport, Ia., Iowa Auto & Tire Company; Des Moines, Ia., Moyer Auto Company; Duluth, Minn., Mutual Auto Company; Dubuque, Ia., Wallis & Culbertson; Detroit, Grant Bros. Auto Company; Erie, Pa., Murphy Bros.; Ennis, Tex., Earl Fain; Glens Falls, N. Y., Glens Falls Auto Company; Harrisburg, Pa., Ideal Motor Car Company; Hartford, Conn., Palace Auto Station Company; Huntington, W. Va., L. A. Walcott; Indianapolis, Indiana Auto Company; Jamestown, N. Y., Jamestown Garage Company; Kansas City, Mo., Central Auto & Livery Company; Kalamazoo, Mich., W. E. Kidder; Louisville, Ky., John M. Strauss; Los Angeles, Cal., R. A. Brassey; Minneapolis, Minn, Barclay Auto Company; Memphis, Tenn., Memphis Auto Company.

To continue with the agents in the United States there are: Milwaukee, Wis., W. L. Hibbard Motor Car Company; Newark, N. J., Harry S. Houpt Company; New Haven, Conn., W. A. Maynard; New Orleans, Crescent City Auto Company; New London, Conn., New London Auto Station Company; New Castle, Pa., C. E. Smith Hardware Company; New York City, Harry S. Houpt Company; Oklahoma City, Okla., Buick Oklahoma Auto Company; Omaha, Neb., H. E. Frederickson; Oil City), Pa., W. P. Lucas; Portland, Me., J. A. Dowling; Philadelphia, Pa., Bergdoll Motor Car Company; Portland, Ore., H. L. Keats Auto Company; Peoria, Ill., J. H. Bontjes & Co.; Providence, R. I., Davis Auto Company; Pittsburg, Pa., Pittsburg Auto Company; Poughkeepsie, N. Y., J. van Benschoten; Portsmouth, O., W. I. Friel; Punxsutawney. Pa., P. O. Freas; Reading, Pa., Penn Auto Company; Rochester, N. Y., A. V. Hart; St. Louis, Mo., Park Auto Company; San Francisco, Cal., Pioneer Auto Company; Scranton, Pa., Scranton Auto Company; Syracuse, N. Y., Syracuse Auto Cab Company; Springfield, Mo., Colonial Motor Car Company; Sioux City, Ia., H. B. Groves & Co.; Saginaw, Mich., Norris Auto Company; Topeka, Kan., N. S. Wear; Terre Haute, Ind., Terre Haute Auto Company; Toledo, O., Kirk Bros. Auto Company; Utica, N. Y., Utica Motor Car Company; Vincennes, Ind., J. N. Dyer; Worcester, Mass., L. W. Locke; Washington, D. C., Motor Car Co.; Williamsport, Pa., E. Keeler Company; Youngstown, O., Standard Auto Garage Company.

In South and Central America and the Philippines by these agents: Argentine Republic, Pratt & Cia.; Mexico City, Mex., Moher & De Gress; Honolulu, H. I., Van Ham-Young Co., Ltd.; San Juan, P. R., Wm. J. Wulf.

RECENT INCORPORATIONS.

Maxwell-Briscoe Motor Vehicle Company, St. Louis, capital $15,000 to buy and sell automobiles. Incorporators are V. Heinrich, L. L. Milks, H. M. Paine, of St. Louis; J. J. Handley, of Newcastle, Ind.; Benjamin Briscoe and J. W. Wellington, of Tarrytown, N. Y. This company has plans completed for the erection of a building 100 by 150, to cost $15,000, but for the present will have its headquarters in the American Garage Co.'s building.

Pierson Motor Supply Company, New York City, capital $20,000, to manufacture motors, engines, machines, automobiles, cars, wagons and boats. Incorporators: F. W. Mills, H. M. Brown and E. J. Forhan, 154 Nassau street.

Hurlburt Company, Portland, Me., capital $400,000, to deal in automobiles and carriages of all kinds. Incorporators and officers: President, C. E. Eaton; treasurer, T. L. Croteau; clerk, J. E. Manter, all of Portland.

Grabowsky Power Wagon Company, Buffalo, capitalized at $25,000, to manufacture and sell automobiles, power wagons and motor boats. J. D. McDonald, J. F. Valley and John Moore are interested.

A. J. Deer Company, Hornell, N. Y., capitalized at $120,000. Buffalo and Hornell men are interested in this company, which will manufacture motors, electric novelties, machinery and dynamos.

Bradley Tire Protector Company, Fort Worth, Texas, capital $20,000, to manufacture steel tire protectors. C. E. Bradley, Houston street, is secretary.

Self-Loading Wagon Company, New York City, capital $25,000, to manufacture motors, engines, machines, cars, wagons and boats.

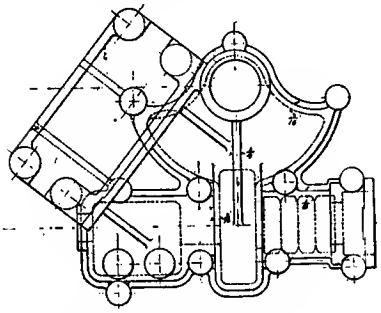
Butler Electric Clutch Company, Yonkers, N. Y., capital $50,000, to manufacture elastic clutches invented by W. W. Butler.

Lexington Motor Car Company, Lexington, Ky., to conduct a livery and garage, and also assemble a car to sell at $2,500.

Boutjes-Hayes Automobile Company, Peoria, Ill., capital $2,500, to manufacture automobiles, parts and accessories.

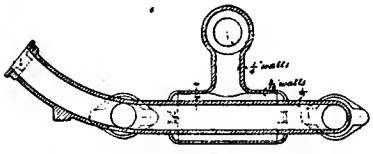
INFORMATION FOR AUTO USERS.

Something About Hess's Steel Castings.—Since 1867, when the first steel castings were used for crossing-frogs by the Philadelphia & Reading Railway, from the plant of William Butcher down to the present time, steel castings have served for many useful purposes, but they would have



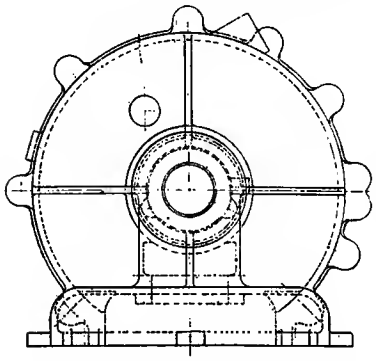
HESS STEERING GEAR HOUSING.

had a far wider range of application were it not for the difficulty involved in obtaining sound castings in intricate shapes, or in the cases involving complicated cores. In late years, because of a better understanding of the situation, the percentage of "wasters" has been much reduced, primari-



END PIECE OF TRANSMISSION CASE.

ly, in view of perfected details in design that indicated more nearly uniform cooling conditions. In the process of evolving steel castings, while uniform cooling is particularly desirable, the fact remains that the "shrink" is not only more than that attending cast iron, but it is far less regular as



EXHAUST MANIFOLD WITH INTAKE PREHEATER.

well, and so it seems the steel casting problem has remained formidable, notwithstanding the improvements wrought.

Henry Hess, of Twenty-first street and Fairmount avenue, Philadelphia, has submitted illustrations of intricate specimens of steel castings which he claims can be readily made by a new process, recently acquired by him, during a sojourn in Germany. In the language of Mr. Hess, the substance of the project is clearly set forth as follows:

"Steel castings ranging from dead soft to self hardening steel, weldable, any specification realizable in wrought or forged material, any section; thick, thin, abrupt change from thick to thin, clean surfaces, no pits, absolutely solid 3-32 below skin, simple or most complicated coring, any shape that can be forged, or cast in any material."

Mr. Hess states that pending the establishment of a foundry in America for the purpose of furnishing castings in accordance with the above claims, deliveries will be made directly from Germany with a view to filling orders. At any rate, the requirements of American manufacturers will be carefully looked after.

Prest-O-Carbon Remover.—The pedestrian hates a smoky exhaust. If he was "onto" his job, the chauffeur or man running the car would dislike it just as much, for it means work for him later. That is, a smoky exhaust is caused by a surplus of oil or of fuel, usually the former, and this, if continued for a long time, will result in carbon deposits. These may be in the cylinder itself, on the piston head, or on the valves. Wherever they occur it means dismantling the motor and scraping them. At least it has meant this in the past, but now we have a new solvent for the carbon, known as a carbon remover, which may be inserted in the cylinder by means of an oil gun or poured in through any suitable opening. Among the carbon solvents that have been proved good is the Prest-O-Carbon Remover, Prest-O-Lite Company, Indianapolis, Ind. This is put up in liquid form in sealed cans holding respectively a quart, half gallon, or gallon, and should stand for 30 minutes. This works by softening the deposits, then when the engine is started the loose particles of carbon are blown out through the exhaust valve opening. As this saves the work of tearing the whole engine down, cleaning, and assembling it again, with the consequent loss of the use of the machine for a couple of days, these solvents will doubtless become very popular with automobilists.

PREST-O-CARBON REMOVER.

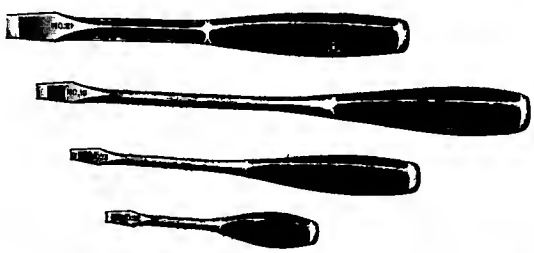
Grand Prix Horn.—The Motor Car Equipment Company, of 1727 Broadway, New York, states that its new "Grand Prix" wheel-shaped horn is now in great demand. As may be seen from the cut, this horn has a very odd shape, and has also good noise-making qualities. It

"GRAND PRIX" WHEEL-SHAPED HORN.

makes a fine racing horn because it can be blown in the face of the strongest wind, and is also admirably adapted to low racing tourabouts. This horn will undoubtedly appeal to automobilists desiring a novelty as well as a serviceable article for practical use.

Acheson Graphite Greases.—The International Acheson Graphite Company, of Niagara Falls, N. Y., is making what it believes to be a very superior line of Graphited Greases. The company blends very soft, pure, amorphous, unctuous Acheson-Graphite with a high grade grease, the product being one which it claims is very far superior to graphited greases made of natural graphites, as these latter contain friction-creating impurities, while the graphite is guaranteed at least 99 per cent. pure, thus being the purest and best graphite in the world for lubricating purposes. The claim is made that these new Graphited Greases will do far more work than any other grease because the Acheson-Graphite used is a true lubricant in itself, the grease simply acting as a carrier. Acheson-Graphite, Grade "1340," is claimed by the makers as the world's purest and best graphite for lubricating purposes.

B. & S. One-Piece Screwdrivers.—All steel one piece screwdrivers in eleven sizes, specially designed for automobilists' use, are the latest productions of the Billings & Spencer Company, of Hartford, Conn. For more than a quarter century the "B. & S." trade mark has been a synonym for high class products, and the new line of drivers will meet a ready welcome with discriminating buyers. They are made in one piece, and drop forged of steel, the handles being of a new and special design which insures lightness, a positive, easy grip, which cannot get out of order, become loosened, or lost. As will be seen by the illustrations, the handle portion has the section of a cross, but on the heavier models the sides are left solid, giving a square section on which a wrench may be used. The smallest size is 5 inches in length and the longest 18 inches for general use. In the machinists' sizes with squared handle sections, the lengths are 9 1-2 and 10 1-2 inches.



ONE PIECE "ALL STEEL" AUTOMOBILE S. & S. SCREW DRIVERS.

VOL. XIX NEW YORK—THURSDAY. DECEMBER 24, 1908— CHICAGO No. 26

THE AUTOMOBILE

ITALY *for the* AUTOMOBILIST

By FRANCIS MILTOUN

ITALY for the automobilist is not France, not by a good deal. Its roads are not French roads, and its hotels are not French hotels—more's the pity! And you pay two prices for everything that matters to the automobilist. Gasoline comes in the American five-gallon can of commerce that you find in China, Dahomey—and Italy, and here you pay for five gallons a price often double what you pay for a more volatile spirit in France. Oil—any old kind—costs a franc and a half a kilo, which is dear or not, according as to where you have done most of your automobiling in the past, but as it does not give as good results, nor go so far as that you get in France, so oil, too, works out as high-priced as gasoline.

You buy all these things at a drug store or a grocer's. That is, you can buy them there if you wish, and at a better price than at the average misnamed "garage," which in Italy is often an establishment where they sell sewing machines, agricultural machinery, baby carriages, and bicycles. In the small town you are bound to go to the drug store for your supplies, but as you can get your quinine at the same time—which you will have need of in fairly large doses—it does not so much matter.

All these variations on the automobilist's ordinary procedure are not so serious as to take away entirely from the enjoyment of automobile touring in Italy. The worst is the fact that a larger extent of bad road will be encountered in a week's touring in Italy than will be met with in a month in France.

A Typical T. C. I. Road Sign.

Italy's hotels, taken by and large, are neither so good nor so reasonable in price as those in France, and you invariably pay for garaging your machine two or three francs a night—which you are not often forced to do in France—and often you'll be obliged to stable your automobiles outside the hotel, in an inferior and most incommodious shelter.

What weather one will have along the road in Italy and notably in the Campagna depends entirely upon what God wills. No Italian peasant professes to be a weather prophet. "Ah, Signore," he says, invariably, "chi lo sa?" For this reason an automobilist in Italy must be prepared for meteorological surprises. "Domini Deo!" you say when you strike a bad road and you praise God for the good. *Avanti* is ever the watchword in Italy. You mustn't stop for an occasional bit of bad road. It won't improve, at least not while you wait.

The above are some of the bad points of automobiling in Italy. For the good things of life let us be fair and admit that Italy does not lack them utterly. Their infrequency is what mitigates against one's appreciation of them; or does it work the other way about? It all depends upon the individual mood.

A dozen, twenty or fifty kilometres of good road through Æmelia suddenly descends into a mere trail. That is a bad piece of management and you think so when, after you have had a dozen kilometres of it, it suddenly becomes good again. Maladministration, the poverty of a certain haliwick, or indif-

ference or incompetence on the part of some one in power accounts for this state of affairs.

You buy your gasoline along the route, usually at 14 francs the five-gallon tin, when suddenly, without any warning, and without a thought on your part as to the propriety of asking the price beforehand, you are mulcted 18 francs for the same thing. You put that down to bad management, too, a sort of a sacrificing of the goose that lays the golden egg. You suffer, perhaps in silence, or perhaps not, but some day the thing will regulate itself and the next comer will have no such trouble. One hopes! Automobile touring in Italy is still in a chaotic stage; good in parts and bad in parts, like the curate's egg.

You occasionally find a very good hotel, with ample courtyard accommodation for your automobile, well-sheltered and well-lighted, where you yourself lodge and feed comfortably and well at a reasonable price (higher than in France for the same accommodation, however), but at you very next stopping place you are "exploited" and made to eat beefsteak and fried potatoes when what you wanted was a chicken and a dish of macaroni and a salad. You are put to bed in a regal apartment with electric lights everywhere. And with all this pretended luxury you are forced to put your automobile in an outhouse with loose straw and broken bottles. It takes all kinds to make up the gamut of one's automobile and hotel experiences in Italy. One does not speak, of course, of the palace hotels of the Quai Parthenope or the Lung' Arno; they are in another class, but they are nothing Italian, and are not what one comes to Italy for.

It simply comes to this: one has got to take chances when touring Italy in an automobile. If he keeps to the large towns and frequents only the tourists hotels he is sure of a certain cut-and-dried conventionality, neither good nor bad, btu dull. But if he makes his stopping place for a meal or a night at Barberino di Mugello in the Tuscan hills, or at Subiaco back of the Alban Mountains, near Rome, he does take chances. He may fare well or ill, but he won't be exploited unduly, and will probably be well cared for, indeed, humbly but amply; the food will have character; the wine will be good, though perhaps strong; and to be lodged in some quaint beam-ceilinged old room of a mediæval chateau will give one the pleasantest of dreams.

There is a good thing to say of the garages of the cities, those of the Garages Ruiniti, Fiat, Alberti, Storero, at Turin, Milan, Genoa, Padua, Florence, Rome, and Naples. They can hardly be excelled by any similar institutions to be found anywhere. It is to be regretted one cannot give the same praise to a den of bandits conducting a so-called garage at Pisa. The hotels are forced to send the inquiring automobilist there because there is no other. There is one hotel that won't do so any more. *Verb sap.* Automobilists, don't put off until Pisa anything that by any human means you can as well accomplish before or after or go without. Of these other most excellent garages it can be said that their accommodations are ample and luxurious, prices moderate and invariably uniform, and stocks of tires and accessories most complete. What more does an automobilist want?

In Italy, of all countries, this is to be appreciated, and would be in England, where the gas-fitter mechanic is still allowed to hang out his shingle and tamper with the intricacies of a ten thousand-dollar auto whenever a confiding stranger of that ilk is obliged to leave one in his bands.

In Italy, as in France, one finds in garages a real mechanic, one who has a knowledge of automobiles and their functions. No gas-pipe threads or bolts come from his hands. Give him time and he will cut a "Whitworth," a "standard" or a "Metric" thread for an odd-sized bolt for an American or English car, and will not hammer or force it unwillingly into place. The Frenchman is a good automobile engineer and mechanic, but the Italian is running him close, else why would the Fiats, Italas, and Isottas be gathering the plums that they are.

Not every automobile tourist in Italy covers the entire country in his wanderings. Naples, Rome, Florence, Padua, and Venice; or Florence, Bologna, Milan, Como, and then Switzerland are the usual itineraries followed, and because of their directness (there is one road through Æmelia 32 kilometres in length and perfectly straight and flat), and conventionally much that is really Italian is missed, and much that is the same thing that one gets elsewhere in Europe is included. In the articles which make up the series of Italian itineraries here outlined are four chief routes, which may be combined or taken separately, according as to where one makes his respective exit and entrance. They have been connated by personal observation, and barring the changes which may be expected to arise from the change of seasons, or such as are brought about by even brief intervals of time, they may be depended upon to lead out of many pitfalls that might otherwise cause annoyance and delay. They cover the best of Italy, on and off the beaten track; the roads are of the best—and the worst; there is the seashore, the mountain, and the plain.

If one would push on further and descend into Calabria, be must be prepared to take chances—not necessarily with brigands, though perhaps he may have some experience of them, too—with very, very many of the conventional discomforts of travel. One must literally be as tough as hickory, as patient as an owl, and with the stomach of an ostrich, if he is to come back safe and sound and wholly satisfied with bis round from, say, Naples to Reggio in Calabria and back again, or to Otranto and Brindisi. The thing is worth doing, however, by any one with sporting proclivities, though the road is easier to follow than to ride over. But one can do it.

The following hints as to ways about will be useful:

For maps, get the French-made "Carte Taride d'Italie." It is in three sheets, covering all of Italy, including Sicily, and is printed in three colors. It is very easy to read, plainly

ROYAL ITALIAN AUTOMOBILISTS

marked and cheap, costing only a franc a sheet. It does not distinguish the good roads from the bad as well as it might be made to, and many of the minor crossroads are omitted altogether, but in general it is a very satisfactory map, and the most legible of any made covering Italy up to the present writing.

For absolute accuracy there are no road maps of Italy as good as those issued by the Touring Club Italiano. They are presented gratis to members of that excellent organization, and sold at a low price to outsiders. The objection is that it takes 58 sheets to cover Italy. The hills between 4 per cent. and 7 per cent., and those above 7 per cent. are marked plainly, the altitudes are given throughout, and the great lines of communication by road are marked as to the quality of their surfaces.

Another similar series of Italian road maps is the "Carta d'Italia Sistema Becherel-Marsieni," scale one 250,000ths, 35 sheets, printed in colors, with a system of roads classification, and selling at a franc a sheet. It is similar to the Italian Touring Club map and is everywhere obtainable. For this reason it will perhaps best serve the visiting automobilist who has not provided himself with maps before hand.

Guide books for the automobilist in Italy are as follows: The most useful of all is the "Annuario di Touring Club Italiano," with plans showing exits and entrances to all the chief cities and towns, the location of the principle hotels, garages, etc., besides a mass of useful contributory information.

Next in importance, and of inestimable value, are the three volumes published by the Italian Touring Club, entitled "Strade di Grande Communicazione," with detailed itineraries, and illustrative profiles of the elevations along the road, showing all rises and falls in an unmistakable manner so that he who runs may read.

Baedeker's or Murray's guide books have little or no information of value to automobilists, though some of the large scale maps of certain regions in the former may be found useful in making excursions from a center. In this class are the maps of the Italian lakes and the environs of Naples, Rome, Florence, etc.

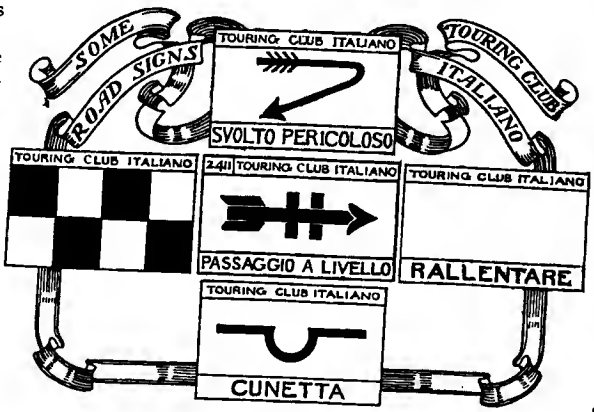
For hotel lists there is nothing to be compared with the "Annuario" of the Italian Touring Club, but those given in the "Annuaire pour les Pays Etranger" of the Touring Club de France and of the Automobile Club de France are good as far as they go. Joanne's "Italie" (in French) lists Italian hotels having garage accommodations for automobiles, and in this respect is ahead of any regular guide book published in English. Some of its large scale maps, too, are good. Indeed, it is a very useful book for the traveler by road in Italy.

The road signs of Italy are not what they are in France. They are neither so frequent, so conveniently placed, nor so well kept. They are often found wanting at some particularly puzzling crossroads.

The privately-placed road signs, those found here and there throughout Italy, erected by the Touring Club, are all sufficient and very readable, and in certain sections, as in Venetia, the local automobile clubs have rendered similar services. So far as they go the privately-erected road signs of Italy are distinctly good, but the government itself has been remiss.

There is nothing in the way of sign-posted information which gives the percentage of the rise on a hill, however, as in France, and the information to be acquired from local sources is often unreliable.

From Florence to Bologna, via La Futa Pass, is an easy enough hill-climb, if you don't stray from the main road; if you do you may strike a bit of 17 per cent. hill, or another of 25 per cent., for a kilometre or more, as the writer did. And at Florence, in the garages even, they will not tell you that there is an easier route via the aptly-named Montepiano, or via Pistoja and La Poretta. Either of these is a much better road than the main route over La Fute, which in spots rises and falls from 8 to 10 per cent. for a considerable distance, and the itinerary is hilly throughout. The distance by the direct road is in the neighborhood of a hundred kilometers, and by La Poretta perhaps twenty-five more.



Road building in Italy has not reached the height that it has in France. This seems mainly to be because of a lack of unity of purpose on the part of the various road-building authorities.

Throughout north Italy the "good roads" are as good as any "good roads" anywhere, and that's saying a good deal when one admits France into the

classification. But there are shockingly bad bits, even in the Italian lake district, near Lecco; on the great high road between Ferrara and Padua, just out of Ferrara, in fact; while the road from Spezzia to Pisa is unspeakable, to say nothing of being practically unridable.

The road surfaces in Italy in general are not nearly as good as they ought to be, and the upkeep is inefficiently performed.

Getting in and out of the small towns is not so bad, and the passing through the towns is often much more direct and simple than in France. With the largest cities, except in and out of Milan and Torino, the exits and entrances are awful, particularly at Genoa and Naples—and Spezzia, always Spezzia. Florence is bad enough, coming from the west or south, but the exits to the north are good. Most Italian cities and towns have a great encircling road, the Strada di Circonvallazione, which diverts a vast traffic from passing through the centre of the town. The Italians beat the world here. We must all take this leaf from out their road-making book.

The Minister of Public Works is responsible for the laying out, building, and repairing of the national, provincial, and communal Italian roads. The national roads, properly speaking, are those which connect the chief cities of the kingdom with each other and the seaports. The provincial roads connect the capitals of the different provinces, and the capital of a province with the county seats, and again link these cities and towns up with their nearest seaports. The communal roads are those running between the small cities or large towns. Below these ranks are other roads of merely local use and value.

The Italian classification of roads follows largely that of the French; perhaps it is their common origin in the Roman roads of old that accounts for this. The national and provincial roads of Italy have a width of eight to ten metres and the communal roads five to six metres.

Every automobilist in Italy should know something about the Roman roads of old, just in order to understand why the present lines of communication are laid down where they are, and why they often go straight up and over some Tuscan hill instead of going around.

"Those ancient roads,
Deserve they not regard! O'er whose broad flints
Such crowds have rolled,
So many pomps, so many wondering worlds."

Thus sang some poet of old, and with reason. What he did not take into consideration was their degeneracy to-day, their abrupt rises and falls in a hilly country, and their shockingly bad surfaces. The flints are not all broad on Italian roads, neither are the ruts.

The word *viae* with the Romans meant any sort of a road or highway, but more particularly was it adopted for historical references to those great lines of communication, surveyed, paved, and well cared for throughout all the régime of consuls and emperors. These Roman ways were above all strategic, as became the genius of the warring, conquering peoples.

The great Roman roads were marked with division stones or bornes every thousand paces, practically a kilometre and a half, a little more than our own mile. These mile-stones of Roman times, many of which are still above ground (milliarii lapides) were sometimes round and sometimes square and were entirely bare of capitals, being mere stone posts usually standing on a squared base of a somewhat larger area. A graven inscription bore, in Latin, the name of the consul or emperor under whom each stone was set up and a numerical indication as well.

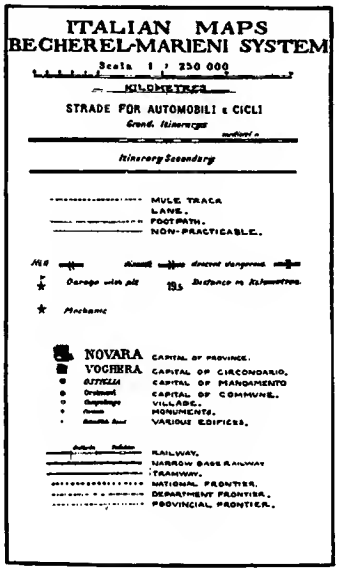
Caius Gracchus, away back in the second century before Christ, was the innovator of these aids to travel. The automobilist appreciates the development of this accessory next to good roads themselves, but if he stops to think a minute he will see that the old Roman was the innovator of many things which he fondly thinks are modern.

The greatest of all Roman roads was the Viae Appia, running from Rome to Capoul, the Appian Way of to-day over which automobiles, hunters and race horses fume and gallop in an effort to bury all thoughts of the past and keep up the pace of modernity. The young Roman of to-day is a very sporty individual, though he has got his ideas of sport from Anglo-Saxons. One fancies, when he comes to think of it, that the sportsman chariot-driver, runner, discus-thrower, or even gladiator of the old days was a good deal more thorough a sportsman nevertheless.

The desire for the quick transport of troops was the chief reason for the tracing and building of these famous Roman roadways, and the art sense was given full play at the same time, for these highways were refined and beautified by monumental and artistic bridges, arches and trophys. Even in Gaul these things were numerous, and to-day many of them are in an admirable state of preservation. Automobilists, coming to the French and Italian Rivieras, will recall this when rolling over the Viae Aurelicn, where, at Saint Chamas, is still the sublime Pont Flavian arching the roadway, as well as the Touloubre, or when viewing the old mile-stones at Salon and Saint Maxim and the now crumbled and desolate trophy at La Turbie.

At Rome, in the very geographical center of the empire, before the Basilica of Julia, was erected by the great Augustus a great *milliarium aureum*, a golden mile-stone—from which all the roads radiating from Rome took their departure. All along the length of the main roads were other mile-stones, many of them monumental and commemorative, and some even serving as roadside tombs of some good man or great.

Nine great roadways left this golden mile-stone leading to the ends of the kingdom. They were the Viae Appia, ending at Brindisi; Aurelia, traversing Etruria and Liguria and ending at Ailes in the Narbonnais; Claudia, which crossed Etruria; Flaminia, extending to Bologna; Lata, a subsidiary connecting roadway joining the Flaminia with the capital; Latina, a similar road, connecting with the Appia; Salaria, running east to the Adriatic; Trajana, also extending to the Adriatic; and finally Valaria, crossing the Sabine country.



Up to 312 B. C. these Roman roads were mere dirt roads, but when Appius Cladius set about to pave a Roman street he gave that impetus to road building which places the Romans firm in history as the first and greatest road engineers and builders.

This first road projected by Appius Cladius—an experiment it may be presumed—became the famous Appian Way leading to Capoul. Then came progress rapidly.

"GARDEN" IS TO BECOME A "CIRCUS MAXIMUS"

IT IS no easy task to supply a word picture of the plans of the decorative scheme of a big automobile show. Therefore, herewith is presented much of the material that comes from Press Agent Jervis concerning the "Ninth Annual Automobile Show" in Madison Square Garden, January 16 to 23, inclusive:

For many years Madison Square Garden may be said to have been to New York what the Circus Maximus was to ancient Rome. In the Garden the big shows, such as the "Wild West" and the circus with its chariot races, have held forth, similarly as the big races were held on the concourse of the Circus Maximus. Yet in all its history of varied service the Garden never has been treated by any showmen or decorators as if it were related to the famous Roman arena. The novel idea of doing this remained to be taken up by the promoters of the annual automobile show. The idea is now being carried out for the ninth national exhibition, to be held under the auspices of the Association of Licensed Automobile Manufacturers, January 16-23. The result will be an entirely new handling of the big ampitheater from a decorative viewpoint, simple and yet magnificent beyond all previous occasions.

In seeking to produce within the Garden a semblance of the Circus Maximus, the primary thought was to "open it up" and give the impression of spaciousness. All the signs and decorations of the main floor will be subordinated to this idea and kept lower than usual, so as not to interrupt the view from end to end.

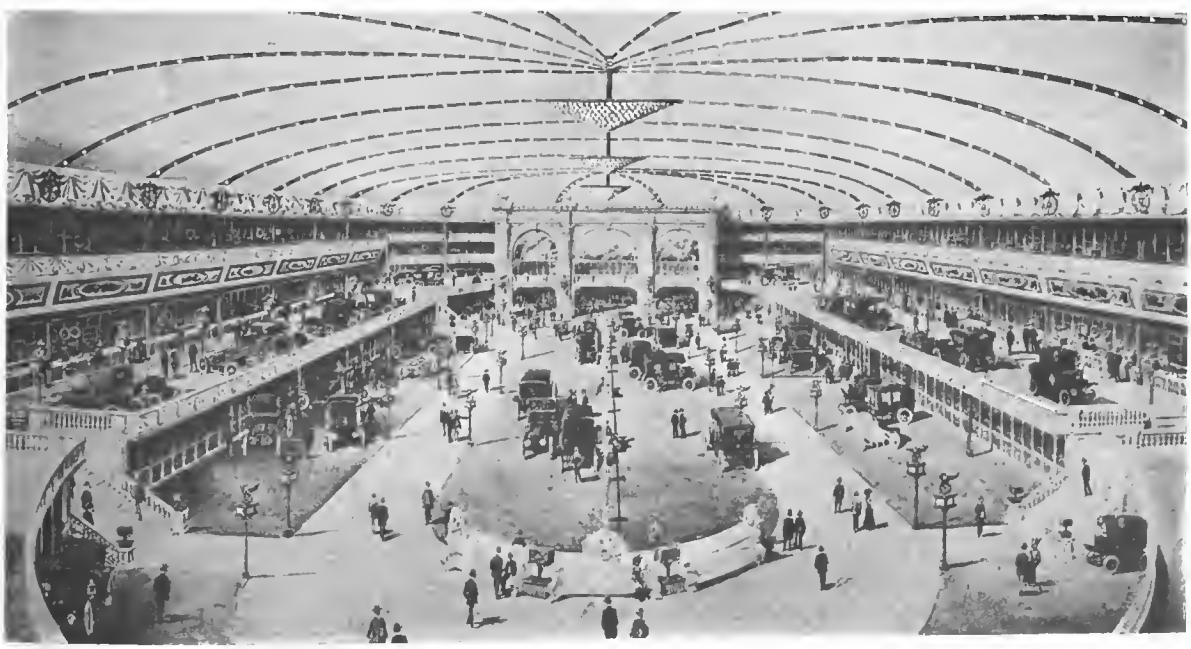
In working out this idea, W. W. Knowles, the architect, who conceived it, and who has done the designing for the whole show, has missed no point of which advantage might be taken. The layout of exhibitors' spaces, of the elevated platform, the galleries, railings, and other features, will be made to lend themselves to the idea, by being all in curved lines instead of angles. Most important in obtaining this effect is the building of the platform over the entrance, which for the first time will be in the shape of a half circle, so that from the entrance the mirrors will make it seem that one is standing within a complete ellipse and looking far away toward the other end of it.

The actual work on the decorating and the execution of Mr. Knowles' designs is in charge of S. R. Ball, who has done this work in former years. For the main floor the color scheme is brown and white and green, beneath a sky of azure blue. Immediately beneath the canopy of blue the girders of the Garden dome will glitter with myriad incandescent lamps, and a new feature of lighting will be found in twenty-five flaming arc lights, with colored shades, that will depend from the iron beams of the roof.

The floor beneath will be carpeted with green, where the exhibition spaces are, and bare boards will serve for aisles. In a row down the center and at all the spaces of the sides will be white lamp-posts that will inform visitors of the names of the exhibitors, and will be also guide-posts, directing them to the various departments of the show. Between the central row of posts will be tufted seats. Opposite the Madison avenue entrance will be a low electric fountain of gray stone, that will sweep in a curve about the foremost exhibits of the central space, the convex side being toward the entrance. In the basin of the fountain, beneath plashing sprays of water illuminated by parti-colored lights, goldfish will disport themselves, while real pond lilies ride upon the wavelets.

At the Fourth avenue end of the main floor will be the masterpiece of the whole great plan, the big triumphal arch, having three bays and extending from floor to roof.

The elevated platform will be supported from the main floor by white Doric pillars, and also the steps leading to the platform will be white. The walls back of the platform will be finished in panels of brown burlap, and in the beveled soffit, between the walls and the facing of the gallery, will be oval panels containing frescoes that depict the history of vehicular progress. These illustrative panels will be on both sides of the ampitheater and the pictures will tell the story of man's advance in personal transportation from his seat astride the little ass to his seat at the wheel of an aeroplane. Above these colorful panels will be the face of the gallery draped in white bunting; back of this the side wall will show in brown burlap and above between the sky line and the vertical decorations, will be an apron of white bunting, tufted and festooned, and pinned at places by the new show emblem of the A. L. A. M.



Main Floor of Madison Square Garden as Arranged for the A. L. A. M. Show, January 16-23.

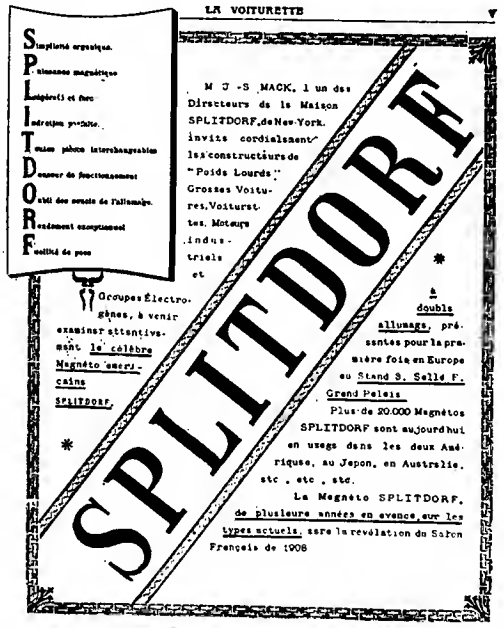
Even as the main floor, the different departments of the show in various parts of the Garden, will have a wholly new treatment. Nothing more novel ever has been introduced in decorations than the latticed arbor that will hood the concert hall with an arch 42 feet in span and 28 feet in height.

In the café, just off the foyer of the Madison avenue entrance, where are to be the electric vehicles, another strikingly novel scheme will be presented. Here the exhibits will appear beneath an Italian pergola, and as one looks over or between the cars he will get the impression of looking over a stone wall upon an Italian landscape.

In the basement, the white and brown color scheme will be maintained, and the rathskellar, which has been a feature for two years, will be more interesting than ever.

AMERICANS WHO WERE AT THE SALON.

PARIS, Dec. 17.—There was an exodus of American automobilists from Paris on the closing of the Salon at the end of last week. Among those who crossed the Atlantic to attend



First Indication of American Accessory Invasion.

the European shows and hurried home for Christmas were: Charles C. Clifton, of the George N. Pierce Company, Buffalo; David J. Post, of the Veeder Manufacturing Company, Hartford, Conn.; J. D. Maxwell, of the Maxwell-Briscoe Motor Company, Tarrytown, N. Y.; Mr. and Mrs. Emil Grossman, William Hyslop, automobile agent in Toronto, Can.; Russell Huff and H. D. Wilson, respectively chief engineer and European representative of the Packard Motor Car Company.

Mr. Wadsworth, of the Michigan Steel Boat Company, has gone South, and will sail from Naples on the *Caronia* December 22, in company with his wife and family. Another automobile passenger on the same boat will be Howard B. Coffin, of the Chalmers-Detroit company, who visited the London and Paris shows. Mr. King, formerly of the Northern company, who has been resting in Europe for several months, will stay here together with his wife until the spring.

John L. Poole, now European representative of the Buick company, and for several years chief selling agent in Europe of the Oldsmobile, soon intends to sail westward, severing all connections with the European market. After undergoing an operation at Chicago and resting for several weeks at French Lick or Hot Springs, Mr. Poole will take up an engagement in the States, the nature of which he is not yet ready to communicate.

Joseph Mack and Paul L. Snutzel, who have visited Europe on behalf of C. F. Splitdorf, will return home after making a tour of the Belgium factories, sailing from Antwerp on the *Zeeland* December 19. They will both return to Europe later in order to terminate arrangements for Splitdorf agencies in Europe. Mr. Mack declares that the results of the stand at the Paris Salon have exceeded all expectations; the Splitdorf coils and electric appliance have been well received by European constructors. The interest in the first American magneto to be placed on the European market is proved by the fact that arrangements have been made for the magneto to be tested on the cars of the following important manufacturers: Pipe, Gregoire, Bianchi, Pilain (of Lyons), Rollain-Pilain, La Buire, Delaunay-Belleville, Delahaye and Roy, of Bordeaux.

Charles C. Clifton declared that the most striking tendencies of the Paris Salon is toward the construction of small two and four-cylinder cars, rated at 8 to 12 horsepower in France, but which would pass for 15-20-horsepower models in America. "Practically every constructor of importance has produced such a model for the coming season, the supply apparently being so great that one may wonder if it will not exceed the demand. There is a lot of interesting matter tending toward the simplification of all mechanical organs; there are also plenty of new mechanical features well worth watching. A striking tendency is toward the adoption of dark colors for automobile bodies, this being so general at the present show that a light-colored car is a distinct novelty. It seems evident that there is a desire to avoid the necessity of frequent washing."

TO SHOW OR NOT TO SHOW, IS THE QUESTION.

PARIS, Dec. 15.—It is now for the Automobile Club of France to decided whether there shall be a salon in 1909. Recently a deputation of nine of the leading constructors, representing Renault, Dietrich, Panhard, Delaunay-Belleville, Brasier, Motobloc, Gobron and Bayard-Clement, waited on Gustave Rives, organizer of the salon, and informed him that a large number of important firms had decided to take no part in any show next year, and requesting that no salon be held until 1910.

The only reply that could be given by Gustave Rives was that he would communicate the wishes of the deputation to the Automobile Club of France, who would consider the matter and give a decision at an early date. The chief mover in the Paris shows took the opportunity of pointing out that even if the Paris Salon were abandoned, it was not likely that London would consent to cast off its annual exhibition, thus it would still be necessary to create new models every year whether they could be exposed at Paris or not.

Small car builders have also met to consider which party they shall support, but were unable to come to a decision. The accessory men are strongly in favor of a show, while aeroplane constructors believe that a salon every year would be a valuable means of developing their branch of the industry.

NEWARK WILL HAVE ANOTHER SHOW.

NEWARK, N. J., Dec. 21.—Newark will hold an automobile show from February 20 to 27. The State Military Board has granted the use of the new Essex Troop Armory, in Roseville avenue, to the New Jersey Automobile Trade Association, which organization will conduct the affair, which will also be held under the auspices of the First Troop, N. G. N. J.

H. A. Bonnell, of East Orange, treasurer of the American Automobile Association, has been selected to manage the show. Mr. Bonnell was formerly secretary of the New Jersey Automobile and Motor Club, which position he relinquished last year to become secretary-treasurer of the Associated Automobile Clubs of New Jersey.

Farman Trying Out His New Aeroplane over the Plain at Châlons.

PARIS, Dec. 17.—James Gordon Bennett has offered a cup valued at $2,500, which will doubtless take the same position in the flying-machine world as was held by the Bennett trophy in the realm of the automobile. In addition to the cup, to be competed for annually, there are three prizes of $5,000 each to be paid out in cash to the winners of the trophy in 1909, 1910 and 1911. The trophy has been placed in the hands of the Aero Club of France and must be put up for competition by them under regulations to be drawn up by the International Aeronautical Federation.

The scene of the first race will be in France, the succeeding races to be held in the country of the club winning the trophy, as was done for the Bennett automobile cup.

The first race will be held over a distance yet to be decided upon, either in a straight line, in a broken line or over a closed circuit, the winner being the one who completes the course, or in case several complete it, the one making the fastest time. General regulations for the race must be decided each year before the end of January by the International Federation, engagements being received until March 1, and the race run between May 1 and November 15. Each federation or club has the right to enter not more than three competitors for the Bennett race, with the same number of reserve men, the competitors and reserve aeronauts being of the nationality of the club.

Club Accepts President Roosevelt's Offer.

NEW YORK CITY, Dec. 22.—At a meeting of the medal committee of the Aero Club of America President Roosevelt's offer to present the gold medals awarded by the club to the Wright brothers, in the East Room of the White House, was formally accepted. The club originally invited the President to make the presentation in New York, which was declined and the above offer made. It is anticipated that the presentation will take place some time during the week of January 23.

The committee has selected the design submitted by Victor D. Brenner from the numerous sketches made by various artists. The obverse will bear a portrait of the Wright brothers, while the reverse will show an accurate representation of the Wright aeroplane in full flight, in addition to the seal of the club. The medals will be three inches in diameter and of gold, though a number of replicas in silver and bronze will also be struck off. The cost is estimated at $2,000, of which over $1,200 has already been raised. At the request of the medal committee, Congressman Herbert Parsons, who is a member of the club, will introduce a bill into Congress asking that official cognizance be taken of the achievements of the Wright brothers by presenting them with a special Government medal in appreciation of the fact that they have placed America in the front rank in the science of aviation.

The annual dinner of the Aero Club will be held in New York shortly after the presentation of medals at Washington.

Wright's New Records.

LE MANS, Dec. 18.—By remaining up for a greater length of time than has yet been possible to any other aviator, by flying a greater distance than had previously been covered, and by ascending to a height not hitherto attained by a heavier than air machine, Wilbur Wright again demonstrated his complete mastery of the air to-day. The first trial was undertaken at 10:12 A. M. and was an official attempt at the Michelin prize for distance. This is a cup offered by M. Michelin for the greatest distance made by an aeroplane during 1908. Mr. Wright continued to circle the aerodrome until 12:05, during which time he went round the Auvours circuit 45 times. According to an official of the Aero Club who was present, this was the equivalent of 90 kilometers, but as Mr. Wright circled the posts wide at each turn, the actual distance covered is said to have exceeded 120 kilometers, or about 72 miles.

During the afternoon Mr. Wright competed for the height prize offered by the Aero Club de la Sarthe, and in less than ten minutes after leaving the ground demonstrated conclusively that the limitation of 328 feet imposed by the captive balloon anchored on the circuit for the purpose was a mere nothing. After circling around several times he sent his machine well above the balloon, at a height estimated at 360 feet.

F. S. Lahm Seeks Aeroplane Capital.

NEW YORK CITY, Dec. 21.—On the French liner *La Provence*, arriving here yesterday, were Frank S. Lahm, father of Lieutenant Lahm, now at Fort Myer, Va., in charge of the Government aeroplane tests, and Cortland Field Bishop, president of the Aero Club of America. Mr. Lahm has been a resident of Paris off and on for the past 30 years, but he is an enthusiastic American and a strong believer in the fact that the Wright brothers' methods of aviation will eventually be adopted universally, either commercially or for purposes of warfare.

Speaking of his experience in flying with Mr. Wright, Mr. Lahm said that it was a bit exciting at first, but taken all in all was a most delightful sensation. "It was as if we were on a steamer in a calm sea with a gale of wind driving past us," he continued, "or sitting in a chair exposed to a strong breeze. Had I not seen Mr. Wright alight a great many times, our sudden drop would have been unnerving, as we came down at the rate of a mile a minute in big spirals, until when near the ground the machine was manipulated so that it came to earth without a jar. I expect to see a Wright machine make a flight across the English Channel and back before next spring."

Cortland Field Bishop said that the Wright brothers had become the idols of all France, and that Orville Wright's intention was to establish a school at Pau, upon his return to Europe. "I am informed that the Wright brothers will begin the manufacture of aeroplanes on a large scale," said Mr. Bishop, "the best ones costing about $5,000, with small ones as low as $1,000.

HOW THE A. C. F. IS KILLING ITS GRAND PRIX

PARIS, Dec. 17.—Engagements are open for the French Grand Prix, to be run on the Anjou course in "Chateauland," July 2, 3 or 4. For $1,000 a single car not exceeding 130 millimeters bore can be entered; for two racers the price is $1,800, while for a full team of three the sum of $2,400 must be paid over to the Sporting Commission of the Automobile Club of France. But if automobile constructors want to race over the smooth roads in the neighborhood of Angers they must pay down their cash with unusual promptitude, for the Racing Board has taken the decision to abandon the Grand Prix unless forty entries are received at 6 p. m. on Thursday, December 31. In other words, the Sporting Commission of the Automobile Club of France has decided to kill its own race. Lacking sufficient courage to put it out of existence with an honest blow, they have imposed such conditions that there is nothing to be done but accept the Grand Prix as dead and awaiting a formal interment.

Seventeen European firms, comprising Benz, Brazier, Bayard-Clement, Dietrich, Germain, Mercedes, Motobloc, Panhard, Renault, Berliet, Deon Bollee, Darracq, Delaunay-Belleville, Isotta-Fraschini, Minerva, Peugeot and Pipe, have signed an agreement not to take part in any race in 1909, and further, to do everything in their power to prevent outsiders using their cars for racing purposes. Breakage of the engagement will incur a penalty of $20,000.

The result of this agreement is that the possible number of starters in the next Grand Prix is reduced by twenty-four. In 1906 there were 32 cars in the French Grand Prix; in 1907 the number was 37; this year there were 48 starters at Dieppe. Deduct 24 from the highest of these figures and we are still far from the 40 which the club must have for its annual race.

Officially the reason for this minimum is that the race cannot be made to pay with a smaller number of cars. One does not need to be a mathematician, however, to figure out that since the 1908 Grand Prix realized a profit of about $30,000 with 48 starters, and that the 1907 race gave a credit balance of about $10,000 with only 37 cars, it is possible to hold the race with even 30 cars or less and still have a balance on the right side. Another reason for putting this ban on racing is that long distance speed contests are too costly for the manufacturer. No one denies the truth of the statement, but with the profits already in hand and obtained each year the objection could easily be removed if there was any desire to do so.

The truth of the matter is that the big French manufacturers have got cold feet. Dieppe disheartened them; Bologna discouraged them still further; Savannah had no influence whatever, for there was not a manufacturer in France or an engineer acquainted with the cars who had the least hope of seeing a French machine carry off the trophy.

But for outside pressure and liberal help from the tire firms not a single French car would have been sent across the Atlantic.

For the present entries are open, and indeed three have already been received by the secretary of the racing board, the firm being Cottin-Desgeuttes, of Lyons, and the cars four-cylinder models of 130 millimeters bore and 200 millimeters stroke. A small group within the club and a still larger group without have hopes that the forty cars may be found in the twenty-one days allowed, thus forcing the club to organize the race it has promised but has done its best to kill. Of those taking part in last year's race Mors, Itala, Fiat and Opel have refused to sign the anti-racing agreement, and might all be induced to take part in the 1909 event. Add to these three cars from America, six from England, six from the smaller Italian firms which took part in the 130 millimeter Italian race of this year, nine from the smaller French firms not previously taking part in big races, and the figures would be so near the limit that somebody would be induced to complete the number. It is indeed declared that should the entries be only two or three short of the necessary number De Dion would come forth and fill the breach. The Marquis de Dion has been one of the stoutest opponents of racing, but is now of the opinion that, in view of the engagements taken and the promises made, the club cannot abandon its Grand Prix without losing all prestige.

STRUGGLING WITH BRIARCLIFF TROPHY RULES

SUPPLYING satisfactory rules for a stock chassis race is a task that requires patience, ingenuity, and a conclusion in advance that the regulations will not be acceptable to all those who might care to participate. After the so-called "Committee of Automobile Manufacturers" had announced the rules drawn up last week, there was immediate objection from several quarters, protesting against a maximum bore of 5¼ inches, minimum weight of 2,600 pounds, and minimum wheel base of 110 inches. It was immediately shown that these conditions made the event a high speed race and would compel concerns which had competed in the 1908 event to build special racing cars for the 1909 contest. So pronounced were the objections that the committee met again on Tuesday last at the clubhouse of the Automobile Club of America and continued in session the whole afternoon.

The final outcome was the announcement of new conditions providing for a maximum bore of 4⅝ inches and a maximum stroke of 6 inches for a four-cylinder engine, or, in other words, a total piston displacement of 403 1-5 cubic inches. The revised wheelbase minimum calls for 118 inches and the minimum weight is reduced to 2,300 pounds. Furthermore, the committee decided to ask the donor of the trophy, Walter W. Law, to agree to the changing of the conditions requiring that "the manufacturer of a car entered in the race shall have sold and delivered or have built and have had ready for delivery at least thirty days before the date of the contest in the year 1909 at least ten cars similar in each and every respect to the car offered for entry."

It is predicted that Mr. Law, who is now en route home from Europe, will not agree to change the character of the race.

After the meeting the first entry was filed, it being that of Paul LaCroix, who nominated a Renault.

While in Kokomo the other day, John C. Wetmore interviewed Apperson Bros., who are quoted as follows:

"We do not believe that a satisfactory stock car definition can be evolved. Henry Ford, H. O. Smith, Walter Marmon, A. C. Newby, George A. Weidley and one of us spent ten days in trying to evolve a stock car definition for the A. A. A., and I don't think we succeeded very well. If we are to have races let us set a cylinder and a weight limit, and then let each maker build around them the best cars he can. These limitations, however, should be limitations suitable for the engines that are to be included in our regular stock cars. In a word, we should demonstrate in the big races the capability of the actual engine used in our stock cars. What bodies or running gear are used it is really immaterial, provided the outfit be within the weight limit. We favor engine and weight limitations for each class of standard car in, say, four distinct classes. For instance, class A might be 5½ by 5, class B, 4½ by 5, and so on down the line. The public, we repeat, wants a stock-car engine demonstration and not an exhibition of speed attained by engines not appearing in regular stock models."

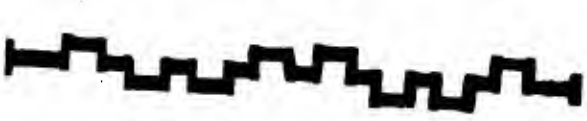
AUTOMOBILE MOTOR CRANKSHAFTS DISCUSSED

By THOS. J. FAY, President Society of Automobile Engineers.

As a measure of the utility of steel, it is possible to devise a formula such as will serve to forecast (in a modest way) the probabilities. Such a forecast might be set down as follows:

$$U = \frac{\text{Tensile Strength} + \text{Elastic Limit} \times \text{Elongation}}{10^5} = \text{Utility.}$$

It is, of course, necessary to make all comparisons using test specimens of exactly the same dimensions in every case. The



An Eight-Cylinder Proposition in One Piece.

author prefers to use the "International Standard," the main dimensions of which may be set down as follows:

Between enlargements = 2 inches

Diameter enlargements = 1-2 inch

To show the working of the method, it will be the idea to establish the U value of the chrome nickel steel previously taken for comparison, thus:

$$U = \frac{150{,}000 + 130{,}000 \times 12}{10^5} = 33.6$$

A very low value, due to heat treatment of the steel.

It is not the purpose here to set down in black and white the unqualified statement that high elongation is an absolute sign of kinetic ability irrespective of any other consideration. It is fair to say that the absence of this property is in the absence of kinetic ability.

Looking at the matter from another angle it is to say,

$$\frac{\text{Elastic Limit}}{\text{Elongation}} = \text{the lowest possible value in the best possible steel.}$$

For the steel just taken this value would be as follows:

$$\frac{130{,}000}{12} = 10{,}833$$ which is a rather high value for the class of steel represented, but the same class of steel is prone to go wrong in this direction; 5,000 would be a good value.

Take "carbon steel" and fix upon its "utility" factor "U" under changing conditions of the carbon content. To begin with, it will be necessary to fix upon the physical properties under the several conditions of the carbon content, which will be as follows:

PROPERTIES OF ACID OPENHEARTH STEEL.

Points Carbon.	Tensile Strength.	Elastic Limit.	Elongation % in 2 Inches.	Utility Rating.
10	55,000	28,000	30	24.9
20	65,000	32,000	26	25.3
30	75,000	37,500	22	24.75
40	85,000	42,500	19	24.22
50	95,000	47,500	17	24.22

The figures taken were picked more or less at random from tests of carbon steel, which, however, does not debar their use for the intended illustration. What we find is that according to the method employed the value "U" is not changed (substantially) by changing the carbon content. Of course, by treatment the values are lowered when desired, but it can be shown that the "U" value will be nearly the same, irrespective of the changes, so long as the steel is not alloyed.

A genera of steel, then, has its own utility value, and if a greater value is desired it is necessary to alter the chemical composition of the product. It will be possible to say that there are any number of cases in which the tests would show a substantial departure from the values as here given. This fact does not make the method wrong; indeed, it would show that some of the steel might be below the quality possible of attainment in good practice, or it might show an occasional test of steel better than can be expected in the general run of things.

In further proof of the accuracy of the scheme it is only necessary to compare the results attained by the usual manipulation of a given specimen of steel, such as the following:

The tests of a specimen of 44 points carbon steel show results as follows and the "U" values as calculated by the author show substantially constant for all, no matter what the treatment:

STEEL IN THE NORMAL STATE.

Tensile strength in pounds per square inch	92,000
Elastic limit in pounds per square inch	36,000
Elongation	19%
Utility value	24.32

WATER QUENCHED AT 850 C. AND ANNEALED AT 550 C.

Tensile strength in pounds per square inch	156,000
Elastic limit in pounds per square inch	92,700
Elongation	10%
Utility value	24.87

OIL QUENCHED AT 850 C. AND ANNEALED AT 550 C.

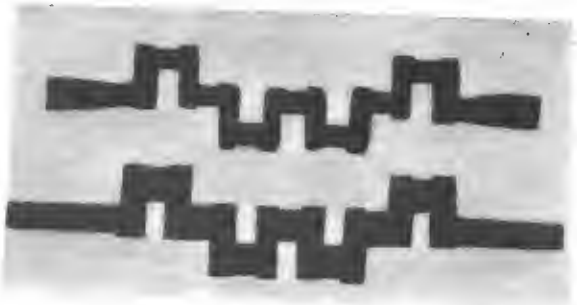
Tensile strength in pounds per square inch	126,000
Elastic limit in pounds per square inch	70,000
Elongation	13%
Utility value	25.48

It will be observed that this utility rating, or value, as it is termed for want of a better name, hangs to the carbon steel with great tenacity at or near $U = 24$. It is true, however, that very low and very high carbon contents are prone to influence the results.

There is one other point of moment to take into account, *i.e.*, each genera of steel has its own figure of merit, such as ought to be reached, else it would be possible to say of the steel, it is not up to the customary standard of merit. These values can be set down about as follows:

(1) Swedish iron 34
(2) Carbon steel 24
(3) Nickel steel 34
(4) Vanadium chrome steel 44
(5) Chrome nickel steel 54
(6) Special alloy steel 64

(1) Swedish iron and some brands of English iron as "Farnley" are possessed of a higher "U" rating than any of



Showing Die Forging of Chrome Nickel Steel.

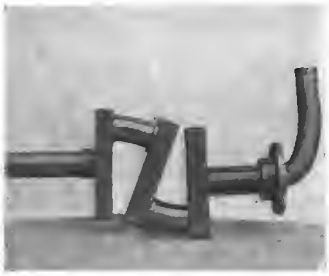
the grades of carbon steel. It is on this account, perhaps, that Lemoine and others were wont to use iron in automobile construction, be it said to their credit, with more than a little success.

(2) So variable in its character as not to lend confidence, either in the matter of fixing a rating or in the use of the steel, due entirely to the presence of carbon.

(3) A very stable rating in the grades of nickel steel holding a low carbon content, that is to say, with carbon below 16 points.

(4) Subject to considerable variation, especially if the carbon is somewhat high, or, in treated products.

(5) The author never found more than one grade of alloy steel in which the "U" rating reached the high value here given.



Double Opposed Krupp Steel Shaft after Test.

(6) The carbon content does not alter the rating materially, even considering wide variations of the same. Heat treating does not increase this rating over and above what it should be in well-fabricated normal steel. Heat treating, however, will readily decrease the rating. This will be possible for several reasons, as, overheating, heating at too great a rate, or quenching under mal conditions. If the material is not what it is supposed to be and the treatment is not therefore in accord with the requirements in view of the composition of the steel in fact, then it is assured that the rating, so called, will be altered. On the whole, however, it is to say, the rating will hold to a fairly constant value for any given genera of steel.

Without further reasoning we can reach these conclusions:

CRANKSHAFT STEEL.

(*a*) Should have a low carbon content.
(*b*) The tensile strength should be high.
(*c*) The elongation should be high.
(*d*) The "U" rating should be high.
(*e*) The unit stresses should be low, very low indeed.
(*f*) The elastic limit might be low without detriment if kinetic ability may not be reduced thereby.
(*g*) The steel should be well fabricated.
(*h*) The low carbon would indicate higher manganese and some alloying.

The general inference is that the tensile strength should be high and that the initial rigidity will be a maximum. The elongation should be high since kinetic ability might then reside in the steel. The elastic limit is not so important provided the unit stresses are established by designing at a very low point. Low carbon indicates ability to manipulate the steel without danger of destroying the good qualities of the same.

HEAT TREATMENT.

The desired heat treatment is that which will increase tensile strength and elongation at the expense of elastic limit in such a way as to improve kinetic ability, referring, of course, to crankshaft work. The following table shows that it is possible to do so:

SOME RESULTS OF HEAT TREATMENT.

Condition.	T. S.	E. L.	Ex.	Identification.
Normal.....	65,000	29,100	27.2	Manipulation of carbon steel in which the carbon content was 16 points, as reported by "Brinell."
Annealed.....	67,000	40,000	30.9	
Treated.....	78,800	30,900	22.1	
Treated.....	71,900	25,300	27.8	

An inspection of the test shows that the tensile strength can be increased at the expense of the elastic limit without affecting the elongation. The test also shows that the "U" value will not be diminished in the process below the customary point. The difference as between oil and water quenching, with subsequent reheating, was well illustrated in this case. Alloy steel if treated at the temperatures suitable for its qualities would be quite as or even more susceptible. Finally, it may not be too much to say the whole discussion rather goes to show that it is the mal use of steel that ends in disrupted crankshafts rather than a question of the materials to use. It is a fact, nevertheless, that very effective results might follow were the steel somewhat especially fabricated for the work, although it does not follow that the best steel for the purpose will necessarily have to be the hardest and the strongest steel.

There is one other point that can well be mentioned at this time. The advantages of heat-treating will be influenced by the shape and the manner in which the steel is handled. If the forgings are bruised in the process it will be quite out of the question to realize any very noteworthy results, no matter what the process may be. Then, again, there is the question of the shaping of the cheeks, that is to say, the manner in which the contour is effected. If crankshafts are cut from the solid they may be good, or bad, depending upon the question of the relation of the grain to the contour, if there is any indication of fiber in the structure of the steel. In a dozen different ways the treatment may be effected, as, for illustration, twisting the crankshaft to locate the cranks in the desired angle will surely effect the results, if the material is not of the kind to stand the twisting; moreover, very few are the grades of steel that will stand this twisting and not deteriorate in the process. On the other hand, if the steel is of the right grade, the tensility, hence the rigidity, will be increased by the twisting. If rigidity is wanted, this is one way to realize the same.

Relation of the Bearings to Material of the Crankshaft.

Discussion in relation to the question of the relative value of "plain" and ball or roller bearings is a matter that cannot well be advanced to any definite conclusion without considering the materials used in the crankshafts. In a word, if plain bearings are to be used the material of the crankshaft will have to be of the kind or in the condition such as will allow of the use of plain bearings. It is probably well understood that there is a great difference in the performance as between steel in the normal state and the same steel in some one of the several conditions in which it can reside. Pearlitic steel (steel in the pearlite state) is generally regarded as a poor material for use in bearings. All untreated steel, if the carbon content is below 90 points, is of the pearlitic genera and is not the best for bearing work. True, there is a considerable difference as between the various brands of pearlitic steel. For instance, a well-fabricated steel will serve better for a bearing than will the same steel not well fabricated.

Wootsite, or steel in the Marientistic state, may be far better for bearings of the plain type, but it must be remembered that these conditions are the product of a special heat treatment. This special heat treatment is not always afforded, and it is not always a fact that the crankshafts are in the best possible state. With ball or roller bearings these are not matters of moment since the "journal" portions of the crankshafts do not have to do bearing work. In other words, where the materials have to do special bearing duties they are heat treated to bring about the desired condition. If it is true that in ball bearings the steel has to be rendered as Wootsite to afford the desired results, then it is equally true that plain bearings should be rendered suitable. It is not the purpose here to maintain that any one of the intermediate conditions will best serve the purpose more than to say that for the best results in bearings the steel has to be heat treated, which involves a quench from some high temperature and subsequently the steel has to be "let down." It is some intermediate condition due to "letting down" or tempering that is sought in order that the steel will be in the

Balanced Four-Cylinder Crankshaft of Alloy

best possible condition to do bearing work. As before intimated, in ball or roller bearings this matter is attended to since they are heat treated and in them the material resides in the best state for bearing work.

Material in Crankshaft Should Be in a Different State.

These are all matters besides the question of the strength of the crankshaft and they are of even greater importance since a crankshaft is of no value at all if the bearings fail to work in a satisfactory manner. It is not uncommon to hear the statement made that the "Babbitt" lining in the bearing proper is of some wonderful grade that assures entire freedom from bearing troubles of every kind. There is nothing in such a statement unless the materials of the crankshaft (journals) are also suited to the purpose. Of course, it would be an unjustifiable expense to use such fine materials as go into ball bearings (of the grade that are used in crankshafts) for crankshafts and, again, such materials are not so good for the purpose under the conditions in which a crankshaft has to work as they are in ball-bearing work. It follows that the best combination is one involving the materials for crankshafts of a highly kinetic character and of great rigidity in combination with materials of the highest bearing qualities in the ball or roller bearings, the later from the bearing point of view only.

It is a well-known fact that materials for ball or roller bearings are not suitable for crankshaft work. It is equally well known that the ball or roller bearings are made of the best materials for the purpose. How, then, can the best possible results be realized without actually resorting to the use of the special bearings; that is to say, the ball or roller bearings. Without stating definitely the composition of materials for ball bearings, it is fair to say they take into account the carbon content at a point bordering upon free "cementite" with the steel in the normal state. Free cementite presupposes carbon above 90 points, and in such steel it is out of the question to consider the same as suitable for use in what are known as "machine members," in which the dynamic conditions are such as to include bending, sheering, and torsional moments. Statically, this material will serve very nicely, or, if the moments are as in a ball bearing, the results are very fine, as has been proved in practice.

Reducing the carbon reduces the ability of the balls and the races, and as a result it is plain that the materials that serve best for ball, and, roller bearings, are the least suited for crankshafts. Logically, then, the ball bearing crankshaft is something to take into account. The reason for this should be quite clear, since it enables the designer to use,

(a) Crankshaft materials of a highly kinetic character that is easy to work.

(b) Ball-bearing materials exactly suited to the work.

INTIMACY OF THE RELATION OF TORQUE TO SPEED

CURIOUS as it may seem, it is not uncommon to hear autoists talk about the torque of their motors on a basis of the pressure that is due to "cold compression," not taking into account that the compression, in fact (under running conditions), is entirely at variance with the cold compression. The difference is generally considerable, and, unfortunately, the compression falls away as the speed of a motor is increased. In a general way, it will be possible to look at this important matter in the manner as follows:

Let

$H.P.$ = the actual horsepower of the motor;
S = the angular velocity of the crankshaft, in r.p.m.;
P = pull in pounds;
R = radius of the lever-arm in feet;
π = the ration of diameter to circumference;

then,
$$P = \frac{H.P. \times 33{,}000}{2\pi R S} \qquad (1)$$

and,
$$S = \frac{H.P. \times 33{,}000}{2\pi R P} \qquad (2)$$

$$H.P. = \frac{2\pi R S P}{33{,}000} \qquad (3)$$

$$\pi = \frac{22}{7} \text{ nearly}; \quad = 3.1416, \text{ nearly} \qquad (4)$$

$$R = \frac{H.P. \times 33{,}000}{2\pi S P} \qquad (5)$$

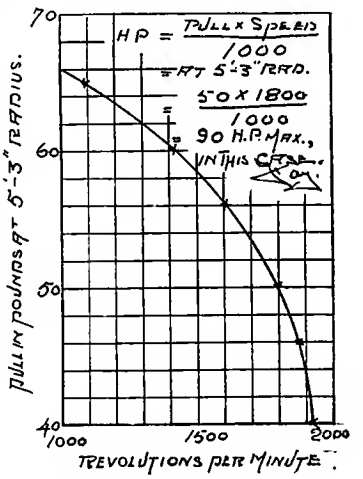
Considering a "prony" brake for testing purposes, if the arm of the same is 5 feet 3 inches long (balanced), it is then possible to simplify the formula (3) in a manner as follows:

$$H.P. = \frac{P S}{1{,}000} \qquad (6)$$

The curve as here given is of a test using a brake (compensating) of the description in which the lever-arm was of the length as stated. An inspection of the curve will disclose not only the shape of the curve of torque, but the point at which the motor (in this case) delivered its maximum power. The best way, perhaps, to make the matter show up to excellent advantage, will be to give a tabulation of the results as follows:

(a) $1{,}000 \times 66 = 66{,}000 \div 1{,}000 = 66$ horsepower.
(b) $1{,}500 \times 58.5 = 87{,}750 \div 1.000 = 87.75$ horsepower.
(c) $1{,}800 \times 50 = 90{,}000 \div 1{,}000 = 90$ horsepower.

In the actual test of this motor it was a fact that the motor did deliver slightly more power than the value given in the line (c) at a speed somewhat above 1,800 r.p.m., but it is also true of this motor that at 1,900 r.p.m. the power fell away, showing that the limit of useful speed was reached. As will be seen, the power increased steadily, between 1,000 and 1,900 r.p.m., although it is also true that the torque decreased during all that period. On the other hand, the torque did not decrease in the same ratio as the speed increased, hence the increase in power.



Relation of Torque to Speed in a Motor.

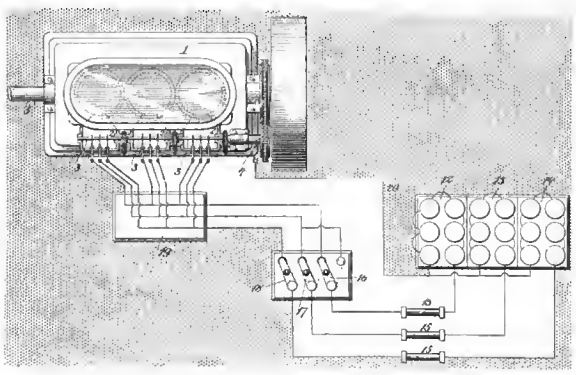
The relation of torque to speed is desirable just so long as the speed will increase at a greater rate than the torque will decrease. So long as this state of affairs can be maintained, just so long will the power continue to increase, thus increasing the "weight efficiency," which is the matter of great moment in work involving the automobile. Under such conditions it is only necessary to take into account the question of the stability of the motor, assuming a fair first cost, in dollars per horsepower rating, and not in dollars per pound of motor. When a motor delivers so much power that it depreciates too rapidly, then it is equal to saying that the weight efficiency is excessive. This condition can be due to bad material or inferior design in motors involving a good relation of torque to speed.

DUAL IGNITION PATENTS CLAIMED BY APPERSON

ETERNALLY events repeat, and it is now claimed that the patent situation will take on exciting phases due to the presence of another "basic patent," or a patent with such broad claims as to give to the owners a monopoly in so far as dual ignition systems are concerned in conjunction with internal combustion motors such as are used in automobile work.

Elmer Apperson, of Apperson Bros.' Automobile Company, Kokomo, Ind., partially by acquiring the patent issued to F. E. Canda, January 17, 1899, and by taking out another patent in his own name, has built up what is claimed to be a strong situation. The Canda patent is No. 617,806, and the Apperson patent is No. 905,625, which later patent was issued December 1 this year. These patents, as the further information here given will show, relate to dual ignition systems as are in use on nearly every automobile on the market at the present time employing the double system.

To what extent this situation will complicate matters is a question that the future will have to decide, and as to the merits of the patents enough it is to say that they hold until



Plan of Canda Patent Electric Ignition System.

they are upset by a court of competent jurisdiction, and not before. In the meantime, it is not too much to anticipate that the present owners of the patents will endeavor to realize upon their holdings. With a view to showing, in the most accurate manner possible, just what these patents amount to, the preamble and the claims of each will be given in full. Since the Canda patent was issued first, it will be first exposed to view, as follows:

Preamble of the "Canda" Patent.

My invention relates to improvements in gas and oil engines, and particularly to improvements in electric igniting and speed-regulating mechanism for such engines.

My invention consists in employing a plurality of igniting devices for each engine cylinder and operating, by preference, a plurality of such igniting devices during each working stroke of the cylinder, so as to insure the production of a spark by some one of the igniting devices during each working stroke; in providing separate circuits and batteries for the separate igniting devices of each engine cylinder and switches by which one or more of the batteries may be disconnected or connected with a different set of igniting devices from that to which it is ordinarily connected, thus making it possible to locate or bridge over any defect in the operation of the igniting mechanism which may occur during the operation of the engine; in so arranging the several igniting devices of each engine cylinder that ignition may be produced at different periods in the stroke, thus making it possible by throwing one or more of the igniting devices of each engine cylinder out of circuit to vary the speed of the engine, and in the novel combination, construction and arrangement of the parts.

The objects of my invention are, first, to provide an igniting mechanism which shall more certainly ignite the explosive charges of oil and gas engines than the igniting devices heretofore in use; second, to provide means for locating defects in the operation of the igniting mechanism and for bridging over such defects without interfering with the operation of the engine; third, to provide simple means for varying the speed of the engine which may be operated at a distance from the engine.

In the drawings the invention is shown as applied to a three-cylinder vertical engine, but it may be applied to any single or multiple cylinder gas or oil engine of any type, and the particular igniting mechanism employed comprises a series of sparking contact-points, with means for bringing them together and separating them at proper intervals, and suitable circuits and electrical generators therefor.

In former gas or oil engines having electrical igniting devices trouble has been experienced through the occasional failure of the igniting device to cause ignition at the proper times. Entire failure of the igniting device to cause ignition continued for several successive strokes necessarily stops the engine, and the occasional failure of the igniting device to cause ignition at the beginning of a working stroke or ignition at too late a period in the stroke interferes greatly with the efficiency of operation of the engine and causes undesirable fluctuation in speed. As electrical igniting devices have been constructed heretofore it has been difficult to locate any defect in the operation of the igniting device or to bridge over the defect without stopping the engine or otherwise interfering with its operation. I have found that by employing a number of separate igniting devices for each engine cylinder the effectiveness of the whole igniting mechanism is very much increased.

Considering the fact that any patent is as broad as its claims, it will be necessary to examine the claims of the "Canda" patent in order to ascertain the scope of the same. The Canda claims were stated in the grant of the patent as follows:

Claims of the "Canda" Patent.

1. An igniting mechanism for the working cylinders of gas and oil engines, comprising a plurality of separate electrical igniting devices having separate circuits, means for supplying current thereto and means for throwing said igniting devices into and out of action, and for throwing each into action independently of the others, substantially as described.

2. An igniting mechanism for the working cylinders of gas and oil engines, comprising a plurality of separate electrical igniting devices having separate circuits, means for supplying current thereto, and switches in said circuits for throwing each igniting device into and out of action independently of the others, substantially as described.

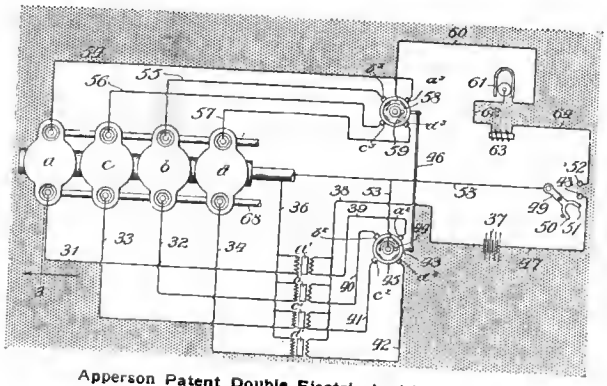
3. An igniting mechanism for the working cylinders of gas and oil engines, comprising a plurality of separate electrical igniting devices having separate circuits and separate electrical generators, and switches in said circuits adapted to throw each igniting device into and out of circuit with its own generator and also into and out of circuit with the generator of a different igniting device, substantially as described.

4. A speed-regulating mechanism for gas and oil engines, comprising a plurality of separate electrical igniting devices, adapted to ignite the charges at different periods in the stroke, and means for throwing the several igniting devices into and out of action, at will, substantially as described.

5. In an internal-combustion engine, the combination with an engine cylinder, of a plurality of separate electrical igniting devices for said cylinder, set to ignite the charges at different periods in the stroke, and having separate circuits and separate electrical generators, and switches in said circuits adapted to throw each igniting device into and out of circuit with its own generator, and also into and out of circuit with a generator of a different igniting device, substantially as described.

6. In an electrical igniting mechanism for gas and oil engines, the combination, with a camshaft within the engine cylinder, a series of cams thereon and staggered with reference to each other, and means for rotating said shaft, of a series of movable pins opposite said cams, means for pressing said pins toward and against said cams, and means for limiting the motion of the pins, said pins being insulated from the cams except at the points of contact, substantially as described.

The Canda patent, in itself, does not seem to be all that would be required in order to establish the monopoly such as any "inventor" is entitled to if his invention is such as to breed an exclusive right. It will be necessary, then, to examine the Apperson patent in order to find the broad ground on



Apperson Patent Double Electric Ignition System.

which to establish the claims that are now being made by the present owner of the two patents. The declaration of the Apperson patent is as follows:

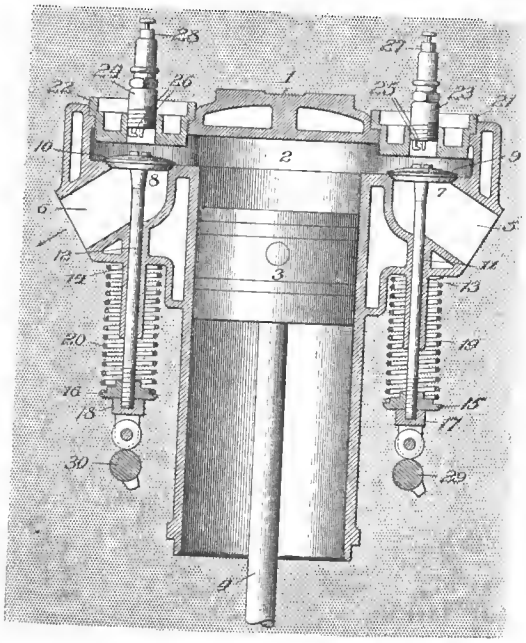
Preamble of the "Apperson" Patent.

My invention relates to explosion engines of the type used in automobiles, and has as an object the provision of means for overcoming the necessity of removing the ignition plugs from the cylinders to clean the contacts carried thereon when they become covered with oil, soot or other undesirable dsposit.

It has heretofore been the practice to supply the cylinders of engines of ths above type with one ignition plug, and it has been necessary to remove this plug and wipe or scrape the contacts carried thereon in order to clean them. In my present invention I provide two such plugs entering the explosion cavity of the cylinder at different points. I also provide two distinct electric circuits—one connected with each of the plugs, and means for using the circuits and plugs separately so that the plugs may be used alternately, whereby, when the ignition contects upon one plug become coated with oil, so that the spark does not pass properly, the other plug may be thrown into use and the explosions occurring therefrom may be allowed to burn the oil or other deposit from the contacts of the plug just abendoned.

In carrying out my invention, I preferably use electric circuits of different character associated with the different plugs—that is, when used in connection with automobiles I prefer to connect one of the plugs with a battery circuit and the other with a magneto-generator circuit. I also preferably arrange these circuits so that they may both be used at once, as it may frequently occur in an engine comprising a plurality of cylinders that one of the plugs of one cylinder may become coated, while the opposite plug of another cylinder may become coated, so that in order that all cylinders may explode properly, it is necessary to use botb of the electric circuits at once.

My invention relates further to certain details of construction hereinafter described and shown in the accompanying drawings forming a part of this specification.



Cross Section of the Apperson Dual Ignition.

If the Apperson patent is as broad as its claims, which is the matter that will demand some attention, on the part of users of dual ignition systems, it will be a very interesting matter in the near course of events. The claims of the Apperson patent are as follows:

1. An explosion engine heving a cylinder in which the explosive is adapted to ignite, a pair of spark plugs extending into the cylinder, a magnsto, eiectrical connections from the magneto to ons of the spark piugs, a battery, separate electrical connections from the battery to the second spark plug, and a switch for throwing the spark plugs into and out of operation.

2. An explosion engine having a cylinder in which the explosive is adapted to ignite, a pair of spark plugs extending into the cylinder, one of said spark plugs having a fixed spark gap, a magneto electricaliy connected with one of the spark plugs, a battery electrically connected witb ths other spark plug, a periodic circuit interrupter in the connection to the spark plug having the fixed gap, and means to control the connections to ths spark plugs.

3. An explosion engine having an explosion chamber with two spark plugs therein, a magneto electricaliy connected with one spark plug, a battery electrically connected with the other spark piug, adjustable timers in the respective circuits, and means for adjusting the timers similarly and simultaneously.

4. An explosion engine having a cylinder in whicb ths explosive is adepted to ignite, a pair of permanent spark gaps within said cylinder, a magneto electrically connected to the terminals of ons spark gap, a battery electricaliy connected to the terminals of the othsr spark gep, and circuit interrupting devices in each of said connections.

5. An explosion engine having a cylinder in which tbe explosive is adapted to ignite, a pair of spark piugs extending into the cylinder, a magneto in circuit with one of said spark plugs, an induction coil having its secondary in circuit with the other spark plug, and a battery in circuit with primary of said induction coil.

Conclusions at this time would be futile. The whole matter will simply have to be threshed out in a businesslike way, or in the courts, if business acumen so dictates.

A ROTARY ENGINE, SAID TO BE WONDERFUL.

PITTSBURG, Dec. 21.—A new engine for which some big claims are made has been invented by Newell O. Allyn, of Hiram, O., formerly with Packard and Winton. It is of the rotating cylinder type, four air-cooled cylinders being used. These are operated on the two-cycle principle and have no valves, the inlet and outlet ports being opened and closed by the rotating part of the machine. No flywheel is provided owing to the large rotating mass of the cylinders. Contrary to most revolving motors a muffler is provided and somehow attached to the cylinders.

It is stated that there is no battery to get out of order. This may be, but a more complicated mechanism will then be necessary to supply the ignition current.

This "wonderful new" motor is to be installed in a car fitted with a sliding gear transmission; the engine is placed in front under the customary hood and the gas tank carried under the front seat. A company, the Valley Automobile Co., of Warren, O., with $200,000 capital, has been organized and the plant for manufacturing this engine and car will soon be started.

The claims for the engine are light weight, simplicity, strength and graceful appearance. From the scant description at hand it is hard to see any point in this motor not already well covered by such sterling machines as the Adams Farwell five and seven cylinder rotating engine or the Torbensen three and four cylinder rotating motor.

Colors Show Temper of Horses.—An automobile authority, who has made a study of horses, is authority for the statement that sorrels are the only absolutely safe horses, white animals, on the other hand, always being dangerous. Between these two extremes comes the bays and the blacks, the former being the better natured of the two. Automobile drivers will save themselves lots of trouble by remembering this point and driving very carefully past a white horse.

LETTERS INTERESTING AND INSTRUCTIVE

TANKS FOR CARBONIC ACID TIRE INFLATERS.

Editor THE AUTOMOBILE:

[1,684.]—If carbonic acid is ueed in the inflation of tires and in view of tbe bigh pressure that obtains with the same in the liquid state the question arises as to the safety of the same especially if it is exposed to the direct sun's rays on a hot Summer day in the South. What can be said about this phase of what would be regarded as a serious matter in other zones of activity? P. B.

New York City.

True, the pressure is high. Equally true the containers must be designed to withstand the pressure, and it is well not to expose the same to more heat than that normal to the surroundings. That the vendors of this gas for any purpose are interested in rendering its use safe, is a matter that can be taken for granted. On a basis of 120 degrees Fahrenheit, according to Reid T. Stewart, in his paper on "The Physical Properties of Carbonic Acid," A. S. M. E., December, 1908, meeting, among other statements, it was said, the walls of a tank, 6 inches outside diameter, should be 0.2514 inches. This is on a basis of 18,000 pounds per square inch extreme fiber strain.

The pressure exerted by carbonic acid on the walls of a cylinder will depend upon the density of the acid and the temperature. At 120 degrees Fahrenheit, and a density of 0.61, the pressure will be 1,760 pounds per square inch, according to the same authority. The thickness given is the minimum, considering the use of material of such physical properties as will allow of a fiber strain as given without eating into the reasonable factor of safety that should obtain in a case of tbis sort.

THE RELATION OF POUNDS TO KILOGRAMS.

Editor THE AUTOMOBILE:

[1,685.]—In connection with racing in particular, it is, more often, tban not, that the weight of cars will be referred to in kilograms. What is the easiest way to reduce theee units to English?

New York City. YANK.

Use the formulas as follows:

$$\text{lbs.} = \frac{75 \times Kg}{34}$$

hence:

$$Kg. = \frac{34 \times lbs.}{75}$$

Example:

If a racing car is to weigh not more than 2,204 pounds, what will be the equivalent weight in kilograms?

$$Kg. = \frac{34 \times 2{,}204}{75} = 1{,}000 \text{ kilograms (in round numbers)}$$

and

$$lbs. = \frac{75 \times Kg.}{34} = 2.204$$

REQUIREMENTS FOR A CAR ENTERING CANADA.

Editor THE AUTOMOBILE:

[1,686.]—I am contemplating a tour East next Summer, and would like to know, if I ehould return by the way of Niagara Falle and through Canada to Detroit, if I will have any trouble with customs at Niagara Falls or Detroit?

Waterloo, Ia. W. HILLMAN.

If you become a member of the Automobile Club of Buffalo, upon presentation of a membership card, you will be able to spend three days in Canada, without any other formality. Otherwise, to conform to the "custom" requirements will be necessary. Briefly, you will have to deposit $25 and put up a bond double the estimated duty on the car. The forms in force at the Custom House must be used and you should produce a bill of sale, showing the purchase price of the car. The more clearly you present your case, the less trouble you will have. For further information, see "The Automobile Official Blue Book," section 1.

INDICATION OF CONSIDERABLE DEPRECIATION.

Editor THE AUTOMOBILE:

[1,687.]—In order that I may determine the extent of repairs to be made to my double opposed engine, will you kindly answer the following through "Letters Interesting and Instructive."

1. When compression leaks past piston and rings very badly, what does it signify, assuming that rings have not turned?

2. With ringe removed from piston, should the piston be a close fit in cylinders?

3. How can I determine whether or not I will bave to have tbe cylinders rebored in case I have to have new pistons?

4. Will I have to get the piston that was designed for the motor, or will any other piston do that will fit?

5. With both rear wbeels jacked up and a pull exerted on the left rear wbeel, there isn't any lost motion between wbeel and differential; they both act as a unit. But with the rigbt rear wheel when pulled there is quite a lot of play, say about an inch on the circumference of tbe wheel, before the power is applied to the differential. Is this condition right? NEW OWNER.

South Braintree, Mass.

1. Loss of compression, which, in turn, means loss of power, is the first answer.

2. In reply to the second question. No. The piston becomes hotter than the cylinder, because the cylinder is artificially cooled and the piston is not. The hotter piston will expand the most, and, as a consequence, it will stick, if there is not a difference.

3. "Size" the cylinders. If they are out of round, they should be rebored.

4. It is best to get pistons such as were designed for the motor, if they proved to be valuable for the purpose. If you find that the design is not good, then it will be time to experiment.

5. The rear axle seems to be in need of overhauling. The condition is not right. It is not much of a job to take it apart and see just what is at the bottom of the trouble.

CERTAIN CAUSES OF LACK OF POWER.

Editor THE AUTOMOBILE:

[1,688.]—I have a two-cylinder Ford, Model T, whicb I bought second-hand. It runs fairly well, but it will not develop much power with the throttle wide open. The compression is poor. It cranks eaeily. The beet authority here says it needs new pistons. Is it ljkely he is right? Or is it probable that new piston rings would be sufficient? Ie it possible that it would be best to get new cylinders and new pistons? What might be other causes for its having so little power? J. B. NEILL.

Pecos, Tex.

What you say would seem to indicate that the carbureter wants attention. If the compression is diminished, you can determine the fact by cranking. On the other hand, you cannot expect to realize "difficult" cranking (due to a high compression) in a motor with cylinders less than 4 inches bore. To "spin" a four-cylinder motor, such as the one you are the possessor of, is not a difficult task, and the "experts" may be mistaken. If your carbureter is not in good working order, it will manifest itself by "dead points" in the range of speed. If the carbureter is in good order, then you can look to the timing and the battery. A good (energetic) spark at the propitious instant will do wonders for you. There probably is small reason to go to the expense of new pistons, in any case; the question of new rings is a matter to be taken up when the carbureter and the timing, as well as the source of the electric energy, are fully investigated, and found to be competent.

MADE BY SIMPLEX COMPANY, NEW YORK CITY.

Editor THE AUTOMOBILE:

[1,689.]—I have a complaint to make and some questions to ask. The questions will help explain the complaint, and I will ask them first.

1. Whose Simplex car is handled by Palmer & Singer, of New York and Chicago—the Sheffield Simplex, of England; the Simplex, of Mishawaka, Ind., or the Simplex made where?

2. What (i. e., maker) Simplex car won the second Brighton Beach 24-hour (Robertson-Lescault)?

3. What Simplex wae victor in the Long Island Motor Parkway Sweepetakes, Lescault driving?

4. What Simplex (Seymour) stood about eleventh in the Thanksgiving Day Grand Prize race at Savannah? Was it the two-cycle car or what?

5. Wae it ths $1,000 Buicke (formerly $900) that were driven by Hearne, Eaeter and Jeffers in tbe light-car race at Savannah?

You, in common with other automobile papers, do not give sufficient details pertaining to the care and the manufacturers participating in various events in this country and abroad.

La Fayette, Ind. A SUBSCRIBER.

1. The Simplex product handled by the Palmer & Singer Mfg. Co. is manufactured in New York.

2. It was the Simplex of Palmer & Singer that participated in the second Brighton Beach 24-hour race, which event it won with 1174 miles to its credit, thus establishing a new American competition record.

3. Again it was a P. & S. Simplex stock car which scored in the Parkway Sweepstakes.

4. The P. & S. Simplex at Savannah was the same one which proved a winner in the 24-hour race.

5. Perhaps the Buick company might care to answer.

CONSIDERABLE FLEXIBILITY IS AIMED AT.

Editor THE AUTOMOBILE:

[1,690.]—What is the advantage of having universal or cardan joints on each sids of the differential; also the arched axle and dished wheele as on ths Peerless? Is it a fact that carbureters having the float chamber set to one side of the spray jet give trouble going around corners and up bills? Are valves-in-head engines, with both valves actuated by one double acting cam, considered an entire success?

Marysville, O. L. PIPER.

If the axle is arched, the spokes of the wheels will be "plumb," presupposing a camber in the road. The Peerless construction is such as to enable the car to negotiate roads in which the usual camber is to be taken into account, and also tires are thus enabled to take the load fairly. There are other matters that could be taken into account in this connection, as the workmanship in general of the same axle. Obviously the universals, in the absence of good practice in other ways, in an axle would be of no great avail. If "float chambers" set to one side, as you say, give trouble, it would seem to follow that it is not good practice to do curves at high speed.

Your question as it is put is not fair to the scheme of valves you refer to. There is a certain amount of trouble about or in connection with every mechanical device that man ever turned out. To say, then, that there is to be no trouble with any one scheme, is to be a little farfetched. The fact that the scheme is in vogue, at the instance of builders of repute, coupled with the fact that its use is continued, is good assurance of commercial success. In point of theory it is an excellent idea.

HERE'S A KICK FROM MILWAUKEE.

Editor THE AUTOMOBILE:

[1,691.]—In your issue of December 10, under the head of "Newe in General," tbere is a paragraph entitled "Another Triumph for Locomobile." After attributing to Pabst the honor of having mads Milwaukee famous instead of to Schlitz, who was the originator of that phrase, you proceed to make some very peculiar statements. While we are willing that our competitors shall have all ths glory that belongs to tbem, that "to him that hath shall be given," so that more shekels may be poured into tbe coffers of Jeffriee, we hardly think it right that an infant industry like ourselves ehould be robbed of the credit of having eold to the board of echool directors a car. Then you say that the board of public works is about to choose a car. Well, what for? Not for themselves. Then you speak of the common council appropriating $4,600 for a police car. So far you are right, and you are also right when you say that the chief wants a Locomobile, but the whole bunch has been trying to pretend that there was competition. At present we have an injunction againet the board of public works and the chief of police, demanding tbat the automobile shall be bought upon specifications, advertisement and lowest bidder, like other material and supplies. You also are giving the Locomobile very great credit for track races in Milwaukee. Did you know that in the last track race it used up forty tiree in twenty-four hours? Do you call this an endurance run or a non-endurance run if $1,600 worth of tires ie the price of a merry-go-round victory? JOHNSON SERVICE COMPANY.

Milwaukee, Wis. W. S. Johnson, President.

P. S.—Since the above was written the real estate board of thie city has passed a resolution requesting all city departments to purchase automobiles made wholly or in part in the city of Milwaukee where such purchaee is consistent with good work.

THE AUTOMOBILE CALENDAR

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, General Manager, 29 West 42d Street.

Jan. 5.....—New York City, Fourth Annual Meeting Society of Automobile Engineers. (Will adjourn until January 19 after opening session.)

Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. M. L. Downs, Secretary, 7 West 42d St., New York City.

Jan. 27-Feb. 3..—Philadelphia, Second Regiment Armory, Eighth Annual Show, Philadelphia Automobile Trade Association.

Feb. 6-13.....—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York.

Feb. 15-20.....—St. Louis, New Coliseum Building, Third Annual Show, St. Louis Automobile Manufacturers' and Dealers' Association. Lloyd Ricksrt, Manager.

Feb. 15-20.....—Detroit, Wayne Pavilion, Annual Show, Detroit Automobile Dealers' Association. E. LeRoy Pelletier, Manager.

Feb. 15-20.....—Cleveland, First Regiment Armory, Annual Show, Cleveland Automobile Dealers' Company.

Feb. 16-18.....—Denver, Col., Auditorium, First Annual Automobile Show, Denver Motor Club.

Feb. 18-25.....—Toronto, St. Lawrence Arena, Third Annual National Automobile, Motor Boat and Sportsmen's Exhibition. Ontario Motor League. R. M. Jaffray, Manager.

Mar. 1-6.....—Buffalo, Convention Hall, Seventh Annual Automobile Show. Buffalo Automobile Trade Association. Dal H. Lewis, Secretary.

Mar. 6-13.....—Boston, Mechanics Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. C. I. Campbell, Manager, 5 Park Square.

Mar. 27-Apr. 3..—Pittsburg, Duquesne Garden, Automobile Show. Pittsburg Automobile Dealers' Association.

Races, Hill-Climbs, Etc.

Jan. 1-2.....—Philadelphia, Two-day New Year's Run of the Quaker City Motor Club.

Feb. 20-22.....—New Orleans, Fair Grounds Track, Mardi Gras Race Meet, New Orleans Automobile Club. Henry George, Secretary.

March 5-12.....—Palm Beach, Fla., Lake Worth, Fifth Annual Regatta, Palm Beach Power Boat Association.

FOREIGN.

Shows.

Jan. 16-25.....—Belgium, Brueeels Automobile Exhibition.

Races, Hill-Climbs, Etc.

May 2.....—Sicily, Targa Florio, Automobile Club of Italy.

May 26.....—Russia, Moscow—St. Petersburg Race.

June 10-18.....—Germany, Prince Henry Cup Competition.

June 14-19.....—Scotland, Scottish Reliability Trials.

July 1-3.....—France, Angers Course, Grand Prix, Automobile Club of France.

July 13-17.....—Belgium, Ostend Automobile Race Week.

Sept. 5.....—France, Mont Ventoux Hill Climb.

Sept. 11-19.....—Italy, Bologne, Florio Cup Race, Automobile Club of Bologne.

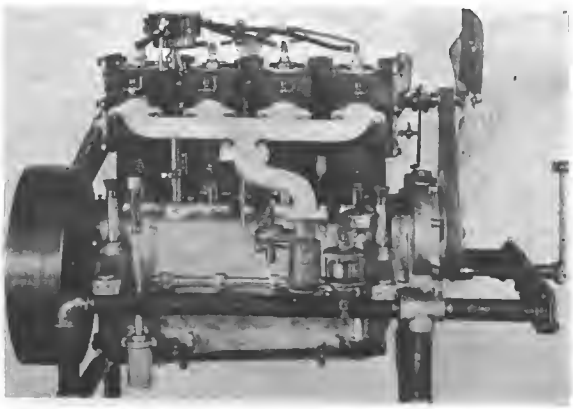
Pullman in Several 1909 Models

Five-Passenger Touring Type Pullman for 1909, as Seen from the Operating Side.

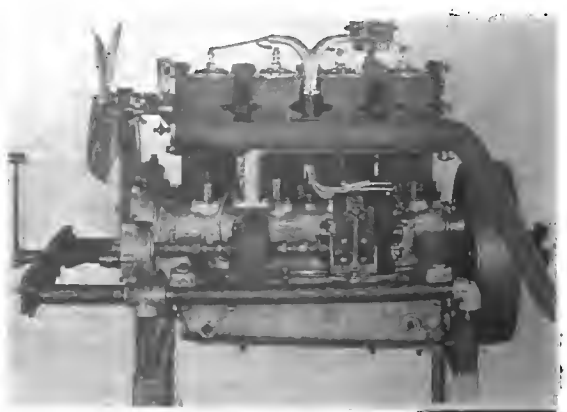
IN order to be in a position to supply as widely varying a demand as possible, the York Motor Car Company, York, Pa., will list no less than four different chassis for the 1909 season, each of which will be made in several body types so that the range of Pullman cars will be very extended. At the lower end of this list is the new Model L, 20-horsepower runabout; next comes the Model K, 30-horsepower light touring car, while a six-cylinder car of the same power is to be known as the Pullman Model 6-30. Above this where power is concerned is the Model 4-40, which, as its name indicates, is a four-cylinder car of 40 horsepower. This title, however, only applies to it as a gentleman's roadster, as in a seven-passenger type of touring car, it is known as Model M.

Motor Design.—Taking what may best be termed the "baby" Pullman first, otherwise the Model L runabout, its cylinder dimensions are 3 3-4-inch bore by the same length of stroke, while its rating is 20 horsepower, with a speed range of from 200 to 2,000 r.p.m., though its nominal capacity is developed at a moderate speed, namely, 1,000 r.p.m., and it is naturally capable of exceeding this power output to a considerable extent. Like its larger confrères of the Pullman line, the cylinders are cast separately. The Model K, 30-horsepower type, has 4 1-2-inch "square" cylinders, its speed range extending from 150 r.p.m. to 1,800 r.p.m., while its output is delivered at the moderate normal speed of 900 r.p.m. The same cylinder castings as are employed on the Model L, 20-horsepower runabout are also utilized as the foundation of the power plant of the Model 6-30, while in the case of the 4-40 the cylinder dimensions are 5-inch bore by 5 1-4-inch stroke, its rating also being delivered at 900 r.p.m. As the same features of design and construction that have characterized the Pullman motors during the past year are perpetuated in these new models, it will be evident that a description of the features of one is applicable to the others, so far as the motor itself is concerned, its accessories, such as the magneto in particular, depending more upon the list price of the car. For instance, the cylinders are cast separately in every case, while on the Model L and the Model 6-30 Pullman, the valves are all on the same side; in the case of the Model 4-40 and the Model M, the valves are oppositely disposed in outboard valve ports and are interchangeable. The cylinder heads and waterjackets are cast integral in every case, an interesting feature of the Pullman motor, being the manner in which the independent castings are joined together by means of special fastenings between them, thus throwing the waterjackets of all four cylinders into one.

Chassis Specifications.—Standard practise has nowhere been departed from. The remaining specifications of the Model L, 20-horsepower car are pressed steel frame of the usual channel section, with a substantial subframe carrying the engine and transmission, Timken rear axle, single-piece drop-forged I-beam, front axle; jump-spark ignition through a single vibrator coil and distributor fed by a set of storage cells; lubrication by means of a new self-contained system, a positive oil level being maintained by a valve adjustment. The gear-set housing is packed with lubricant and grease cups are provided wherever necessary. A standard type of leather-faced cone clutch using cork



Pullman Power Plant Viewed from Carbureter Side.



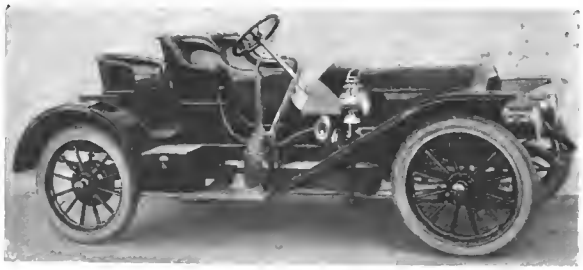
Fan Pump and Magneto Drive of the Pullman

inserts is employed in connection with a three-speed gear-set operating on the selective principle of shifting, the shafts of the latter being carried on Hess-Bright annular ball bearings, while the Timken roller bearings are used in the wheels. The suspension consists of semi-elliptic springs front and rear, the former measuring 40 by 2 inches, while the latter are 48 by 2 inches. The wheelbase is 102 inches, the tread standard and the clearance 10 inches, while the car weighs 1,750 pounds. With the usual equipment, including two acetylene headlights, the car lists at $1,500.

Model K, 30-horsepower Pullman is a machine that comes between the other two four-cylinder types, the Model L, 20-horsepower, and the Model 4-40, so far as power is concerned, it will doubtless constitute one of the most popular of the Pullman models, and will accordingly be listed as a five-passenger light touring car, a roadster and with a toy tonneau. On a larger scale, corresponding to its increased power, the specifications of the chassis are practically the same as those already given in the case of the 20-horsepower car, namely, pressed steel frame, with a subframe for the motor and transmission support, drop-forged one-piece I-beam front axle, semi-elliptic springs all round, the dimensions in this case being 40 by 2 inches front and 50 by 2 inches rear. The wheels are 34 inches instead of the 32 by 3 1-2-inch size used all round on the smaller car, while the tire equipment consists of 3 1-2-inch front and 4-inch rear tires. For ignition a Bosch high-tension magneto forms a regular part of the standard equipment. The same type of three-speed selective gear-set is employed, the gears and shafts being of chrome-nickel steel, while the latter are supported on Hess-Bright imported ball bearings, the latter being used throughout the car, with the exception of the motor. Nickel steel shafts and gears are employed in the rear axle, which is made with pressed steel housings and is held in alignment by means of a V-type torsion rod.

Dual ignition is regularly fitted on this car, the emergency system consisting of a single vibrator coil on the dash and a high-tension distributor. So far as the other accessories are concerned, the same self-contained oiling system, made integral with the motor, is a feature of this, as it is of the other Pullman motors, and this is likewise true of the special float-feed carbureter. The wheelbase is 106 inches and the tread standard, while the weight all on, is 2,250 pounds. In complete running order with the usual equipment of acetylene headlights, sidelights, etc., the car lists at $2,000.

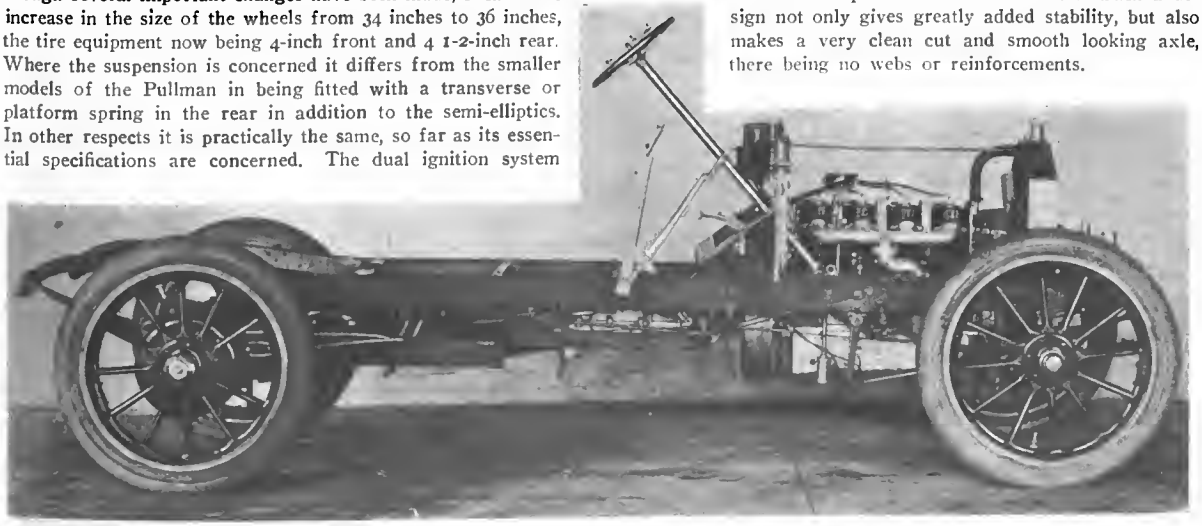
Model M has been designed especially to meet the wants of the purchaser of a seven-passenger touring car, the chassis being practically the same as the 40-horsepower Pullman of 1908, though several important changes have been made, such as the increase in the size of the wheels from 34 inches to 36 inches, the tire equipment now being 4-inch front and 4 1-2-inch rear. Where the suspension is concerned it differs from the smaller models of the Pullman in being fitted with a transverse or platform spring in the rear in addition to the semi-elliptics. In other respects it is practically the same, so far as its essential specifications are concerned. The dual ignition system



One of the Pullman Three-Seaters for 1909.

consists of a Bosch high-tension magneto and a synchronized single-coil and distributor supplied by storage cells; a three-speed selective gear-set is employed, Hess-Bright annular ball bearings being used here as well as in the remainder of the car. The front axle is a one-piece I-beam drop-forging, while the rear axle is of the floating type made by Timken with a pressed steel housing. In the case of the Model K, 30-horsepower Pullman two brakes are placed on the rear wheels, while a third, which constitutes the emergency, is placed on the transmission shaft, while on the Model M, 40-horsepower car, both sets of brakes are placed on the driving wheels. The wheelbase is 119 inches and the tread standard, the car having a clearance of 10 1-4 inches. The weight all on is 3,100 pounds and the list $3,500. As a runabout the same chassis is slightly altered to make the Model 4-40, which lists at $3,000, the same as last year.

One of the distinguishing features of the Pullman car is the use of the Timken rear axle unit, which represents a great advance over the usual design for this essential. One of the great troubles with the present form of built-up axle is that it requires a truss to brace and stiffen it, and, as it is more or less difficult to keep the members of the truss under tension, this constitutes an element of weakness. The Timken Company in manufacturing this new axle have taken advantage of the fact that tubular forms give great strength, while the resistance is distributed proportionally to the points of greatest stress by grading the thickness of the metal so that the heaviest parts are at the spring seats where the strains are greatest, and the thin parts are at the center. The axle has been so designed as to carry the load without the necessity of trussing, a pressed one-piece housing of a special grade of basic open-hearth steel of high static resistance being employed. In the design of this axle, sharp curves have been entirely eliminated, thus avoiding any angles which would tend to add leverage and increase the liability of shock at the points of least resistance. Such a design not only gives greatly added stability, but also makes a very clean cut and smooth looking axle, there being no webs or reinforcements.



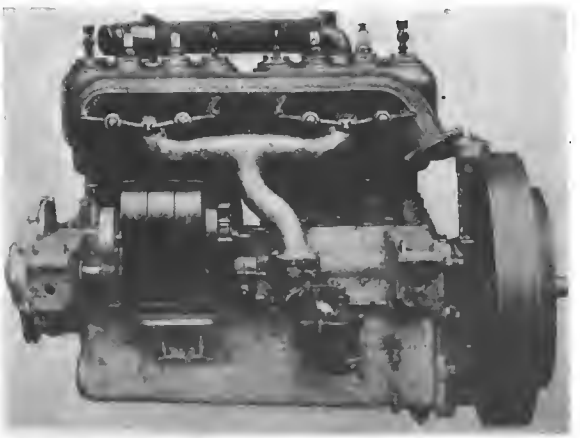
Side View of the Pullman Chassis Illustrating Its Well Balanced Outline.

Regal in 1909 Form

By CHARLES B. HAYWARD.

DETROIT, Dec. 21.—Upon reviewing the specifications of the Regal car for the 1909 season, with the subject of the inspection before one, the conclusion that the makers' efforts to combine the best features of standard practice in a machine selling at a low figure have been very successful is inevitable. And it is further substantiated by an inspection of the manner in which the work is being carried out in the Regal factory, for the best of materials and design would be of doubtful value when handicapped by poor workmanship. As a matter of fact, it was the original intention of the Regal Motor Car Company to place its product on the market at a higher price, but it was found possible by means of multiple production on an extended scale to reduce the figure to $1,250, at which the Regal now lists. But for the delay in perfecting a factory organization, a large number of the Regal cars would have been placed on the market during the past season. Shipments of the new model began about a fortnight ago, and with greatly increased manufacturing facilities, it is the intention of the makers to market as many cars as it is possible to turn out, though it it planned to make 2,000.

Some Motor Specifications.—In the details of the design of the power plant and its accessories particularly are to be found a number of features ordinarily confined to much higher-priced construction. Among these may be mentioned the use of a one-piece drop-forged camshaft, the cams being integral. They are hardened and ground to an accurate finish with a set of master cams as a model, thus insuring interchangeability and close adherence to the timing regulation outlined by the designer in every one of the many motors turned out. The cylinders measure 4 by 4 inches and are liberally water-jacketed, water being provided for between the valves. Large openings are provided in the cylinder heads, these being covered with plates carrying the cooling water outlets. Circulation is on the thermo-syphon principle, the outlets from the cylinder heads measuring 1 1-2 inches in diameter, while the connection from the lower portion of the radiator to the jackets measures 2 inches, deflected plates being employed to spread the incoming cold water. The hot-water outlet takes the form of a Y, the water being discharged into the tank portion of the radiator, thus condensing any vapor formed and effectively preventing steam pockets.



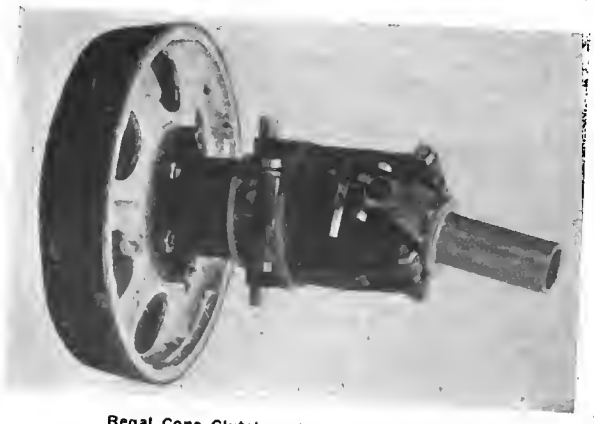
Regal Power Plant Shows Simplicity and Compactness.

All valves are placed on the same side, the push rods being equipped with roller ends, while the valves themselves are of large diameter, so that in connection with well-worked-out manifolds, an easy flow of gas is provided for. Main bearings are of liberal size of die-cast babbit, while drop-forged connecting rods are employed. Helical timing gears enclosed in an aluminum housing make for silent running, the oil pan also being of this material, while the engine base is of cast iron. The lubricating system itself is particularly noteworthy. It is of the constant circulating type, consisting of a small gear pump, placed at the lower rear right-hand corner of the oil pan, from which it takes its supply. From the latter the oil is raised and discharged into a copper tube of liberal dimensions running the entire length of the crankcase and parallel with the crankshaft at about the same height as the journals of the latter. Holes are drilled in this tube at intervals to correspond with the various bearings, and when the pump is in action oil is spurted on each of them in liberal quantities, splash being depended upon to lubricate the piston and wrist-pin. Small brass petcocks are inserted in the crankcase at two levels to show the state of the supply in the oil pan. Both the tube and its discharge holes are of large dimensions and are consequently proof against clogging, but provision is made for examination, as the tube may be easily withdrawn without disturbing anything but its own fastenings.

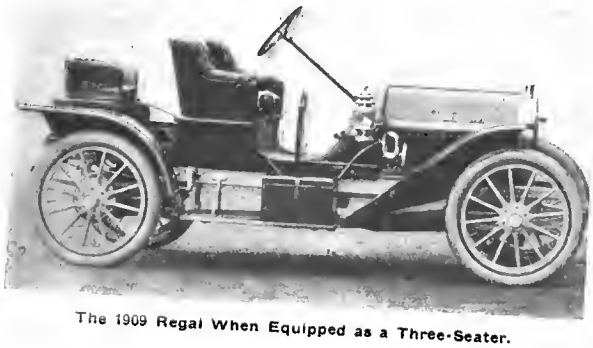
Ignition is taken care of by a Remy magneto of the high-tension type employing a single coil, the latter being mounted on the dash. Experience with this installation has shown that there is no necessity of using batteries for starting, but an emergency system consisting of a set of dry cells operating the same spark plugs through the distributor of the magneto has been provided. The remaining accessories consist of a Buffalo carbureter and a McCord radiator of attractive design.

Clutch and Drive.—Standard practice has been adhered to in the conical leather-faced clutch, but here again the effort to provide the best of its kind, regardless of the selling price, is evident in the detail of the design. The engaging spring is of the self-contained type, thus avoiding thrust, while flat springs are placed beneath the leather facing to insure gradual engagement. Lubrication is taken care of by packing the clutch spring housing full of grease. Two universals, one of which combines a telescopic joint, are employed on the propeller shaft, extending from the clutch to the combined change speed gear and drive on the rear axle, the angle of the shaft being such that the drive is practically a straight line when the car is carrying its normal load.

A short distance back of the clutch is placed a transverse pressed steel member riveted to the sides of the frame. This serves as the forward support of the tubular torsion rod, surrounding the propeller shaft. The double universal at this end is of the cross-pin type, the pins measuring 1 inch in diameter, while liberal bearing surfaces are allowed. The whole is enclosed in a babbited malleable iron housing. The rear axle



Regal Cone Clutch and Double Universal.

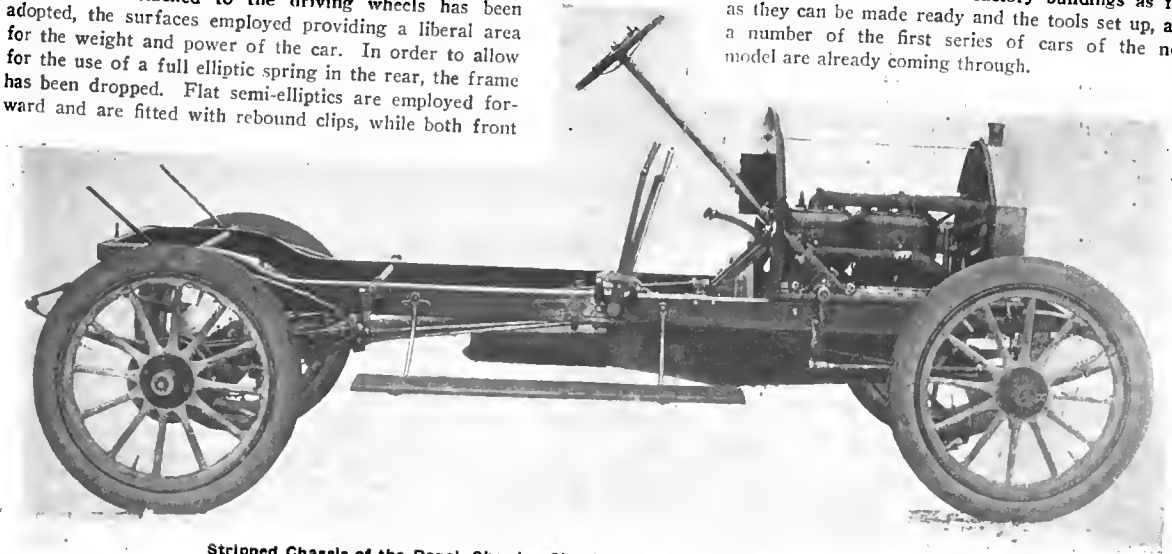


The 1909 Regal When Equipped as a Three-Seater.

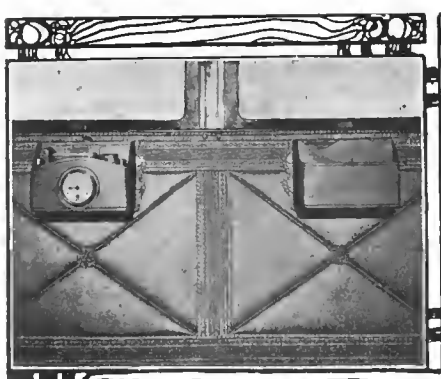
driving combines a three-speed selective change-speed gear box, the bevel drive and the differential in a housing of small dimensions and correspondingly light weight for the whole member, thus obtaining the advantages of the unit form of construction in assembly without the disadvantage of a great deal of unsprung weight on the rear tires. The rear axle is of the fixed type, being made fast at the outer ends directly to the wheels, Hyatt roller bearings being interposed between the driving shafts and the supporting tubes, while ball bearings are used in the gear-set. The usual rear wheel braking equipment in the shape of a set of internal and external contracting shoes acting on a drum attached to the driving wheels has been adopted, the surfaces employed providing a liberal area for the weight and power of the car. In order to allow for the use of a full elliptic spring in the rear, the frame has been dropped. Flat semi-elliptics are employed forward and are fitted with rebound clips, while both front and rear springs are of ample length and number of leaves to insure easy riding at all speeds. The frame is of the usual channel section pressed steel construction, amply reinforced, while the front axle is of the tubular type. The wheelbase is 106 inches.

This chassis will be known as Model A in the regulation touring-car type, and as Model B, as a roadster. Throughout the design every effort has been made to keep the weight down while still providing a liberal factor of safety, with the result that the touring car complete tips the scales at 1,900 pounds, and the runabout is 75 pounds less. In addition to these two there will be the Regal Model C, which will be continued as a taxicab, while Regal Model E will be equipped with a toy tonneau type of body and will be ready for delivery about January 15, so that the Regal line for 1909 will present quite a range of models, although but one type and size of chassis will be made, thus making it possible to center the entire facilities of the plant and working force on the production of series of the same sizes in parts throughout the entire manufacturing season. In this way the number of complete cars that can be turned out in a given time is very largely increased.

The Regal factory has been running night and day for some time past in getting cars, but with the recent addition of fully 50,000 feet of floor space it is anticipated that no difficulty will be encountered in building and delivering the output of 2,000 cars that have been planned for. New machinery is being installed in the additional factory buildings as fast as they can be made ready and the tools set up, and a number of the first series of cars of the new model are already coming through.



Stripped Chassis of the Regal, Showing Simple Lines of Design and Clean Underbody.



LUXURY IN LIMOUSINES

AS typical of the present day refinements in high-powered limousines is the interior of a special car for Robert L. Fryer, of Buffalo, built by the E. R. Thomas Motor Company. This body has an interior seating capacity for five people, the auxiliary seats being detachable. When not in use these are simply removed from a socket, which is then very inconspicuous. The car is a six-cylinder 70-horsepower Thomas, with a hand-hammered aluminum body made in the new two piece construction. This is the latest type of construction in metal bodies and one that is thought well of by the up-to-date coach builders.

The doors have a full royal turn-under and the low base body does away with the awkward appearance sometimes found in large limousine bodies. A wheel house on the side quarters gives ample clearance to the guard and permits the use of chains without the slightest interference.

The car has an effective color scheme. The body is painted a Napier green with black moulding and black upper quarters, while the hardwood finishings are in walnut. A new type of drip on the roof prevents the water from dripping over the doors. The material of the interior is a golden drab imported broadcloth and the lace is of a French weave to match. While being a full round cornered body, the trimming is put on in a panel or square corner effect. All the fittings are in brass. The toilet case contains numerous articles, as in the latest cases, and the new style hasty notebook. There is also a gentleman's case, containing ash tray, cigar holder, etc. In keeping with the high-grade completeness, there is also a Chelsea eight-day "Safety" limousine clock, most useful as well as ornamental.

The electric annunciator of the new French type and the electric cigar lighter are both neatly arranged. The electric dome light has a Holophane globe. A ventilator in the front of the body, allowing the circulation of air, adds to the comfort of the occupant and can be regulated according to the weather. Instead of using the clouded horn trimmings, this car is fitted with a new Maltese pearl, which is exceedingly handsome. While the outside of the window frames are finished in ebony, the interior is left in natural walnut, harmonizing with the trimmings.

THE MODERN TREND IN LIMOUSINE DESIGNING

THE time was when limousine body work was so very heavy as to be objectionable. The reason for this was more because of the distribution of the weight, rather than a matter of the total thereof. In other words the center of gravity was very high indeed, and the rolling tendencies were far from satisfactory. In the early days the wheelbase was short and the weight distribution was, on that account, in favor of a high center of gravity. Increasing the length of the wheelbase had the effect of lowering the center of gravity because the weight in pounds per foot of length was increased, which was equal to decreasing the weight in pounds per unit of elevation.

It is easy enough to see that any plan which increases the weight per unit of length, for a given weight, would decrease the weight per unit of elevation, and lower the center of gravity. That a lower center of gravity will help the performance enormously goes without saying, and much of the modern luxuriousness is due to the superior performance of the cars, directly traceable to the lowered center of gravity. The greater length results in more room, but the whole gain was not due to the greater wheelbase, since motors are shorter than they were before and in this fact is a further reason for increased comfort.

Still, the last word has not been said. The design details of limousines have undergone considerable change within a short period of time. It was recognized that easy riding qualities were in a measure due to weight, putting the same in the right place. The result of this reasoning led to heavy underframing and light upper work. In thus proceeding it was to render the body work strong enough to stand road strains, and at the same time engender that "Pullman" effect so much to be desired.

The better distribution of the weight also reduced the strains, and as a consequence the depreciation of this class of bodies is a very much reduced factor. Then, again, there is the use of superior materials throughout; certainly there has been quite as much gain in this direction as in other ways. It is fortunate that the finish will stay on the modern bodies far longer than was the case in the earlier examples due to the fact that the panels will not split and the vibrations are not nearly so noticeable. On the whole, then, it is plain that the great improvement wrought in limousine construction is not limited to luxuriousness within.

Then again, there is the influence of the limousine upon the life of the chassis. If the body work is with a high center of gravity, the car as a whole will be with a higher center of gravity than would obtain otherwise, since the body is superimposed. To deny that rolling and tossing will not affect the life of a car is to overlook the prime causes of depreciation on automobiles. The difference as between static strains and dynamic work is the difference as between assured long life and a great uncertainty. A limousine, presupposes a user who can afford a good car, and one who would not want to put up with one that has failed to sustain in nearly perfect order.

COMPARING LONG AND SHORT-STROKE MOTORS

By E. A. MYERS, Designer of Model Automobile Company, Peru, Ind.

WHILE there is so much discussion as to the relative merits of the long and short-stroke motor it is somewhat interesting to make a comparison of the different articles written on the subject and to note the grounds upon which each bases his claims.

In the beginning I will say that my knowledge of gas engine construction has been practical as well as theoretical. During the fifteen years I have devoted to the study of this subject I have superintended the construction and testing of over five thousand engines of a great variety of sizes and types covering the single-cylinder engines from a 4-inch bore up to a 17-inch bore and 30-inch stroke and the four-cylinder from the very smallest to a 16 1-2-inch bore and a 26-inch stroke. Up to six years ago my work covered what is known as the short-stroke engine, and since that time it has been divided between the short and the long-stroke motor, most of the time having been devoted to the latter.

I do not claim to know it all by any means. Others, perhaps, have found out things in motor construction which I have been unable to learn. On the other hand, I do not believe that I will be charged with egotism when I say that I have at least had an opportunity to find out some things denied to the designer who has had experience with the short-stroke or small motor only. In my experience I have found out things which have been of material advantage to me in the construction of larger engines as a result of my work with the smaller high-speed motors. On the other hand, I have secured much valuable information about small motor construction in my work and experience with large engines which otherwise I might never have been able to detect.

When the A. L. A. M. adopted the plan on which the horsepower rating was based it is quite evident that but little thought was given to the question of accuracy of horsepower. At any rate, just now it is somewhat difficult to get any one to admit that he really believed at any time that the stroke had nothing to do with the horsepower of a motor. On the other hand, it has been but a few years since any attorney involved in the trial of a case wherein the horsepower of an engine was in question had but little difficulty in getting gas engine experts to testify under oath that the stroke had nothing to do with the horsepower of the engine and that a motor with the bore equal to the stroke would produce just as much horsepower as another motor with the same bore and with one, two or more inches longer stroke.

We take it for granted that the recent trend of automobile manufacturers toward longer-stroke motors and the comparative tests of the past year have put to rest for all time the contention that a motor with the stroke equal to the bore would produce as much actual horsepower as one of the same bore with the longer stroke and that we need not spend time on this particular point.

Some Questions to Be Answered.

With this point settled the remaining questions are: First, to what extent does it increase the horsepower? and, second, is the longer-stroke motor more desirable for motor-car construction and service?

In an article recently written by G. H. Baillie he refers to a formula wherein the claim is made that by increasing the stroke 50 per cent. the horsepower is increased 17 per cent. Nothing could be more misleading than a statement of this kind without a detailed explanation on which the claim is based. It appears that those making this statement have lost sight of the fact that speed must be taken into consideration and that it is utterly impossible to give any formula by which the increased horsepower can be shown by increasing the stroke unless a given speed is taken on which to base the rating. For illustration: We take a 6 x 6 four-cylinder motor and make a test of it, as compared with a 6 x 9. At first thought we would figure that the 6 x 9 would develop just 50 per cent. more power than the 6 x 6, whereas at one speed it will develop over 50 per cent. more power than the 6 x 6, and at another speed it will develop less than 50 per cent. Piston speed must be taken into consideration in figuring the actual horsepower delivered.

Other designers may take issue with us at once when we make a statement that a 6 x 9 motor will develop over 50 per cent. more power than a 6 x 6, both running at a speed of 400 r.p.m., but that such is the case can easily be demonstrated. On the other hand, the 6 x 9 will by no means develop 50 per cent. more power than the 6 x 6 when running at a speed of 800 r.p.m. The question then comes up: How are we going to rate the motor for automobile construction, and where are we going to draw the line, and what formula can be presented upon which the accurate horsepower rating can be based, covering engines of all classes and of different construction? We are free to confess that we know of none that can be proposed that will cover the situation with absolute accuracy. If we had a fixed speed from which to figure then the matter would be simple. But considering the fact that these motors must be run from a minimum to the maximum speed of which they are capable, it is impossible to increase the stroke to the greatest point of efficiency for one speed and secure the same results at all speeds.

Desirability of Long Stroke.

I state most emphatically that better results can be secured from a motor with the stroke in excess of the bore for general automobile construction, but I also wish to state just as clearly that it cannot be increased advantageously to the same extent that it can be where the motor is to be used for some other purpose where less flexibility is required and where it is to be operated at something near a given speed. In making this claim I base it on the following facts:

First: Where I increase the power of a motor by adding to the stroke the power gained thereby is procured without any approximate increase in the weight of the motor and it will not be denied that every move that can be made to increase the power without increase of weight is a step toward high-grade motor-car construction.

Second: In expanding the gases farther the exhaust is discharged under less pressure, lessening the noise of the exhaust and decreasing the amount of heat carried off through the exhaust as well as the liability of back pressure.

Third: The greatest efficiency and economy is obtained when piston is running at a reasonably high speed. As most cars are now built the speed limit is from 40 to 60 miles per hour for ordinary use. These same cars probably run 80 per cent. of the time at a speed of 20 to 40 miles per hour. Therefore, it would seem that for general use the car is used at an extremely low piston speed, which, as every engineer knows, means loss of power and efficiency. Hence, by increasing the stroke a higher piston speed will be secured for general use of the car.

Fourth: The full power of a motor is most needed for hill climbing when the motor is running at slow speed, and right here is where the long stroke shows its advantages over the short stroke. Let us not forget the fact that an internal combustion engine is a heat engine pure and simple. In fact, all engines are heat engines, differing only in the method and the economy of utilizing the heat. In the case of steam engines the coal is reduced by heat to a gas, burned, and a portion of the heat generated is absorbed by water in a boiler,

converted into steam and expanded in tbe engine cylinder, giving up a portion of the heat in the form of work or pressure on the piston, producing power. The balance escapes in the exhaust, as is the case with the gasoline engine.

In the Case of the Gas Engine.

In the case of a gas engine the gasoline is mixed with a definite quantity of air as it is conveyed to the cylinder; this mixture is then burned in the cylinder, producing heat, consequent expansion, pressure on the piston and power, hence the term internal combustion engine as applied generally to gas engines.

The gases so formed contain a given number of heat units to the cylinder. The greater part of this heat is utilized, converted into energy from which the greatest amount of power can be gotten. There cannot be conversion of energy of any kind without some loss of heat and it is a well-designed motor wherein the total number of heat units lost does not exceed 65 per cent. The greater part of this loss is carried off through the cylinder walls and the balance through the exhaust. Therefore, it must be understood that the good designer must strive to convert as much of this heat into work as possible. It will thus be seen tbat the slower the movement of the piston the greater the loss of heat through the cylinder walls and the less the power from a given size cylinder and from a given amount of fuel. From this it should be quite clear that all the advantages are with the long-stroke motor, not only from a standpoint of power, but from a standpoint of fuel consumption, and that the slower the motor must run the more pronounced are these advantages.

Fifth: The initial impulse is less in the long-stroke motor than in the short-stroke of the same horsepower because of the smaller area of the piston. In other words, the initial impulse of a 4x4 is approximately the same as a 4-inch bore and 5-inch stroke, hence if you build a motor of the same horsepower as the 4x5 and make the bore equal to the stroke you must necessarily have a greater pressure on the end of the piston at the time of ignition. This means that for a motor of the same power it is impossible to build one of the short stroke that will operate as smoothly as one of the long stroke.

Some one may say that if it is a good thing to build the motor 4x5 instead of 4x4 why not go still further and make it 4x6 or 4x7. Right here is where the distinction must be made between a motor running at a given speed and one running at all speeds, as is required in motor-car construction. I have heretofore tried to show why it is impossible to carry it out as far as can be done with a motor wherein the question of power and economy alone is to be considered. The great range of speed must be taken into consideration as well as the ratio of gearing and the general construction of the car.

Were I designing a motor for racing only the ratio of the stroke to the bore would not be the same as one I would design for a general use car. Again, if I were designing a motor to be run at a constant speed, the ratio of bore to stroke would conform to neither, but would be designed to secure the best results at that speed. Hence, in increasing the stroke of the motor for general car use I do not contend that it can be carried to the extent that all other points of car construction are of secondary consideration to the question of power and economy, but I do claim that the designer who is unable to retain all the flexibility of the very best cars of the latest development and at the same time use a motor wherein the stroke is one-quarter greater than the bore is not doing justice to at least some parts of the machine.

SOCIETY OF AUTOMOBILE ENGINEERS' FOURTH ANNUAL

TUESDAY, January 5, has been set as the date of the first session of the fourth annual meeting of the Society of Automobile Engineers, and in accordance with the program outlined by the local committee, the members will assemble at the Automobile Club of America in Fifty-fourth street, near Eighth avenue, at 10 a.m. on that date. The entire forenoon will be devoted to tests of different cars to be selected later by the committee, on the club dynamometer, these tests being carried out under the supervision of Henry Souther, a member of the society and the head of the technical committee of the Automobile Club. Following this there will be the usual business meeting and a technical session during the afternoon, the subjects to be discussed being the "Economics of Weight Reduction," by F. D. Howe; "The Factor of Reliability in Ignition Apparatus," by A. Atwater Kent; "Requirements of Automobile Brake Construction," by Thomas J. Fay and Lawrence Whitcomb. Immediately following the conclusion of the reading and discussion of the papers in question the meeting will adjourn for the annual dinner given by the society. This will be held at the Automobile Club. After the dinner the meeting will adjourn to Tuesday, January 19.

The purpose of this second session is to enable members from distant points who will only be in New York for one or the other of the automobile shows to attend the meeting. The clubhouse of the Automobile Club of America will again be the meeting point and the hour will be the same, 10 a.m. A similar series of tests will be carried out on various cars during the morning, while the subjects on which papers have been prepared for the afternoon session are as follows:

"An Improved Type of Compression Coupling," by W. S. Noyes.

"Standardizing Automobile Motor Bearings," by S. P. Wetherill, Jr.

"Some Practical Considerations in Autogenous Welding," by Henry Cave.

"Continuous Form of Engine Indicator," by S. W. Rushmore and H. L. Towle.

This part of the program is not arbitrary, however, and should it be found more convenient to arrange for the presentation of the papers in a different order this will be done. On the occasion of the second session, Tuesday, January 19, only the forenoon will be spent at the Automobile Club of America, the members adjourning to the Engineering Societies building, 29 West Thirty-ninth street, near Fifth avenue, upon the completion of the tests on the A. C. A. dynamometer. The technical sessions will be held in one of the meeting rooms in the latter building and immediately following their close the members will adjourn to the Engineers' Club, directly back of the Engineering Societies building on Fortieth street, where the annual dinner given by the Society will be held. From present indications it appears certain that the attendance will be the largest that the Society has ever had.

The past year has marked the greatest growth in the membership of the Society since its inception, the number of members having been more than doubled in that time. The plan of holding quarterly meetings in various cities of the country, which was inaugurated last year for the first time, having been found so successful it will be continued, instead of the previous custom of meeting semi-annually. In accordance with this plan. the first quarterly meeting for 1909 will be held in Boston during the course of the show there, while the fourth annual summer meeting will take place in some city of the Middle West. As Detroit and Cleveland were places of meeting during the past year, this will probably be Indianapolis, owing to the importance of the latter city as a center of automobile manufacture, in addition to its vast accessory making interests.

NOW SEVERAL TIRES ON A SINGLE RIM

By W. F. BRADLEY.

PARIS, Dec. 17.—Automobile touring in comfortable, closed cars, such as are becoming more and more common on European roads, seemed likely to be limited by the inability of tires to carry very heavy loads with any reasonable degree of safety. The largest and strongest tires now on the market, with a section of 135 millimeters, cannot be given a load of more

Showing the Michelin Twin Tires When Dismounted.

than 1,600 pounds if a reasonable length of service is required. A load of 1,600 pounds per wheel gives about 1 ton 4 hundred weight per axle as the heaviest load which should be carried on pneumatic tires. It is true that many powerful closed touring cars, fitted with all the luxuries that human ingenuity can devise, have a rear axle load of about 4,000 pounds. But such a load is only carried at enormous cost in tire up-keep, for the generally accepted rule is that the life of a tire is in inverse proportion to the cube of the weight which it carries. Thus, if the weight is doubled, the wear will, on an average, be eight times greater. An increase in weight of but 5 per cent. causes an increase in the wear of the tires of about 14 per cent.

The natural conclusion is that weight should be kept as low as possible in the construction or fitting of a car; or if such luxuries as heavy handsomely upholstered closed bodies, electric light, folding tables, self-starters, tire inflators, dismountable rims and the wealth of accessories which have been showered on the automobile, if all these are deemed indispensable, the user of them must be prepared to face a heavy tire bill, for it is weight that kills.

It is with the view of making possible the carrying of heavy loads on pneumatic tires that the plan has been brought forth of mounting two, three or four tires on one rim. Two or three attempts in this direction were shown at the Paris Salon, the most conspicuous being presented by Vinet and Michelin. Even more important than the case of the costly pleasure car is that of the commercial vehicle, for it has been proved that the excessive vibration set up with steel or solid rubber tires, where fast running is necessary, is ruinous to mechanism.

European commercial vehicle competitions have all proved the wheels and suspension to be the weak points of automobiles carrying loads of more than two tons. As long as the speed is kept reasonably low not much harm is done, but too many drivers are not content with a maximum of 15 miles an hour on steel tires, with the result that the car goes to pieces long before it should have done. There is an example in the Paris omnibuses, which are mounted on solid rubber block tires and are run at as high a rate of speed as possible over roughly paved streets, often being made to compete in speed with the subway trains. The result is that out of a fleet of 162 it is never possible to have more than 97 in service, the remaining 65 being in the repair shop and requiring the attendance of about 200 mechanics and fitters. One of the Paris taxicab companies, which in 1902 started out with cabs having steel-shod wheels, had an average of 7 per cent. broken crankshafts a year; the proportion on pneumatic tires was 1-2 per cent.

It is believed, therefore, that if such commercial vehicles as are obliged to maintain a speed of 15 miles an hour or more could be fitted with pneumatic tires in place of solid rubber or steel rims, there would be a considerable lengthening of the life of the vehicles by reason of the lessened vibration. Naturally, in the case of heavy trucks, with loads of six to eight tons, and required to maintain an average speed of six or seven miles an hour, there is nothing to be gained by an attempt to fit pneumatic tires. The advantage, however, is indisputable for passenger 'buses and delivery vehicles carrying an axle load of from 1,000 to 3,000 pounds.

How the Michelin Twin Tires Look on the One Rim.

The twin and triple tires produced by Michelin, and now being given a public demonstration on a Paris omnibus, were only made possible by the advent of the dismountable rim. If the inside one of a set of three or four tires on one rim required changing on the road, it is easy to see that the old system of wrenching each shoe over the fixed rims would not appeal to the passengers in the bus or to the shareholders of the

company. The dismountable rim was therefore indispensable. Where intended to be used in sets of two or more on a vehicle that does not exceed on an average a speed of 15 or 16 miles an hour, it was possible to strengthen the tire in a way that would not appeal to the fast traveling tourist, but which was excellent for the utilitarian vehicle.

The dismountable rim used on the Michelin consists, like the racing rim, of one fixed rim on the felloe of the wheel, and a split dismountable, the two ends of which are drawn together to bind it on the wheel. On the racing and ordinary touring models this binding is obtained by a turnbuckle—a system that has proved its worth in races on condition that the rim is screwed up as tightly as possible; some French drivers forgot this at Dieppe, and suffered in consequence. On the twin and triple tires there are two flattened portions of the fixed rim, one of these being pierced to receive the valve and bearing also a couple of stops corresponding with similar stops on the dismountable rim, the objects of which are to prevent creeping and facilitate mounting.

Palmer Blowout Preventer Shown at the Paris Salon.

Through the other flattened portion is passed a hardened steel stud, bored to take a bolt, and itself secured in position on the face of the rim in just the same way as a security bolt. A "T" wedge fits on this flattened face, and between the two rims, the stem end of the "T" screwing into the stud just mentioned, and the two arms of the "T" forming wedges, each engaging with a steel stud riveted onto the inner face of the dismountable rim, at each side of the split. The further the wedge is screwed in the closer the two ends of the rim are brought together, and the tighter the whole is bound on the wheel. To dismount the rims the outer wedge is first withdrawn, and a pair of forceps employed to force the two ends apart sufficiently to allow the rim to be lifted off. The projecting stud is taken off and the second tire treated in the same way. The operation is naturally longer than with the racing rim, but it should not occupy, under ordinary working conditions, more than ten minutes to dismount all three rims from a triple tire.

After tests extending over two years—the delay in placing on the market was principally on account of the dismountable rim—it is declared that two or three tires working side by side last from three to seven times longer than a single tire, with an equal load, working alone. The Paris 'bus now in service with these rims has three tires on each of the back rims and two on the front wheels. The weight of the vehicle, with eleven passengers, driver and conductor on board, is about 8,000 pounds. The 'bus is of a special type, with an armchair for each passenger and luxurious fittings.

SOME BRITISH AUTO DOINGS.

LONDON, Dec. 17.—The membership list of the Royal Automobile Club has just reached the 4,000 mark, a figure not approached by any other automobile club in the world. The number of the official gazette which gives this information also shows that the club's declaration of war against the inconsiderate driver is being acted upon. Legal proceedings have been taken in two cases of dangerous driving.

The differences between the Royal Automobile Club and the more democratic Motor Union are still unsettled and each body is seeking the support of the provincial clubs. A large number of these, however, have decided to associate with the two head organizations conjointly, or else not at all, and this evidence of opinion will probably lead to a peaceful settlement.

Three years ago much stir was caused by the announcement that the manufacturers of the Mercedes cars were about to institute proceedings against all Britisb makers whose cars were fitted with gate change. The general opinion was that the German firm had a strong legal case, and hence it was somewhat surprising to find that the matter was allowed to drop. Now it is stated that immediate action is to be taken, and the probable result will be that, with the exception of the Daimler Company, who hold a separate valid patent for their gate change, all British makers will pay royalty.

Newton, that prince of Brooklands drivers, has decided to retire from the racing game at the end of the year, but before then he is anxious to place tbe two 90-horsepower records at a figure far above their present level. Several times lately be has got the big Napier *Samson* up to a 120 m.p.h. gait for the half-mile, and it is possible that as much as another 10 miles an hour may be added, given favorable weather conditions.

The unnecessary use of big acetylene lights on city streets has of late become a grave public nuisance. The London authorities have made the first move by entirely prohibiting the lighting of headlights within the city, and other municipalities are likely to follow suit. Many devices have been tried to obviate the excessive upward glare from these lamps, but none have attained popularity. To encourage improvement in this direction the Royal Automobile Club is organizing a competition of headlights and of anti-dazzle attachments, the date being fixed for early in the new year.

BRITISH MAKERS FAIL TO SEE IT.

LONDON, Dec. 10.—Lending support to the rumor that there will be no Paris show in 1909, the Chambre Syndicale has made a definite proposal to the Society of Motor Manufacturers and Traders that if the latter will agree not to hold the Olympia show next year the French likewise will not have an exhibition. This suggestion is regarded rather with amusement by the leading British traders, who see no possible reason why they should cut off an undoubted source of business merely to oblige their Continental rivals. A second suggestion, that the Paris and British shows should alternate year by year, has met with no better reception, and hence it is definitely fixed that Olympia shall again open its doors next November.

SALT LAKE TO HAVE A MOTORWAY.

SALT LAKE CITY, UTAH, Dec. 21.—Leases have been signed for the right of way of the new automobile speedway from this city to Saltair, Utah. This will be built by a stock company and backed by the Salt Lake Automobile Club. The boulevard, which will be 25 feet wide and over 12 miles long, will cost, according to the promoters, no less than $50,000. The sources of revenue will be a small fee charged for the use of the boulevard, but the larger item will be the race meets, at which it is proposed to hold straightaway contests of one, five, and ten miles, all of the famous racing machines being expected. A modern grandstand will be erected just outside of Saltair at the end of the 12-mile straightaway.

PROPOSED LAW RESULT OF GOVERNORS' CONFERENCE

BOSTON, Dec. 21.—Acting in accordance with the suggestions made at the recent conference in this city of the governors of the New England States, the Massachusetts Highway Commission has drafted and reported to Governor Guild a new automobile law suitable for adoption by all the New England States. One of the things brought most prominently to the front in the conference of governors was the necessity of uniformity in dealing with automobilists, and in making up this bill the commission has studied the existing laws of nearly all the States, taking from each such things as seemed desirable for a uniform law, and also including some new features, whicb the experience of the commission in dealing with automobilists the past five years has shown to be advantageous. It is probable that the bill as drafted will be offered before the Massachusetts Legislature as a substitute for the present automobile law, and it will also be offered before the legislatures of the other five New England States. Numerous changes are made in the existing law, some of tbem being intended to increase the rights and privileges of automobilists, wbile others are restrictive in character.

One of tbe most notable of the changes proposed is to increase the maximum speed limit from twenty to twenty-five miles an hour in the open country. Twenty miles is the legal limit in Massachusetts, but some of the other States have twenty-five miles as a limit. It was felt by the commission that with proper safeguards as to reckless driving and the proper enforcement of these provisions the limit could safely be raised to twenty-five miles. But whereas under the Massachusetts law speeding in excess of twenty miles is prima facie evidence of improper driving, under the new draft speeding in excess of twenty-five miles will be conclusive evidence. The new draft also increases the limit in thickly settled sections, making this fifteen miles an hour instead of twelve as formerly. Speeding in excess of fifteen miles in thickly settled sections is to be prima facie evidence of improper driving. The limit at corners, curves and intersecting ways, including entering ways, is kept at eight miles an hour.

The draft provides for the elimination of local speed regulations, including those passed by park boards. Local authorities and park boards may make such local regulations, but they will not be valid unless approved by the Highway Commission, and the automobilists will not be under the necessity of taking the initiative in bringing such local regulations to the attention of the commission by filing a protest. It is provided in the law that, although speed in excess of twenty-five miles an hour is conclusive evidence of improper driving, a court may place cases on file whenever in its opinion the offence was unintentional or it is shown that nobody could be injured.

This change in the speed limit is a great concession to the automobilists, but they are to be made to pay for their privileges if the proposed law is adopted. Registration fees are to be based on horsepower, and the horsepower is to be determined by tbe authorities in charge of automobiles in each state. The proposed scale of fees is $5 for cars under 10 horsepower, $10 for cars of 10 and under 20 horsepower, $15 for cars of 20 and under 30 horsepower, $20 for cars of 30 and under 40 horsepower, $25 for cars of 40 and under 50 horsepower, and $30 for cars of 50 horsepower and over. Motorcycles are to pay $2 and commercial vehicles $5. How the Massachusetts Highway Commission would determine the horsepower, whether by actual measurements or by catalogue specifications, is not stated.

Another increased charge on the automobilist in the proposed law is an annual renewal of operators' certificates. At present in Massachusetts private operators' certificates are not renewed from year to year, though the annual registration system prevails.

For the second offence of driving while intoxicated the new law proposes a penalty of six months' imprisonment, while minimum fines are established for the ordinary offences, $10 for the first offence, $25 for the second and $50 for the third, within the same period of twelve months. Driving cars for racing or on a bet or wager of any kind is specifically prohibited.

It is proposed to make some important changes in the law as applied to non-residents. In Massachusetts non-resident owners may now drive their cars for seven days without securing a Massachusetts registration certificate. The new law proposes to extend this period to ten days and to allow chauffeurs as well as owners to drive cars during that period. But people whose home is in other States, and who live in Massachusetts or any other New England State for three months or more in a year, must register in Massachusetts and can secure a certificate for half price. This is intended to cover the cases of Summer residents.

Private operators' licenses will not be issued to persons under 16 years of age and chauffeurs' licenses to persons under 18 years of age. Further, nobody can operate who is under 16 years of age, even when accompanied by a chauffeur.

It is provided that all persons receiving compensation in connection with automobiles, such as salesmen, repairmen and the like, shall be considered as chauffeurs. Every car over 10 horsepower must have double sets of brakes, and when the car is standing the motor must be stopped.

The requirement for numbers on the side lamps is dropped, but a new requirement is made that the rear registration number shall be illuminated. Persons who rent cars are considered as dealers, this including presumably taximeter cab companies, and they may have uniform number plates. In every garage it is required that a record be kept of the entrance and exit of every car, and the word garage is defined to include club and private garages where fees are charged, as well as public garages.

QUAKERS EXPECT TO SEE A CHANGED JERSEY LAW

PHILADELPHIA, Dec. 21.—Quaker City autoists are looking for a revamping of the Frelinghuysen law at the coming session of the New Jersey Legislature. Not only have the long-continued plaints of the seashore bonifaces had their effect on the legislators, who are ready and willing to make the required changes, but even Motor Vehicle Commissioner Smith gives evidence of a change of heart. Of course, that official has had to carry out the law as it is on the books, but to many he has seemed a trifle overzealous at times. Now the Commissioner is out with a suggestion that everybody who desires a bettering of the lot of the automobilist who tours—or would like to tour—in New Jersey should hold a conference and decide on what amendments will be necessary to bring about improvement.

Mr. Smith admits that the Frelinghuysen law isn't the best ever, but thinks some allowance should be made for the legislators, who have been tinkering with the railroad laws for over half a century and haven't evolved an ideal yet, whereas they have wrestled with the automobile problem but five short years, and they cannot be expected in that short time to have learned it all. At any rate, they have learned something from this year's experience, when tens of thousands of dollars have been lost to the State's hotelkeepers and tradesmen through the practical boycotting of New Jersey by the automobilists, and now there are evidences of a willingness on their part to not only emasculate the Frelinghuysen law of the bulk of its harshnesses, but to make amends for the past derelictions by putting a law on the statute books which will make a veritable autoists' promised land of the erstwhile inhospitable "Garden State."

THE AUTOMOBILE

THE STEADY GROWTH OF AN INDUSTRY.

In two recent issues we have published no less than twenty-one notes of commercial cars in nineteen different cities of fifteen State and two foreign countries. These have included the whole range of commercial cars, taxicabs, trucks, tractors, railway motor cars, passenger buses, police, fire, ambulances, school, board of health, board of public safety and public works service.

We mention these figures taken at random for the purpose of emphasizing the fact that this gradual movement or undercurrent is international and universal rather than local or sectional. To recall our statistics given above, we may make the additional statement that no less than eight of these are in the nature of repeat orders after an extended and eminently satisfactory test of a previous utility car, and in every other case but one it is a case of one installation being modeled after a successful one in another city, which when analyzed also assumes the aspect of a repeat order.

From the foregoing we are perfectly safe in the statement that the commercial car is gaining ground all over the world and for every purpose. The rapid advance in motor propelled fire apparatus may be mentioned as particularly worthy of notice. This particular branch has made most unusual progress, partly on its merits and in a small part from the scarcity and consequently high price of suitable fire horses. And horses are subject to ailments that are many and varied.

And yet this branch of the industry, and the commercial vehicle industry as a whole, is only in its infancy. Manufacturers of pleasure cars in this country the coming year will reach the 65,000 mark, but we doubt if the whole commercial car output for the coming year will be 5 per cent. of this figure, and if we except cabs, the figures will probably not run as high as 3 per cent. Whereas in the future there is no reason why the figure may not go up to 70 per cent. of the number of pleasure cars, while the latter then will have increased say to 125,000. This means for the commercial industry an increase of no less than 3,100 per cent., which spread over a period of five years would be an increase of 100 per cent. each year. How many of our commercial manufacturers are prepared to double their facilities and consequently their output each of the next five years? Similarly how many of our pleasure car manufacturers are prepared to get their share of this great wonderful increase, as compared with the pleasure car increase of about 92 per cent. total or a little over 13 per cent each year?

* * *

NOW A BASIC PATENT IN DUAL IGNITION.

Basic patents so broad as to be the basis of a monopoly are, fortunately, very scarce, the statement of which fact does not mean to infer that the inventor of a device should not be protected and afforded the just reward that merit indicates. A basic patent affords the means honestly to demand merit; in other words, dollars. There is a difference between a basic patent and a belated "broad" patent. The "Selden" patent to many has had the air of a belated patent, and the courts are still trying to decide its scope in the light of basic principles.

The "Apperson" dual ignition patent, in conjunction with the "Canda" patent of earlier vintage, may, in some measure at any rate, create something of a furor. If it can be shown that the inventor did invent, rather than to take advantage of the absence of earlier applications for "letters patent" current with advances in the state of art, then it is plain to be seen that the inventor should be allowed to spend the product of his brilliancy and what of energy the situation demanded.

On the other hand, there is something abhorrent in the plan that allows a broad patent to go to issue years after the device has become a common expedient, through its common use on dozens of different designs of automobiles or what not. True, the inventor should not be allowed to suffer if the delay is due to inactivity in the patent office, and at the same time the cause of the delay should be ascertained, if possible.

The extent to which the ignition patents under discussion will prove akin to basic principles, is a matter that can not well be foreshadowed in view of the uncertainty of the rulings of courts, as the records bearing upon the subject will adequately prove. In general, it is the case that the inventor is entitled to his claims and the good that may come of them, if they are not contested; the cost of contesting can be more than the royalty that fairness might reasonably demand.

ONLY ONE AMERICAN CONCERN SEEKS TARIFF REDUCTION

WASHINGTON, D. C., Dec. 21.—In the concluding minutes of his appearance before the Ways and Means committee, which at present is occupied with the subject of the tariff, John J. Carton, attorney for the Buick Automobile Company, last week unwittingly explained the attitude of the company, for which he made a plea for the reduction of the duty on automobiles. Representative Boutelle, by reference to former testimony, asked if the Buick company did not intend to start a factory abroad. The question failed to elicit a direct response, though it is a well-known fact in the automobile industry that Buick cars are being manufactured at Oshawa, Ontario, by the McLaughlin Motor Car Company, Ltd., which is understood to have a direct connection with the Buick company at Flint, Mich.

Commenting upon Mr. Carton's unsatisfactory answer, Mr. Boutell remarked: "If this is a fact, it will explain much that is now a mystery. It will explain why you wish a lower protection on an American product, as you are going to become a foreign manufacturer."

"It is unlikely," replied Mr. Carton, "that we are arguing against our own business. We have a factory in Michigan, and it doesn't seem probable that we would try to hurt its business in order to help our possible activities abroad in the future. Besides, I don't know about that foreign factory with certainty."

Previously Mr. Carton had said: "From my talks with the general manager of our company, W. C. Durant, I desire to state to the committee that we are occupying somewhat of a middle ground. We differ from those who want a 45 or 60 per cent. tariff, and we also differ from those who do not want any tariff. The company which I represent, and for whom I speak, is of the opinion that there should be a moderate tariff placed upon the importation of automobiles, somewhat from 20 to 25 per cent. The general manager of our company is of the opinion that a 25 per cent. ad valorem tariff would be a sufficient tariff to take care of the automobile industry and to give it proper protection in this country.

"Now, it is a fact that the Buick Automobile Company is to-day selling automobiles in Europe and selling them there in competition with the automobiles manufactured there, and selling them successfully. Of course, at the present time they are not manufacturing an automobile which, in the common acceptation of the term, is as high grade as some of the other factories, but Mr. Durant said to me in a conversation the other day, and authorized me to say it here, that next year they will turn out as high-grade automobiles as any factory in the country—as good an automobile as can be made—and that they will sell it at 70 per cent. of the price which is now being charged for the same grade of automobiles by the so-called high-grade factories.

"Now, improvements are constantly being made, and the business of the manufacture of automobiles is being reduced more and more to a science every day, and there is, in the opinion of the gentlemen I represent, very little to fear from foreign importations. Of course, there should be something on it to make the difference—to take care of the difference—in labor."

Chairman Payne asked Mr. Carton if he thought 20 or 25 per cent. would make up the difference between the cost of labor here and abroad, to which the latter replied: "Yes, taking everything into consideration. That is what I am advised." Chairman Payne then wanted to know why the motor car was not a pretty good thing to produce revenue upon. Mr. Carton replied: "Well, yes; the question is whether you will produce more revenue with a 45 or 60 per cent. duty than you will with a 20 or 25 per cent. duty." Mr. Payne said it would seem at first sight that the automobile was a sort of luxury that could well afford to contribute to the revenues of the government, to which Mr. Carton replied that the automobile as a luxury was fast passing out of that stage.

Representative Crumpacker wanted to know how Mr. Carton, as a manufacturer, would be interested in having the tariff reduced on automobiles; in a word, what effect it would have. Mr. Carton thought it would be better for the trade generally by and by. Judge Crumpacker then wanted to know how, in the future, a reduction of tariff would improve business in this country. Mr. Carton replied that he did not know that it would improve the business, but he and his associates did not think it was necessary to have a high tariff on automobiles. "If the tariff were reduced from 45 per cent. to 25 per cent., in order to obtain the same revenue, we would have to import about twice as many automobiles as we have before, and that would displace an equal number of the American make?" asked Representative Crumpacker. Mr. Carton replied it might be so considered. Judge Crumpacker said he asked the questions because he had not been able to understand the interest the Buick people had in the manufacture of automobiles in the reduction of the duty from 45 per cent. to 20 or 25 per cent. To this Mr. Carton said: "Well, I am presenting the views of the managers of the company. They are of that opinion. We are protectionists, so far as that is concerned, and we think that there should be sufficient to compensate for the difference in the wage scale. But outside of that there isn't any reason why an automobile could not be made here, considering the skill and workmanship of the American manufacturers and the American workingmen, cheaper than they are made in Europe."

Representative Dalzell asked about the Selden patent. Mr. Carton replied: "We are not paying any license fee. We have concluded that the Selden patent does not mean anything."

"That is all right," said Representative Dalzell, "but you have been paying?"

"Yes," replied Mr. Carton, "but we have declined for a year or more now to recognize it."

It was then that Representative Boutell said he could not understand why the Buick concern went to the expense of sending somebody down to Washington to make an argument for the lessening of the duties. It seemed, he said, more or less of a mystery to him.

Mr. Durant Evaded the Question.

WASHINGTON, D. C., Dec. 21.—The Ways and Means Committee gave a hearing Saturday to W. C. Durant, of the Buick Motor Company, and the following excerpts from his testimony are of interest:

"Mr. Carton, our attorney, appeared before the committee some days ago at my request, because it was impossible for me to present the case. He stated the case as best he could with the limited knowledge possessed by him, having been called upon to help me out of a difficulty, and I had a conversation of about two hours with him, attempting to express my views. I wish to correct some of the statements made by Mr. Carton, fearing that the committee may be laboring under a misapprehension.

"The Buick Motor Company has been accused of being interested in the reduction of the tariff by reason of owning a factory in Canada. I wish to say that the Buick Motor Company does not own or control a factory in Canada, but has a very slight interest in an institution in Canada. That concern last year, as I understood, employed a capital of $65,000. They produced 197 automobiles. It has been represented that the fact that we are interested in a small way in that Canadian plant is operating against the statements which we are now making, and which we hope might enable the committee to give us a reasonably fair tariff bill."

Mr. Durant submitted certain figures bearing on the direct cost of labor in the manufacture of an automobile, and got into a wrangle with the committee over the figures.

He was asked the direct question if his company contemplated erecting a factory abroad, but evaded the question by saying that his company was after foreign trade.

A BUDGET OF LATE NEWS FROM TIRETOWN

AKRON, O., Dec. 21.—The Mansfield Rubber Company, of Mansfield, 65 miles west of Akron, has been organized by F. A. Wilcox, of this city, with $250,000 capital stock. Mr. Wilcox has been elected president, and the other officers are the following: Vice-president, C. H. Walters, Buffalo; secretary, F. W. Walters, Buffalo; treasurer, F. M. Bushnell, Mansfield; directors, F. A. Wilcox, C. H. Walters, F. W. Walters, L. Hautzenroeder, F. M. Bushnell, H. Homberger, W. H. Bissman. The company will manufacture especially the National tire tube, but will be devoted entire to turning out high-grade pneumatic tires and casings and a full line of molded and mechanical rubber goods. The plant is to be installed by January 10 with a complete equipment, which is to include a Harris-Corliss engine of 550 horsepower, with four boilers of 200 horsepower. By March 1 the plant is to be in operation, and forty experienced rubber men, some from here, will go to Mansfield. By next Fall it is expected 250 persons will be employed.

Mr. Wilcox is a director of the Pennsylvania Rubber Company at Jeannette, Pa., and he and C. H. Walters were the early managers of this same company when located at Erie. Messrs. Walters were connected with the Victor Rubber Company for years, and Mr. Wilcox organized the India Rubber Company, of this city, which he managed until it sold out to the trust.

Tire Town Has a Little Auto Show.

The Akron Auto Garage Company, A. Auble, Jr., and F. C. Wood, managers, gave a very successful automobile show this week, representatives of five auto manufacturers and of numerous accessory concerns being present. This is the second show of the kind given here, and interests the entire trade of the city. One of the most interesting features was an aeroplane model exhibited by Fred T. Childs, a local machinist, whose flying machine moved about at the will of the operator easily. Childs expects to construct a full-sized aeroplane next Spring. It will weigh about 600 pounds and will be equipped with a 25-horsepower engine weighing only 110 pounds. It will carry its wings in such way that the inventor claims such an accident as occurred to the Wright machine will be avoided.

At this show Winton, Oldsmobile, Franklin, Baker Electric, Peerless and Buick cars were shown in 1909 types, and two of the Webb auto fire trucks were also shown. All of the Akron manufacturers of accessories were well represented with exhibits. Several Eastern companies bad representatives present.

International Harvester Has New Air Cooler.

The International Harvester Company has completed a test car and is now ready to turn out a new style of air-cooled automobile with four-cylinder engine and tourabout body, which will constitute a roadster much larger and more imposing than the ones now manufactured at the rate of ten a day here. The test car has already been put through hard work, one continuous run of 35 miles bringing the engine through in the best of shape, with the air-cooling apparatus working perfectly, there being no sign of heated parts. The engine will have a heavy horsepower. While it is to be something on the order of the famous Franklin engine, the designer expects it to be more powerful. In connection with it Mr. Johnston, the designer, has invented a starting mechanism for explosive engines also.

Motz to Extend Its Operations.

The Motz Clincher Tire & Rubber Company, of this city, is preparing to extend its business very materially. Recently the company sold $15,000 worth of treasury stock, bought principally by the stockholders, and the money will be used to extend the company's operations. Branches are to be established in Chicago and New York after the February sbows. P. E. Bertsch will have charge of the New York branch. The company is also talking of establishing a plant, the Buckeye Rubber Company now producing its tires. The lines to be extended especially are motor buggy and other vehicle tires, as well as solid truck, cushion, and special electric tires.

Firestone Employees Organize Benefit Body.

The Firestone Tire & Rubber Company employees in the factory and office have organized a society known as the Firestone Mutual Benefit Association, for which a charter will be asked soon. It will have several hundred members to start off with, and the purpose is to provide sick and death benefits for the members and to cultivate social ties. The opening function is to be a large dance in the top floor of the new addition to the south wing of the factory.

OLDS WORKS BECOME JERSEY CORPORATION.

LANSING, Mich., Dec. 21.—Notice to local stockholders in the Olds Motor Works to the effect that they may exchange their holdings in the latter company for shares of the General Motors Company, on the basis of $4 in preferred and $1 in common of the new company, for each share of the Olds stock, is the first intimation received here that the Olds Company has been transformed into a New Jersey corporation with a capital of $12,500,000, of which $7,000,000 is in the shape of 7 per cent. cumulative preferred shares, while the remainder is common. It is said that an offer was made for 75 per cent. of the Olds Motor Works stock, but was not considered by a majority of the holders, unless the proposal were made to include the entire issue so that all stockholders would have an equal opportunity to exchange on the same basis.

The interests back of the new corporation have acquired control of 75 per cent. of the outstanding stock of the company and will accordingly be in a position to elect new officers and directors, but otherwise there will be no change. No formal transfer of the property will be made, and the corporation will continue the business as heretofore, except that it is said to be the intention of the new interests to greatly enlarge the business. It could not be learned whether there are any other Michigan automobile interests involved or not.

NEW OFFICERS FOR POPE COMPANY.

HARTFORD, Conn., Dec. 21.—A meeting of the directors of the reorganized Pope Manufacturing Company was held in New York City Friday, and the following officers were elected: Chairman of the board of directors, Harry Bronner; president, A. L. Pope; vice-president, Charles E. Walker; treasurer, Colonel George Pope; secretary, Wilbur C. Walker; assistant treasurer, Ezra M. Cutting; counsel, Joline, Larkin, and Rathbone.

The new company has authority to take over the properties of the company on the payment of the debts of the old concern and the transaction of this is being accomplisbed with all possible dispatch; the new concern is practically running under its old officers. A petition of the receivers of the old company will be filed in the court of chancery at Newark for permission to make the final payment of the fourth dividend.

C. O. SACKS NOW PRESIDENT ROWLAND AGENCY.

Clarence O. Sacks, for a number of years associated with the late John B. Rowland, in the Rowland Advertising Agency, has become president and treasurer of that concern. Eugene F. Kinkade, who represents a New Jersey district in Congress and is president of the New Jersey Street Car Advertising Company, of Newark, is secretary and a director of the Rowland Agency.

OUTLOOK FOR LARGE CAR VIEWED IN CLEVELAND

CLEVELAND, Dec. 21.—Developments in the automobile field during the past half year have not only followed one another rapidly, but have been of such a nature as to give rise to numerous questions of interest concerning what the future may hold in the way of bringing forth new types, or rather of definitely setting the seal of approval on certain types and sizes of cars. Not the least interesting of these has to do with the size of the car; in other words, what is to be the outcome of the "Large Car vs. the Small," and what influence will the trend of the demand during what is now generally conceded to hold forth promise of being far and away the best year the industry has ever experienced, have upon the settlement of this question? With a view to obtaining the opinions of some of those directly concerned, the representative of THE AUTOMOBILE called upon some of Cleveland's leading manufacturers. It will be evident upon reviewing the manner in which they have placed themselves upon record, particularly when taken in connection with the unprecedented amount of business they now have on hand, that the call for high-priced and high-powered machines has never been greater and that there is little likelihood of this phase of the demand for automobiles undergoing any decided change for some time to come. The discussion of this question by Cleveland manufacturers is particularly apropos, as Cleveland has always been a center devoted almost exclusively to the production of machines of the better class.

Alexander Winton, of the Winton Motor Carriage Company, thought there would always be sufficient demand for cars of large power and seating capacity to make it worth while for leading manufacturers to list such a type. "Not that I think there will always be a call for large machines simply on account of their size, as I feel convinced that the day when people were fond of running around with a big seven-passenger touring car, regardless of the requirements of their families, is gone by. Vacant seats in a car have too long been regarded as a standing invitation to one's friends, who would otherwise not be included in a party, and the average owner of a car has long since realized that carrying extra weight around means increased fuel and tire bills. Of course there is a certain legitimate demand for large cars with big bodies, but for every man who has to invest in a seven-passenger car to accommodate the seating requirements of his family, there are ten or twenty whose limit is three or four, so that not a few of our 60-horsepower six-cylinder machines will be fitted as roadsters or with a small tonneau.

"Probably we are not in as good a position to discuss the relative demand for cars of the two sizes as some other makers, as the 48-horsepower six-cylinder Winton was on the market for a whole season before we listed the 60-horsepower size, and naturally our orders for the former are very largely in excess of the calls for the higher-powered car, but even at this early day we have had a very gratifying demand for the big car, and the number of inquiries received by our agencies in different parts of the country goes to show that a very fair percentage of our season's output will be 60-horsepower cars. Many of these will naturally be closed types, such as the limousine and landaulet, and where it is necessary to carry a number of people such as only one of these machines will accommodate comfortably, there is nothing else that solves the problem quite so well. Just what percentage of our total output will consist of the 60-horsepower type it is difficult to predict now."

Walter White, of the White Company, thought it a hard matter to say at the present moment just how the demand would shape itself in the next few months where the two sizes of White steamers that are now being turned out are concerned. "Having come out with the announcement of the 20-horsepower White early in the season, we have naturally had to devote considerable attention to its manufacture," said Mr. White when seen at his office, "and have already produced a series of these cars, which are now being delivered as rapidly as is possible.

"It strikes me that the real question, at least so far as we are concerned, is not so much what sizes of cars to turn out as how to be able to turn out more of them. That is the situation that now confronts us, and it applies more particularly to the large car than to the new White of less power. When it comes to a shifting of the demand in either direction, our facilities are such that we will be in a position to take care of our orders one way or the other, and the same thing applies to the total number of cars that we will build during the season, as we have always found that no matter what our plans made at the beginning of the season happened to call for, we were compelled to exceed the original number to a greater or less extent. Judging from the present outlook, the prospects are that this will be the case next Spring."

George J. Dunham, president of the newly reorganized Royal Company, now known as the Royal Tourist Car Company, was enthusiastic over the outlook for a high-grade car along similar lines to those of present standard models, but of smaller dimensions, and doubtless Mr. Dunham's long agency experience in Boston makes him better qualified to speak on the subject than the average manufacturer, as he has been in direct touch with the purchaser for several years.

George J. Dunham.

"That is my opinion on the subject," said Mr. Dunham, "but so far as we are concerned here at the factory, it will probably be a long time before we are in a position to devote any attention to a new model, other than the one which Mr. Jardine has been perfecting during the last year or two and which we will now begin to turn out in quantities. There couldn't have been a better time to perfect the reorganization of the company, though we would naturally have been in a better position to make deliveries had it come about earlier."

F. B. Stearns, of F. B. Stearns & Company, was confident that there would never come a time when those American makers who had achieved a reputation for their product in the past several years, would find it difficult to sell all the large cars they could make. "Regarding the small car question," said Mr. Stearns, "that depends entirely upon what you mean by a 'small car.' We have added what we call a small shaft-driven car to the Stearns line, but compared with what is usually regarded as coming within this category, it is really a large car, but not as powerful a machine as the regular Stearns, on which we are giving an option of chain or shaft drive, though we prefer the former for a big car designed to run at high speeds over all kinds of roads. But the motor of Stearns small car shows 40 horsepower on the test block, and, when equipped with a baby tonneau, of which we are turning out a number, it will also be capable of traveling at high speed, at the same time having all the enduring qualities of the bigger machine. It is practically a smaller edition of the big Stearns with a shaft drive and naturally handles easier in congested traffic, thus making it particularly suited for town work when used with a closed body.

"Things could scarcely be better," continued Mr. Stearns, speaking of the outlook. "By October 1 we surpassed our entire 1908, production, and that month of this year ran several times ahead of the same month a year ago. We planned to build 250 cars last year, and, when the slump came, cut that figure to 200, but there was so little actual falling off in the demand that we built and delivered 243 of the 30-60 Stearns before the end of the season. This year we have made preparations to double that figure by planning to turn out 500 cars, but at the present rate there is every prospect of our running considerably over that."

DETROIT ENTHUSIASTIC ABOUT SHOW.

DETROIT, Dec. 21.—Allotment of space for the forthcoming show under the auspices of Detroit Auto Dealers' Association, proves conclusively the accuracy of the statement made earlier in the season that it would be the best ever. Every bit of available space on both floors of the huge Wayne Pavilion, where the show will open February 15, lasting one week, was snapped up by those anxious to participate in the exhibition. Sixteen of those who drew were members of the Detroit Auto Dealers' Association, all large auto concerns. Of the twenty-one non-members some were automobile companies, some motorcycle agents, and some accessory manufacturers and agents.

The latter were the innocent cause of some caustic interchanges of correspondence between "Dada" officials and officers of the Motor and Accessory Manufacturers. At the annual meeting last summer the latter body voted not to take any part hereafter in local automobile shows because of the heavy traveling expenses. Local shows in this resolution were defined as all those save New York, Chicago, and Boston. Failure to sanction the local show was taken by "Dada" officials as an attempt to hamper them, which they promptly resented. Now that the true situation has been made known, peace once more reigns.

FIRST CHAUFFEUR CONVICTED IN MARYLAND.

BALTIMORE, Dec. 21.—The first arrest to come under the law making it a misdemeanor for chauffeurs to take out the cars of owners without their consent, was that of James L. Hild, employed by President Oscar G. Murray, of the Baltimore & Ohio Railroad Company. Hild was fined $100 and costs, making a total of $101.45, while his chauffeur license within this State was suspended for three months. Hild had previously been fined $25 and costs on a charge of exceeding the speed limit of 12 miles an hour. Hild took the machine, a Packard car, and a party of friends for a "joy ride," early on Sunday morning, December 13. While speeding out Charles street avenue boulevard the car was dashed into a telegraph pole and one of the occupants, Harry Kessler, was killed and the machine wrecked. The coroner's jury decided that Kessler's death was accidental, and exonerated Hild of any criminal charge, but he was compelled to pay the fines on the other two charges. The Automobile Club of Maryland, at a specially called meeting, condemned Hild's conduct, while the State Automobile Commission has determined to embody a severe penalty for reckless driving in the proposed bill to be presented to the next State Legislature.

BUFFALO TRADESMEN ELECT JAYNES.

BUFFALO, Dec. 21.—W. C. Jaynes, of the Automobile Supply Company, has been elected president of the Buffalo Automobile Trade Association. This step is said by insiders to have averted an open rupture with the Automobile Club of Buffalo. It was recently announced that a faction of the trade association, if elected, would promote a show in opposition to the automobile club show. The defeat of this faction at the polls by Jaynes, known as the "peacemaker," puts an end to the talk. The other officers elected were: Vice-president, Maxwell-Briscoe-Buffalo Company; treasurer, Brunn Carriage Mfg. Co.; secretary, Dai H. Lewis; executive committee, George N. Pierce Company, E. R. Thomas Motor Company and G. H. Poppenberg.

LUXURIOUS STAGE FOR SOCIETY FOLKS.

LAKEWOOD, N. J., Dec. 21.—The latest innovation is one intended for the society people who visit this resort. This is the installation of a luxuriously appointed automobile stage or motor 'bus to run from the Hotel Knickerbocker, in New York City, to this resort. The roads are among the best and the scenery en route is very beautiful and picturesque, so that the elegantly appointed vehicle will doubtless be well filled each day. This mode of travel is increasing in popularity daily.

DETROIT'S TAXICAB INTRODUCTORY.

DETROIT, Dec. 21.—Now it is the taxicab that has fallen under the ban. When the first of these buzzabouts appeared on Detroit's streets they were regarded with curiosity by the old-time cabbies, who for so long had a monopoly of the passenger business. In quick succession came distrust, apprehension, alarm. Now the cabbies are panic-stricken. You can't get one of them to admit this. The fact remains, however, that they have united to compel the taxicabs to operate under the ordinance governing the rates of fare to be charged, and in this manner hope to check the rapid inroads made on their business.

The cabbies have long enjoyed the privilege of having their conveyances stand about the city hall waiting for passengers. The taxicabs have the consent of hotel and café proprietors to stand outside their establishments and skim off the cream of the business, hence the trouble. As a matter of fact, the taxicab fare by the hour is cheaper than that charged by the cabbies. It is only on the short haul that the latter's rates are more reasonable.

A suit to determine the status of the taxicab and discover whether it is amenable to the existing ordinance has been instituted by Police Commissioner Smith, and the outcome is breathlessly awaited by local Jehus.

Literally Overland in an Overland Car.
Frank Moore, manager of the Fisher Automobile Company, Indianapolis, driving his Overland roadster up one of the steepest bluffs in the neighborhood of that city.

AUTO MAIL COLLECTING IN INDIANAPOLIS.

INDIANAPOLIS, IND., Dec. 21.—The local post office last week placed in service two gasoline cars for the collection of mail and the cars are to be run to all parts of the city.

The cars in use were built by the Overland Automobile Company and will be leased by the post office for one year as an experiment. After that time if the test is successful all of the mail collection work in the city will be done with automobiles.

Bodies enclosed with heavy screen wire and canvas as a protection from the cold are mounted on the regular chassis of Model No. 32 Overland. The cars are painted red, white and blue, after the style of the horse-drawn mail wagons. There are two of the automobiles and so far have given excellent service. Drivers are supplied by the Overland Automobile Company, a carrier accompanying each car.

PROVED ECONOMY OF AUTO OVER HORSE.

PHILADELPHIA, Dec. 21.—The Oxford Automobile Company, local agent for the Brush car, gave a very convincing demonstration of the workings of the Brush package-delivery wagon last Saturday, when a route of 101 stops was covered in 2 hours 39 minutes, as against the best previous 5 hours 14 minutes with a horse-drawn team. At $600 this little wonder figures out as a sure economical proposition, especially in rush times like the Christmas holidays.

News in General

Speedwell Rapid Delivery Truck—a Successful Commercial Car.

This car is designed to carry a load of 3,500 pounds, although some of them have successfully carried as high as 5,000 pounds in an emergency. The chassis, including the driver's seat, is so built that any type of body can be mounted thereon. The makers, the Speedwell Motor Car Company, Dayton, O., report a heavy demand.

Weights of Accessories, Tools, Etc.—The subject of weights and weight distribution has of late come to be a very interesting one. Beginning with the practice of some makers of suspending the body between the axles to get the proper distribution of weights, we may look into the matter of accessory weights. It is a fact that the average automobile owner cannot tell how the weight of his car is distributed. A table prepared by the George N. Pierce Company, of Buffalo, gives a close insight into this matter, so far as Pierce-Arrow cars are concerned. The Pierce-Arrows are equipped very completely, and what is known as the "stock car" has with its equipment, not generally included, these articles: Shock absorbers, 28 pounds; odometer and fittings, 2 pounds; foot rest, 7 pounds; robe rail and brackets, 5 pounds; dash cabinets, 3 pounds; luggage carrier, 17 pounds; tool box, 26 pounds; sprag, 12 pounds; rubber bumpers, 5 pounds; rear axle straps, 2 pounds; gasoline gauge, 1 pound; tools and spare parts, 55 pounds. Aside from the actual mechanism and body of the car there are extras, such as cape top, 138 pounds, and the glass front, 44 pounds, that count in the weight of the car. Water, oil, gasoline and grease add another 220 pounds. The ignition outfit of a Pierce-Arrow adds more weight. Two separate systems are used, a high-tension magneto and storage batteries. The magneto system weighs 32 pounds, and the battery system 70 pounds. Then the lamps, lamp brackets and horn weigh 87 pounds. This added gives a total of 738 pounds over and above the mechanism and body of the car.

Does Reo Get the Record or Not?—An interesting discussion has sprung up between an Eastern and a far Western crowd of automobile enthusiasts relative to a certain record. The question under discussion is: Did Leon T. Shettler win the world's non-stop record run in Los Angeles last March? Shettler's rivals concede that the 4.992 miles which his Reo covered in the sleet and slush around Los Angeles lowered the previous non-stop record by 86 miles. It is alleged that he confined his run principally to the city streets, whereas his rivals covered the roads around Bridgeport, Conn. Thus, it is alleged to be a non-stop world's record, while the other is a non-stop world's record road run, which is splitting it very fine. Shettler says: "As far as running the Reo over the streets is concerned, fully half the distance was on country roads. We started out to run over the streets of Los Angeles, but they were in such bad condition that we took to the roads. If we had done so in the first place, we would have added about 50 miles a day to the record." There is enough merit in either stunt to justify a medal being awarded to both cars.

Oil Your Bearings.—Autoists who have all ball-bearing cars, or cars well equipped with ball or roller bearings, should use oil freely, according to one well-known maker of both. "There is a false impression prevalent that ball and roller bearings do not require oil, but this is incorrect, as they need it not only to prevent rust, due to moisture from condensation or other causes, but they also require it as a lubricant, although a comparatively small amount is consumed," says S. S. Eveland, president of the Standard Roller Bearing Company. "It has been found desirable to use a heavy non-fluid oil or grease, free from animal fat or foreign substance, or a good machine oil fed under pressure, or have the bearings mounted in an oil bath."

Demand for an All-Around Car.—There still exists a big demand for an all-around-the-year car, one that will have lots of power with the touring body on, and yet drive slowly and easily when the summer body has been replaced by the limousine. Commenting on this, James Joyce, president of the American Locomotive Company, says: "We have something out of the ordinary to meet this demand for the all-around machine. This is our 40-horsepower car, which is made with direct drive on the third, as well as the fourth, speed. With this car a man can get about the city on third speed, driving direct and throttle down to the necessary pace, and yet run silently and with no straining of the gears, much the same as with a car of lower horsepower."

Maxwell Agent Challenges.—The Maxwell agent at Hartford, Conn., R. D. Britton, has issued a challenge to any car costing less than $1,000 for a race in mid-winter from Hartford to Pittsfield, Mass., and return. The distance is 154 miles, and includes some of the worst roads in New England, with many hill climbs, one of which reaches an elevation of 1,500 feet. Mr. Britton has entered two Maxwells, the only conditions being that the race be held within a few weeks; cars must be owned and driven by Hartford residents, and must go the distance under their own power. The Hartford *Times* will offer a cup if any one accepts Britton's sporty proposition.

Self-Starting Devices.—Although few new self-starting devices have been brought out lately, considerable interest is being manifested all over the world. One of the simpler American arrangements consists simply of a clutch and spring attached to the magneto armature, allowing the latter to be spun around. A famous French manufacturer has paid Alexander Winton the high compliment of imitating the Winton device. However, in order to avoid infringement, the French device accomplishes its purpose by a roundabout rather than a direct method, hence the foreign self-starter lacks the Winton's simplicity.

Lists a 90-Horsepower Racer.—That speed races help the companies building high-powered cars is shown by the fact that immediately after the recent Savannah races no less than five prominent autoists tried to buy the 90-horsepower Simplex car that made such a good showing. This the manufacturers, Palmer & Singer Manufacturing Company, New York City, refused to sell, but took orders for duplicates and now are building ten of these Savannah models, which will be equipped with bucket seats, large fuel tank and generally resemble the Savannah car. A guarantee of 90 miles per hour goes with every car.

Doubled the Capacity.—Nearly every day sees the announcement of a new factory or a new building for automobile factories. That the accessory makers are not idle is shown by the fact that one maker alone, the Edmunds & Jones Manufacturing Company, of Detroit, Mich., has built an immense addition that will increase its capacity to five times that of last year. Despite this great increase the factory is running night and day, having on hand orders for 60,000 pairs of oil lamps and 40,000 pairs of gas lamps.

St. Joe Company to Move.—The St. Joe Motor Car Company, of Elkhart, Ind., has fully decided to move to Hutchison, Kan. While no bonus is promised the firm, it is understood that Hutchison capitalists will invest $50,000, thus raising the amount of capital stock from $50,000 to $100,000. The name will be changed to the Sunflower Motor Car Company, and plans have been made for producing 300 cars each year.

Bendix Will Go to Logansport.—It is understood that the Bendix Automobile Comnany, of Chicago, Vincent Bendix president, and the Logansport, Ind., stockholders have arrived at an agreement whereby the company will remove to that town, starting work immediately on a new building. This company, it will be remembered, holds the patents on the Bendix friction transmission.

Will Manufacture Transmissions.—The General Manufacturing Company, of Elkhart, Ind., of which D. E. MacCarthy is president and treasurer, has established and will manufacture a standard line of auto parts, starting with cone clutches and selective type of transmissions. They will also bring out two sizes of planetary transmissions for use on lower priced cars.

IN AND ABOUT THE AGENCIES.

Cameron, New York City.—The Cameron Motor Company, of New York, will occupy with its general sales offices the entire building at 231 West Fifty-fourth street, January 1, 1909, in charge of Harry W. Doherty as manager. The factories at Beverly, Mass., and New London, Conn., are planning to turn out 2,000 of the air-cooled Cameron "fours" and "sixes" in runabouts, baby tonneaus and racers, and will shortly add to these models a taxicab and light delivery car.

Waverley Electric and Gyroscope, Chicago.—The S. H. Peterson Automobile Company, Chicago, have taken up quarters at 1229 Michigan avenue, where they will represent the Waverley electric and Gyroscope. Mr. Peterson, formerly with the Woods Motor Vehicle Company, has surroundcd himself with an able staff of technical men and salesmen in anticipation of a big year's business, particularly in the new models of the Waverley electric.

Stevens-Duryea, Philadelphia.—A. G. Spalding & Bros., Philadelphia agents of the Stevens-Duryea, have taken a lease of the old quarters of the Maxwell and Mora agents—the Kelsey Motor Car Company—at 202-204 North Broad street, and after a thorough overhauling, which is now in progress, will abandon their present salesrooms at 510 North Broad street. Manager F. W. Eveland thinks the change can be made in about three weeks.

More Franklin Agencies.—The Franklin will be handled the coming season by these dealers: Florence, S. C., Brown & Ingman; Montgomery, Ala., Capital City Automobile Company; Comanche, Tex., L. B. Russell, Jr.; Corsicana, Tex., Corsicana Motor Company; El Paso, Tex., P. L. Abel Cycle Company; Ispeming, Mich., E. R. Nelson; Easton, Pa., Easton Automobile Company; Elizabeth, N. J., Elizabeth Automobile Company, Inc.

Portland, Ore., Agent Increases Facilities.—H. M. Corey, of Portland, Ore., agent for the Pierce Arrow and Cadillac, has recently taken a new building 100 by 100 and two stories high, the salesroom of which set a new high mark in elegance for that part of the country. This is finished in antique with oak-stained beam ceiling, dull-brass drop lights, very sumptuous offices and waiting rooms.

An Active Pennsylvania Concern.—The Sunbury Automobile Company will handle the Locomobile, Matheson, Mercedes, Pope-Hartford and Studebaker electrics at Sunbury, Pa. This vigorous young company also plans to manufacture a car of its own, a new factory building, 60 by 150, three stories high, being under construction.

Speedwell, New York City.—Broadway's automobile row will gain one more agency January 1, when the Speedwell Motor Car Company, of Dayton, O., opens its New York City branch at 2002 Broadway. This will be a distributing house for the eastern section of the country.

Bosch, New York City.—The Bosch Magneto Company announces removal to its new building at 223-225 West Forty-sixth street, New York City. This change was necessitated by steadily increasing business, which made the old quarters inadequate.

Waverley Electric, Indianapolis, Ind.—The Hearsey-Willis Company, Indianapolis, is closing out the carriage business and will devote its entire attention to automobile trade. The company has added the Waverley electric agency to its list.

Middleby, Newark, N. J.—The Middleby Automobile Company, of New Jersey, has taken the Newark agency for the Middleby, a new four-cylinder air-cooled car manufactured in the old Duryea plant in Reading, Pa.

Mercedes, San Francisco.—W. E. Travis, whose headquarters are with the Pioneer Automobile Company, San Francisco, will personally have the Western agency for Mercedes cars.

Mitchell, Media, Pa.—Penn Motor Car Company, of Philadelphia, has opened a branch house at Media, Pa., from which the southeastern corner of the State will be supplied with Mitchells.

Premier, Southern California.—The newly formed Schwaebe-Atkinson Motor Company, of Los Angeles, Cal., will have the Southern California agency for the Premier car.

Regal, San Francisco.—Daniel E. Whitman, the well-known San Francisco agent for the Rambler, has added the Regal to his line.

PERSONAL TRADE MENTION.

Victor M. Gunderson, ex-secretary, treasurer and general manager of the Northern Motor Car Company, who resigned when the consolidation of that company with the Everett-Metzger-Flanders Company took effect, has decided to take a well-earned vacation and will spend the winter touring Mexico, Florida, Cuba and Puerto Rico. Mr. Gunderson has been in the automobile business since its earliest days. He was elected secretary and treasurer of the Northern Motor Car Company in September, 1903, when the output of the Northern Motor Car Company had only reached a total of three machines in six months. Under his management the "Northern" developed a car of high efficiency and the business to a point where it was considered one of the powerful factors in the industry. The Northern Motor Car Company was organized with a capital stock of $20,000, and under Mr. Gunderson's management developed and grew until it had a paid-in capital stock of $385,000 and had paid substantial annual dividends. Mr. Gunderson has not made any definite plans for the future.

Victor M. Gunderson.

H. K. Sheridan, who has driven the White steamer to victory in a number of important reliability runs, has accepted an offer from Manager George W. Bennett to become superintendent of the New York branch, and he will hereafter be in charge of the garage and repair shop. Mr. Sheridan has for several years held an important position at the White factory in Cleveland, and he is exceptionally well qualified to direct the affairs of the garage on West End avenue, "the largest in the world devoted to a single make of car."

George Patterson has been appointed manager for the newly established Rambler branch in Cleveland, which supersedes the agency for that car formerly held by T. C. Whitcomb. Mr. Patterson is one of the best known and most popular of the Cleveland dealers, and was for the past three years agent for the Reo and Premier in that city, which agency will be continued under new management, but with the same staff as before.

David Henry is the sales manager of the Inter-State Automobile Company, Muncie, Ind., which position he has occupied for the past two months. It was erroneously stated in these pages last week that Mr. Henry was sales manager of the Auto Parts Mfg. Company, Muncie, Ind.

C. A. Newman has become manager for Guy E. Blackwelder, Franklin dealer at Oklahoma City, Okla. Mr. Newman was formerly with the Atwood Automobile Company, Toledo, and the Sid Black Automobile Company, of Cincinnati, O.

Robert W. Blake, formerly manager of the Knox branch house in Philadelphia, has joined the sales force of the E. L. French, the Quaker City Pullman agent.

R. K. Swett, formerly with the Pope-Hartford Company, is now with the H. H. Franklin Manufacturing Company as a salesman.

N. J. Eisenberg has joined the sales force of Brock's garage, Trenton, N. J., which has the Winton agency.

OBITUARY.

Arthur W. Tobin, president of the Continental Motor Works, of Muskegon, Mich., died recently in Chicago of blood-poisoning, following an operation to remove a growth of bone in the nose. Mr. Tobin was born in Chicago and only removed to Muskegon three years ago, but had built up a very large and flourishing business in that time.

BUSINESS DIFFICULTIES.

Toledo, O.—J. W. Lane, trustee in bankruptcy of the Craig-Toledo Motor Company, Toledo, O., has filed suit against the stockholders to recover $30,000 with which to pay the debts of the defunct concern in full. Lane alleges that the debts aggregate over $45,000, while the assets produced but $16,000, and asks that the court collect unpaid stock subscriptions to pay the balance. He further alleges that when the firm was formed $51,000 stock was issued to one of the promoters for the assets of the Maumee Motor Car Works, worth not more than $1,500.

RECENT INCORPORATIONS.

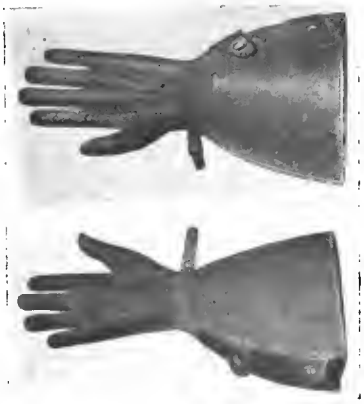
Hyle Spring Hub Company, Buffalo, N. Y., capital $150,000, to manufacture motors, engines, machinery, cars, carriages, boats and motor vehicles. Among those interested are: W. A. Hyle and Blum Yates, Ellicott Square, Buffalo; V. E. Peckham, Jamestown, N. Y.

Dubred Machinery Company, New York City, will deal in automobiles and knitting machines. Capital $5,000. Incorporators: P. E. Dubred, Convent Switzerland; P. A. C. Dien, J. B. Bruyn, New York, and Henry Escher, Jr., Brooklyn.

Sharp Arrow Automobile Company, Trenton, N. J., capital $125,000, to manufacture automobile and vehicle engines and machines. Incorporated by W. H. Sharp, F. J. Sharp, J. R. Farlee, I. W. Burnett and A. M. Yetter.

INFORMATION FOR AUTO USERS.

Price Automobile Gloves.—In the manufacture of this line of automobile gloves, two views of which are shown in the illustrations, the maker, the Henry W. Price Company, Rockford, Ill., has produced something classy and distinctive that appeals to the practical autoist in point of style, comfort and wearing qualities. The graceful lines of these gloves, together with the care that marks their finish, not only makes them particularly dressy, but at the same time contributes to their comfort and serviceability. Among the exclusive features of this line of gloves is the great length, the large and wide gauntlet cuffs with wide folding gore and clasps a solid leather wrist strap with snap strap buckle, and inseams throughout the base of the thumb. These gloves are made throughout, even to the cuff linings, from the best quality of selected washable horsehide, no cape or sheepskin being used in them, and the makers state that they put them up as carefully as though they intended to wear them themselves. A copy of illustrated catalogue describing the line can be obtained by addressing the Henry W. Price Company, Department 25, Rockford, Ill.



FRONT AND BACK VIEWS PRICE GLOVE.

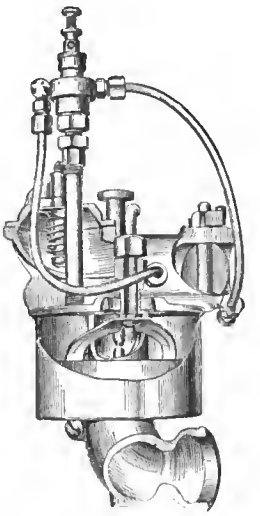
Pressure Indicator for Tires.—The recent interest in tire pressure adduced by a long and careful series of English experiments on this subject has perhaps paved the way for some small compact form of pressure indicator. The tests of several large sizes showed, for instance, that of two similar sets of 36 x 5 rear tires one at 95 pounds' pressure gave exactly twice the mileage of the one carrying 60 pounds. As the average autoist this pressure is only necessary, but a neat, compact and medium-priced little indicator recently put on the market by the Brown Company, Syracuse, N. Y., will rapidly change this guesswork to an absolute certainty.

BROWN TIRE PRESSURE INDICATOR.

This little instrument shown in the cut may be carried in the pocket and slipped on the tire valve whenever it is necessary or advisable to read the pressure. This company recommends the following tire pressures, which autoists desirous of obtaining full mileage from their tires should maintain at all times:

Size of Tires.	Pressure in Front.	Pressure in Rear.
3½ inches	60 pounds	65 pounds
4 "	65 "	70 "
4½ "	75 "	80 "
5 "	80 "	90 "
5½ "	90 "	95 "

A Practical Fuel Economizer.—The tendency of to-day from large toward small-sized cars, which is manifested by a large number of buyers, is mainly a matter of economy on the part of the owner of the car, this manifesting itself largely in a desire to economize on fuel. This may be accomplished to a great extent by the attachment of a fuel economizer to the carbureter. The G-L Economizer, which is illustrated in the drawing, is an air controller, and is designed to give the motor the right mixture at all speeds. By its use it is claimed the user of an automobile can save at least 25 per cent. of gasoline, and have the horsepower increased. The economizer accomplishes its work by converting the atmospheric pressure in the float chamber into a partial vacuum, which is controlled by the speed or load of the engine, and is therefore automatic. It can be attached to all carbureters that have a float and throttle. The G.-L. Economizer Company, Times Building, New York City, is the general distributer to the trade and public.

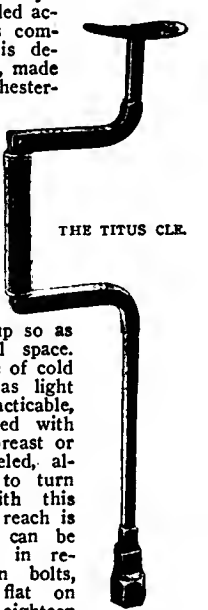


THE G-L ECONOMIZER APPLIED.

V-Shaped Leather Belting.—This belting is made on a different principle from the usual article of this character. It consists of four layers of leather one-eighth inch in thickness, securely bolted together with copper rivets, set seven-eighths of an inch apart. It is accurately beveled on both edges into the V-shaped form, and is specially adapted for automobile fan belts and for motorcycle belting. The maker, the American Belting and Tanning Company, with tannery at Princeton, Mass., and offices and factory at 135 Oliver street, Boston, lays great emphasis upon the properties of pliability possessed by this belting (the illustration showing this characteristic to a nicety), its great strength and resistance to heat, oil and mosture. The company is a large producer of leathers for mechanical purposes and this new belting is the result of much experience and careful experimenting.

SHOWING PLIABILITY OF BELTING.

A Folding Socket Wrench.—One of the newest and most convenient of auto tools consists of a bit and brace, the ordinary bits being replaced by a series of steel sockets for nuts graded according to the sizes commercially used. This describes the Titus Cle, made by the Quincy-Manchester-Sargent Company, Plainfield, N. J., and placed on the market by the Frank Mossberg Company, Attleboro, Mass., and the Factory Sales Corporation, Chicago, Ill.



THE TITUS CLE.

This wrench has the additional advantage of folding up so as to go into a small space. The sockets used are of cold drawn steel made as light and thin as is practicable, seven being furnished with each handle. The breast or hand plate is swiveled, allowing the handle to turn more readily. With this wrench a very long reach is obtained, one that can be used, for instance, in removing transmission bolts, etc., while lying flat on the floor, perhaps eighteen inches away. The Titus Cle promises to attain a wide popularity with autoists.

Speare's Zero Fluid.—The Alden Speare's Sons Company, 369 Atlantic avenue, Boston, makers of the well-known line of Speare's auto oils, make a special non-freezing compound, under a distinctive formula that for the past five years has stood the test of severe winter in thousands of cars. It is the proud claim of the makers that Zero fluid has never failed or caused a cent's worth of damage. It is put up in five and ten-gallon cans, and sold under an iron-clad guarantee.

The Unisparker.—This new accessory, the latest product of the Atwater Kent Manufacturing Works, North Sixth Street, Philadelphia, may best be described as a simplified form of the Atwater Kent Spark Generator. It is designed for use on cars

UNISPARKER WITH SIDE COVER REMOVED.

where the arrangement of the cam or magneto shafts make it inconvenient to install the spark generator, or where it is desired to use an outfit of somewhat lower cost. It consists of two separate units—a contact maker and distributer, adapted to go in place of the ordinary timer on any convenient half-time shaft, and a spark coil

SPARK COIL COMPLETE WITH SWITCH.

complete, with condenser and switch, adapted to go on the dashboard.

Current is derived from six or eight ordinary dry cells, a set of which will last from 1,500 to 2,000 miles in the average four-cylinder car. But one spark is produced per ignition, and the contact duration is as brief as will permit the coil to "build up," whether the engine speed be slow or high. The mechanism of the contact maker in the Unisparker is the same as in the spark generator, and most of the working parts are identical and interchangeable with those of the latter. There is no vibrator, and contact is made and broken at one point only.

The distributer casing is of hard rubber and is held by three screws. Four posts in the casing (or as many as there are cylinders) connect the spark plug cables. A central post receives the high-tension current from the coil and carries it to the distributer blade. This blade is carried by a hard rubber block removably mounted on the contact maker shaft. The coil box is mounted on the dashboard. It is of unusual size and efficiency. The condenser is enclosed with the coil, and the switch is mounted on the box. On closing the switch, snapping the lever to the left against a special contact permits the engine to be started on the spark when there is fresh gas in the cylinders. Access is ordinarily needed for but one thing: to adjust the contact screw once in about 500 miles. This screw is reached by taking off the side cover. To remove this cover it is only necessary to pull out the spring plug to which the positive wire from the coil is connected, and turn down the spring clip holding the cover. On removing the three screws holding the distributer, all parts are exposed. The Unisparker and coil is furnished for six, four, three and two-cylinder cars. For the last named, the switch is not self-starting. The prices range $50, $45, $45 and $35, respectively.

Bay State Autokit.—This new ratchet and socket wrench, made by the Tudor Manufacturing Company, of Taunton, Mass., is most complete in every detail, being regularly furnished with a reversible ratchet, extension shank, a universal drop-forged folding handle, 30 sockets, including spark plug socket; screwdriver and universal joint, all put in a very neat case. A

USING THE BAY STATE AUTOKIT.

chief characteristic of the ratchet is that it can be moved up and down the shank to any desired point, depending upon what part of the mechanism of the car it is desired to reach. It has extension shanks to give 18 inches complete length without any socket attached. The universal drop-forged steel handle folds neatly against the shank, or can be removed when replacing in the case. This particular handle will in most cases do away with the use of a universal joint, but to make the set complete as possible a universal joint is furnished. A new

APPLYING AUTOKIT EXTENSION SHANK.

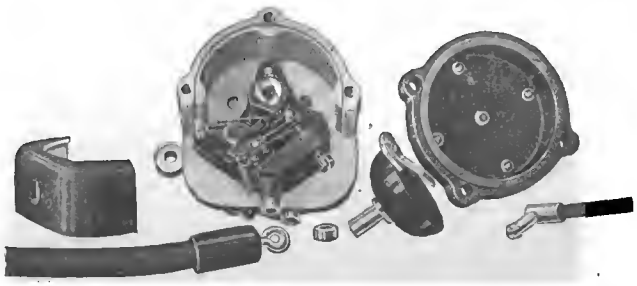
method employed for holding the sockets is the use of spring balls. The case itself is strong and attractive, with dull black outside finish and mahogany finish inside.

Heater for Closed Cars.—Coincident with the development and refinement of closed cars for comfortable winter touring comes a similar refinement of accessories for the same. Most of these are designed primarily for comfort and are therefore rapidly attaining popularity. Among these might be mentioned the Pele Heater, which utilizes the jacket water for warming the interim of the car, thus costing nothing to run or maintain after it has once been installed. This may be done by any mechanic in two hours' time and does not alter the construction or appearance of the car. Being made of aluminum, it is very light, weighing but ten pounds, and may be turned on or off at will. These are sold by the manufacturers, the Automobile Heater Company, 1133 Broadway, New York City, and Fort Dearborn Building, Chicago.

Brampton Motor Chain.—Charles E. Miller, the well-known manufacturer, jobber, exporter and importer, with headquarters at 97-101 Reade street, New York City, and branches in Philadelphia, Boston, Cleveland, Detroit, Buffalo and Brooklyn,

BRAMPTON CHAIN LINKS.

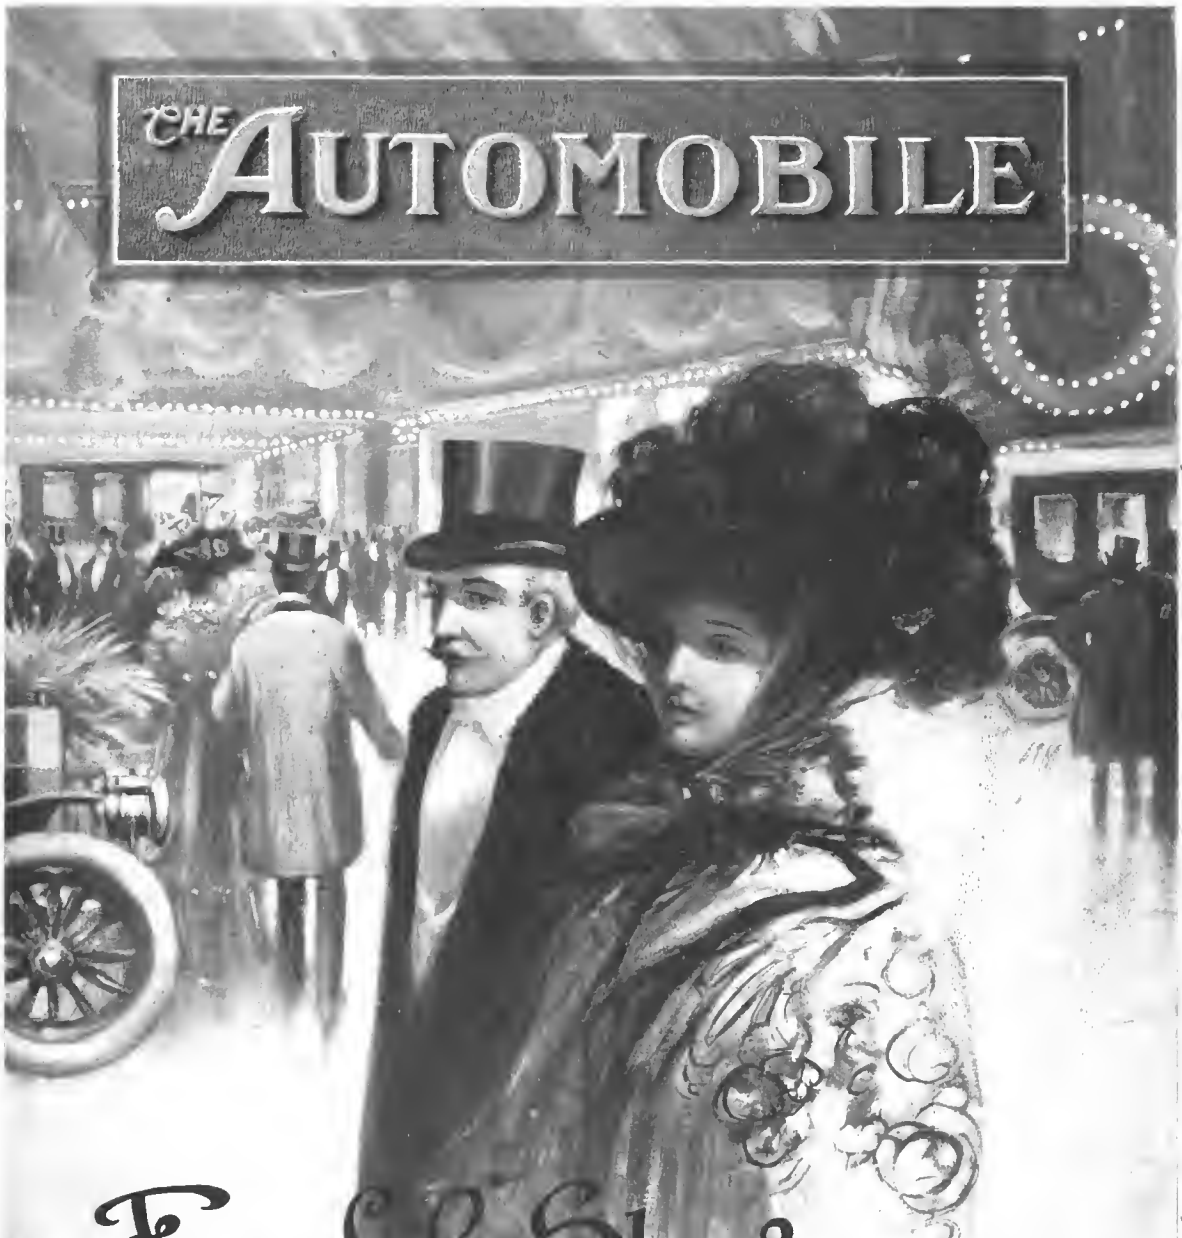
is the sole American agent for the Brampton chain, which has met with such pronounced success in this country. This chain, the form and construction of which is exemplified in the illustration, is made of self-hardening steel, with all parts polished, and will fit all properly cut sprockets without friction. Brampton Bros., the manufacturers, were established in 1832, and have been making chains for over a half century, a pretty good backing for the claims made for excellent quality and remarkable strength. All the Miller stores are prepared to furnish Brampton chains in all sizes upon demand.



DISTRIBUTER AND SIDE COVER REMOVED, SHOWING CONTACT MAKER.

VOL. XIX NEW YORK—THURSDAY, DECEMBER 31, 1908—CHICAGO No. 27

THE AUTOMOBILE



First of the Shows

Grand Central Palace

December 31st to January 7th

What the A. M. C. M. A. Offers

Motor and Accessory Manufacturers

Also the

Importers' Automobile Salon

THREE HUNDRED makers of automobiles and accessories allied thereto are represented in the Grand Central Palace on Lexington avenue, where the American Motor Car Manufacturers' Association is holding forth in exhibition in conjunction with the Motor and Accessory Manufacturers and the Importers' Automobile Salon. A few unattached help to fill the odd spaces. 'Tis a most impressive showing by an industry which a fortnight hence will utilize another building for another show in order to complete the evidence of its amazing and substantial growth.

This afternoon the elect had a "private view" of the "Ninth International Automobile Show"—so-called this year because of the presence of the importers, who, by their diminishing numbers, are illustrating the old saying about the "survival of the fittest." Very few of those invited could have declined, for the rejuvenated and beautified old Palace had an enormous throng soon after the doors were open. This denoted undisguised interest.

But to-night the crowd came, and when President McGowan, of the Board of Aldermen, officially opened the exhibition, the aisles were becoming congested, and later the building probably held the largest crowd in its history. It is expected that a hundred thousand people will have passed through the turnstiles before the show closes, a week from to-night.

When it is said that the lowest priced car is sold at $150, even though it be for the rising generation, and the highest priced vehicle is listed at $15,000, with the greatest variety of selection in between, it is apparent that this show should meet the wants of any class of buyers, even the most exacting.

The car exhibits are subdivided into 67 American, 14 foreign and 12 commercial, supplemented by 220 spaces occupied by accessory manufacturers.

Over 2,000 carriage dealers have received special invitations to attend, and a goodly number of them are already examining the automobile field, realizing that their own domain is gradually succumbing to the inevitable invasion of motor-driven vehicles.

Of course, there will be dealers from all over the country, and the National Retail Automobile Dealers' Association has headquarters in the Palace.

From cellar to roof the Palace was converted to the needs of an automobile show, and many difficulties were successfully met with in the thorough work that progressed with surprising rapidity. According to the story of the press representative, $30,000 have been expended in the decorations, which this time include the porte cochere and outside of the building. Jean Palelogue, well known in connection with automobile show art, has supplied some huge paintings which assist harmoniously in the interior embellishment, the racing scene possibly attracting the greatest amount of attention, for the public is ever fascinated by a scene of speed such as can be supplied by the modern distance chariots.

Naturally included in the cars exhibited are the Savannah big and little Grand Prize winners—the Fiat of Wagner and the Lancia of Hilliard. The cups are also displayed with undisguised pride by the possessing firms.

The decorative scheme is of an early English period, including statues of heroic size, some 9,000 incandescent lights, several searchlights and bevel-glass mirrors. Never before has the Palace been flooded with such a burst of electric brilliancy, and the result makes it appear strange and decidedly pleasing.

"Good art always costs money," said H. O. Smith, chairman of the show committee, previous to its opening, "and the best in the line of statuary, paintings and electrical equipment will be seen at the show in the Palace on the eve of the new year." What the chairman of the show committee said has been made good, and that the work has been in progress for several months can scarcely be doubted. The results tell a story without words.

Manager Reeves boasts of a most artistic office, fitted with Turkish draperies and it incidentally contains a cozy corner. L. M. Bradley, the assistant to the big little energetic man, has an office deluged in blue, while the press-room, several times the size of the former one, has red and white panels with a blue cornice, thus accentuating the national idea in colors. All around, the Palace has received the best dressing up that ever came to it through any one of the various exhibitions that have been housed in it since it bid for show favor.

It would appear from the opening attendance that the day of the automobile show in this country is some distance away, especially in the metropolis, whither there come from all over many thousands who consider it a treat to find the leading cars of the industry under one roof ready to be inspected and explained and purchased. Possibly shows may become unnecessary in many cities, but the value of exhibitions in New York City and Chicago, and possibly in Boston, is likely to continue of such worth that the manufacturers will hesitate and consider most carefully before deciding that the history of shows has been written.

Special nights are to be a part of the present show, the schedule calling for a Municipal night, a Merchant's night, an Engineers' night and a Military night. "Society" is to be specially catered to on Tuesday night next, and while its members have always had a predilection for the foreign car, the progress of the American maker has brought about serious inroads into the business of the importer. But a certain percentage of "Society" seems to be firm in foreign car liking, and undoubtedly will continue so to the end of the chapter.

The military orchestra of Fred W. Bent is supplying the music, and this includes an "International March," a two-step called "Around the Jericho Turnpike" and a gallop named "The Last Lap," with a waltz christened "The 1909 Model." The substitution of an orchestra in place of a noisy band seems to be one of the many excellent features embodied in this decidedly creditable exhibition arranged by the hard-working committee of the A.M.C.M.A., which has demonstrated that the makers did not need assistance from any other source whatever in order to insure what is certain to be a most successful week. Nowadays the public asks first to be pleased.

The Men Who Run The Show

BENJAMIN BRISCOE-CHAIRMAN AMCMA

ALFRED REEVES GENL MANAGER

R.M. OWEN

S.H MORA

E.R HOLLANDER-IMPORTERS DIV.

DAVID J. POST-M.&A.M.

H.O. SMITH CHAIRMAN SHOW COM

ALFRED REEVES thus interestingly tells how the "show" is made ready and run:

More than eight months of work, the time, attention and labor of some 4,000 men and the expenditure of thousands of dollars is required for the putting on of an automobile show like the Ninth International affair which opens in Grand Central Palace, New York, on New Year's Eve. Prior to the show some 400 workers devote all their time to the preparations, while during the affair not less than 200 employees are at their posts day and evening in the general caring for the public and exhibitors. Added to this are some 3,400 manufacturers and their employees on hand showing the very latest in the motoring world both as to American and foreign cars and accessories, including the captains of industry, the sales managers, salesmen, chauffeurs, demonstrators and those of other callings.

The art work required to properly stage the glittering, power-driven machines of modern life will cost something like $30,000 for the single week, being expended on decorations, electric lights, paintings, statues and the other features of the big exposition. Excepting the electrical equipment, all of this is practically useless after the show. It is all made possible by the tremendous and increasing interest in motoring and the motor car, evidenced best by the record-breaking attendance that always favor these affairs and which results in the valuable business returns to those showing their products.

As in former years, every inch of available room has been taken, there being something like 70,000 square feet of space allotted to exhibitors at the coming show, with a dozen or more firms on the waiting list. Added to all this is the record-breaking attendance of agents which is assured for this affair, a major portion of the 3,000 motor car agents and 2,200 leading carriage dealers of America being certain to view the 1909 offerings of the automobile tradesmen. As for the attendance of the general public, it is predicted that not less than 100,000 people will visit the Palace from the opening on New Year's Eve to the closing of the show on January 7.

There is really no great secret about the handling of a motor car show. It is the same old story of perfect organization, made a bit more difficult by the fact that plans for these affairs are somewhat of a temporary sort, hastily devised and the men trained quickly for their work, somewhat like artists are trained for a big stage production which has only a short time for rehearsals.

A clean-cut system must be in vogue for some months prior to the show to handle the preliminaries, and a most exacting one to look after the comfort of the exhibitors and visitors during the progress of the affair. Some nine months ago the first plans for the Ninth International Exposition in Grand Central Palace were laid, when Benjamin Briscoe, chairman of the American Motor Car Manufacturers' Association, appointed the show committee. The men selected as directors of the affair were H. O. Smith, chairman; R. M. Owen and S. H. Mora, with the addition of E. R. Hollander, representing the Importers' Automobile Salon, and D. J. Post, of the Motor and Accessory.

After surveying the Palace, diagrams were issued, contract and space applications prepared and the whole distributed throughout the automobile trade. This was followed by the plans for advertising, an essential part of an exhibition depending upon public support. Poster designs were submitted, the approved ones were printed and arrangements made for their distribution on bill boards within 50 miles of New York City Hall, many of the posters being illuminated by electric lights. Then followed the advertising in the daily newspapers and the automobile papers, running into many thousands of dollars, and the handling of the publicity end which supplies the news regarding the show plans.

Most important of all contracts made was the one for decorations, which in this case went to the S. R. Ball Company of New York, whose design was considered the most original and best adapted to the Palace and to motor cars.

The printing of thousands of pieces of stationery of all sorts, the arrangements for the shipping to New York of the products of 300 automobile and accessory factories and the printing of some 200,000 tickets of all styles came in for consideration.

Following the applications for space and the drawing and the signing of contracts, the matter of plans for the care of agents during the show had to be given consideration, together with the annual show luncheon and the meetings that are always on schedule during show week.

Some time prior to the show the regular departments for handling the affair were organized with a head to each, the whole being in charge of the general manager under the guidance of the show committee.

As the show must open on time, everything must be scheduled and carried out without delays of any moment. Four or five days before the show opens the Palace is turned over to an army of workmen who proceed to transform it in a manner that is astonishing to the layman. Included in this vast corp of help are carpenters, carpet layers, artists, drapers, sculptors, plaster workers, modelers, telephone operators, linemen, wiremen, furniture makers, brass workers, scene painters, ironworkers, telegraph operators, sign painters, freight handlers, shipping clerks, laborers, ushers, ground glass workers, floor polishers, silk hangers, banner makers and woodworkers.

For three or four days and nights the Palace is turned into a veritable beehive of industry, and to the layman it looks as though the show could never be ready on time. Order comes out of chaos, however, when the whistle blows for the opening for the private view, the cleaners quickly dispose of the debris and the public marches through the aisles with comparatively little knowledge of the accomplishments required to provide them with an exhibition of their favorite machines.

After the doors open the Palace becomes a city in itself, with a small army of employees who look after the public and exhibitors. The information bureau where out-of-town visitors and others ask for information, requires veritable human encyclopedias to supply. A complete telephone exchange is installed and begins work, wires going to almost every one of the 300 exhibitors, whose names are printed in a special telephone directory. Telegraph and telephone booths are opened up and thousands of pieces of mail matter are received daily. There is a day and night force of special police in uniform as well as plain clothes men, to keep the Palace clear of questionable characters. Then there are ticket sellers, ticket takers, counters, pages, watchers, demonstration chiefs and helpers, laborers, porters, electricians, program boys, cleaners, two chefs, waiters and watchmen. The band of 25 pieces under Professor Bent, plays pleasing music and the English Inn is ready to supply food and refreshments to the multitude.

The executive officers of the show, with its cashiers, bookkeepers, stenographers, department clerks and office boys, work religiously for the comfort of the exhibitors. The press department opens its doors, and almost 400 newspaper men from all quarters of the globe are on hand to write of the great exposition, sending their stories to the prominent daily, weekly and monthly publications of this country and Europe.

Sign painters, decorators and electricians are kept in attendance for the use of exhibitors who arrive late. The various parlors and lounging rooms are alive with maids and attendants, and the building is patrolled by firemen and special deputies to prevent smoking and maintain order.

The flashing lights, searchlights, the 9,000 pearl incandescent lamps, the low murmur of voices, the music of the stringed orchestra and the display of the glittering, life-like machines all supply a picturesque scene that has few equals from a spectacular point of view.

After a week that is strenuous for everyone identified with the show in any way, the band plays "Home Sweet Home," the cars shipped to new owners or to other shows, tons and tons of accessories are removed, the beautiful decorations are demolished and within twenty-four hours the exhibitors have scattered all over the country. Once again the big Palace is quiet and a big motoring public has seen the best automobiles of America and of Europe with their accessories in a setting that is commensurate with motoring as a sport, as a pastime and as an industry.

CONCERNING THE GROWTH OF AUTOMOBILE SHOWS

By H. O. SMITH, Chairman A. M. C. M. A. Show Committee.

NO better illustration can be cited to demonstrate the magnitude of the industry than the wonderful growth of automobile shows since their inception November 3-10, 1900, when the Automobile Club of America launched the first exhibition in Madison Square Garden. To the A. C. A. belongs the credit of fathering automobile exhibitions in this country. Little did this young automobile club realize what a huge oak their little show acorn would develop into.

That infant exhibition of but 69 exhibitors created in the automobile buying public the first desire to become a motorist. The public knew little then of automobiles, and had a varying faith in the "horseless carriage." The vehicles were crude affairs, propelled principally by steam and electricity.

The rapid development of the A. C. A.'s shows is now history, and only a glimpse at the number of exhibitors of past shows and the present one in the Grand Central Palace, under management of the American Motor Car Manufacturers' Association, with their exhibit list totaling 286, is needed to demonstrate the growing popularity of the automobile.

On December 2, 1901, the A. C. A. opened its second show with 92 exhibitors. There was no show in 1902, but each year since has seen successful exhibitions with the following schedule:

1903—Jan. 17-24.....	Madison Square Garden—	198 Exhibitors.
1904—Jan. 16-23.....	Madison Square Garden—	205 "
1905—Jan. 14-21.....	Madison Square Garden—	247 "
1906—Jan. 13-20.....	69th Regiment Armory—	218 "
1906—Dec. 1-8.....	Grand Central Palace—	216 "
1907—Oct. 24-31.....	Grand Central Palace—	257 "
1908-9—Dec. 31-Jan. 7..	Grand Central Palace—	286 "

Not only has the number of exhibitors increased from 69 to 286, but the attendance has been tremendous, which means that automobile shows are a necessity, and a great business-getting proposition for the exhibitors.

The manufacturers who exhibit meet practically every live dealer who go to the shows from the most remote parts of the country. Dealers meet the buying public, make new acquaintances and secure the names and addresses of those who are really interested and intend to purchase. All this can be accomplished in no other way at so small a cost.

Automobile shows have been the direct cause of changing many carriage dealers to the ranks of automobile distributers. Carriage dealers of every country are seeing the handwriting on the wall and the inevitable downfall of the horse. During the past season there has been a scramble among carriage dealers for an automobile agency.

Automobile shows are increasing in popularity and have become a fixture. The manufacturer, the dealer and the public all unite in the belief that automobile shows are imperative and should be continued. The automobile show has become such an important factor that it ranks with theaters in appealing to the masses. It has pushed the Horse Show into second position from a society standpoint, as is amply demonstrated by the reduction in demand and prices for Horse Show boxes at the recent horse exhibition in New York.

At no time in the history of automobile shows has there been so great a demand for space as this year at the Grand Central Palace show. If automobile shows did not well repay exhibitors, certainly there would not be such a demand for space.

At no time in the history of the automobile, has there been so much interest manifested in the annual show as this year. It has been fifteen months since the public have had an opportunity to attend an automobile exhibition and the attendance will unquestionably be tremendous.

That the automobile show in the Palace has become an important society event in New York is amply demonstrated by the fact that hotels and cafés have decorated for the occasion.

AMERICAN MOTOR CAR MANUFACTURERS' ASSOCIATION

By ALFRED REEVES, General Manager A. M. C. M. A.

UNDER the careful leadership of some of the greatest men in the industry, who at all times have carried out its original purposes, the American Motor Car Manufacturers' Association is classed in the front ranks of industrial organizations of its kind. It has assumed the leadership in motor car organizations and is now looked upon as an authority and a power for good in its chosen field. The product of its members bearing the stamp of "Standard Manufacturers" is received with favor throughout the civilized world, and the public that buy cars feel that in buying a car which is enrolled in the American Motor Car Manufacturers' Association are securing cars of reliability and for the money invested. Membership constitutes the badge of all that is desirable in motor car trade.

In all that has stood for the advancement in the producing, disposing and using of motor cars, the A. M. C. M. A. has taken a leading position. The real power of the association may perhaps be judged best by the fact that estimates place 65 per cent. of all cars made and sold in America to the credit of A. M. C. M. A. members.

During the four years of its existence the association has accomplished a world of good, not only for its members, but all interested in the making, selling and operating of an automobile.

The automobile industry, being extraordinary in many respects, it was natural that its trade association should have a growth of a phenomenal sort in its four years of organization, during which time it has accomplished so much for those involved in the trade and pastime. It has worked consistently for its members to the ultimate benefit of the buyer.

The association was formed in the belief that competitors in the business had certain mutual interests that could best be cared for by a central organization. Independence is the keynote, for its members believe competition brings advancement. Within its ranks are the makers of the highest as well of the lowest priced cars, including all styles and types. It is believed that these makers offer the best values, and this would seem self-evident, for they are selling the largest number of cars.

It aims to further the use of motor cars in general and to assist the common interest of its customers as well as its members. Buyers of cars made by concerns in the A. M. C. M. A. are assured of proper construction and materials at fair prices. The companies conduct their business independently under their own business methods, each endeavoring to secure the greatest favor and trade from the public. Their interests are identical only in so far as they are concerned in the work of the association which relates to the obtaining of combined privileges for their good with the ultimate object of securing for the public the very best in automobile construction. The work of the association at all times is to obtain privileges and information such as will better enable the various standard manufacturers to retain their present leadership in motor car building.

Information and benefits are sought that will permit A. M. C. M. A. members to produce the best cars at the lowest possible cost, so as to offer their cars to the general public at prices within reason and yet permit of a fair margin of profit. When a maker can combine the maximum of quality at a minimum of price, the trading is certain to be satisfactory to buyer and seller.

While much of the work of the association furnishes benefits of an abstract nature which is enjoyed by the trade and public in general, there is more of a concrete nature that involves the members alone.

Compilation of statistics, both here and abroad, furnish a valuable guide to the makers. The lists of agents and dealers is another good work of the A. M. C. M. A. Uniform guarantees that are liberal to the buyer and fair to the maker are advocated, while plans for advertising and information regarding the value of mediums are offered. Work for a national law providing for a single license number, good in every State; the perennial question of good roads and legislative matters are handled by competent committees. Every year hostile legislation is opposed and many unreasonable bills have been withdrawn through the work of the legislative committee.

Its work in the matter of good roads has been of great importance, and on this department alone many thousands of dollars has been expended. There is unquestionably a great improvement under way for improved highways, and undoubtedly the A. M. C. M. A. was of great assistance in the bringing about of this condition.

One of the best works of the association is the publicity department, which aims to supply authentic information to the newspapers and trade publications. Articles of a technical and a statistical nature are supplied for the information of the general public, all of which has contributed to a more thorough understanding of the automobile, its rights and the rights of its owner and driver. Such things as liability insurance, freight rates, larger and more freight cars, are given attention.

In the early days, when the foreign cars were factors in the trade, a representative was maintained abroad and a delegate sent from this country to attend the foreign shows. A careful record is kept of importations, which are rapidly decreasing.

There are scores of other things which the association does quietly and industriously, but those mentioned will give a fair idea of its work. On its committee of management and in its membership are the pioneers and most of the leading men of the automobile industry, including Benjamin Briscoe, chairman; R. E. Olds, H. O. Smith, G. Vernor Rogers, W. H. VanDervoort, Charles Lewis, W. C. Marmon, C. G. Stoddard, S. H. Mora, and Alfred Reeves, general manager.

GROWTH OF MOTOR AND ACCESSORY MANUFACTURERS

THOSE who have followed the course and rise of the automobile show in this country can readily recall the time when there was no such thing as an accessory exhibit—when the vast amount of floor space represented by balconies and galleries and the hundred and one odd corners and nooks that are now so zealously sought out and filled were vacant. Simply because there was no one to fill them—there were no manufacturers of accessories pure and simple, and the dealer in automobile supplies had yet to come into existence, so that an automobile show could then be comprised by the exhibits of its main floor and with room to spare. Then along come the accessory manufacturer and, with the increasing demand for space in which to show cars, he was perforce relegated to the upper regions, or to the basement. He had to bid for space as an individual and as the weight of his protest as such was small, he had to take what was handed out, or nothing at all.

But in the course of a surprisingly short period, the accessory manufacturers became so numerous that it was quite evident that in the aggregate their weight would be sufficient to exert no little influence, not alone for better treatment at the hands of show-managing committees, but likewise for many other purposes where reforms were needed. The outcome was the incorporation of the Motor and Accessory Manufacturers. Within a very short time after its organization the new association included practically all the important accessory manufacturing interests in the country in its membership.

The present officers are H. S. White (National Tube Company), president; H. E. Raymond (B. F. Goodrich Company), first vice-president; H. T. Dunn (Fisk Rubber Company), second vice-president; F. E. Castle (Gray & Davis), third vice-president; W. S. Gorton (Standard Welding Company), treasurer, and P. S. Steenstrup (Hyatt Roller Bearing Company), secretary, the headquarters and office of the secretary being located in the Union Building, Newark, N. J.

The directors are Clarence E. Whitney (Whitney Manufacturing Company), D. J. Post (Veeder Manufacturing Company), C. T. Byrne (Byrne, Kingston & Company), H. W. Chapin (Brown-Lipe Gear Company), E. S. Fretz (Light Manufacturing & Foundry Company), and L. M. Wainwright (Diamond Chain & Manufacturing Company).

In order to confine the expense of its members for space at automobile shows to legitimate events of this kind, the Motor and Accessory Manufacturers issue sanctions for shows, and the members of the association do not exhibit at those which have not received the approval of the governing body. And by dealing with show managements as a unit, much expense and inconvenience is saved the members, the Motor and Accessory Manufacturers being one of the largest single purchasers of space at the Palace this week. The entire needs of its membership are contracted for *en bloc* and the association itself then parcels out the space and awards the different locations, the accessory manufacturers themselves thus having no dealings whatever with the show management as individuals.

But it is not alone in the matter of shows that the Motor and Accessory Manufacturers has succeeded in benefiting its members, the association maintaining a credit department which has proved of considerable value, and it has also lent its aid as a body to the procurement of more equitable freight rates from the railroads, while other matters affecting the interests of its members as a whole have likewise come in for attention.

IMPORTERS ARE SHOWING AT PALACE AS A BODY

IN view of the fact that the imported cars represented in this country are now being shown by their agents in connection with the A. M. C. M. A. show in the Palace, the impression is current that each exhibit represents the individual and independent efforts of its sponsor, and that the Importers' Automobile Salon had nothing to do with the show as an organization. This is not the case, as when the question of exhibiting foreign cars this Winter came up some time ago, the Importers' Automobile Salon came to an agreement with the American Motor Car Manufacturers' Association and contracted for 15,000 square feet of floor space, all of which is located on the main floor of the Palace. The Importers incorporated early in 1904, the objects being to hold shows and further the introduction of foreign cars in this country generally. Its first show was held on the top floor of Macy's in December, 1904, and introduced the plan of uniform decorations for exhibits, which has since been universally adopted in this country, reaching its climax in the Importers' show in the Garden last January, which was generally conceded to be the most artistic conception ever produced for an American automobile show.

When first organized the membership of the Importers' Salon was very small, but its work of encouraging the introduction of foreign cars and of cooperating for the mutual benefit and protection of its members which has been carried out in the interim, has proved so successful that now it numbers practically every importer of foreign cars in the country in its ranks, even including the New York Taxicab Company.

C. R. Mabley acted as manager up to a short time after the holding of the Garden show last January, when he resigned, and the efficient work of Walter R. Lee, up to that date secretary of the organization, was recognized and he was promoted to the vacancy left by Mr. Mabley's resignation. The other officers of the Salon are, Andre Massenat, president; W. H. Barnard, vice-president; Paul Lacroix, secretary; W. C. Allen, treasurer, the directorate comprising E. R. Hollander, A. A. Barrelet and K. Neubauer, in addition to the officers already named. Charles H. Sherrill acts as counsel to the organization. The members include the Renault Frères Selling Branch, Panhard & Levassor, C. G. V. Import Company, Hol-Tan Company, Delahaye Import Company, Palais de l'Automobile, S. B. Bowman Automobile Company, De Dietrich Import Company, New York Taxicab Company, Brewster & Company, Benz Auto Import Company of America, the Hotchkiss Import Company, and the Fiat Automobile Company.

RETAIL DEALERS HAVE STRONG ARM IN N. R. A. D. A.

JUST a little more than a year ago, the National Retail Automobile Dealers' Association came into being—during the course of the 1907 Chicago show, to be more definite, its inception being due to the foresight of a few progressive dealers attending that show. They laid the plan before a number of their confrères at the time, and the result is already history, the N. R. A. D. A. now being able to celebrate its first anniversary.

While this brief résumé of the manner of its coming into being suffices to tell the story of its creation, it does not by any means convey the slightest idea of the task confronting its organizers, prominent among whom are C. F. Jensen, Joliet, Ill., president; Rudolph Hokanson, Madison, Wis., vice-president; L. Ohnhaus, Ft. Wayne, Ind., treasurer, and J. A. Crum, Oshkosh, Wis., secretary. These dealers and their confrères on the board of directors, D. P. McClure, Oskaloosa, Ia.; J. C. Tanberg, Eau Claire, Wis., and J. B. Sutter, Burlington, Ia., were instrumental in fostering the idea of organizing a cooperative association of automobile dealers and of carrying the plans into execution at the Chicago show a year ago.

So far so good, but only those who have had experience in the formation of similar trade organizations can appreciate the true extent of the job undertaken by these progressive dealers.

President Jensen and his associates of the N. R. A. D. A. have realized this to the full from the very start, and there are accordingly no sinecures attached to the Association; the directors and officers receive no compensation for their work in connection with it and their reward can come only through the Association's success, and then only to the same extent that it will benefit every automobile dealer who becomes a member. The dues are merely nominal. It is plain then that there are no selfish motives actuating its incorporators in their efforts to place the retail automobile business on a more satisfactory and profitable basis, and that their work should be seconded and encouraged by every automobile dealer who is alive to his own interests becoming a member of the Association.

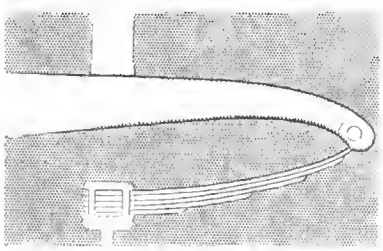
Generally speaking, the objects and purposes of the N. R. A. D. A. are along lines similar to those of any organization formed for the purpose of mutual benefit and protection by dealers engaged in marketing the products of any industry. Such organizations when founded and conducted on business principles for the sole benefit of their members have almost invariably proved highly successful in achieving the ends sought.

The second annual meeting of the Association will be held during the Chicago show next February.

THE MECHANICAL LESSON OF THE PALACE

By THOS. J. FAY.

LET it not be supposed that a great exhibition like the one now going on at the Grand Central Palace can be held year after year and no good to come of it. China tried to live in isolation and that ancient empire fell away to nothingness because the time came when she had nothing more to teach her progeny, nothing more to learn from herself, and nothing to gain by living. The automobile industry, aside from any attempt to stimulate trade, has much to learn, and of progress the half of it is yet as the unearned increment. Each year with its offerings renders up an accounting on a scale far greater than the previous, and the question is as yet unanswered as to when the end of the years of great improvement will say a last farewell.



Front End of Chassis (Frame). Showing increased depth and decreased curvature.

The doings during 1908 in preparation for the 1909 trade were the most active and, on the whole, the most advanced in the way of practical results. The plausible theories were given a working chance, the after thoughts were put in better settings, and the things that promised much and delivered little were withdrawn from active service. The effect of quantity on cost is to be seen at every hand, but all the improvements to be noted must not be understood as the product of doing things on a large scale. As a matter of fact, many of the crystallized features in the 1909 automobiles were long in contemplation, awaiting the day when they could be utilized to advantage, and in many instances they took the place of less desirable schemes, thus rendering the improvement of double value.

Classification of the Automobiles Available.—Variety is the password, and a cleaner line of demarcation is to be distinguished. The condition of "chaos" that once permeated the situation is gone. As it is, the respective classes or types of automobiles are distinctive and are capable of being classified.

Runabout Types.—In the main, this class of automobiles are of the single-seat variety, but it cannot be said of them that they are confined to the cars in which the motor is of the one-cylinder design, since some have two cylinders, and the four-cylinder runabout is also to be seen. In some cases the little cars have accommodations for more than two persons, in that either a rumble seat is furnished or a folding seat is provided. In general, they have longer wheelbase dimensions than formerly, and they are very much more formidable than even some of the "roadster" types of even last year.

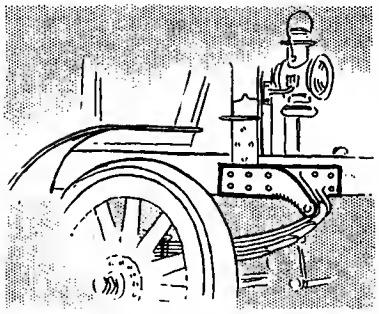
Roadster Types.—They cover a wide range, both as respects the size of the cars and the power available. In some cases it is difficult to tell a roadster from a runabout, and again the roadster looks like a big racing machine. The roadsters use motors from the low-powered "double opposed" to the finest examples of the "six," with "fours" numerous.

Light Touring Class.—There is probably no other division of the industry that has undergone nearly the same evolution as the light touring cars. They are in great presence, in divers sizes, and they represent value such as was never before to be seen. In the cars in this class will be found more capable propositions than were classed as "big" touring cars even last year, and these same light touring cars would put to shame the "foreign red devils" that cost $10,000 less than four years ago. The wheelbase ranges from 100 to 110 inches, and the motors are of the four-cylinder type, for the most part rated at from 24 to 30 horsepower. As a rule, the bodies are of the five-passenger touring class (straight-line effect), with ample accommodation and artistic in effect. On the whole, it is these automobiles that will be the mainstay of the makers in this field for the immediate future.

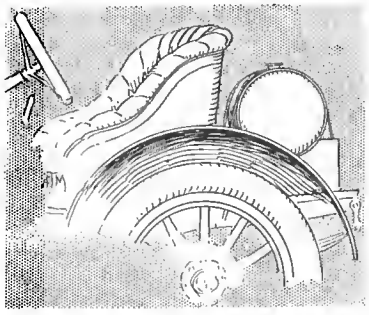
Standard Touring Cars.—These are automobiles in the broadest sense of the word. When the dictionary is restandardized and the word "automobile" is defined the definer will have the image of these cars in mind, and he will be right. Any further play on words is a loss of time, and yet to dismiss the most interesting part of the exhibition without affording to the cars as much space as is accorded the runabout types would seem to be ill-advised. In these cars the power plant is the most complete and systematic piece of sturdy mechanism that man ever devised. The wheelbase is long, ranging from 110 inches as the low range to 140 inches (or thereabouts) in the extreme examples. The body work, aside from the luxuriousness and the space afforded, is art personificd. The silent performance is the wonder of tbe age, and it is due to absolute precision of fit of the 2,400 separate parts that enter into the construction of an automobile of tbis class. One single loose member in a car of so much power and speed would make itself known were it of an ill fit, or if the relations were out of harmony. The motors range from the "big six" down to the four-cylinder examples of equal or even greater power.

Town Cars.—In this class will be found cars not with great power or of a long wheelbase, for neither are necessary. The wheelbase is not far from 100 inches, as an average figure, and the power is rarely over 30 horsepower. With a short wheelbase, the road performance is quite in accord with the needs, and, as the speed is not to be high, considering paved streets, the power does not have to be over the maximum stated, while some of the examples are even with half (or less) of the figure given. The body work in town cars is the exterior feature that attracts attention, although from the mechanical point of view it is the least of the features to be considered. At all events, the body work in the town cars is the most luxurious and the most costly of all the work there to be seen. The bodies are made in broughams, landaus and limousines, richly upholstered and fitted with every convenience possible to place on wheels, from the point of view of convenience and comfort.

Buggy Types.—The surprise of the exhibition is due in no small measure to the number of cars of this type to be seen, and again to the fact that while the buggy type has held to its aims it has expanded and amplified. The uses to which these cars can be put, in view of their low first cost, coupled with their extreme simplicity and low cost of maintenance, are not to be lightly regarded. They serve for a wide range of purposes, largely in the utility zones of activity, and they number their friends by the thousands among the pleasure-seekers as well. The power for speed is high, which is but a way of calling attention to the fact that they will make headway on all kinds of roads in inclement weather. The body work holds to the buggy type as it was handed down by the "craft." and the reasons are good.



Manhattan Commercial Front Spring Hanger Shows Stability.

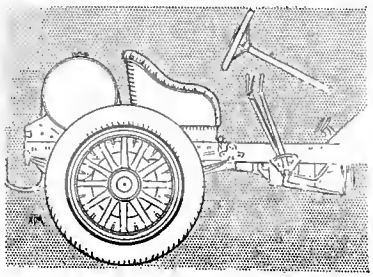


Gasoline Tank on Rear of Chassis.

Taxicabs.—They differ but little from town cars, unless it is that the body work is with a view to hard usage. The power plant is generally identical, with a short wheelbase for the same reason, and as to speed there is no occasion for gearing to a high ratio, hence the power is limited as well. There is goodly showing of cars for this service, and the schemes of design are such as to assure a low cost of maintenance.

Specialties.—For public service there are fine examples of automobiles to be used in fire, hospital and police service. Most of the companies who cater to this class of trade find it of small avail to exhibit the products and are therefore content to depend upon literature to make known the facts. But if there are automobiles for municipal work, it is true as well that "sight-seeing" automobiles and cars for hotel "bus" service are in a high state of development. Indeed, this phase of the industry has grown a wide pace, and the demand is strikingly large, with small chance of having reached the limit in view of the wide field as yet fully explored.

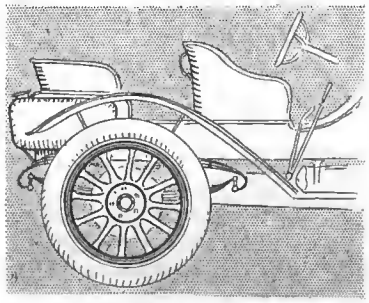
Having thus introduced the several types of automobiles to be seen at the show, it may not be out of place to discuss the "mechanical trend" in some detail, hoping thereby to evolve the drift of events. But if it is expected that this exposé will be as an indication of revolutionary thoughts, disappointment will await the reader. A thorough examination of all the products at the show fails to develop anything but a more complete refinement of accepted principles as they have existed for several years.



Roadster Seat Well to the Rear.

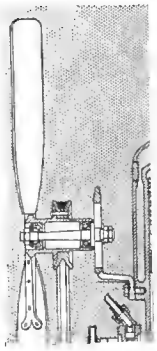
Power Plant Tendencies.—Motors are divided up among the three classes as follows: (a) four cycle, water cooled; (b) four cycle, air cooled; (c) two cycle, water cooled; in the proportion as they bave heretofore held, with little indication of gain, the one over the other. If anything can be said, it will be to maintain that each type has its supporters, and they find no valid reason for backing down.

The Number of Cylinders.—In spite of all the talk that has gone the rounds, the fact still remains that the situation is substantially as formerly, in that the single-cylinder propositions are looked upon as a stable basis, serving well in the cases requiring about 10 horsepower. There is even a tendency to take advantage of the inherent economy of the single-cylinder idea. It is well known that a single-cylinder motor indicates a high thermal efficiency, which is but another way for saying that the gasoline consumption is low in the type. With well-balanced reciprocating members and fairly long stroke, if the flywheel is suitably designed, the single-cylinder motor serves as a suitable source of power in the automobiles weighing not over 1,000 pounds.



Rumble Seat Over Gasoline Tank.

The double-opposed idea is still to be seen in the cars in which its application has been found to be advantageous, and there are fine examples of the scheme scattered all through the show. There are no three-cylinder motors to be seen, the reason for which has never been adequately explained. Of the "fours" it might be said, "The woods is full of them," and of the "sixes" they are there, in far greater and more imposing presence than ever before.



Fan Pulley with Ball Bearings.

How the Cylinders Are Fashioned.—"Individual" cylinders are about as prevalent as before. "Cast in pairs" has held all former ground. "En bloc," representing the real advance, has numerous good examples. Gray iron is used, a little better than in former years, walls more uniform, and the desire to attain tissue-paper thickness has retired to obscurity. Water jackets extend down to about the lower end of tbe stroke, thus affording a cooling medium on the exterior surface of every portion of metal that entertains hot gases on the interior surfaces. Steam pockets are carefully avoided, and unequal expansion is a phenomenon of the past, in so far as skill can influence the situation.

Crankshafts.—The five-bearing type for four cylinders is fighting the two-bearing type for supremacy. The three-bearing crankshaft is as a disinterested spectator on neutral ground. In the show, it is fair to say, the three-bearing crankshaft is in the greatest presence, with the five as a close second. As to the bearings, it is to note that the "plain" type is still the mainstay, with here and there a fine example of what can be done with ball-bearing crankshafts. The ball-bearing type seems to hold in every case in which it is so fortunate as to gain a footing, but it does not spread rapidly because of the higher cost. If plain bearings will do the work, they being cheaper, the makers naturally hold to them. The materials of the crankshafts are not "jewelry steel," as some of the alloyed products are called, unless in a few cases. The plan seems to be one in which advantage is taken of the fact that heat-treated (special) steel holds the requisite qualities to a marked degree, and, since a slight increase in "section" lends enormous extra ability, the section is a little "flatter" and the material is far easier to work, while the cost of replacement is relatively very low indeed.

Aluminum vs. Cast Iron.—In crankcases and the housings for gear sets, aluminum is the main product. Cast iron is used in isolated cases. That cast iron is the superior metal, from the strength point of view, is not to be gainsaid. That aluminum is lighter goes without saying. In all the examples there are evidences of refinement, in point of design, and here and there are examples in which provision is made to get at the bearings through covers big enough to serve the purpose. The bearing supports are more stable than formerly, and the means for disposing of the "used" oil are carefully worked out.

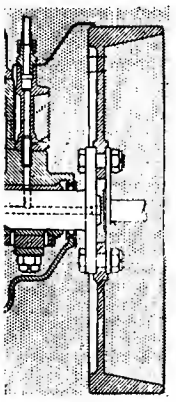
Valve Gear.—The valves of special steel, in probably every instance, are not extra large, nor are they small. They are, in point of area, as large as possible, without becoming noisy. This question of noise has been looked after to a mighty degree. Makers have looked at the question from the angle that the patrons take, and the result is a happy medium between large valves and noiseless performance. The tappets and guides are with adjustments in most cases, and the "play" is so little as to abort the tapping noise that made automobile motors conspicuous up till a short while ago. By suitably shaping the cams, it was

found possible to do away with almost all of the lost motion, instead of the large amount that formerly did obtain (as much as 1-16 inch in some cases), and means are provided to cushion the "tap" in notable instances. The half-time gears are more healthy than in earlier examples, in that they are more securely keyed on to the shafts and spindles, while the gears themselves are of wider face and better material than before.

Clutches.—A pretty mess. With tendencies, without any question, tendencies that cannot be defined at this time in bold language. The multiple disc clutches are slowly taking definite shape, along lines in which an attempt is being made to depart from the trouble tendencies of the type. It is well understood that a large number of thin discs will ultimately give trouble because the edges of the discs as they press against the keys will "broom" and then the members will not engage. It is also known that oil will become "gummed" and then the clutches will fail to do the required work. Then there is the question of "flashing" the oil, if the pressure is high and the clutches slip.

The tendency is in the direction of a less number of wider discs, lower pressure, and materials that will show a high coefficient of friction at low pressures in oil with a high flash point and free from tendencies to "gum." The discs are naturally of an increased diameter, and in many cases "cork inserts" are used; they afford the requisite advantages. Besides multiple disc clutches, there are many of the well-known cone clutches in use, some with leather faces, but more with leather together with "cork inserts," it being the case that the presence of oil on the faces will work no ill effect if the cork is used also. Besides the clutches, as before stated, there are examples of discs with grooves in the faces, and some examples of band clutches as well. On the whole, the clutch situation is in a very encouraging state, and failures (outright) will not be found in the cars at the show.

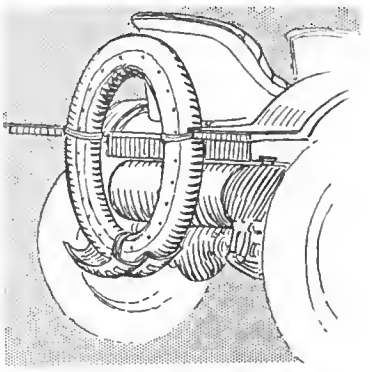
Transmissions.—Three speeds and reverse, direct on the high, selective, and the story is three-quarters told. A few of the gear-sets are with four speeds, direct on high or second; and of the "planetary" type they are used in the well-known cases in which the advantages are not to be gainsaid; of the progressive types of gears there are few examples, those of the makers that have always adhered to the principle claiming for them that ease in shifting that comes, with no chance of sliding into the wrong speed, or stalling the motor. The materials used in the gears is mostly "alloy steel" of the finest grades, and trouble in gears due to inferior material is now unheard of.



Separate Flanged Cardan Shaft.

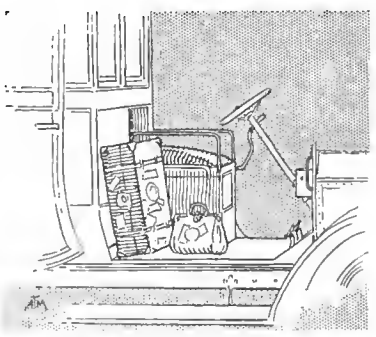
Live Rear Axles.—With floating, semi-floating and keyed shafts, all are to be seen, under such splendid conditions of design, material and workmanship as to render a choice as the expression of a prejudice rather than as a necessity. The "housings" are far more stable than formerly, notwithstanding the fact that excess weight has been eliminated very largely, if not completely. Struts are still used, but they are more stable, and in some cases the housings are as "drawn steel tubes," free from joints, and they are quite as good as they look. The "spring perches" are not "brazed," but are allowed to slip on the tube, within limits, doing away with the strains that formerly did reside in the springs on that account. The "differential" and the bevel drive, all housed in, with adequate means for oiling, frame up for continuous and noiseless performance as never before, while the ground clearance is now adequate.

Side Chain Drives.—From abroad came a story that the "sprocket," as a passing fancy, is losing ground. They may be copying some of our "shaft drives" over there; they can well afford to do it; we always had them on the hip in this connection. But let us not go wild about their slants. In "stable America" there is a place for everything, and we know the value of putting the right horse in the right stall. That the chain situation is now just as good as it ever was, is shown by statistics which did not prevent the multiplication of the "shaft drives." The distribution has followed along natural channels, and that the same is now fairly representative of what will be a natural future is assured by those who seem to be abreast of the times.



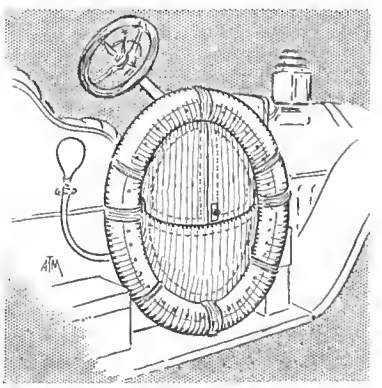
Good Provisione for Extra Caeings

Brakes.—Law, and more law, all about brakes, rather goes to show that they were not all that they should be in the past. The new crop is in anticipation of the fact that the community will demand good brakes in the future. Time was when cars were studded with brakes, none of which was over good, and numbers were placed to make up for the deficiency in point of quality. In the 1909 cars the brakes are capable in the extreme, and, as a result, few in number. In some cases there are two sets in the rear wheel drums (internal and expanding), while in other examples the old idea holds, in that one set is on the rear wheels, and a differential brake is used for service. In all the examples the drums are of increased diameter, and the faces are ample to assure long life. The facings are all the way from metal to metal to "cork inserts," with a decided tendency to get away from the class of materials that will not stand heat. Fortunately, the properties of cork are such that they will not char and the presence of oil does good. The further tendency is in the direction of the use of asbestos supported by a wire mesh to give strength.



Baggage Space in the Atlas Taxicab.

Axles in General.—Departing from the question of the types of "live rear axles," it is to note the very general use of I-section axles, both for rear and front. They are die forged, frequently without welds, and so nicely proportioned for the work as to be difficult to improve upon. In heavy trucks the axles are both I-section and square, depending, on circum-

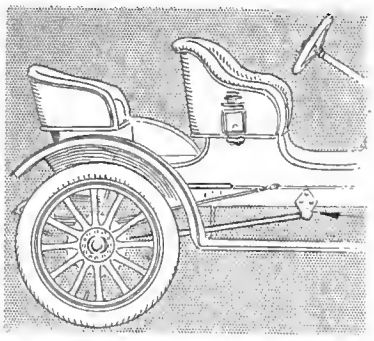


Waterproof Casee for Extra Tires.

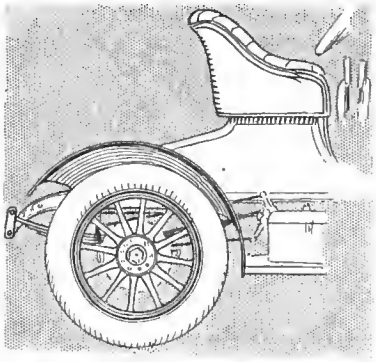
stances. The road wheels turn on ball and roller bearings, and in general the construction is all that can be desired or suggested.

Wheels, Rims, and Tires.—As a rule the wheels are of wood, with nicely shaped spokes, and in so far as can be determined at the show the wood is up to a high standard. There is evidence of the use of "disc" wheels, which in the course of time will have to be seriously considered, unless a new supply of wood can be located, wood such as will maintain the high standard claimed for second growth hickory, which is growing more scarce year by year. Rims are up to a high standard with a decided showing of "demountable" methods. Tires are larger than ever before, which is one of the year's improvements. The "foreign" idea of using "dual" rear pneumatic tires (as is the practice with solid tires on commercial trucks) has not been adopted in this country. Spare wheels are in good demand, and the autoing public seems to take to the idea.

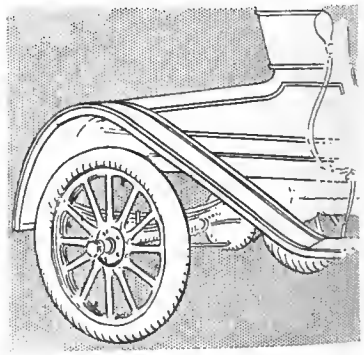
Chassis Features.—Channel sections of alloy or special carbon steel seem to be the mainstay. Wood is used to some extent. The autoing public now fully understands that wood is adequate for the purpose, and they also know that the channel section is appropriate. Referring to the channel section, the shapes are much more stable than before and the "drop frame" idea is much in vogue, especially in town cars, but not confined to them. As a rule, the frame is deeper and the flange is wider, while the "laterals" are nicely placed and well braced.



Ball and Socket Distance Rod. (Overland.)



A Very Effective Mud Guard. (Mitchell.)



Mud Guard of Length and Sweep. (Maxwell.)

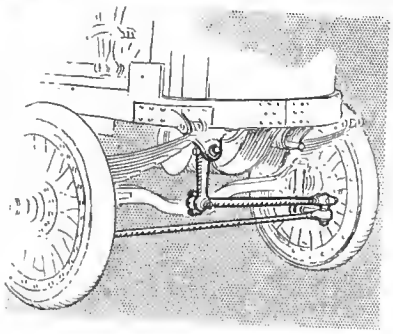
Three-point Suspension.—In point of theory, this principle is adapted by every builder of automobiles, but it is not directly applied in all cases. When the unit power plant is used the three-point suspension is invariably directly advanced. When, however, the separate unit system is used, then the three-point suspension is applied to the separate units. In some cases the principle is so deftly applied that only the designers are fully alive to the fact. In other words, they may fasten at four points, but closer observation will show that one of the fastenings is with a "clearance" hole, so that the fourth point is merely a "rest," the advantages of which are self-evident. On the whole, it is fair to observe that the principle of the three-point suspension is in pretty general use.

Self-Contained Power Plants.—A goodly number of the cars of the year embody the self-contained power plant idea. In other words, the motor, clutch, and transmission gear-set are all enclosed within one housing, and the claim is made for them that the bearings will maintain correct alignment. Nothing could be more near the truth, and the plants so designed are very compact indeed.

Individual Unit Power Plant.—As against the self-contained power plant, there is the old standard construction in which every unit is separate. In this construction all the bearings are maintained in perfect alignment, because there is no rigid connection between the separate units, and within the respective housings the alignment is under the best possible conditions, because the housings are short. Universal joints are used between the units, and they, in turn, are housed in, thus preventing the oil from escaping and "grit" from entering. In this class of work, it is the aim to be able to remove one of the units without disturbing the other, and this plan is nicely carried out in the examples to be seen. It is fortunate for the purchasers of cars that they can embrace the talking points of either school, with no very great fear of having to suffer for their choice; both plans work and that is all the purchaser, in any case, is entitled to, unless it is that he would like to bolster his business acumen to the extent of enjoying the feeling that would be his were the plan he rejects to prove a failure. To this extent the 1909 purchaser is booked for a disappointment.

Spring Suspensions.—The springs as they now obtain "can" the vibrations as they never did before. The reason for this is not on the surface, nor is it well understood by autoists in general. It was not so long ago that it was the style to lay the failures up to the quality of the material used in the springs that failed to render complete returns, when as a matter of fact, it was because enough material was not used. When, in the attempt to improve, a scant amount of inferior material was supplanted by a more scant quantity of the finest material, it came as a surprise when the trouble increased instead of decreasing. It did not take long to determine that it was largely a matter of supplying the requisite quantity of material to accomplish the task. A pound of steel will dissipate a certain amount of energy on a basis that will not shorten the life of the steel below a commercial point. If the steel is of a fine grade, it will have a longer life, but it is also true that however good the steel, if it is sadly overworked its life will be short indeed. In the cars of the year this matter is on a fair footing, and as a result the springs, while they look very much as in the past, they are more capable. There is a growing tendency in favor of "scroll" types of springs, in relation to which there is an argument that speaks well of them. Otherwise the situation is as formerly, excepting that it is the custom now to use enough material to perform the service.

Ignition Systems.—Magnetos are now regarded as standard, and they are used extensively, if we may not say to the exclusion of the other systems. In every case in which a dual system is employed, the magneto is there as the system to run on, the "coil" being placed for emergency purposes. Were magnetos lower priced, they would be employed to the exclusion of coils on the systems using but one source of energy, provided motors could be started on the magneto, which does not seem to be impossible. On the other hand, the coil systems have improved so much that they are thoroughly capable under all the conditions in which it is not necessary to squeeze the last drop of power out of the motor. Many of the smaller cars are fitted with coils, and in some cases "master vibrator" systems are used. In some instances the magneto is used in conjunction with a battery, both



Steering Linkages of Great Strength.

as the source of energy, and a "step-up transformer" is employed in common between them. In any event, with ample motors and light cars rolling on wheels of big diameter, it would seem as if the ignition question is quite well settled.

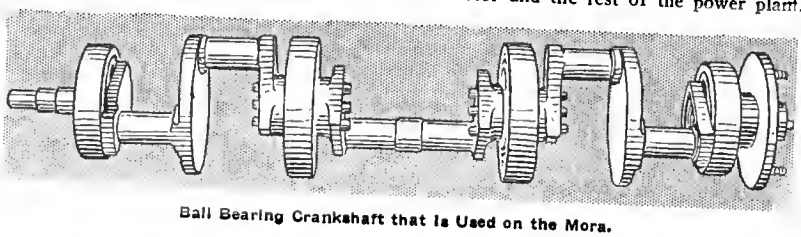
Fuel Systems.—Gasoline is still the liquid fuel, in spite of all the talk that went the rounds bering upon the question of the availability of alcohol. Carbureters are water-jacketed to a considerable extent, the idea being to run the hot water from the exhaust into the jacket of the carbureter to absorb the latent heat in the fuel that manifests itself during the period of evaporation, retarding the rate of evaporation. In some cases, as formerly, hot air is used. In only one or two instances is the formality dispensed with. Automatic carbureters have not made the headway that was promised for them and the auxiliary air supply is still with us. There is some evidence of what may be called "carbureter complication," but it is quite limited, and of justification there may be ample; one cannot tell at the show. Gasoline tanks are of liberal size, which, however, is not a compliment. The tanks are very well made, and the piping is quite healthy in most cases, with here and there a car in which so much is given at the price that the piping shows evidence of "skimping."

Lighting Systems.—Gas tanks are as thick as fleas on a dog's back, and they vie with the generators for supremacy. Let it not be supposed, however, that they are having it their own way. Generators are to be seen in great numbers, and they are not all on the low-priced cars. In other words, it is an even break, with little chance of either system falling far below the high estate they now lay claim to. Piping for the gas is not so good.

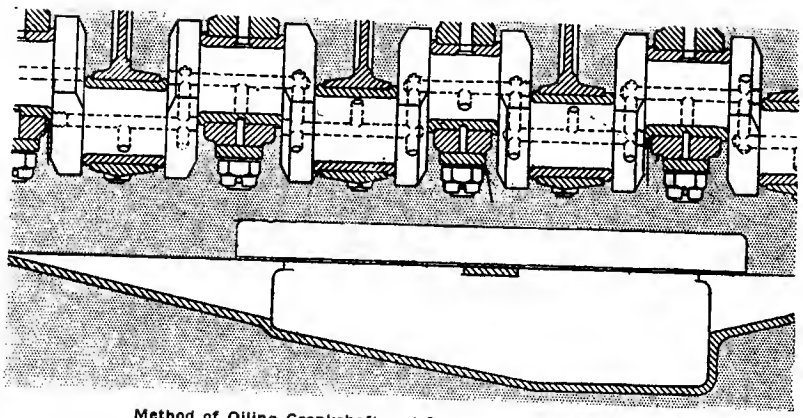
Of the lamps, too much cannot be said for them. They are in fine taste, there is a wide range to choose from, and for lighting (which is what they are there for) it is believed they are more capable than they ever were before. On the low-priced cars, die-forged (steel) brackets are used: they are capable, but it cannot be said of the cast bronze kind that they are quite so good as die-forged steel, which can be rendered as brass if they are "roll-plated," as they are in the fine examples to be seen. The oil lamps that look like "hearse lights" (as some wag put it) do cut a shine, and in the nighttime they keep it up. The question of electric lighting is one that we have not heard the last of. This method of lighting is forging to the fore, and it has a legitimate zone. Batteries are now so good that to use them for lighting, as well as the ignition system, is the natural thing to do. It is being done.

Tops and Windshields.—In the touring car class, "cape tops" are much in vogue, and they have reached a high state of development. They, with windshields and curtains, go a long way toward rendering touring under inclement conditions of weather less to be dreaded than ever before. The windshields have more of the "dodger" principle than formerly, and they do not rattle. The tops are not only in good style, but they are well made; broken bows should be of the past.

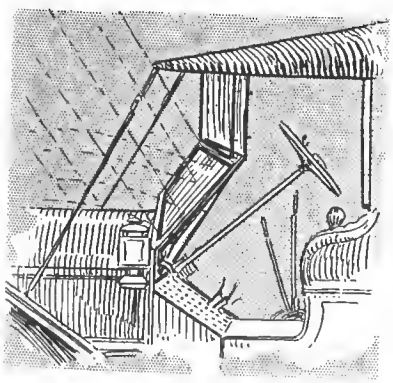
Underpans.—If it is desirable to protect the autoist from the ills of inclement weather, it is equally desirable to keep mud accumulations from the motor and the rest of the power plant.



Ball Bearing Crankshaft that Is Used on the Mora.



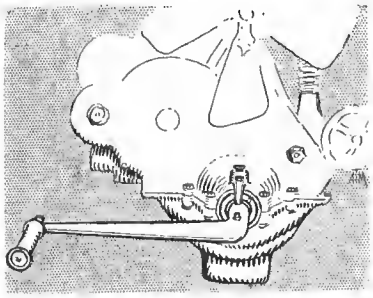
Method of Oiling Crankshaft and Sump to Prevent Splash.



Clear Vision Windshield on Gaeth.

This is looked after in a fitting manner, and the mud aprons (pans) are not only capable but they are easy to drop down, in order to be able to get at the machinery in the event necessity dictates. In this connection, it may not be out of place to call attention to the year's offerings by way of adequate mudguards, which is a matter that was never before on a fitting basis. As it is, the mudguards extend down to the chassis (frame) and the amount of protection they thus afford is only equalled by their neat appearance. The fellow that invented the "flaring mudguard" was helped enormously by the other fellow that added the mud drip, but the idea of extending the mudguards down to the chassis (frame) was the one that capped the climax.

Noise and Lubrication.—Both subjects will be treated in common, on the ground that in the absence of one, the other will render itself manifest. The absence of oil will at first show by a squeak. In the long run the squeak will propagate a rattle. Lubrication, then, is important, and it is pointed out that no amount of oil in the crankcase, for illustration, will be of avail when it comes to preventing rattle in the multitudinous small parts and in and about the chassis. If oil cannot be used, a

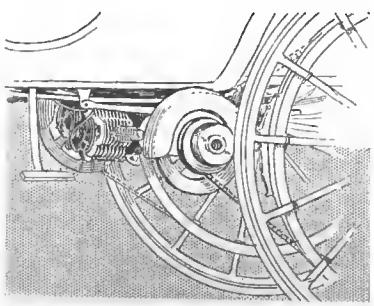


Means for Holding Starting Crank.

grease cup can. If the parts are coated with oil or grease, "grit" will be warded off, and noise will not creep in. If a squeak is an indication of a dry surface, rattle tells of the fact that the squeak fell on dull ears. At all events, it cannot now be said of the builders of cars that they failed to do their part, for in about every case the oiling question has been treated seriously. The systems are not all the same; all the designers did not reach exactly the same conclusions; but they all seemed to be alive to the facts, and all made a stagger at a solution of the problem, to say the least. It was a good stagger, too; the end was a complete solution of the problem in the great majority of cases. It is nice to see universal joints protected from dirt and oiled. This year's cars are nice in this respect. Grease cups are used to a large extent. Grease may now be had in which the lubricating qualities are equal to the same qualities in any fine lubrication oil. A clean dash is in style; this comes through the use of force feed oilers, aided by the fact that magnetos are used for the ignition systems. A couple of tell-tales and a coil are all to be seen on the dash these days; not always the coil, for the same is ofttimes placed elsewhere, with the idea of keeping the dash free of incumbrances.

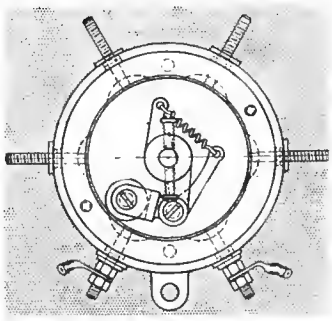
Cooling Systems.—Radiators are in several styles, as honeycomb, vertical tube, horizontal tube, and flat plate, or plates of thin copper fashioned in imitation of the honeycomb type. Then there is the round tube radiator, as used on some of the fine examples of cars. At all events, it is to note a fine display of radiators, and of pumps for the circulation of water there is the centrifugal and the gear pump, not forgetting some flat "paddle" types to boot. In notable instances the thermo-syphon principle is used, and on the whole the cooling question is handled so that few indeed are the cars that are troubled with steaming radiators or hot motors. Of the piping, it is assured that a better condition prevails. Within the water jackets of the cylinders much has been done to eliminate trouble, and it is a noteworthy fact that cooling is less in need, which is another way of saying that the amount of heat to be wiped out of the water is reduced and the radiators have less work to do, hence the tendency to steam is reduced. The improvement, then, has been in two directions.

Harmony of Relation.—Considering the power of the motors and the weights of the cars, it is to note that harmony resides in the 1909 products as it never before made bold to proclaim itself. This is a detail that was not taken account of to any great extent until recent times, and when designers awakened to the seriousness of the question it is fair of them to say they allowed no grass to grow under their feet. In many cases, this same harmony was a natural conclusion, but some of the overpowered cars were the sufferers, as were the runabout types that sported touring bodies in the early days. The time was when to note a body that weighed more than the chassis was as common as it is scarce to-day. If a chain is as strong as its weakest link, it is assured that some of the earlier products were very weak indeed. Thanks to experience and opportunity, this matter has been taken care of.



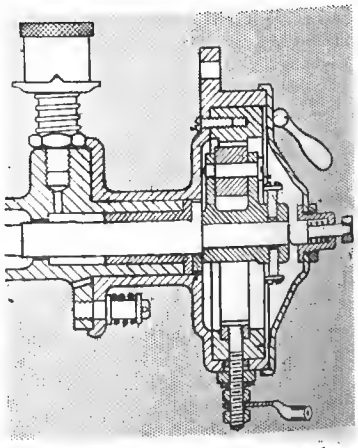
Holsman Method of Cable Drive.

Attention to Details.—In divers ways the details that formerly gave trouble in the long run, if not very early in the process, are reduced to a sane basis. The earlier failures were, in a large measure, due to a desire to inflict something distinctive on the user of cars, perhaps passing by devices that were known to be good for the purpose. Take, for illustration, timers: they should be stable and electrically suited to the exacting service required of them; they are as they obtain on the cars at the show as they never were before, due to a better understanding of the requirements in the hands of men of skill. Consider, for instance, the question of the lubrication of the timer; how many examples of no provision to be found in old models will never be known, while in the work of the year this question has been worked out to a nicety. Now the hard lubricants available are dependable if they are purchased of the companies that make a specialty of this class of trade and who know the needs as they now exist.



Roller Contact, Spring Tension Timer.

Cost of Maintenance.—The time was when the cost of maintenance of an automobile was regarded as a bar to the ownership of a car at any price because the purchase price was, as some said, the easiest part of it. This matter was disposed of to a large extent in the earlier examples of the better makes of cars, but the 1909 products are quite generally to be included in the list of the cars with a low cost of maintenance. The reason for this lies in the fact that the vendors of materials, knowing the wants of one, have the same information to give to all; and it takes but a little time in connection with a matter of this sort to level the situation. The cost of maintenance should be very low, indeed, in view of the standardized condition of the industry, and in further view of the general use of suitable materials, such as found their way into but few of the automobiles at first on account of the high cost, a question now disposed of by mere force of quantity.



Good Lubrication on Timer and Bearing.

Absence of Complication.—Users of cars soon learn how to control automobiles if such are mechanically as simple as can be. The time was when numerous mysterious trinkets were dangled from supports all through the then "half-baked" products, but the designers of acumen soon learned how to do without such useless complications, and they stayed at it until they had done away with the devices that lent zest to the efforts of "astronomers" who crawled under cars, thereafter to gaze toward the canopy of Heaven through a dark and dismal aggregation of levers and other things that intercepted the line of vision. As it is, there is no reason for going under a car, even if something does need a little attention. It can be reached from

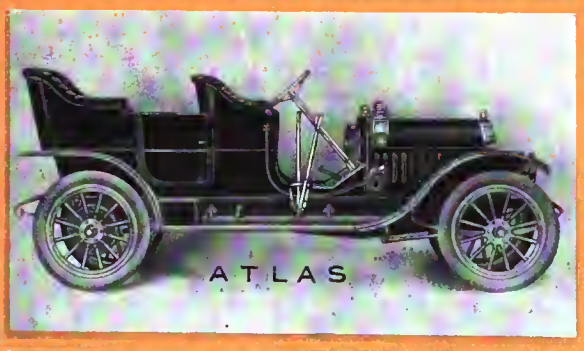
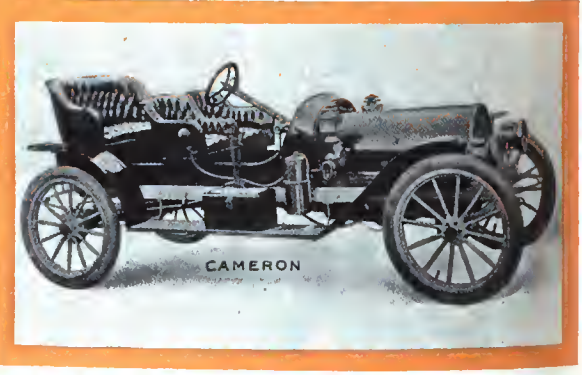
WORD PICTURES OF EXHIBITS.

A possible purchaser of an automobile might lose a whole day trying to locate the kind of a car he may want, and with the idea of aiding the selection, short word pictures of the cars to be seen may serve a far more useful purpose than to extol the beauties of the show as a whole and to generalize in relation to the advances in the industry, in relation to which every autoist is fully alive. The word picture will be supplemented by a short table, showing the types of cars made by the several companies, and, in some instances, illustrations will be given to help out. It would have been a good idea to illustrate at least two cars of each make, but this was out of the question, because photographs were not at hand and the makers did not have time to get them out. It will be understood, then, that cars illustrated were not so selected through any desire to give them undue prominence.

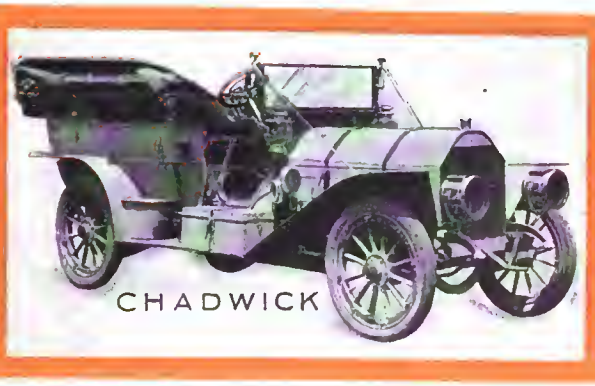


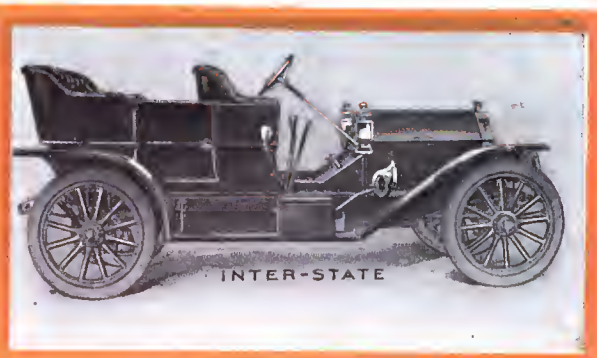
THE AMERICAN PLEASURE CARS.

American.—Beginning with the 50-horsepower American roadster, there is an attractive line of cars listed by the American Motor Car Company, Indianapolis, Ind., for the 1909 season. On the same chassis as the roadster are the American "Toy Tonneau" type, and the American "Wayfarer," all three of these cars listing at $3,750. Then there are the American "Tourist" and the American "Traveler," both being priced at $4,000, while above them is the limousine model listing at $5,000. Practically the same 50-horsepower chassis forms the foundation in the case of each, the only differences being such as are necessary to adapt it to the particular type of body, one of the chief points of distinction being the varying wheelbase, which ranges from 110 inches in the case of the roadster up to 124 inches in the case of the "Wayfarer," toy tonneau and limousine models. The motor dimensions are 5 1-4 by 5 1-2 inches, a cone clutch, four speed and reverse selective type of sliding gear and shaft drive constituting the transmission.



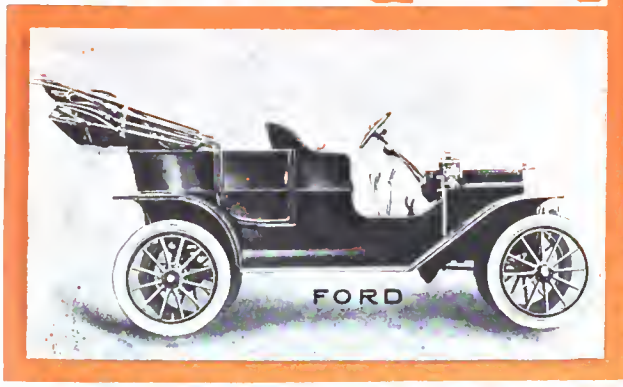
American Simplex.—This product comprises four models, each with a 50-horsepower motor of the four-cylinder type and transmission of the sliding gear genera, three speeds and reverse. The 50-horsepower motor is distinctive and the construction throughout is such as to attract the notice of buyers. The motor is two-cycle, for illustration, and the valveless condition, with water cooling and such other nice features as are recognized in this product, has rendered it possible for the makers to claim that they have made mile-a-minute records and established a reputation of a character that speaks well for the two-cycle





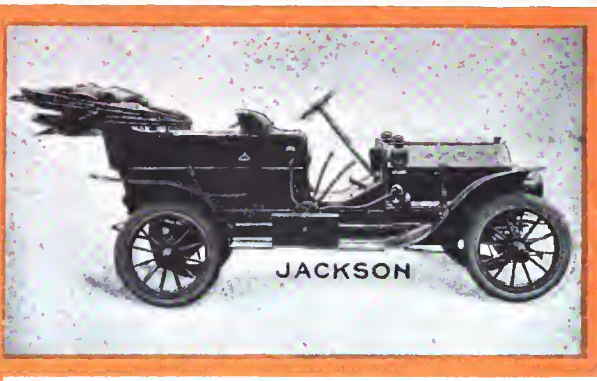
motor. The American Simplex is made at the works of the Simplex Motor Car Company, Mishawaka, Ind.

Acme.—The line of the Acme Motor Car Company, Reading, Pa., comprises some eight models, ranging in price from $2,500 to $6,000, and with bodies seating from two to seven. Three of the models are fitted with transmissions of three-speed and reverse and the remaining models are of the four-speed type of transmission. In this line of cars customers can choose between the four and six-cylinder motors; the first is of 30 horsepower or less, and the second choice is 48-horsepower or above. Reference to the general table will give the data of the Acme line.

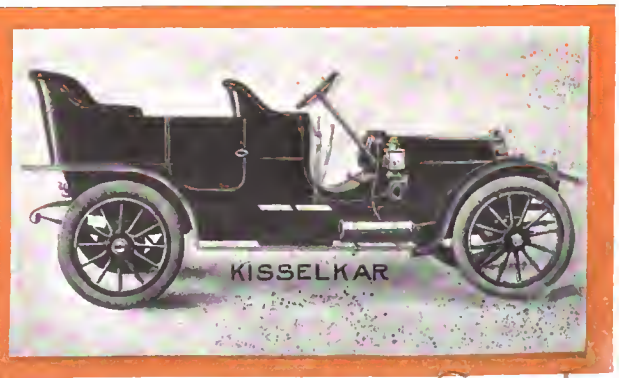


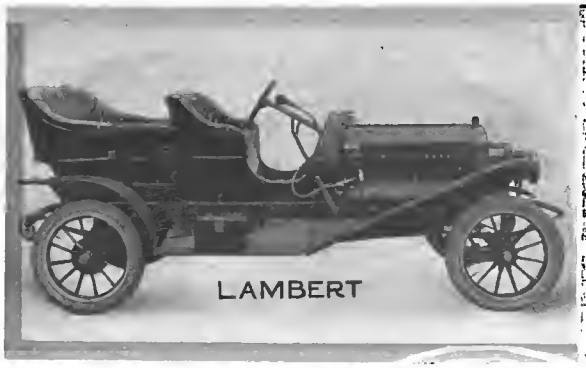
A-K.—The Allen-Kingston Motor Car Company, of New York City, offer to a discriminating public two models as follows: a 17-horsepower car with a four-cylinder motor for touring, and a 48-horsepower chassis with body work to suit. The 48-horsepower motor is with cylinders 5.12 by 6.18 inches, bore and stroke respectively. Attention is called to the use of the "New Departure" ball bearings in the cars, almost to the entire exclusion of plain bearings. The 17-horsepower model is of the type involving "en bloc" cylinder castings and the "left-hand" steering is something to take notice of. This model is especially designed for maneuvering in congested streets and can turn in an ordinary street. It is the desire of the company to call attention to the details of the line in point of finish, even down to hardening the nuts, which are finished in blue.

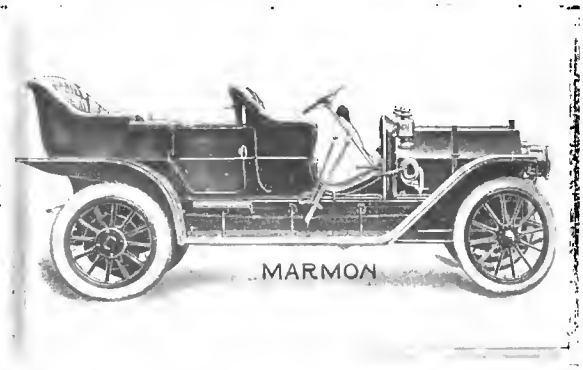
Atlas.—The Atlas Motor Car Company, Springfield, Mass., will be one of the very few concerns showing cars with two and three-cylinder motors, these, of course being of the two-cycle



type. Two chassis are shown in five different models. These are the 20-horsepower two-cylinder Atlas, which is listed as a runabout with rumble seat at $1,150, as a taxicab at $2,350, and as a town car at $2,500. Then there is the three-cylinder 30-horsepower Atlas, which is shown either as a runabout or as a touring type at $1,900 and $2,000 respectively. The cylinder dimensions in the case of each of these chassis are the same, namely 4 1-2 by 4 1-2 inches, the Atwater Kent spark generator being fitted for ignition, this apparatus having proved itself particularly well adapted to the two-cycle motor. The clutch is a contracting band type, while the small chassis is fitted with a two-speed sliding gear, and the 30-horsepower chassis with a three-speed selective type. The tire equipment of the 20-horsepower Atlas runabout is 32 by 3 1-2 inches, while with a closed body 30 by 4-inch tires are used, the equipment of the larger cars being 34 by 4-inch all round, quick detachable rims being fitted in every case.



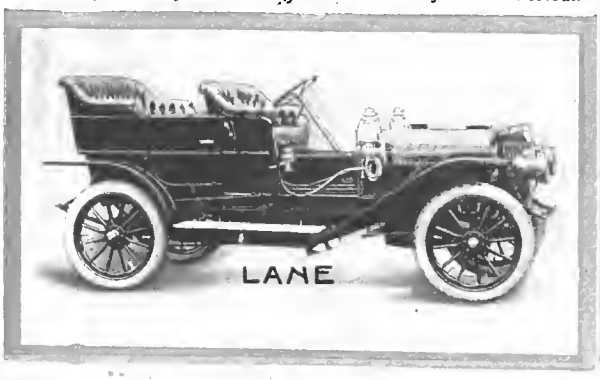


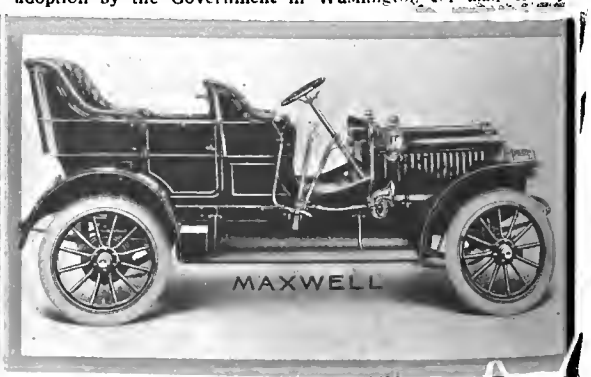


Austin.—This line comprises some nine models, ranging in price from $2,850 to $6,000, and the motors range in power from 45 to 90 horsepower, some of which are four-cylinders while the remainder of them are six-cylinders. The body work is of a high order and seats are from three, in the R-45 roadster, to seven in the T-60. The transmissions are with three and four speeds, depending upon the model, and a wide range of choices is afforded the company's patrons. The general table offered will give detailed data of the models in the Austin line, the product of the Austin Automobile Company, Grand Rapids, Mich.

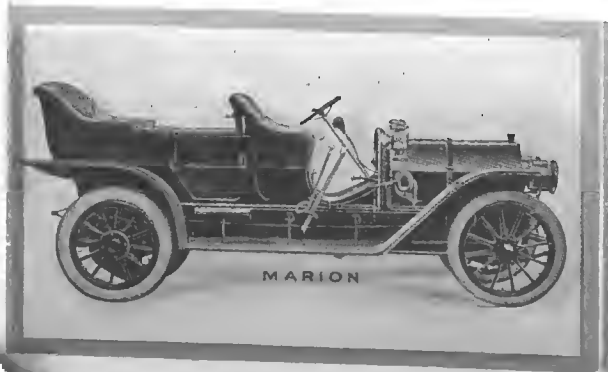
Alco.—Formerly the "Berliet" as made by the American Locomotive Company, Providence, R. I., would scarcely require any introduction at all were it not for a desire to remind the patrons of the company of the fact that in addition to the "four" a "six" is of the line, and a "taxicab" also numbers among the good. The "six" rated at 60 horsepower and the cylinder dimensions are 4 3-4 x 5 1-2 inches bore and stroke respectively. As respects the "four" it is to say, the cylinder dimensions are 4 3-4 by 5 1-2 inches bore and stroke respectively for the 40-horsepower model, while the taxicab demands the cylinder dimensions on a basis of 3 15-16 by 4 3-4 inches bore and stroke respectively. This company is holding to its usual policy of maintaining a separate exhibition, and they will entertain friends at the Waldorf-Astoria from January 2 to 23, where the cars can be seen.

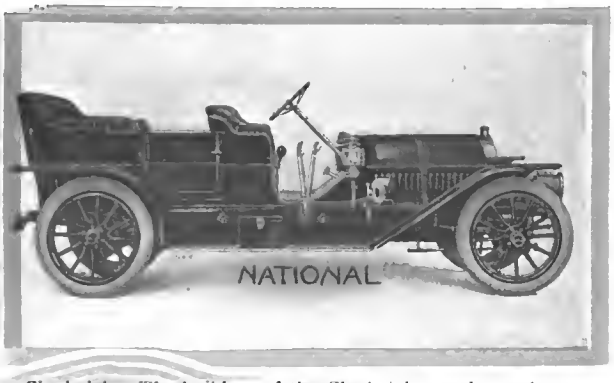
Brush.—Apart from a slight detail here and there, practically no changes have been made in the Brush runabout for 1909 as compared with its predecessor, and the latter proved so successful that the builders, the Brush Runabout Company, Detroit, Mich., are planning to turn out no less than 3,000 of these little $550 cars, besides 1,000 of the Brush delivery wagons mounted on the same chassis. The records established by the Brush runabout during the past year by demonstrating its ability to travel all over the country on a fast schedule and its adoption by the Government in Washington for mail delivery purposes give some idea of what the little car is capable of.





Cameron.—In these days when water-cooling is supreme and arrogant in its supremacy, it really is refreshing to come across an air-cooled motor now and then, particularly if this be a low-priced car of marked simplicity, intended for the man of moderate means and equally moderate mechanical ability. To such people the car made by the Cameron Motor Car Company, of Beverly, Mass., will appeal with a peculiar force. This little machine is now built in both four and six-cylinders, with runabout, roadster and touring car bodies. The transmission, although affording direct drive on all three forward speeds, is simplicity itself. This, located on the rear axle, is an exclu-

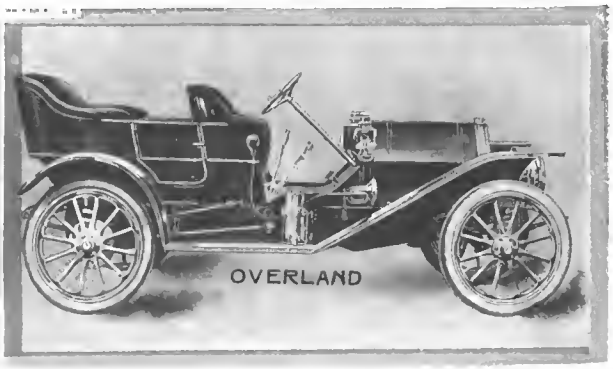




sive Cameron feature, this company holding patents which cover it thoroughly. These cars, owing to their extreme simplicity, are very light in weight, varying from 1,100 pounds in the four-cylinder runabout to 1,650 in the six-cylinder touring car. The prices of this product are within the reach of the masses, varing from $900 up to $1,500, the latter figure being asked for the six-cylinder models regardless of type of body.

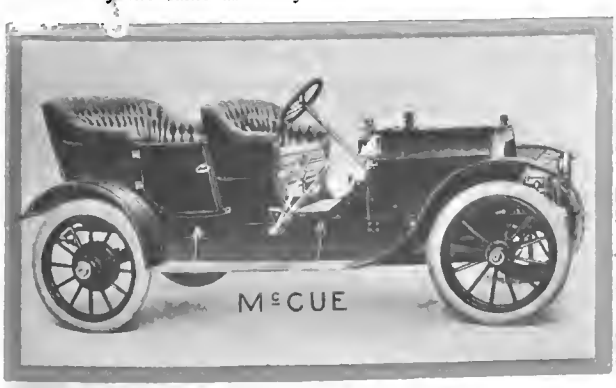
Cartercar.—During the time that the Cartercar has been on the market it has served to show in an unmistakable manner the capacity of the friction type of transmission for driving a car under the most severe conditions to be met with in automobiling, and doubtless the greater part of its success has been based upon its performances under adverse circumstances. For the coming season its builders, the Motorcar Company, Detroit, Mich., will exhibit an 18-20-horsepower chassis and a 22-24-horsepower chassis, both being equipped with the horizontal opposed type of two-cylinder water-cooled motor. So far as models are concerned, three will be listed, starting with model H runabout, listing at $1,000, this car having the smaller motor; then there will be a racy type Cartercar, with the 24-horsepower motor, listing at $1,350, while model K touring car, seating five passengers, will also list at the same price. With the exception of minor improvements here and there, the chassis design is substantially the same as last year.

Chadwick.—The builders of the Chadwick cars have always been consistent advocates of the high-powered machoine, and its line for the coming season shows nothing smaller than the 60-horsepower six-cylinder chassis, which made such an excellent showing in the leading contests of the year, while it carried off top-line honors at practically every hill-climb of importance in which it was entered. The efforts of both the designer and factory have always been concentrated on the production of a single type of chassis, which has accordingly been brought to a high state of perfection. The Chadwick is probably the only car ever built that has the distinction of being regularly fitted with two high-tension magnetos as a standard part of its equipment.



It embodies numerous other distinctive features such as the cop-water jacket encircling each one of the twin-cylinder castings, thus making the cooling of each pair of cylinders very uniform and at the same time independent of the others. Three types of bodies are listed, seating two, five and seven passengers. The Chadwick Engineering Company, Pottstown, Pa., are the builders.

Coates-Goshen.—With two chassis and four models, the Coates-Goshen Automobile Company, Goshen, N. Y., has entered the show prepared to hold its own in view of the modern work put upon the cars this company has to offer to its patrons. The model "25" has a four-cylinder motor, 4 by 4 inches bore and stroke respectively. It is water-cooled, has a cellular radiator,



and the ignition includes a "Bosch" magneto. The selective transmission has three speeds forward and reverse, and the wheelbase is 112 inches, with a 56 1-2-inch tread. Referring to model "32," it is noted that the bore and stroke respectively of the motor are 4 1-2 by 5 inches, and in general all the good features to be found on the model "25" are included. The transmission is with three speeds, as well as reverse, with a wheelbase of 116 inches and 56 1-2-inch tread. For more complete data of the cars, look for same in the general table of the cars.

De Luxe.—The De Luxe Motor Car Company, Detroit, Mich., will make but one chassis for the 1909 season and will list this in three models, namely, the model C touring car, model D tourabout and model C limousine, the first two listing at $5,000 while the last named is $6,250. The motor dimensions are 5-inch bore by 5 1-4-inch stroke and it is rated at 50-60-horsepower, its chief distinguishing feature being the use of oppositely disposed valves placed in the cylinder heads at an angle and operated by a single rocker arm from the same camshaft. High tension ignition is used, a magneto and storage battery being supplied as sources of current for the dual ignition system. The gear set is a selective type, giving four speeds forward, final drive being by shaft. Two sets of brakes are fitted on the driving wheels. The wheelbase is 121 inches in the case of all three models and the tire equipment is 36 by 5 inches all round. Both the touring model and the limousine have a capacity for seven passengers, while the tourabout seats five.

Ford.—Quite in contrast with its concentration of effort on a single type last year, the Ford runabout, the Ford Motor Company, Detroit, Mich., will for the 1909 season list a larger line of models than it has ever built before. There will be no less than seven types of Fords to choose from, beginning with the touring car at $850, of which doubtless a very large proportion of the proposed output of 25,000 cars will consist, and ending with the four-passenger tourabout at $1,000. Between these there is a three-passenger inside-driven coupé, listing at $950, the Ford taxicab at the same price, a two-passenger runabout, three-passenger roadster, and a five-passenger town car, all of which, like the tourabout, are listed at $1,000. Naturally, all of these models will have as their foundation the 20-horsepower four-cylinder chassis, the chief feature of novelty of which is the new ignition system, consisting of an inductor type of magneto embodied in the flywheel, thus making it an integral part of the motor, so that it goes without saying that a magneto will form part of the standard 1909 equipment.

Gaeth.—The Gaeth car for 1908 was the outcome of a policy of consistent adherence to certain lines of design, along which Paul Gaeth has been building cars on a small scale for several years, so that it was to be expected that the Gaeth Automobile Company, Cleveland, O., would show a machine reflecting the same tendencies for the 1909 season. Attention will be confined to a single type of chassis for pleasure car use, while the same is true of the commercial end, the Gaeth delivery wagon being continued in substantially the same form. The pleasure car is known as Model XX and is rated at 38-horsepower, being equipped with a four-cylinder vertical motor of special design that has been developed by Mr. Gaeth, this referring particularly to the low-tension ignition system and the means provided for retarding and advancing the spark timing. A band clutch, three speed selective sliding gear and shaft drive complete the transmission. Four-seated roaster, and five and seven-passenger touring models are listed at $3,500, while the Gaeth limousine is priced at $4,500.

Gyroscope.—This is the product of the Blomstrom Manufacturing Company, Detroit, Mich., and as its name indicates it is entirely in a class by itself. The two-cylinder, horizontal opposed motor is placed parallel with the side members of the frame, being supported on two special transverse members located under the bonnet. By removing two bolts, the entire power-plant can be taken out complete. The flywheel is of unusually large diameter and runs in a horizontal plane beneath the cylinders, thus giving rise to the name. At right angles to the flywheel and so arranged as to contact with the under face of it is a friction wheel, sliding on a squared shaft, an extension of which constitutes the propeller shaft of the car, thus giving a straight line drive. By moving this friction wheel backward or forward across the center of the flywheel, an extensive range of gradually increasing or decreasing forward or reverse speeds is obtained. By means of a small friction clamp on the rim of the flywheel, the motor may always be started from the seat through the medium of the side lever. An interlocking device connected with the spark advance eliminates all danger of a back fire.

Certain to command attention is the effort of the Gyroscope Automobile Co., of New York City, in so far as its efforts at the show are to be noted, lies in the 16-horsepower "friction" drive model of that make, the same fitted with a roadster body at $750, or a touring body at $800, and other options at the behest of patrons. This model weighs 1,500 pounds, is a ball and roller bearing proposition, and has its range of distinctive features, among which it may be well to call attention to the thermo-syphon cooling, including a honeycomb radiator which takes care of the two-cylinder motor, the bore of cylinders being 4½ inches and the stroke is the same. The car is of the shaft drive, with channel section frame, and a 95-inch wheelbase with a standard tread accounts for the good road performance.

Inter-State.—With a 40-horsepower four-cylinder motor of a refined type, using a three-speed (and reverse) transmission among the features, the Inter-State Automobile Co., of Muncie, Ind., will court fortune at the show. Dwelling upon the one model, with nothing else to detract the attention of the designers, it has ended in a car such as can scarcely go through the show and fail to attract the notice of buyers of intimate knowledge of what a good automobile should be like.

Jackson.—As has been the case during the past year or two, the Jackson Automobile Company, Jackson, Mich., will devote its attention partly to the two-cylinder type and partly to the four, the complete line comprising seven different models, of which three will be equipped with the two-cylinder horizontal opposed type of motor, and the remainder with the four-cylinder vertical. Beginning at the bottom of the list there is the Model F runabout, a 16-18-horsepower machine, with a twin cylinder motor listing at $850; Model K consists of the same chassis with a regulation type of touring body, the selling price of the car thus equipped being the same; Model C is a five-passenger touring car of the same type, but its two-cylinder engine is larger, being rated at 20-24 horsepower. There will also be two four-cylinder machines turned out, the smaller being a 30-horsepower car listing at $1,600, while the larger is a 35-horsepower car selling at $2,000, each being shown in touring and roadster bodies.

Kisselkar.—There is no less than three models listed by the Kissel Motor Car Company, Hartford, Wis., for 1909. Two of them are new and one is an eye-opener in the shape of a 30-horsepower model, listing at $1,500. It is practically a replica of the higher-priced machine, the performances of which, both in contests and in the hands of numerous private owners, served to make the Kisselkar reputation the country over in the course of a single season. Probably its most distinctive feature, where the power plant is concerned, is the dual ignition system, consisting of an Atwater Kent timer and dry cells on one side, and a Remy high-tension magneto with single vibrator coil on the other, both sets operating with independent plugs. The other two models are the 40-horsepower four-cylinder type, which is a continuation of last year's model of the Kisselkar, with a number of improvements, prominent among which may be mentioned the adoption of 36-inch wheels, instead of 34, while the other is a 60-horsepower, six-cylinder car. All embody numerous features of design and construction that make them noteworthy productions at low figures.

Lambert.—Friction drive is the chief distinguishing feature of the Lambert cars, manufactured by the Buckeye Manufacturing Company, Anderson, Ind., although they embody numerous other

points of design and construction that have been worked out by their builders during the several years that this car has been on the market. For the 1909 season, they will be sbown in a greater range of sizes and prices tban ever before, beginning with the Model A-1, three-seated, 20-horsepower runabout, listing at $800, and ending with the Model B-2, 35-40 horsepower, seven-seated touring car, which is being placed on the market this year at $2,000. Between these two, there are three different models, a touring type on the 20-horsepower chassis, and four and five-passenger cars on the 28-horsepower chassis. With the cxception of the smallcst, whicb is equipped with a horizontal opposed type of engine, a four-cylinder vertical motor will constitute tbe Lambert power plant. The Lambert friction drive, giving a universal range of speeds, is employed on all the models in question.

Lane Steamer.—For 1909 there will be two of the Lane steam chassis listed, one rated at 20 horsepower and the other at 30 horsepower. On the former there will be shown a three seated roadster type priced at $1,800, and a five-passenger touring car, listing at $2,000; while on the larger chassis there will be a Lane roadster at $2,800, a close-coupled four-passenger car at $3,000, and a seven-passenger touring car at $3,100. The features that have always characterized Lane construction during the past nine years have been retained, the power plant consisting of the combination fire-tube and coil generator under the bonnet, at the forward end of which the condenser is carried, while the engine is a two-cylinder compound placed in a sloping position under the footboards and driving to the rear axle by means of a single chain. A simpling device is employed by means of which the high pressure steam may be employed in both cylinders when extra power is needed. The Lane Motor Vehicle Company, Poughkeepsie, N. Y., are the manufacturers, while the car is marketed by the Lane Sales Company, 2637 Broadway, New York.

Marion.—Numerous excellent features of design characterize the Marion motor and, needless to add, these will be continued in the 1909 models of this car, which is manufactured by the Marion Motor Car Company, Indianapolis, Ind. The cylinders are cast independently, and are of the T type, having the valves oppositely disposed in outboard ports; two camshafts are used, the valves being operated by the direct thrust method. The gear pump for circulating the water and the ignition timer are both located on the forward end of the motor in accessible locations. The carbureter is a Schebler with automatic piston throttle, while high tension ignition is employed, a six-volt sixty-ampere hour set of storage cells supplying the current, with a set of dry cells for emergency use, on the four-cylinder Marion, while a magneto will be specified on the six-cylinder car. The clutch is of the multiple disc type, while the change-speed gear is a selectively operated silding set.

Marmon.—For the coming season the Nordyke & Marmon Company, Indianapolis, Ind., will place on the market the most extensive range of models that they have ever attempted. They will build three distinctive chasiss, namely, the 32-40-horsepower, 40-45-horsepower and 50-60-horsepower types, all of which will be equipped with four-cylinder motors. It is hardly necessary to add that those characteristic features of design and construction that have always served to place the Marmon product in a class of its own will be perpetuated in each one of the new models for 1909. Probably the most striking of these is the Marmon flexible running gear, by means of which a double three-point suspension is obtained, the power-plant and drive being supported on one member and the body on another, thus making either free to move according to the nature of the road surface. This prevents the severe binding and twisting strains imparted to the frame and body from reaching the power-plant or any one of the links in the transmission. The Marmon separable head water-cooled cylinder casting is also a striking feature of the Marmon power-plant.

Maxwell.—The new Maxwell runahout at $500, which is practically a replica of its confrères of the same name on a smaller scale, is the only addition to the Maxwell line for 1909, but it will be turned out in quantities, tbe company planning to build no less than 5,000 of these small cars during the coming season. The three models listed last year will be continued in substantially the same form. These include the Maxwell Model L B, which is a 14-horsepower runabout with a two-cylinder horizontal opposed type of motor, multiple disc clutch, and shaft drive, a two-speed planetary change gear set being employed. One of the features of this car not hitherto included as a part of its standard equipment will be a high tension magneto for ignition. Next to this size comes the Maxwell HD, a 20-horsepower touring car listing at $1,450. It is also equipped with a horizontal opposed type of twin-cylinder motor and multiple disc clutch, but has a three-speed sliding type of gear-set. Model KA 25-30-horsepower, four-cylinder car, shown in both touring and runabout types, completes the Maxwell line.

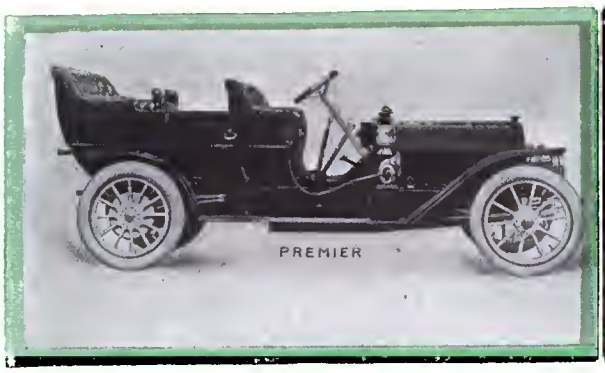
McCue.—This is the product of the McCue Company, of Hartford, Conn., and the patrons of the industry are justified in the interest they take in the McCue 30-horsepower model at the show. This car has a four-cylinder motor with double ignition—Bosch magneto and battery—selective type transmission, floating type rear axle, I-beam front axle, artillery wheels with 36 by 4-inch tires, and actually weighs 2,020 pounds. The wheelbase is 117 inches, track 56 inches. The engaging of this concern in automobile construction is considered significant, its previous energies having been greatly connected with the horse and carriage trade.

Middleby.—This product comprises two models from the point of view of immediate interest, as it centers around the show. Both the Model A and B bave a 25-horsepower motor, and the transmission is with three speeds, as well as a reverse to be sure. The motors are of the four-cylinder type, and the design, material, and workmanship is up to a high standard. Both models sell for $850. It is the Middleby Auto Co., of Reading, Pa., that turns out this line of cars.

Midland.—The Midland Motor Car Company, Moline, Ill., will list two models for the coming season, one a 25-30-horsepower car and the other a 35-horsepower machine. The former is known as Model E, and is equipped with a four-cylinder vertical motor, the dimensions of which are 4¼ by 5 inches, while the latter is termed Model G and has a 4½ by 5¼-inch motor. Model E has been designed to sell at $1,800, but it embodies many features of higher-priced machines, such as the three-speed selective change speed gear. It has a disc clutch, nut and screw type of steering gear, two sets of brakes on the rear wheels, and is equipped with 34 by 3½-inch tires all round. The wheelbase is 110 inches. Model G is a larger car listing at $2,250, and is shown in both touring and roadster types. Its motor dimensions are 4½ by 5¼ inches, developing its rating of 35 horsepower at a moderate speed. The remainder of its design is along practically the same lines as the smaller car, but proportionately larger, the wheelbase being 112 inches and the tire equipment 34 by 4 inches all round.

Moline.—For the 1909 season the Moline line, made by the Moline Automobile Company, East Moline, Ill., will be composed of two four-cylinder chassis, the smaller of which lists at $1,500 as a touring car, while the larger will be shown both as a runabout and touring car at $2,500. The power plant of the smaller car is rated at 24 horsepower, and embodies all those features of design and construction that have characterized the Moline cars during the past two or three years and that have done so much to contribute toward Moline success. This machine will be known as Model M. Model K is a 35-horsepower car, which is shown both as a three-seated roadster and as a five-passenger touring car, and while its specifications show it to be substantially a continuation of the Moline chassis of 1908, detailed improvements have been made in a number of instances, while both so far as its accessories and the materials and workmanship employed in its construction are concerned, it represents a much higher value at the price than before.

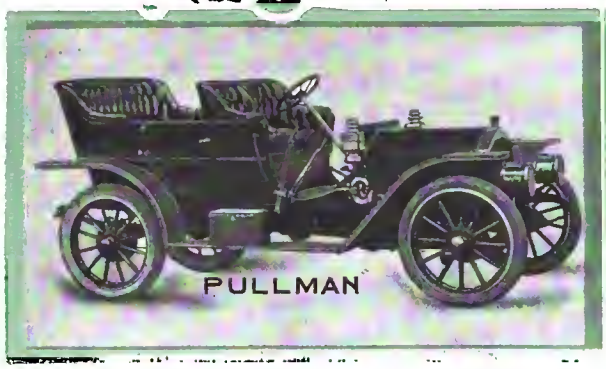
Mitchell.—The Mitchell Motor Car Company, Racine, Wis..

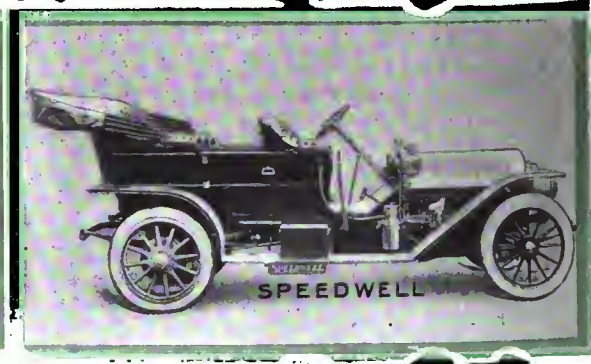


will devote its entire energies to the production of three models during the 1909 season, beginning with a four-cylinder 4 by 4 inch, rated at 20 horsepower, listing at $1,000 as a two-seater and known as Model J, and ending with the 35-40-horsepower Model L Mitchell, listing at $2,000. Intermediate these two, there is Model [illegible], which is a 28-30-horsepower car designed to sell at $1,500. It is fitted with a five-seated body of the touring type, but having a detachable tonneau so that it may readily be converted into a runabout. Its motor dimensions are 4¼ by 4½ inches; ignition is of the high tension type employing a magneto with dry cells for emergency use and a cellular radiator is fitted. The clutch is a cone type driving through a three-speed selective gear by shaft to the live rear axle. The wheelbase is 105 inches and the tire equipment 32 by 4 inches all round. Model L Mitchell has the same features of construction, but is on a larger scale, the wheelbase being 122 inches, while the tire equipment measures 34 by 4 inches, the car being a seven-passenger touring type.

known as Model D, will [illegible]. As a roadster, with a toy tonneau or [illegible] regulation touring type of body, it will be known as Model C and will list at $[illegible]. Some of the distinctive features of design of the [illegible] overhead camshaft with oppositely disposed valves in the cylinder heads, an arched type of rear axle permitting the driving wheels to be set slightly off the vertical plane, something that has only been possible hitherto with the side chain drive type of car. Annular ball-bearings are used throughout the [illegible] rear axle driving unit, a triangular form of torsion rod being employed to relieve the latter of stresses.

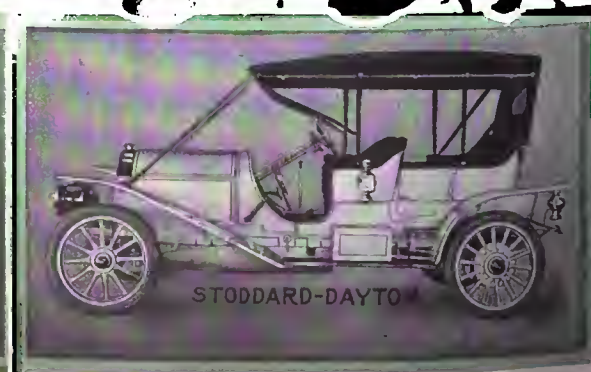
Mora.—With a view to [illegible] the great-

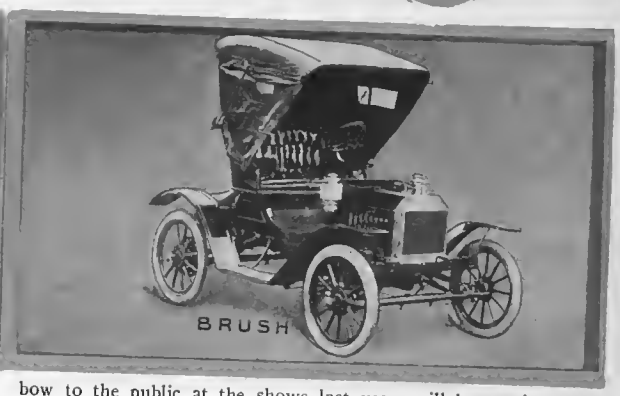




Moon.—Adhering to its past policy of devoting all its energies to the production of a single type of chassis, the Moon Motor Car Company, St. Louis, Mo., will feature the 30-35-horsepower car which is substantially the same as its predecessor for 1908. But it will be shown in four models, ranging from the three-seated roadster up to the seven-passenger touring car,

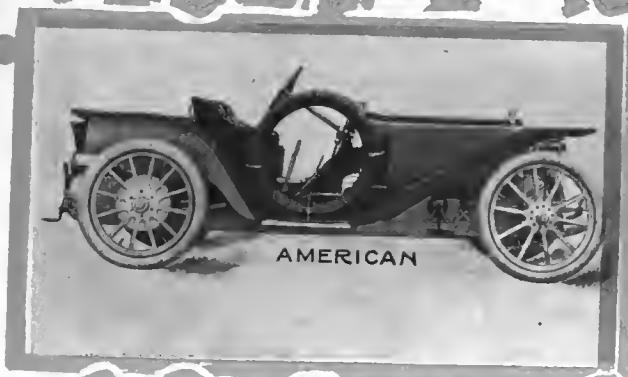
est number of purchasers, [illegible] Mora [illegible] will [illegible] a "Light Four" and a "Light Six" [illegible] to a [illegible] erful four-cylinder car, each one [illegible] with different styles of bodies, including the "Raceabout" [illegible] there will be an extended range to choose from. The Mora Motor Car Company, Newark, N. J., has been in [illegible] facilities considerably during the past few months and plans [illegible] made to turn out a much larger number of cars, for the season than ever before. Like their predecessors, they will be characterized by those features of design and construction that have served to make the Mora distinctive since its inception. Chief among these is the Mora [illegible] plant, the [illegible]





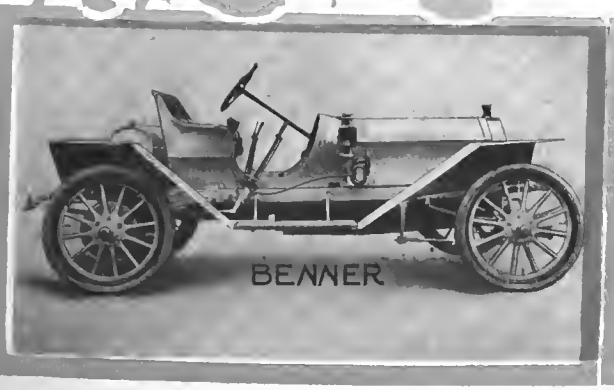
clutch and gear-set being mounted directly upon a cast aluminum alloy supporting pan, which is bolted directly to the side members of the frame.

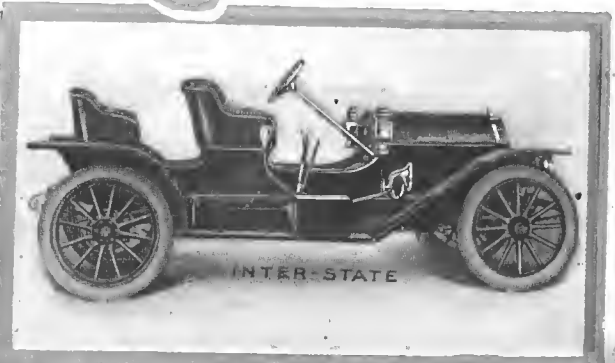
National.—This is the car that was made famous by the world's 24-hour stock car record and the happy phrase, "Watch for the Round Radiator," which latter phrase has not been given much publicity of late. However, this ball-bearing car of the National Motor Vehicle Company, Indianapolis, Ind., is just as good in every detail as when it made the 24-hour record. The ball-bearing feature is one that the company has much faith in, and it is retained in toto in the new models. This means that not only the crankshaft and both camshafts but also the transmission shafts, propeller shaft, all wheels, magneto shaft, practically every rotating part, will run on these friction reducers. As it has been ascertained that these bearings consume but 1-8 of 1 per cent. of the power delivered to them, this makes a very high-powered car, comparatively speaking, out of one with a medium sized motor. The power delivered at the rear wheel being such a large percentage of the motor power, a car thus equipped has a lesser weight per effective horsepower, which is a desirable feature.



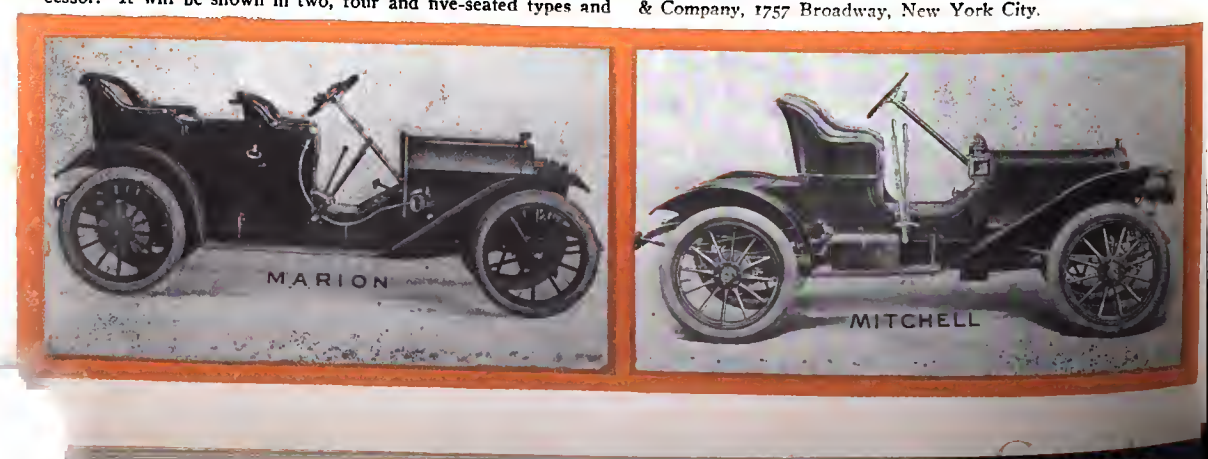
Oakland.—While the two-cylinder vertical 20-horsepower Oakland car with the special balancing system, with which the Oakland Motor Car Company, Pontiac, Mich., first made its bow to the public at the shows last year, will be continued in three different models for the coming season, the leader of the Oakland line will be a 40-horsepower, four-cylinder car, upon which Designer Alanson B. Brush has been working during the past summer. Although rated at 40 horsepower, it will not tip the scales above the 2,000-pound mark. Its motor has twin cylinder castings measuring 4 1-2 by 5 inches, the valves all being on the same side. A specially designed carbureter, a mechanical force feed oiler, centrifugal pump, and a storage battery working through the usual low-tension timer and coil constituting the accessories. A high-tension magneto is fitted as an extra. Roller and ball bearings are used throughout the chassis construction, the motor bearings being plain and very liberal in size. This also applies to the tires, which will be 34 by 4 inches all round.

Overland.—Prominent as a leader of the Overland line for the coming season will be the Model 30, which is a 30-horsepower car equipped with a four-cylinder 4 by 4-inch motor, Remy magneto, thermo-syphon circulation, tubular radiator, force-feed lubrication, cone clutch, shaft drive, and two-speed planetary change-gear set located at the rear axle. A worm and sector type of steering gear is employed and the wheelbase is 108 inches. As a runabout this car is listed at $1,250, while as a four-passenger car the price is $1,300. A distinguishing feature

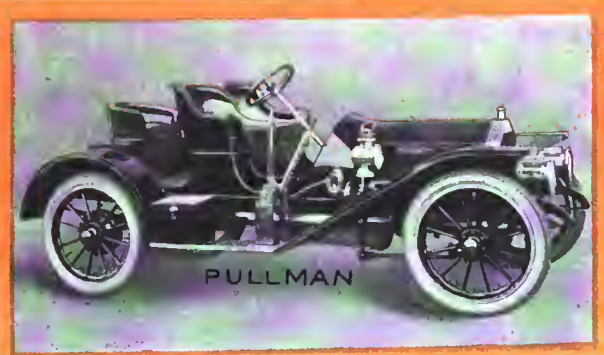




is 28.8 horsep[illegible], which shows that its title is only a nominal indication of its [illegible]bility in this direction. While it has been brought out to me[illegible] the demand for a small car, no [illegible] has been made to mee[illegible] competition [illegible] its design and construction [illegible] the same painstaking care that has always characterized its larger predecessor. It will be shown in two, four and five-seated types and fr[illegible] 34 h[illegible] rear. [illegible] Premier, which is equipped with a six-cylinde[illegible] 45-55-horse[illegible]wer motor, lists at $3,500. Its cylinder dimens[illegible] same as the smaller car, the extra pair of cylinders accounting for its higher rating, while it also has the same features of design, such as the three-speed selective gear and shaft drive. The Premier is marketed by R. M. Owen & Company, 1757 Broadway, New York City.



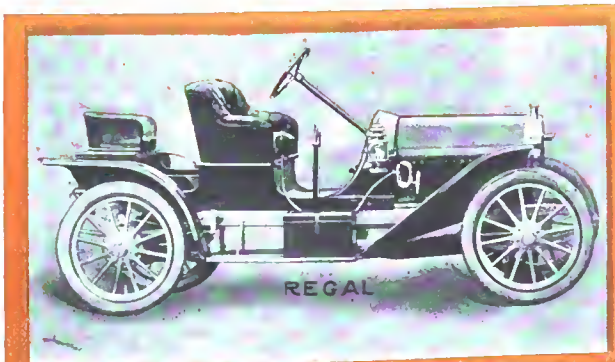
Pullman.—With everybody talking of small cars and preparing to build small engines, it must be a pleasure to be able to say truthfully, "I told you so," and back it up by several years' production of small motors. This is the unusual position in which the York Motor Car Company, York, Pa., finds itself to-day, having built a 3 3-4-inch by 3 3-4-inch four-cylinder motor for the past three or four years; a "six" 3 3-4 by 3 3-4 for two years, and a "four" 4 1-2 by 4 1-2, 4 1-2 by 5 1-4, for a similar length of time. Now another taxicab model is announced, having a four-cylinder 3 7-8 by 3 7-8 engine. This makes a total of five distinct engines by this firm, all 5 inches or smaller in diameter, and three of them are less than 4 inches in diameter. This long and varied experience in small motors should have given this company a large and commanding lead in this now popular form of construction.

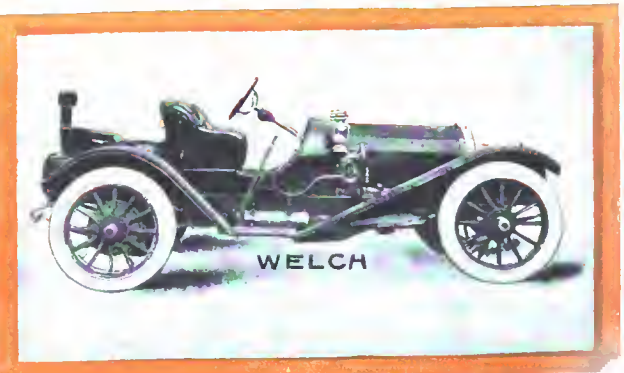


Rambler.—The Thomas B. Jeffery Company, Kenosha, Wis., will not exhibit at the Palace, but will entertain friends and patrons at the New York City branch showrooms, 457-459 Broadway, at which place the entire line of the company can be shown to better advantage than would be possible in a place not devoted to the undivided "Rambler" interest. For 1909 the company is in a position to enhance an already secure reputation with a line of cars apparently embracing everything that has a place in automobiledom.

Regal.—There are not many cars on the market at anything like the price of the Regal that can approach its value, which becomes evident upon an inspection of the car itself, in the shape of the care taken in the elaboration of the details. For instance, the valves are actuated by roller tappets—a feature not to be found on many higher-priced cars. The motor is a 4 by 4-inch twin-cylinder type, the design of which has been well worked out. Its accessories consist of a McCord radiator, circulation being on the thermo-syphon principle through unusually large connections, a Buffalo carbureter, and a Remy high-tension magneto operating through a single coil on the dash. An emergency ignition system is provided by means of a set of dry cells, the magneto distributer being common to both systems. The self-contained oiling system is a valuable feature. It consists of a gear pump at the lower rear right-hand corner of the aluminum oil pan. This draws its supply from the lowest part of the pan and discharges it into a tube running parallel with the crankshaft. It is drilled with a number of holes through which the oil is squirted out on the bearings. The Regal Motor Car Company, Detroit, Mich., are the builders.

Reo.—"Greater value for the money" rather than any





radically new models or changes in design may be said to concisely sum up the plans of the Reo Motor Car Company, Lansing, Mich., which is accordingly continuing the two models it has featured ever since it started in business. These are the two-cylinder chassis and the single-cylinder runabout, both being fitted with horizontal motors. The 20-horsepower two-cylinder chassis will be fitted as a regulation five-passenger touring car, or as a roadster with a folding rear seat, the list being $1,000 in either case, instead of $1,250 as last year, although the car has been improved and has been given several inches more wheelbase than formerly, thus making the tonneau much more comfortable. A similar cut has been made in the case of the runabout, which is now listed at $500 instead of $650 as formerly, though it has been similarly improved. In the case of the 20-horsepower roadster, a top forms part of the standard equipment and is included in the selling price given. The Reo is handled by R. M. Owen & Company, 1784 Broadway, New York City.

Speedwell.—The Speedwell Motor Car Company, of Dayton, Ohio, is putting forth its efforts for 1909 in the pleasure car line by producing three models of 40 horsepower each, the same motor being used in each case. The touring car and runabout list at $2,500 and the limousine at $3,500. The transmission is of the selective type, provided with three speeds and reverse, the power being transmitted to the rear wheels by propeller shaft and live axle. Ample foresight has been used in providing two sets of brakes, both acting on the rear hubs, one expanding and the other contracting. In other respects the Speedwell conforms to a certain standard of practice which has received favorable mentione on notable occasions.

Stoddard-Dayton.—Among the Western products to which that Western phrase, "Bright and breezy," may be employed, as indicating that they are always in the front rank and always right up to date, is the product of the Dayton Motor Car Company, Dayton, Ohio. For 1909 three bright and breezy right up-to-the-minute chasses will be built, furnished with a full range of suitable bodies. The chasses will have 25, 35 and 45-horsepower motors, all of the four twin-cylinder vertical type. These vary in price upward by steps of $500, the 25-horsepower car being low at $1,500. Despite a fire in its plant, the company bobbed up serenely with a very large production for the past year, and a still larger one promised for 1909. The smallest car has been redesigned, and with a larger and more powerful motor comes into the so-called "1,500" class, which is distinctly a Middle Western clan. But if the Middle West produces this line of cars it is a fact also that the East gets away with a lot of them. The Stoddard-Dayton is one of the cars that is much to be seen on the streets of the big cities all over the East, and it is to their credit to say they are popular in the extreme.

Welch.—Pioneer is a good word to apply to this Michigan product of a Pontiac shop, the Welch Motor Car Company, for the Welch Bros., designers and manufacturers of this car, produced in 1904 many forms of construction which are to-day considered absolutely correct. Thus this firm were pioneers in the production of the multiple disc clutch running in an oil bath, the truss reinforcement for the narrowed frame, the overhead valves and camshaft, and the completely finished spherical combustion chamber. The latter, featured by this firm for the past four years, is now accepted "on the Continent" as the form for racing cars, and, accordingly, all Continental racers are so equipped. The Welch company has gone one step further and applied this theoretically and practically perfect cylinder arrangement to all cars built by them. These will consist of two chasses, one four and one six-cylinder, with the usual range of bodies for each.

THE AMERICAN BUGGY TYPE

Anderson.—The present interest is in two models, one of which is fitted with solid tires and the other with pneumatics. Both models are provided with a 12-horsepower motor of the two-cylinder type, more complete data of which will be found in the general tables devoted to the subject. Model B has a three-speed transmission, while model C is with a two-speed transmission. In all respects the cars as made by the Anderson Carriage Company, of Anderson, Ind., will be capable of holding a prominent place in the hearts of users. The company realizes the need of a stable product in the class of trade to which they by the excellence of their wares claim the right to cater to.

Chicago.—Three two-cylinder and one four-cylinder model will comprise the main output of the Black Manufacturing Company, Chicago. Model 12 is a 14-horsepower car, seating two persons, selling at $450, which in itself will be something to take into account by the purchasing public. All the models, excepting the 40-horsepower four-cylinder car, are fitted with a two-speed transmission, while the 40-horsepower model has a three-speed transmission. This latter model sells at $1,250, and by this fact it will be rendered manifest that the company proposes to cater to popular trade, which, in view of the size and quality of the car, at the price, should realize that the Chicago is a good proposition.

Holsman.—Radical departures both from precedents previously adhered to hy its own designers, and from what is considered as more or less standard practice, characterize the new Holsman for 1909, the improvements in its engine design being such that its makers, the Holsman Automobile Company, Chicago, Ill., feel justified in terming it the "simplest automobile in the world." It has a four-cylinder air-cooled motor rated at 26 horsepower, which, however, is much simpler and more compact than the former Holsman motors of half its rating. It is distinguished by the use of anti-friction bearings throughout, either Hyatt roller-bearings or ball-bearings being employed, even on the connecting rods, which are of an entirely different type from the ordinary. Short pistons similar to those customary in steam practice are employed, and each pair for the horizontal opposed cylinders are rigidly fastened together. One of the new types listed for the coming season is termed the Holsman "Gentleman's Automobile," being an enclosed buggy type.

Kiblinger.—What is probably one of the most extensive lines of the high-wheel type of automobiles to be shown by a single house is now being listed by the W. H. McIntyre Company. Auburn, Ind. While nominally termed "high-wheelers," the Kiblinger cars are in several instances mounted on running gear having wheels as low as 34 inches, but the latter are of the buggy type and are shod with solid tires. With the exception of the Model M, 27-horsepower car, which is equipped with a four-cylinder motor of the vertical type, all of the Kiblinger models are fitted with two-cylinder horizontal opposed motors. The latter are in two sizes, four models being fitted with 16-horsepower motors, and three with 13.5-horsepower motors, all being air-cooled. The planetary type of change-speed gear giving two speeds forward and reverse is employed in every case, the different models ranging from $450 to $750, according to size and power. Their seating capacity ranges from two passengers in the case of the runabout up to six in the case of the surrey.

Schacht.—The model K is an 18-20-horsepower car with a two-cylinder motor, and the scheme of transmission affords five speeds. The price of the car is $680, which is low enough to reach the pocketbook of the most conservative buyer, and it is pretty generally understood that the cars of this make are quite up to a fitting standard. The Schacht Manufacturing Company, of Cincinnati, Ohio, is the maker of the cars.

EUROPEAN CARS IN AMERICAN DEMAND

NO plans having been made for holding an "Importers' Salon" this year, the representatives of European manufacturers in this country decided to cast their lot with the "Indcpendent" American makers, and are accordingly holding forth in the Palace show. Influences responsible for the growth and sale of American cars have likewise worked a revolution in the demand of the American market for the imported car. At thc outset, the importers had the field without much interfering competitiou; there was not an American car that could stand comparison witb the product from abroad for the moment and importing flourished accordingly. Conditions have changed rapidly since then, and with each succeeding year the United States has become a more and more difficult market for the imported car. But despite the fact that America now annually turns out by far thc greatest number of automobiles produced by any one country and exports no small percentage of them, it offers a market so wide that there is still room and to spare for the foreign manufacturer to dispose of a percentage of his product.

But the European must be prepared to meet strenuous competition, and in order to succeed in this must do business *à la Americaine*, if he would dispose of any considerable fraction of his output on this side of the Atlantic. In other words, the time has come when the business of importing forcign automobiles and selling them here has come down to a business basis, and those importers who are desirous of continuing as such have found it necessary to realize this fact and guide themselves accordingly. Otherwise the inexorable mill of competition will surely eliminate them, just as it has numberless American concerns whose backers had small knowledge and no experience of the requirements of successfully marketing automobiles.

Benz.—The makers of the Benz can doubtless lay claim to being the oldest manufacturers of automobiles extant, and were responsible to a great degree for its development in earlier days. It has only been within the past year or so, however, that they have made any attempt to enter this market, the Benz Auto Import Company of America, New York City, now being the agents on this side of the Atlantic. The showing in the Grand Prix of the A.C.F. and its excellent performance in the Savannah cvent, in both of which races it scored a very close second, have served to bring the Benz into considerable prominence, so that the models on display at the Palace will doubtless be inspected with more than passing interest. The German manufacturers plan to make a strong bid for American business, so that the local branch's exhibit includes quite a showing of models.

C.G.V.—The Charron, or C.G.V., as it is more familiarly known, was one of the first French makes to come into this market, where it has been a factor of importance ever since. A large number of these cars have been imported during the interim, but they have never been shown in such a wide range of models as now are to be seen at the Palace. In fact, the C.G.V. Import Company, the New York agents, can probably lay claim to the distinction of showing both the smallest and largest cars on the floor, as their line begins with an 8-10-horsepower model listing at $2,500 and ends with a 90-120-horsepower chassis listing at $10,000. Between these two extremes, the lowest of which represents a two-cylinder town car, there is a range sufficient to meet every demand. For instance, there are 12-15, 15-20, 20-30, 30-40, 50-60 and 75-90-horsepower models, all being equipped with a four-cylinder type of motor. The 12-15-horsepower model is shown complete with body in two types, listing at $3,000 and $3,250, the remainder being listed as chassis alone.

De Dietrich.—The De Dietrich Import Company, New York agents for this car, show a line of models, which, like most of their competitors, runs largely to small powers, for the French maker has awakened to the possibilities of the small car in no uncertain manner during the past year, and instead of devoting his attention to one or two high-powered types, is now in a position to meet the wants of the purchascr of a car of almost any size, from the smallest to the very largest.

DeDion.—The name DeDion is associated with the earliest appearance of the foreign-made automobile in this country, and for the first two or three years not a few machines of this make were sold in this country, though they were principally of a voiturette type which has since completely disappeared. During most of the interim the company has not been actively represented here. The De Dion-Bouton Selling Branch, 32 Cedar street, New York, is now the American agency for this car.

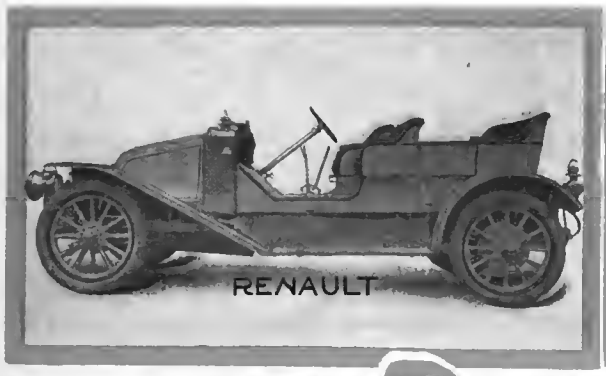
Delaunay-Belleville.—Up to within the past ycar or so this was a car which, though bearing an excellent reputation abroad, was very little known here. Brewster & Company, New York, the old-established carriage house, has recently taken the American agency, and are showing one or two models, which will be supplemented later by a more complete range of powers.

Fiat.—The importers of this car, the Fiat Automobile Company, New York City, will have an ample line to choose from during the 1909 season, the models ranging in power from a four-cylinder 12-horsepower car up to a 60-horsepower model of the same number of cylinders, or a 45-horsepower six-cylinder type. In all there are no less than seven models, the chassis prices ranging from $2,750 to $7,250.

Hotchkiss.—The Hotchkiss Import Company, New York, American agents for the well-known French artillery makers, will put forth a greater effort for business in this country during the coming year than previously, as is shown by its exhibit. The company is one of the first import agents to adopt the American plan of listing its cars complete with body.

Isotta.—In order to be in a position to meet the demand for an extended range of powcrs, the Isotta Import Company, New York City, American agents for the Italian builders of the Isotta, is showing a linc of models from 14 to 50 horsepower. These are the 14-20-horsepower chassis listing at $4,250; 18-24, listing at $4,500 and $4,600, the latter having a slightly longer wheelbasc, but being otherwise the same; the 15-25-horsepower at $5,250; thc 40-45 at $5,600 and the 50-65 at $8,500. With the exception of the 15-25-horsepower model, all are four-cylinder types, the latter heing a six. This car has placed itself so prominently hefore the public, through its highly consistent performance in every racing event in which it has becn entered, that the features of its design have become so well known as to scarcely call for comment.

Lancia.—Italy has always had to look beyond her own confines for an extended market for her automobile products, and the United States have provided no small outlet for Italian cars in past years, so that it is quite natural that this new creation from the works of a racing pilot who is as well known and liked here as in his own land should be popular in the American market. But even had the car not his prestige to back it, the manner in which the Lancia has performed wherever it has becn entered in speed contests would have been more than sufficient to give its name far more than the ordinary prominence, for its work has shown unmistakably that for power, speed, endurance and regularity of running, there are few cars in its class that can approach it. At present the 12-18-horsepowcr and the six-cylinder chassis are being handled here by the Hol-Tan Company, 244 West Forty-ninth street, New York, which is the American agent. This department, in charge of Harry Fosdick, shows a line comprising several models, the foreign practice of selling the chassis and body separate being followed, although

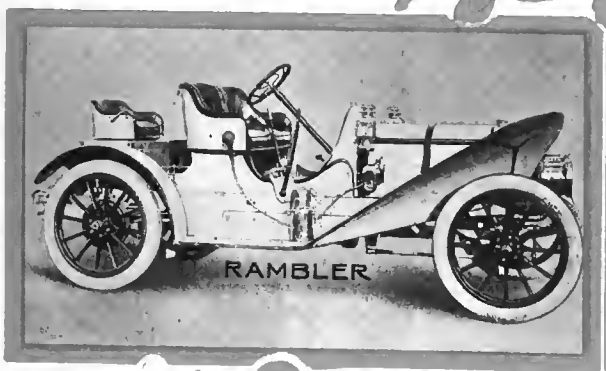


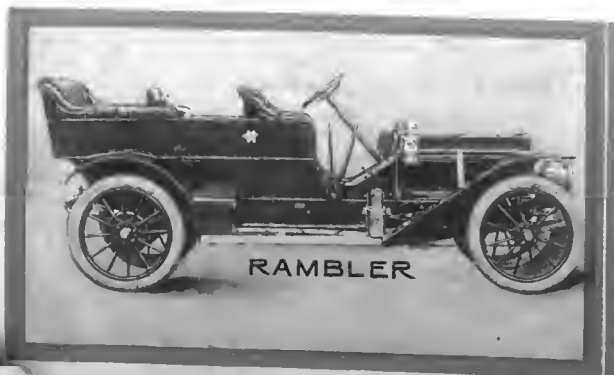
models complete with bodies, such as the touring and town car types, are also listed. The 12-18 chassis lists at $3,000; fitted as the "Lampo" racing car of Savannah fame at $3,300, with a touring body the price is $3,500 and as a town car, $4,000. The six-cylinder chassis, the cylinders being the same dimensions as the 12-18, lists at $3,500.

Mercedes.—The exhibit of the Mercedes Direct Import Company, New York City, is limited to a 35-horsepower shaft drive car, in relation to which the body is attracting notice. This body is styled a "double phaeton" landaulet, and is one of the first of the kind to come over. In outside appearance the car, enclosed, looks like an ordinary landaulet with an extension over the driver and a glass front. However, the body is so built that it can be collapsed and it then takes on the appearance of a touring car. This is due to ingeniously folding the top and the dropping of the windows. Incidentally, the Mercedes as a shaft drive will make something of a commotion. The "Bosch" magneto is used on this car.

Panhard.—Never before has the Panhard been seen in this country in such a variety of models as are now on display by Panhard & Levassor, the New York branch house of the well-known French factory. These range from 8 to 80-horsepower and from two to six cylinders, though naturally by far the greater part of the showing consists of fours.

Renault.—Probably no foreign manufacturer has had such an excellent conception of the requirements of the American market as Renault Frères, and certainly none has always kept in such close touch with developments here. The Renault cars have always sold freely here ever since they were first introduced, and the company's interests grew to a degree of importance where a branch house became a necessity, this being the Renault Frères Selling Agency, at 1776 Broadway, New York City, of which Paul Lacroix is manager. Having a branch manager right in the field, this house has followed changing conditions as closely as any American manufacturer, and must be accorded the credit of being the first to realize that an extensive business could only be done here by following American methods. This the Renault Frères have done by bringing out types of chassis especially for this market and by establishing branch agencies in Chicago and San Francisco, showing in no uncertain manner that they are not only out for American business, but also that they know how to get it and will be in a position to take care of the goodly share that does come their way. The showing of Renault cars is one of the most complete lines of foreign cars staged at the Palace. They are also to be seen on the street and are known even by the "arabs" because of their distinctive appearance, the Renault front being quite different from cars in general.





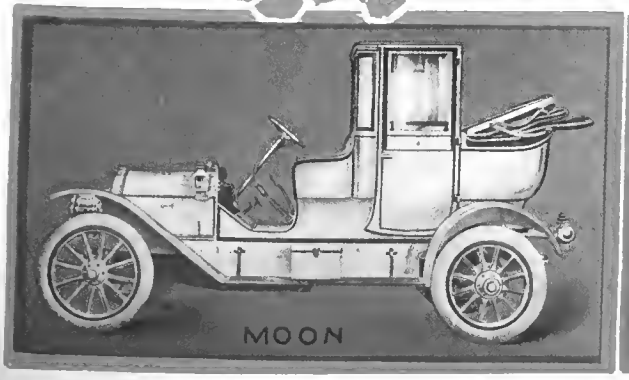
IN THE TAXICAB DIVISION.

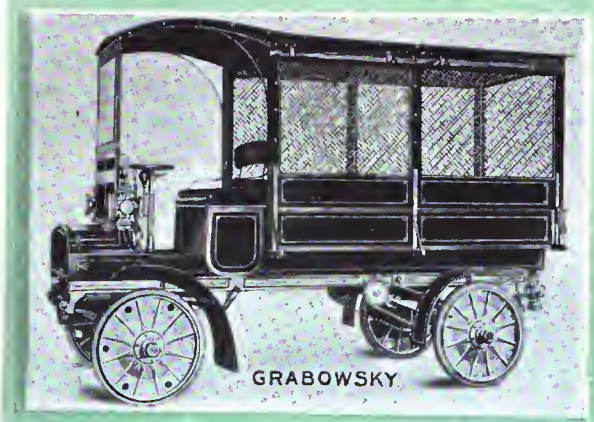
This is a question that is not likely to run into models by the score, since in the service end individual buyers of taxicabs are few and they are more interested in specialized products, usually the outpouring of the older companies after they have satisfied their regular trade. Against this is the fact that some companies make a specialty of taxicabs from the start, never attempting to turn out anything besides. At all events, the situation as it presents itself at the show is one of the greatest interest, in view of the fact that taxicabs have proven to be of masterly commercial value, and the makers of cars, having tasted blood in the taxicab line, are after more delivering quality in the cars as the incentive.

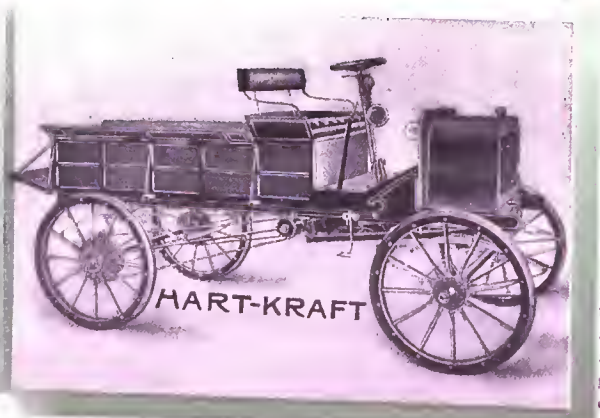
It was only a couple of years ago that the question was handled as a phase of the small touring car proposition, and even now it is not uncommon to observe examples of the converted touring car. It must be remembered, however, that tourings cars are with a longer wheelbase than the same measure in taxicabs, rightly so, in view of the fact that the taxicabs have to make headway in congested streets, and this is not easy if the cars have a long wheelbase and the streets are narrow, as they are in many cases.

The trend is by way of taxicabs that are not with a long wheelbase, nor high powered, since they are not geared to a high ratio, hence the power required is not nearly so much as that of the average touring car. But if the power is low in comparison it is a fact that the control is very perfect, and the cars of the class under discussion are very nimble indeed. Besides ease in handling, these cars are very simple in point of detail, and the labor that must be used in their operation seems to be able to cope with the problems in a manner less cramped than that attending the operation of touring cars. The taxicabs to be seen at the show do not represent all to be had, because it is usual to exhibit models of cars such as will be more likely to interest the patrons in general rather than to attract the attention of the possible single purchasers of taxicabs.

But it would be an incomplete termination of the subject to fail to mention the splendid business that is directly due to this class of automobiles, nor will the traveling public fail to appreciate the means of transportation that enables them to combine business and pleasure. That the horse will have to go, is a matter too settled to require further discussion, unless it is to point out that in the taxicab will be found the most potent reason of them all. The earlier uncertainties were those involving the relative cost, which in the computation did not take into account the "radius of action" of the taxicab.







THE COMMERCIAL VEHICLE INDUSTRY.

The automobile industry has been called the most progressive industry in the world, but surely if this is to be taken literally it must have an addition so that it will read, "excepting only the commercial vehicle industry." If the latter could be separated out from the former it would easily be accorded the premier position. The little work that has been done in the past is, as one might say, only a drop in the bucket to what is being done to-day, while the latter in turn occupies the same position toward the future.

To-day any sub-division of this industry into clearly-defined branches may be made, many of these being possible. These sub-divisions, in turn, may be selected at random and any one of them will show a most unusual progress. This progress has taken on various forms, to specify any one of which would be to delve into the minor details, which is not the purpose here. However, to generalize and at the same time be specific, the subject of motors may be mentioned. The progress in this line may be summed up in the statement that the light and possibly complicated engine of the pleasure car has been divorced from the commercial vehicle. The tendency toward simplification everywhere manifested is here shown in the elimination of the ultra-lightweight metals of high first cost in favor of better known and more stable materials of a low price per pound; in a word, the substitution of cast iron for aluminum. In addition, there is the relative increase in stroke with a corresponding decrease in speed, which may be summed up as the substitution of the long stroke slow-speed motor of long life for the "short" high-speed engine of comparatively short existence. This example brings out a point which stands out clearly in the whole list of commercial improvements, and that is, the decrease in repairs or maintenance, due to the additional skill in designing and superior choice of materials.

This being an item which either encourages or discourages the new convert to the power wagon is of vast importance and far-reaching in its results. Therefore, it is well worthy of careful attention. A specific instance of this under another sub-division is the matter of tires. This has been given most careful attention, both by the tire and the car manufacturers, and well it might, for of all the items which have demanded attention in the past, that of tires has up to very recently received the least. This lack of attention has manifested itself in the use of the tire which cost the least, regardless of the prospective service. It has cropped out in such shapes as the use of one-and-a-half ton tires on three-ton trucks. Naturally this spelled quick tire depreciation, each hardly-won convert soon sliped back to horses, and the truck became known as a "tire eater." It is pleasing to note in this connection the increased attention now being given to this subject by both sides.

The first wheels were merely larger pleasure car wheels with no visible difference. To-day we find the two as different as black and white. The truck wheels are now very properly built for truck use with heavier, more rugged, and long-lived parts correctly proportioned to the work, and account taken of the inevitable and ill-advised overload. The weakest portion of the wood wheel is the junction of the spoke and the felloe, or rather at the reduced diameter of the spoke where it enters the felloe. A recent movement among the English heavy vehicle manufacturers has as its object the elimination of this weak point. This is accomplished by the gradual widening out of the spoke from hub to felloe and the change from a round to a flare end, with a vastly increased area at the breaking point. In this connection, all steel wheels are receiving much attention for important work, and those in use have given satisfaction.

The matter of noise is one that is becoming of larger importance every day, as users of good vehicles find that noise is separable from the proper operation of cars; in other words, as they find out that it is possible to have a noiseless vehicle operate as well as a noisy one. This was for a long time considered as an exclusive feature of the electric, but that is losing ground daily. The change has been brought about by successful use of chain cases, silent chains, and of the worm

drive. A similar desired result has been the reason for the use of the panetary transmission on small cars and of the individual clutch type on larger cars.

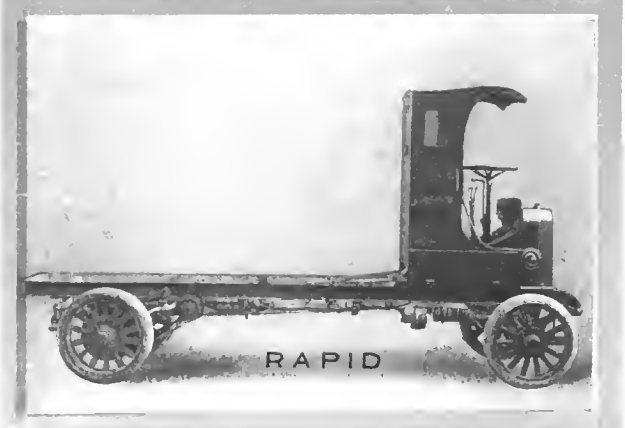
Simplification and increased strength is everywhere noticeable with a distinct absence of that feature of some pleasure cars known as "over-designing." The tendency is to make one simple part do the work of two complicated ones, if possible. Such outcroppings of this as the absence of spark advance have made possible the use of men of more limited intelligence and consequently lower price as drivers. This was a point formerly overlooked, but is now given its proper share of attention, so that one would be safe in saying of some truck, "that vehicle was designed to be driven by a $12-a-week horse driver." This statement upon analyzation is seen to include the points previously dwelt upon, viz., simplification, elimination, strength, and stability. These four words spell progress when applied to the commercial vehicle industry.

American Truck.—The American Motor Truck Company, Lockport, N. Y., covers the field completely with seven regular models, ranging from a 20-horsepower one-half ton commercial known as Model T, to Model O, which is rated at five tons, and is equipped with a 65-horsepower motor. Three of the line use a two-speed transmission, and with ample power through the good offices of a four-cylinder motor, it is not to be wondered at if the system is regarded as an unqualified success. The models with motors rated below 40 horsepower are equipped with three-speed transmissions, and it will be understood that a reverse is included in every case. In sight-seeing work, the American is very well known, and the same company is making inroads in "stage" service. It is to be noted that in general trucking and delivery service the American products are most in use.

Brush.—This maker will concentrate his energy and factory capacity upon one type and model of light delivery wagon. That single product of the Brush Runabout Company, of Detroit, Mich., probably possesses more original features than any other car of a similar type upon the American market. Beginning with left-hand control, coil springs, wood axles, single-cylinder vertical motor, etc., right through the car, this originality crops out and makes this what the maker desired it to be, a decidedly different vehicle. No doubt, when the buying public has been educated to see the advantages of these "decidedly different" features, we may expect that they will sell in very large numbers, as Brush has selected the largest field of all, the small dealer or trader who handles very light weights. This little car weighs but 950 pounds and is built to carry 500 pounds normally and 300 pounds overload, making a maximum weight, when fully loaded, of 1750 pounds. The single cylinder 7-horsepower motor will, then, never have over 250 pounds per horsepower, so that the power provided is ample. In addition, these cars are geared down very low, so low, in fact, that a speed in excess of 14 to 15 miles per hour is impossible.

Cleveland Autocab.—The idea of the Cleveland Autocab Company, Geneva, O., is to place at the disposal of users a reliable "taxicab" quite up to the requirements in view of the arduousness of the service, and to leave out every possible complication. The four-cylinder motor, of a well-designed type, has cylinders 3 7-8 x 4 inches, bore and stroke, respectively, and a multiple disc clutch transmits the power to a three-speed gearset. In all the details, from the taxicab point of view, the product of the company is well worth the serious attention of users of cars of the class, and it is pleasant to note that the trade in this line is so brisk as to vie with the other branches of the automobile trade.

De Dion.—This old and favorably known company has from the first recognized the value of taxicabs and the examples of this make are conspicuous factors in this class of work. Among the "foreign contingent" the De Dion is regarded most favorably, not only because of the nice appearance the cars make, but in view of the reliability that has always been a feature of the products of the company. The American end of the business is handled by the De Dion Bouton Selling Branch, 32 Cedar street, New York City.



Gramm-Logan.—From a delivery wagon to a 3-ton truck, ranging in price from $1,600 to $3,500, the situation from the commercial point of view is in a very healthy state. The three models are each with four-cylinder motors, and all but the delivery wagon have transmissions with three speeds and reverse. The delivery wagon and the 1 1-2-ton truck are provided with a 25-horsepower motor, while the three-ton truck is equipped with a 45-horsepower motor. This product of the Gramm-Logan Company, of Bowling Green, O., has by its conservative practice and the excellence of its product made itself known for its good work in every industrial center. For additional information, the general table of cars may be consulted. In the meantime it may not be out of place to point out that this company has gone into the question of the body work in commercial service, and it is to its efforts largely that the commercial automobile has jumped to great popularity. It is all very well to have a fine chassis, but when all is said, it is important to have a stable and commodious platform on which to rest the goods to be transported.

Hart-Kraft.—For commercial work the product of the Hart-Kraft Motor Company, York, Pa., has a wide range of uses and is becoming very popular, indeed. The model A-0 chassis is available for any purpose that occasion may demand, while models A-1, A-2 and A-3 are used for delivery wagons. The data of these delivery propositions will be found in the general tables, and it will be the idea to limit discussion here to a résumé of the top facts. The motor is the same for all of the models, rated at 14 horsepower, is of the two-cylinder type, and is provided with a two-speed transmission. This company has the right idea when it comes to light delivery work in which time is a large factor. The Hart-Kraft delivery wagon has a wide radius of action and speed in the process. Stores do not have to deliver heavy burdens so much as they do innumerable packages, which are wanted the day they are ordered.

Holsman.—The delivery wagon is an outgrowth of the high-wheeled or buggy type of car produced by this maker, the Holsman Automobile Company, of Chicago, Ill. This wagon has the large 42-inch and 48-inch wheels, made popular by the motor buggy, these being equipped with 1 1-8-inch solid tires. While other makers wondered if the steel cable drive was all right, this manufacturer with accurate foresight proceeded to use it and proved its quality in actual service. The two-cylinder horizontal opposed air-cooled motor and tubular steel frame so lend themselves to light weight that the vehicle ready for service weighs only 930 pounds. With a load of equal weight the ratio of total weight to power will attain the very low figure of 145 pounds per horsepower, as the 4 x 4 two-cylinder motor, while rated at 12.8 (upon which basis the above ratio was figured), will develop quite a little power over and above this rating. In the hands of the ignorant horse driver, usually employed on delivery wagons, this simple machine, with the absence of the water circulation, and consequent simplification, should do very well.

Gaeth.—Ever since Paul Gaeth has been devoting his attention to the manufacture of automobiles, both before and since the formation of the Gaeth Automobile Company, of Cleveland, he has given a great deal of time to perfecting a single-cylinder type of car for commercial purposes, this now being listed as Gaeth Type K, for the coming season. Its power-plant consists of a single-cylinder horizontal motor rated at 12-15 horsepower, while the change-speed gear is of the planetry type, giving two speeds forward, the power reaching the rear wheels through double side chains, thus making the car as a whole as simple as it is possible to design it, so that it can be depended upon to render constant and efficient service in the hands of the most inexperienced driver. The Gaeth Type K delivery wagon has a load capacity of 2,000 pounds and is very economical to run and maintain.

Grabowsky.—One of the biggest, if not the biggest, item in holding back the progress of commercial wagons has been the troubles due to improper maintenance, many a man who looked after his horses and wagons properly failing to give the power wagon a thought, with natural results. This has now been obviated by the Grabowsky Power Wagon Company, of

HOLSMAN

CHICAGO

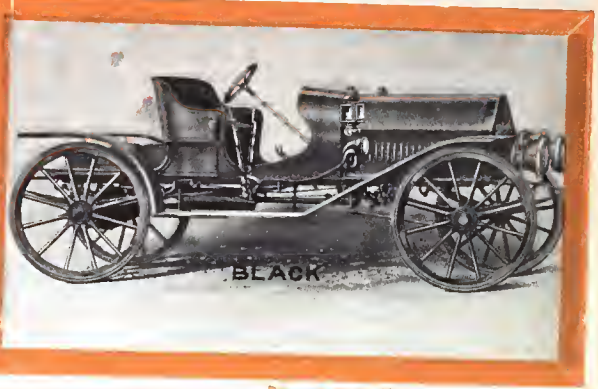
Detroit, Mich., who sell all of their nine commercial vehicles upon a maintenance basis. This scheme includes the entire maintenance, care, repair, washing, cleaning, etc., necessary to keep the vehicle running all day and every day. With this in view, the Grabowsky Company is establishing maintenance garages in the larger cities where they propose to sell their cars. The full line to date includes delivery wagons, one and two-ton trucks, ambulances, police patrols, fire wagons, seven, ten, and

KIBLINGER

twelve-passenger buses, and sight-seeing cars. All these are equipped with the Grabowsky type of quickly demountable power plant, consisting of two cylinder opposed engine, two-speed planetary transmission, water-cooling, and ignition systems grouped at the front end upon a sub-frame, the whole being removable it is claimed in about three hours.

Kiblinger.—The delivery and mail wagons by this motor buggy concern, the W. H. McIntire Company, of Auburn, Ind., while possessing all of the other motor buggy characteristics, do not have the wheels of large diameter peculiar to this type. Instead, the wagons are equipped with small 34-inch wheels, which, however, have buggy tires 1 1-8 and 1 1-4 in size. The other features, such as angle iron frame, horizontal opposed air-cooled motor, planetary transmission, double chain drive of the roller type, etc., which have been successfully used on these well-known motor buggies, have also been applied to the two types of commercial wagons. The power equipment of the two is ample for any service it may go up against, the mail wagon having a motor conservatively rated at 13-horsepower, while the motor on the delivery car will easily develop more than the 16-horsepower claimed for it.

Lansden.—The name of Lansden has been chiefly associated with commercial types of electric vehicles employing the Edison alkaline storage battery as the source of current, though pleasure vehicles have been made by this firm from time to time. In its business of turning out commercial vehicles, the Lansden Company, Newark, N. J., has naturally devoted its attention to a range of types as extended as the wants of its



BLACK

numerous customers. For the 1909 season, there will be added an electric brougham and a taxicab type of attractive lines, the latter naturally being available also for private use as a town car. The numerous features of design and construction that have combined to make for successful service and low cost of maintenance in the Lansden commercial cars will be embodied in these two new cars.

Manhattan.—Among the pioneers in the power wagon busi-

HART-KRAFT

RELIABLE DAYTON

ness who are still in existence is Mack Bros. Motor Car Company, of Allentown, Pa. The name of this car has been taken from the city which this maker claims as his particular field and where he has sold most of his output in the past three or four years; viz., New York City. All cars, regardless of size, weight, and service, are equipped with the same engine and transmission. The transmission of the individual clutch type affords three speeds forward and reverse. This is a rather elaborate piece of mechanism to put into the hands of the ordinary truck driver, having no less than ten imported ball bearings, a very light aluminum case, delicate gear shifting forks of friable material, and other similar points. The full line includes 2, 3, 4, and 5 ton trucks, buses, and sight-seeing cars of 12 to 22 passenger capacity, a special car now under construction having a capacity of 28.

Maxwell.—Among the pleasure car manufacturers who have turned their attention to the broader field of commercial cars is the Maxwell-Briscoe Motor Company, of Tarrytown, N. Y. But one model has been produced thus far, this being a light delivery wagon of about 1,000 pounds carrying capacity. This has all of the characteristic Maxwell features and is one of the very few commercial cars to be equipped with pressed steel frame, multiple disc clutch, and sliding gear transmission. The wheels are small with 30 by 3 1-2 solid tires on the front and 30 by 4 on the rear. A wheelbase of 90 inches allows turning in a very short space and easy manipulation in crowded streets, both very good features on a commercial delivery wagon. The weight of 1,700 pounds is well proportioned to the power, which latter is produced by a 5 by 5 two-cylinder opposed motor, cooled by the thermo-siphon circulation of water. This 20-horsepower will give 85 pounds per horsepower light and 135 pounds loaded. The well-known Maxwell radiator with the four-inch wide brass band is used to complete the cooling system.

Rapid.—The Rapid Motor Vehicle Company, Pontiac, Mich., which previously had a very complete line of vehicles, has now added a five-ton truck. This company, devoted to commercial cars exclusivcly, is producing police patrols, fire wagons, ambulances, opera and other buses, sight-seeing cars, delivery wagons, and trucks. With the exception of the latest arrival, all of these successful vehicles have a two-cylinder motor of the opposed type, size 5 1-4 by 5, rated at 24-horsepower. The big baby of the lot, however, has a four-cylinder vertical power producer, with cylinders 5 1-2 by 6 1-2. While the others have a two-speed planetary, this has a three-speed sliding gear, operated on the selective principle.

The "rubberneck" wagons vary in capacity from the smallest to the largest, the former carrying as low as six, while the latter run up to 22, with a 28 and 30-seater, which will be built on special order. The wide range of this company's line of cars in itself predicts a very wide field of usefulness and a consequently large and widely distributed product. It is, therefore, not surprising that each succeeding year sees a large addition to the factory, made necessary even in years like the past, when not a few makers were obliged to try hard to land any kind of an order, no matter how small.

Reliance Trucks.—The line of heavy trucks formerly manufactured in Detroit, Mich., by the Reliance Motor Car Company, which also built pleasure cars, is now being continued by their successors, the Reliance Motor Truck Company, of Owosso, Mich. The new company will devote themselves exclusively to trucks in the 2, 3, 4, and 5-ton sizes, and 12 to 26-passenger wagons. The whole line will be equipped with two-cycle motors, the number of cylinders varying with the load from two cylinders on the lighter cars to four on the very heaviest. The chassis follows standard truck practice; otherwise, the driver being placed over the motor. The use of the two-cycle engine allows the employment of cheaper drivers, on account of its well known simplicity. This feature is one that has been a big factor in the large sales of these trucks.

Renault.—Among the taxicabs the Renault has taken hold with a grip that might have been foreseen in view of the record of Renault cars in other zones of activity. The motor is especially suited to cab work because it is short, and the chassis of the cab must also be short. The Renault transmission gear is one that seems to hold favor among drivers, and it is a recognized fact that if a man likes a thing he will take enough interest in it to become acquainted with its needs. In taxicab work in particular the personal equation is of the greatest moment to be confined to assured control. In a word, it is not so much a question of how good a cab is as it is a matter of how well the operator will get on with it. The future seems to promise well for the Renault Frères Selling Agency, which is located at 1776 Broadway, New York City.

Rockwell.—One of the newcomers in the commercial field is the Bristol Engineering Corporation, of Bristol, Conn. This concern, which is well and favorably known in other lines, has now brought out an excellent taxicab, not merely a side step from pleasure car production, but a new and original design with many commendable features. The list of parts would show only a standard car of small dimensions with four cylinder motor under the hood, selective three-speed transmission shaft drive, etc., but to delve below the surface would be to find that the parts are standard in name only, the details showing a remarkable quality of up-to-dateness. But one model is produced with 3 5-8 by 4 1-8 motor, rated at 20-horsepower, equipped with landaulet body, and furnished with any make of taximeter.

Sultan.—This "town-car" proposition at $3,000, with a body that seats six, is fitted with a 10-12-horsepower motor and a three-speed transmission, more complete data of which will be found in the general table. The Sultan Motor Company, of Springfield, Mass., proposes to set the pace when it comes to service such as this, and the model above referred to promises to become one of the most popular of the day.

MICHIGAN CLUB WANTS A HOUSE.

GRAND RAPIDS, MICH., Dec. 21.—The Grand Rapids Automobile Club has found that its prospects for a new club house for the next season are very bright. Four plans are now offered, one to buy or lease the club house at Cascade used by the club in 1907, which is favored on account of the pleasant eight-mile drive. Another is the use of the Highland Golf Club house jointly with the golf club. The other plans are to have a club house erected on Grand River, about nine miles west of the city, in the midst of the fruit belt, or the party negotiating with the club offers to put it anywhere the club may desire.

The committee chairmen chosen by the newly elected president, J. R. Jackson, for the following year are: Club house, Dr. D. Emmett Welsh; law and ordinance, Charles B. Judd; auditing, M. D. Elgin; membership, Frederick Z. Pantlind; good roads, A. S. Rathbun; tours and contests, W. D. Vandecar.

CLUB NEWS IN GENERAL.

Elmira, N. Y.—At a recent meeting of the board of directors of the Elmira Automobile Club a resolution was passed renewing membership in the New York State Automobile Association which carries with it membership in the A. A. A., which latter body was endorsed. About 20 new members were elected, and the new president, Clay W. Holmes, appointed the membership, finance, good roads, laws and ordinances and entertainment committees.

Milbank, S. D.—The Milbank Motor Club has been formed with the following officers: President, J. W. Ross; vice-president, G. L. Wood; secretary, P. C. Saunders; treasurer, G. C. Middlebrook. The club will make road improvement its principal object, the roads in Grand County coming first on the list.

Oklahoma, Okla.—The Oklahoma City Automobile Association has pledged $10,000 for the construction of a 25-mile speedway around the city.

Staten Island, N. Y.—The Richmond County Automobile Club is planning a new club house, to be finished next spring, at Grant City.

ACCESSORIES REPRESENT A VAST BUSINESS

IF the show is rich in automobiles, both commercial and for pleasure, it is equally profuse in its representation of the great industries that have grown up around it as a boon companion. The accessories on exhibition are of every kind and description, from tires to tops, for the cars, and gauntlets to gowns for the patrons. They represent all the devices for ignition purposes, as magnetos, timers, coils, batteries, wire and the incidentals that space forbids mentioning.

A little further along and the question of lubrication is dealt with, from the finest of mineral oils to the hardest grease, varying the monotony by illustrations of the application of graphite. If the lubricants are in plenty, it is not to overlook the many devices for their efficient use.

From the lubricants to fuel and the means, is but a step.

Of carbureters there are the best examples of the industry, side by side, with choice as impossible as the selection of the superior of peas in a pod. As well as carbureters, there are tanks, piping, fittings, pressure-regulators, pumps, and last, but not least, all devices for safe and efficient storage of gasoline.

Lighting equipment is so profusely and so well represented that any attempt to discuss the matter is almost futile. Acetylene is favored largely; of generators there are many fine examples, and the storage tanks are there as well. Lamps are bigger, better, and with all the old strictures, as a memory, at rest in the grave of forgetfulness. Oil lamps are in fine style, as emergency necessities and for "town service." Electric lighting is in vogue, and the means are at hand. This is of more than passing interest, since autoists are rather fond of electric lights, having used them on electric vehicles. Tools—they are all there.

The tire problem of to-day as it is portrayed at the show, is the problem of selection. In this line competition is so acute that there are no bad tires, and there are no cars using tires so small for the work that they will not well serve the purpose. That there are selections, depending upon the service to be rendered, it is true, but the question is one to be disposed of by the users of cars, aided by the intelligent staff the tire makers have assembled around them. Pneumatics hold the center of the stage when it comes to pleasure cars, and in commercial work it is the "solids" that are used, unless in a couple of isolated cases. The high-wheelers also use solids, and in such cases they are of small section, because the wheels afford much of the qualities that more properly reside in pneumatic tires.

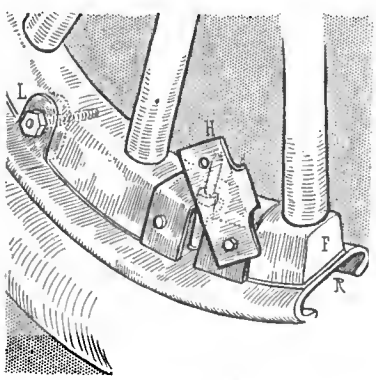
Shocs are made in diverse ways, plain, non-skid, thick and thin. Tubes are far more stable than they once were. Valves and other fittings are secure, and "demountable" rims are much in evidence. Spare wheels and extra rims are exploited, all with the idea of rendering touring more pleasant than it otherwise would be.

Tire inflating devices take on several forms, from tanks to power pumps, and it is now a very simple matter to inflate an unruly tire without soiling the hands or pumping until the complexion changes. It is now possible to issue rules telling how much pressure should reside in the tires, with the expectation that the rules will be followed. In the old days, the idea of pumping up a 36 by 5-inch tire to 100 pounds per square inch, with a bicycle pump, was as a mere joke. The hand pumps now to be had, of which excellent examples are to be seen at the show, certainly do approach near to perfection. Besides tires, pumps and suchlike, there are tire-chains, and non-skid covers in leather and other forms. Some of the covers are "studded."

Cape tops are so well represented as to make one wonder why, unless it is that these tops are of great utility. They come nearer rendering a touring car universal than any other plan possible to devise. A touring car fitted with a good cape-top, provided with curtains, fitted with a wind-shield, comes about as near being wind and weather-proof as anything can be; moreover, the cost is low, and the weight is not enough to take notice of, unless to note that it is far less than the weight of any other device that does the same work. A touring car, fitted with a good cape top, is quite as capable of protecting the occupants of the car, as the protection afforded by a limousine, at a far lower cost, and without the discomfort of being housed in on a fine day, when half the pleasure of touring would be lost were one to take the highway in a limousine. Even the runabout types are in vogue with tops, and they are rendered of double value thereby. Just as useful are the robes and all sorts of costumes, the use of which will require no time to describe. That the autoist is being looked after, however, is assured.

What follows is an incomplete summing up of the accessories division, taking the material which was most convenient and nearest at hand, but the subject will receive more thorough attention in the issue of a week hence. Therefore, those who search unsuccessfully may reasonably expect that attention will be called to their products in THE AUTOMOBILE of January 7.

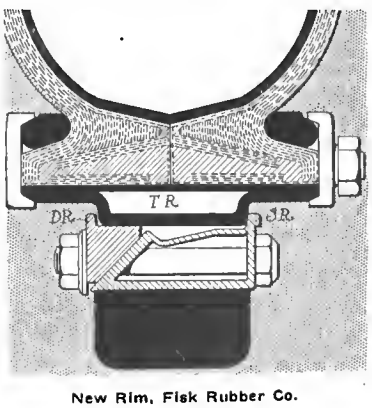
Demountable Rims and Tire Features.—This year will see a landslide to demountable rims, and it is safe to predict that within the coming 12 months many new concerns will spring up manufacturing these great time economizers and labor savers of road work.



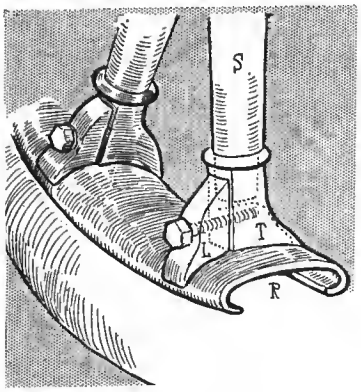
Diamond Demountable Rim.

The improved Diamond demountable rim consists of a rim *R* carrying the tire and which attaches to the felloe *F* by means of several lugs *L* on the rim, which sit in recesses in the side of the felloe, and the rim is anchored on by cross bolts through the felloe and lugs *L* so that removing the nuts on these bolts allows of pulling the rim and tire off at that side. An improvement in the rim is the discontinuance of the blind valve and cutting a slot in the side of the felloe for the valve stem. Where this is cut a supporting brace *H* is used to strengthen the felloe and is held in place by a couple of through bolts. In removing this rim the brace must be removed before the rim can be taken off. There are five lugs *L* on each rim, so that seven nuts have to be taken off in removing the rim.

The Fisk demountable rim, carrying the mechanically fastened Fisk clincher tire, consists of the tire rim *TR*, which, at the right side, rests on the stationary rim *SR*



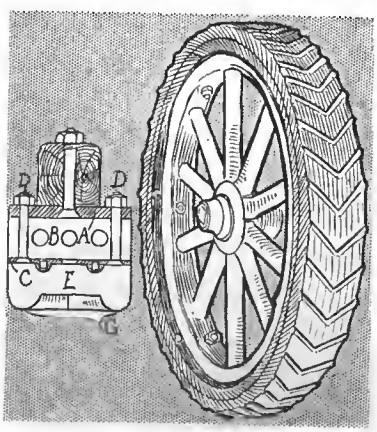
New Rim, Fisk Rubber Co.



Healy Demountable Rim.

and at the other side on an expanding split *V* ring *DR*, which as the nuts holding it in place are tightened, the ring tends to climb the inclined surface of the stationary rim *SR* and so binds the tire rim *TR* on. In this rim it is necessary to remove the nuts holding the expanding ring *DR* in place when the ring drops out and the rim *TR* with tire can be pulled off. In putting the new rim on this process is reversed. Provisions are made to prevent creeping of the rim *TR* through the wheel felloe. As the nuts on these bolts are tightened, the wedges entering between the stationary and demountable rims on one side bind the demountable one in place while a low flange on the opposite side of the stationary prevents slipping off of the demountable on that side.

The Healy Leather Tire Company uses a demountable in which there is no wheel felloe, and when the rim with the tire is off the ends of the spokes are bare. Each spoke carries on its outer end a tenon *T*, which is a steel casting, into which the end of the spoke fits. The outer end of this is curved to correspond with the back of the clincher rim *R*. Secured to each tenon is anchored lock *L* held by a galvanized steel bolt with a bronze nut. By loosening this bolt the locker *L* can be turned part around to allow the rim *R* to be pulled outward and off. In changing this rim there are as many nuts to loosen as the wheel has spokes.



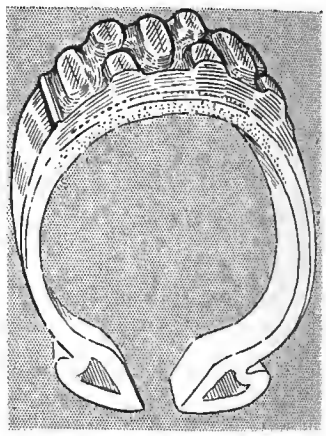
Snell's Solid Cushion Tire.

A new demountable is the Sager, the product of the J. H. Sager Company, Rochester, N. Y. It is designed on the Fisk principle with a removable beveled ring at one side that forces the demountable rim against a beveled flange on the opposite side of the wheel felloe. The beveled ring is held in place by a series of crossbolts in the felloe with hooked ends for resting against the beveled ring and nuts on the opposite ends. In removing this rim the nuts on the bolts are loosened so that the hooks may be turned toward the wheel hub, after which the beveled ring can be pulled off, followed by the tire. Each tire rim has riveted to its inner surface a metal strip with outwardly beveled edges, one of which bears against the beveled flange on the rim shrunk onto the felloe and the other against the anchoring ring.

A new idea is shown in Snell's resilient double-cushion tire, which is designed mainly to prevent skidding. A steel band 1-4 inch thick and 3 inches wide is bolted to the wooden felloe of the wheel. A 1-inch rubber cushion is mounted on this band and over this cushion are two other bands separated by about three-eighths of an inch. The rubber cushion is clamped between the upper and lower bands by bolts, which are free to slide through the lower band when the cushion is compressed. The cushioning effect is increased by the fact that there are in the rubber a number of holes which extend throughout its length. The non-skidding qualities are secured by means of ridges on the outer cushion of the rubber. These ridges, being V-shaped, which permits them to also serve as cleats and thus secure greater traction. As air can circulate between the ridges, it is claimed that this prevents raising as much dust as does an ordinary motor car wheel.

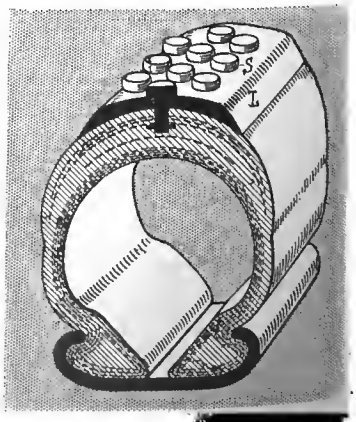
As a rival of demountable rims are the Stepney and Burrows spare rims. The Stepney consists of a clincher rim carrying an inflated tire which is attached to the clincher on the wheel rim by hooks which grip the wheel rim after the tire bead is thrust back. Several of these hooks are distributed regularly around the rim and each, when in position, is tightened, bringing the attached rim into rigid position. In addition to this, straps from the attached rims pass around spokes of the wheel, prevent any slipping of the Stepney. In the Burrowes spare wheel the same method of attachment is used.

The Republic Rubber Company shows a rubber tread round skid. The Republic line for the coming season consists of regular clinchers and also tires of the split-bead made to fit the quick detachables. A rubber tread non-skid tire is one of the features of the Republic Company's line. It is known as the Staggered tread tire, the projections on the tread being about 1-2 by 1 1-2 inches by about 3-16 inch high. They are a part of the main body of the tire and being thus incorporated, they help to eliminate the possibility of the tread loosening from the carcass of the tire.

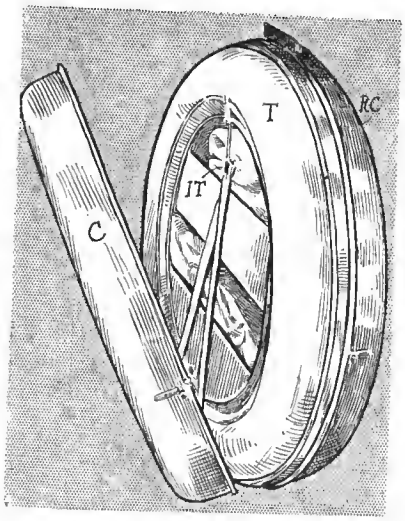


Republic Co. Staggered Tread.

The construction of the Pennsylvania wrapped tread tire is practically unchanged over that of the past season except that a slight variation has been made in the composition used for the tread, which is designed to give longer life to the tire. The company shows a steel-studded non-skid type of tire, the durability of which is increased by the use of harder studs than it was formerly possible to obtain. These are case-hardened by a special process which hardens them practically to the center of the head. They are set in a strip of specially prepared leather on the tread *L*, which encircles the tire and holds them firmly against being pulled out or broken. The company also has a special tire of particularly high-grade manufacture, and in which there is considerable hand work. It has a white cover of extremely tough rub-



Pennsylvania

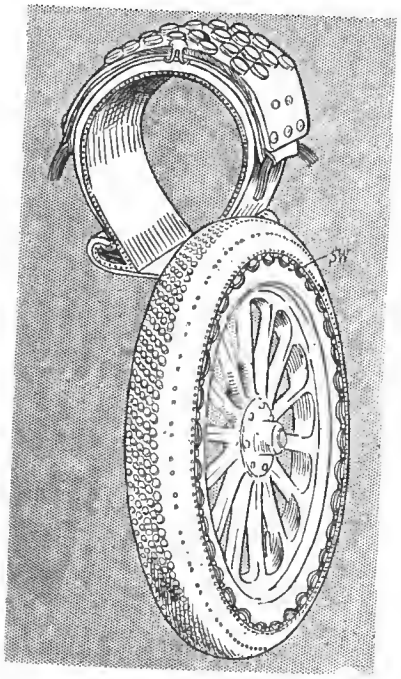


Merchant & Evans Tire Case.

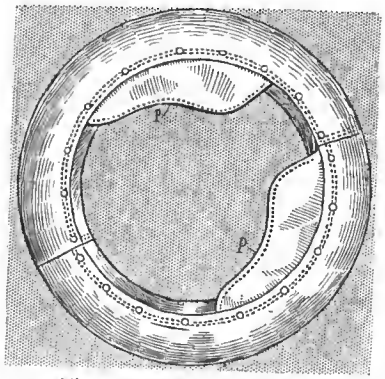
ber and the fabric throughout is of Egyptian cotton with pure Para rubber friction.

The feature of the exhibit of the Merchant & Evans Company is new. As will be seen by the illustration, the metal casing is divided into two sections, *RC* being the rear part and *C* the cover. *T* is the outer casing, while *IT* shows the inner tubes snugly tucked away in the space inside the outer casing. The casing is fastened at the sides by catches and is locked at the top, which makes it proof against theft.

The Zeglen Bullet Proof Cloth Company has utilized its cloth in the construction of the pneumatic tire which is shown by this concern. The company has just started the manufacture of these pneumatics, and expects to have them on the market in another month. The inventor claims that he uses rubber only to secure resiliency and provide a good wearing surface. He uses his bullet-proof cloth for the fabric, the cloth being of silk and of eight strands in thickness. It is interwoven into one solid piece, and the claim is made that when it is vulcanized together with the outer rubber the fabric has more resiliency than the cotton and rubber combination. As an example of its puncture-proof features, the inventor cites an instance where a car fitted with these tires was driven seven times over a plank through which 28 sharp-pointed spikes had been driven. The test showed the outer rubber covering to have been badly lacerated by the spikes, but the inner tubing, composed of his cloth, was not penetrated, he claims.



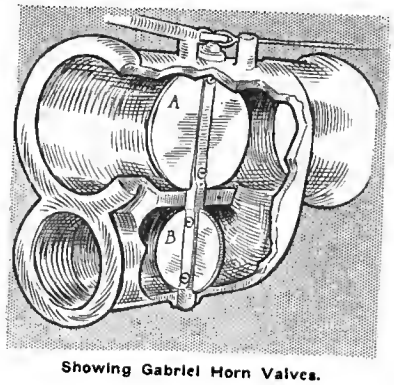
Leather Tire Goods Co. Tread.



Allen Specialty Co. Rim Case.

Transmission Parts.—The Merchant & Evans Company, Philadelphia, continues its rear axle with which is incorporated a three-speed gear-set with direct drive on both high and second speeds. In this axle there are two bevels on the differential constantly in mesh with two pinions on the gear-set mainshaft and between which pinions is a clutch for anchoring either pinion to the mainshaft. This company also has a rear axle gear-set in connection with a solid forged stationary axle, which is centrally dropped, forming a bed into which the housing for the gear-set and differential are anchored.

The Timken Roller Bearing Axle Company, Canton, O., is introducing its new back axle, which is of the floating construction and consists of a one-piece steel casing extending from one rear wheel to the other and with a central expansion for containing the differential. It is without truss rod. All adjustments for the bearings can be accomplished from the outside of the case. The steel casing gradually increases in strength toward the center and sudden variations in thickness are avoided. Internal and external brakes are fitted, the spring seatings are swivelled, and a swivelled V-torsion rod is used which spans the differential.

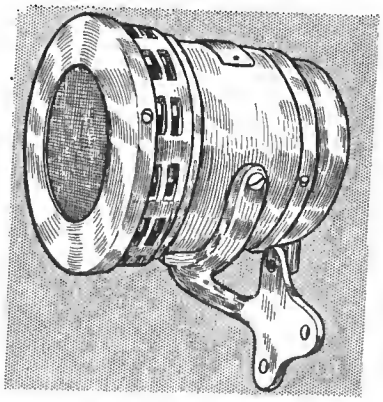


Showing Gabriel Horn Valves.

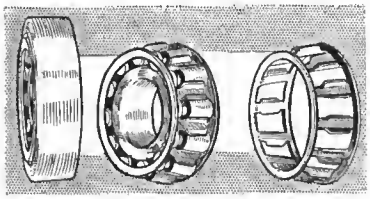
The Standard Roller Bearing Company, Philadelphia, continues its line of front and rear axles, the rear ones being of two types, one of the straight floating construction of the design used on Chalmers-Detroit cars and the other the combined rear axle and gear-set as used on Pennsylvania and Thomas cars.

Ideas in Horns.—Improvements over old models will be noted in the Gabriel Horn Manufacturing Company product, the feature of which the company is most proud being the valve that operates this exhaust horn. This valve is designed to prevent sticking, for as soon as the valve *A* in the main channel begins to close and the disk *B* in the branch channel, placed at an angle of 90 degrees, starts to open, it permits the exhaust immediately to escape, whereupon the horn responds and prevents the building up of back pressure. A cut-out is had by removing the circular disk *A* in the main channel, which gives an escape of 1 1-4 inches and relieves the back pressure caused by the muffler.

The Sireno, of the Sireno Company, is an electric siren with all rotating parts equipped with adjustable ball bearings. There is a field magnet cast of one piece of special metal, the coils are form wound, the armature is of the iron-clad drum type



The Sireno Horn.



Timken New Short Bearing.

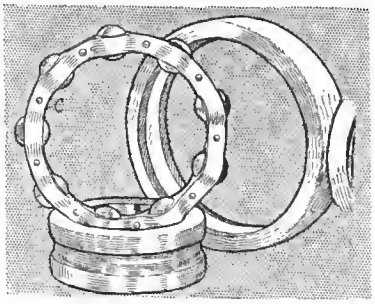
built up with steel laminations, the commutator is of hard-drawn copper insulated with sheet mica, while the turbine is of cast aluminum alloy, machined and keyed to an electric motor shaft. Operating the Sireno is by the pressure of a button on the steering wheel, on the floor, or at the side of the car or wherever the owner may wish to place it. The electric current may be had from the car's storage battery, which will not interfere with the battery doing its duty otherwise. The Sireno operates normally at from six to eight volts, but a louder tone and greater carrying power may be had by increasing the voltage. The principle involved is that of air currents generated by the rapidly revolving turbine driven by the electric motor. The air is drawn through the funnel of the siren and forced out through the peripheral openings on the principle of centrifugal force. There will be several other models, one of which is for touring cars, while there is a smaller type, called the Junior, which has a range of from one to two miles on country roads. Both of these will work from the ordinary six-volt battery.

Bearings.—Improvements noted in ball bearings for 1909 consist in several cases in increasing the number of balls in a given size of bearing, as compared with the number used this year; and the use of metal separators between the balls forming a separate cage for each ball. In roller bearings, one of the noted advances is the manufacture of the short-length bearing which occupies the same space at the annular ball type.

The New Departure Manufacturing Company in its double ball-race bearing uses an inner ring *A* with two ball grooves *V*, in which are races of balls separated by the ring spacer *S* made in V-form, with holes in either side forming ball cages, the balls in one race alternating with those in the other. The outer race is a three-part one of two cup pieces *B*, one for each ball race, and a cover *C* spanning the tops of the pieces *B* and holding them together. Ten balls are carried in each race. In its exhibit booth the company will demonstrate the dual work these bearings perform by being capable of carrying loads at various angles with 1,000-pound flywheels. In this work the bearings will be forced to carry the load at every angle from radial to absolute thrust. On exhibition will also be a transmission set which has seen 16,000 miles of road service.

Hess-Bright bearings for 1909 are in two styles, the new one brought out this year with each ball in a cage of its own, and the old style with spring separators between the balls. In the new cage type the separator is made in halves, one half entering between the balls at one side of the bearing and the other set at the other side, the halves then being secured together. The new magneto bearing has a one-piece inner race, but a two-part outer race. The products of this company are so well and favorably known as not to require description, especially if it is remembered that the H-B, D.W.F., were the first of the annular ball bearings to be used in automobiles, that is to say, annular ball bearings with a fixed adjustment.

The Standard Roller Bearing Company in its annular ball bearing employs one-piece inner and outer races and carries the nine balls in a spacer *C*, which is made in halves riveted together, the halves having semi-circular curved parts for the balls.



Standard Roller Bearing Co. Bearing.

Standard alloy tool steel is used in the balls. The company continues its full type of annular ball bearing in which the balls are introduced through a recess in the outer race. Its line includes the improved Grant conical roller bearing with solid rollers supported in end carriers with individual sockets for the ends of the rollers and which ends are riveted together forming a cage for the rollers. The cone has a wide shoulder against which one end of the roller carrier has a bearing, which shoulder has the same degree of bevel as the ends of the rollers.

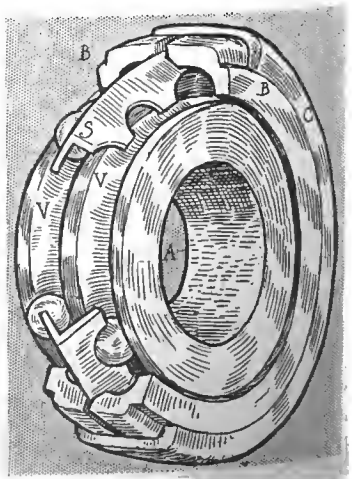
Most interesting in the line of Timken roller bearings is the short-length bearing, which is made so that it is interchangeable with the different makes of annular ball bearings and can be fitted where they can. Its design is the same as the present Timken bearing with the rollers carried in separate cages in a one-piece metal stamping.

J. S. Bretz, exhibitor of the F. & S. annular ball bearing, shows the new type, which differs from the previous one in the employment of a die-cast separator for the balls by means of which it is possible to get many more balls into a bearing, which has been one of the aims of makers of annular ball bearings. Each ball has a separate cage.

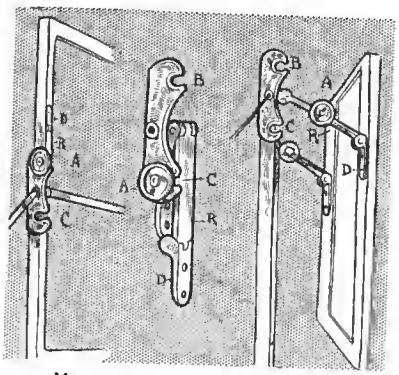
Windshields.—Windshield trend for 1909 is toward small brass frames, folding types without cross-frame pieces between the upper and lower halves of the glass where it obstructs the driver's vision, and upper halves capable of being set at any angle and of being replaced by a wire mesh insect screen for the catching of flies and insects in warm weather, when the glass protection is not needed.

Colonel Sprague, of the Sprague Umbrella Company, has ready a new No. 90 folding windshield which is an advance of previous ones of this type in that when folded the narrow central dividend strips are at the top and do not interfere with the vision. To do this the upper half is upside down when folded behind the lower half. The upper half folds through the usual brackets, which are offset to miss the adjusting nuts. This shield is made with a solid brass molding for a frame. The No. 70 shield does not invert the top half when folding and so the heavy part of the frame is across where the center of the shield when up would be. The No. 42 shield, with wood frame and hinged top half, is continued.

The No. 3 divided folding shield of the Troy Carriage & Sun Shade Company, Fig. 1, has, in brief, two upper halves, one an insect screen, *A*, and the other a glass part, *B*, each hinged at the center of its ends to a cross beam which at its center hinges to the top of the framework of the bottom half of the shield so that when the insect screen is up, the glass can be down and vice versa. On the center of the end frame of the lower half are two curved hooks for holding the insect screen or the upper glass alongside of the lower half; or, if desired, the one part can be anchored up and the other left down. This concern has a rain vision attachment for its No. 2 shield which enables the driver to see ahead in rain storms. In addition are types of folding shields with



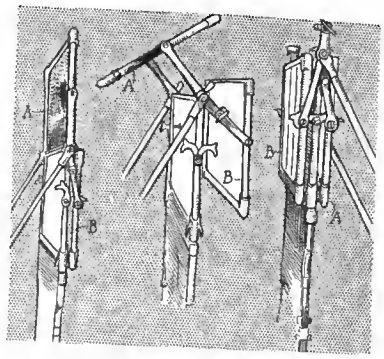
New Depart[illegible]



Vanguard Mfg. Co. Windshield.

brass and wood frames and folding from a hinge or long center arm.

The Vanguard Manufacturing Company has in its new folding windshield an example of the shield free from the cross-bar between the glass halves. The upper half hinges by a long bar *R* at each end to the lower half. Attached to the top of the lower half at each end is a bow-shaped piece with slots *B* and *C*. On the hinge rod *R* is a finger nut *A*, whose stem, when the windshield is up, enters the upper slot *B*, and with the top half folded beside the lower half enters the slot *C*. Once it is in either of these slots, tightening the nut locks it firmly in place.



Troy Sunshade-Carriage Co. Shield.

UP-TO-DATE ROLL CALL OF THE A. M. C. M. A.

THESE are the officers, members and committees of the American Motor Car Manufacturers' Association, which has its headquarters at 29 West Forty-second street, New York:

Committee of Management.

Chairman, Benjamin Briscoe, Maxwell-Briscoe Motor Co.
Vice-Chairman, R. E. Olds, Reo Motor Car Co.
Treasurer, H. O. Smith, Premier Motor Mfg. Co.
Secretary, G. Vernor Rogers, Mitchell Motor Car Co.
Auditor, W. H. Van Dervoort, Moline Automobile Co.
Charles Lewis, Jackson Automobile Co.
W. C. Marmon, Nordyke & Marmon Co.
C. G. Stoddard, Dayton Motor Car Co.
S. H. Mora, Mora Motor Car Co.
Counsel, Job E. Hedgea, 141 Broadway, New York.
General Manager, Alfred Reeves.

SOME OF THE GOSSIP OF THE PALACE SHOW

Premier Centuryite at Show.—The famous Premier Century car is at the Palace show, whither it came after a very strenuous journey from the factory in Indianapolis. This trip was made by a roundabout route which necessitated crossing the Blue Ridge and Allegheny mountains. This run of 1,805 miles from Indianapolis to New York, including stops, was made in 84 hours of actual running time, a large portion of which was made by night. The route lay via Dayton, Columbus, Cleveland, Pittsburg, Hagerstown, Washington, Baltimore, Wilmington and Philadelphia. The speedometer now registers 15,799.7, which is the total of the Premier Century in seventeen States. The ignition is announced to have been perfect during the entire grind, and the original set of igniters is still as good as new. Even the platinum points show no wear at all, and measure up perfectly with new sets. The igniters have only required slight cleaning, without adjustments, every 2,500 miles.

Velie Manager at Hotel Astor.—H. G. Moore, manager of the Chicago branch of the Velie Motor Vehicle Company, of Moline, Ill., is at the Hotel Astor, for the week of the Palace show, for the purpose of negotiating with Eastern dealers for agency contracts of the Velie cars during 1909. Mr. Moore recently severed his connection with the McDuffee Automobile Company, of which he was secretary, and established a branch house for the Velie company at 1615-17 Michigan avenue. The building now occupied by the Packard agency has been leased, the latter interests intending to move in the Spring. In addition to managing the Chicago branch, Mr. Moore will have supervision of the Velie agency department east of Chicago. The Velie Company is an old firm in the manufacture of implements and vehicles, and, in addition to the business managed by Mr. Moore, its product will be handled in the West by the John Deere Plow Company, of Omaha and Kansas City, and the Deere & Weber Company, of Minneapolis, these firms acting as wholesale distributers.

Continental Tire Contest.—In order to demonstrate the advantages to be obtained by equipping a car with Continental tires and the Continental demountable rims, the Continental Caoutchouc Company offers a prize of $5, to be awarded each day of the show, to the owner, driver, or prospective owner of a car making the best time in changing tires with the Continental demountable rims, while at the end of the week a prize of $20 will be awarded to the person having made the best record throughout the course of the show. All official records will be carefully tabulated and the books kept open for examination at all times. Those unfamiliar with the advantages of Continental tires and rims are particularly invited to call at space 170 and watch the demonstrations. They will be allowed two trials in the contest.

Splitdorf Fiftieth Anniversary.—There are probably few exhibitors in the entire Palace show, in whatever line of manufacture, who can look back upon half a century in business. This is the proud record of the Splitdorf Laboratory, the fiftieth anniversary of which was celebrated just prior to the opening of the show. The business was established by Henry Splitdorf in Philadelphia in 1858 as a laboratory for those desiring to experiment with electricity. During the Civil War it was the only plant in the country engaged in the manufacture of electrical detonators, and accordingly prospered. On the occasion of the birth of the present owner, the business was removed to Center street, New York, later going to Vandewater street, in 1888, when Charles Splitdorf assumed control. Last year the business, having entirely outgrown its downtown quarters, was removed to a modern factory building of its own on Walton avenue, the Bronx.

Rapid Truck's Long Trip.—Not to be outdone by the pleasure vehicles, the commercial cars have at least one representative which came to the show under its own power. This is a truck made by the Rapid Motor Vehicle Company, of Pontiac, Mich. Leaving the factory December 20, this one-ton machine, which is the same one that went through the Glidden tour, came by the long Northern route, through Toledo, Cleveland, Erie, Buffalo, Rochester, Syracuse and Albany, and, as was the case during the tour last Summer, the truck was loaded with Goodyear air bottles. After completing the Glidden, the truck was dismounted and its parts calipered, but investigation showed the wear to be hardly noticeable. Since that time it has received no attention, its mileage up to date being 2,021 miles, plus the distance to New York.

A Good Press Agent Is a Good Asset.—Effectively distributing and also getting into print the publicity concerning an automobile show is an art, and, judging from the generous amount of material printed in the daily papers, "Dunc" Curry made a successful job of it this year. While "Dunc" occasionally takes a little exercise in hammer-throwing, his work juggling is always well done, and consequently read even by those who do not always agree with him.

Two Showing Exhibitors Who Are Not in the Show.—Following its usual custom, T. B. Jeffery & Company, makers of the Rambler, are doing their exhibiting in plenteous fashion at their New York salesrooms, 38 West Sixty-second street, where Homan & Schultz have a full line on view. In similar manner the American Locomotive Company is exhibiting the "Alco," formerly known as the Berliet, at the Waldorf-Astoria.

Second A. M. C. M. A. Show Issue, January 6.—In the issue of January 6 THE AUTOMOBILE will give thorough attention to the accessories exhibited in the Grand Central Palace show, covering the things that are new or have demonstrated value to users and builders of automobiles.

Smoker at the A. C. A.—Invitations have been issued by the Automobile Club of America to the trade and visiting automobilists for a smoker which will be held at the clubhouse, in Fifty-fourth street, west of Broadway, Saturday evening. Orrell A. Parker, chairman of the entertainment committee, has prepared an attractive program, and at the conclusion of the entertainment refreshments will be served.

Belated Exhibitors.—Early in the proceedings it was a little difficult to induce some of the exhibitors to come forward and take space; they were waiting for indications of the trend of events. Most of the belated ones took the best space they could get at the last moment, but a few of them failed to get any space at all, although it is true they would have been willing to take the standing room that is reserved for the patrons of the industry.

PARIS, Dec. 25.—Problematical as the aeronautic situation may seem to the novice, it is a fact that the participants in events that of late have astounded the world are in dead earnest, and the first exhibition is therefore worthy of full notice. The salon opened on the day after Christmas, under the most happy auspices, with an attendance which can only be described as "sardinistic." Strange to relate, in spite of the activities in the aeronautic zone that centers around Paris, but a small part of the vast population were previously enabled to observe the doings, and they flocked to the salon as if they feared the passing of the last chance. Our own Wilbur Wright and his doings in the aeronautic line are now regarded as only to be equaled, and seeing the aeroplane is next to seeing him. Wright himself was not present at the opening.

President Fallières informally opened the exhibit at one o'clock Thursday afternoon, but he was followed and preceded by such a large crowd that it is hardly possible that he had a chance to see much, and if he wants to study aeroplanes he will have to go later, during the salon's last days.

One large dirigible balloon, suspended high overhead, runs across the entire breadth of the Grand Palais, but most of the airships, huge, bird-like affairs, rather awkward when seen so close, are on the ground, where they may be carefully studied.

Unfortunately, the Wilbur Wright aeroplane was not in position when the exhibition opened. But Hart O. Berg worked away all day, and on the second day of the exhibition it was ready to be seen. In spite of the fact that nothing but the motor was visible of the Wright aeroplane during the greater part of Thursday, it was impossible to get a glimpse of the stand without waiting several minutes, the crowd was so great.

The Blériot exhibit is very popular. This inventor showed his biplane and his new models of monoplanes, as yet untried, with which he hopes to do great things. The features of the new Blériot biplane are highly interesting. The machine's supporting surface is 65 square yards, to which must be added 6 square yards of balancing wings. The motor is a 40-horsepower Antoinette engine, driving by chain transmission, with a four-bladed Vickery propeller, giving 480 revolutions. Two rear auxiliary planes, having a total surface of 24 square feet, are placed on each side of the steering apparatus, which is a striking novelty and will create a great sensation, being placed in front. The machine is directed by means of a single lever. The rise and fall are managed by means of the front runner, made out of lateral inside planes.

Another exhibit is the Delagrange machine, better known to the public than most others, and yet it has attracted great interest, and a crowd has also hovered about Henry Farman's stand. The Breguet gyroplane of the same type as the one which was tried with little success last Summer near Douai is also here.

Another important exhibit is that of the Esnault. Successful flights were made near Versailles by this inventor. It will be remembered that the chief feature of this machine, which is of the single-plane type, is its extreme lightness, the body being of aluminum and wood, covered with thin gutta percha cloth. The 25-horsepower five-cylinder motor and the four-bladed propeller are in front of the aviator's seat, being placed in the main body of the aeroplane.

One of the most interesting exhibits is that of M. Ader's "Avion," which has been brought from its place in a museum. This ancestor of the modern aeroplane was invented fifteen years ago, but at that time the military authorities laughed at Ader, although he succeeded in flying some distance. Utterly discouraged, Ader destroyed all his papers. The subsequent successful aeroplanes have proved, however, the correctness of his theories.

First Aeronautical Port and Aerodrome.

PARIS, Dec. 24.—Ten miles to the south of Paris, on the outskirts of the little town of Juvisy, is the first aeronautical port and aerodrome ever constructed. The perfectly flat field, over 250 acres in area, has a circular track of about two miles, a straightaway of one mile and surrounding it sheds for aeroplanes and dirigible balloons, workshops and garages, coal and hydrogen gas plants, observation towers, grandstands and postal and telegraph offices. The aerodrome, being on a vast plain within easy distance of the French capital, will doubtless serve as a landing place for airships and aeroplanes traveling from the provinces to Paris. The ground is specially prepared for the testing of new aeroplanes and the tuning up of machines, which will later take longer flights over the plains stretching for miles in all directions. The opening ceremony of the aerodrome, to be attended by a deputation from the Senate, has been fixed for Sunday, January 10.

Blériot's Four-Passenger Flyer.

PARIS, Dec. 24.—Louis Blériot, apostle of the monoplane type of flying machine, has turned to Wright models for the four-passenger flyer that is now nearing completion in his private workshops. The main bearing surfaces are exactly the same length and have the same curve as those on the American's machine, the only difference being a slight increase in depth from front to rear. The position of the engine and of the two seats is also identical with that of the aeroplane from Dayton. Instead of two separate propellers, however, there is only one, with four blades, driven, as in the case of the Wright machine, by means of a chain. Here the similarity ceases, for, instead of the two elevation planes at the front and the lateral rudder at the rear, Blériot has adopted the contrary disposition, the steering being done by three lateral planes carried in front and pivoting together. Change of altitude is obtained by means of small rear supplementary wings, pivoting at the end of what may be regarded as jibs carried at each extremity of the main bearing surfaces.

The apparatus which at first sight so closely resembles that of the American champion is full of differences on closer examination. In the first place, the workmanship, instead of being crude and amateurish, as on the successful American aeroplane, is of the very highest throughout. The power plant is an eight-cylinder Antoinette water-cooled engine, developing 50 horsepower and driving the propeller at 480 revolutions a minute. The two front seats are placed in the same position as those on the Wright flyer, but, instead of being rough boards covered with rougher sacking, they are comfortable cane-bottom office chairs with the legs cut off. Immediately behind them are two more seats to be

occupied by passengers. The radiator is an ingenious arrangement, carried to the left and right of the pilot between two of the uprights. It really consists of a mass of hollow aluminum rings attached to the canvas vertical division, and united one to the other by means of short lengths of rubber tube, the top and bottom rows each being united to a collector.

The aeroplane is mounted on small wire wheels fitted with very large section pneumatic tires. Hydraulic shock absorbers are also employed for the front suspension. Instead of the two wooden levers that Wright has made familiar, the forward rudder is operated by means of a vertical column and automobile wheel, a lever, similar to that on Pierce cars, being carried underneath for the control of the rear elevation planes. Instead of plain linen roughly tacked or sewn in position, the main bearing surfaces are covered with fine rubbered cloth, as used for balloons. Louis Blériot promises to be out shortly with his new apparatus and to carry all the passengers for whom he has provided seats.

Rules for Europe's First Aeroplane Races.

PARIS, Dec. 24.—Regulations are now out for the Monaco aeroplane races, the first of their kind to be held, and which have been scheduled for January 24 to March 24 in the Bay of Monaco. Any type of machine heavier-than-air is admitted, provided it carry with it its own source of power. Three flights must be made over the official course on three different days, the aeroplanes starting from the port of Monaco without touching the sea wall, flying across the bay, and rounding a red and white flag which will be placed at the extremity of Cape Martin, a return being made to the starting point. The time will be taken as the flying machine crosses over the sea wall on the outgoing and return trip. Total distance in a straight line is 5.9 miles.

There are no restrictions on the methods of starting, or on the place from which the machine shall leave the ground, the official start being considered when the aeroplane crosses over the sea wall. After crossing over the finishing line the flying machines may come back to earth in any way desired and at any place that may be most convenient. A suitable type of float, capable of bearing the apparatus on the surface of the water in case of accident, will be insisted upon, the efficiency of the apparatus to be judged by the committee. Only pilots who have already given proof of their ability to handle an aeroplane shall be allowed to take part in the race, the committee to be sole judge of ability. If the pilot of the machine is not able to swim, the organizers shall have power to insist on the wearing of a life belt.

Attempts may be made on any day from January 24 to March 24 between the hours of 10 a. m. and 5 p. m., on condition that the committee has been informed not later than 9 o'clock of the same day of the intention to fly. The number of attempts are unlimited, the three fastest on different days being additioned to give a basis of classification.

Prizes are $15,000 in cash for the first, $3,000 for the second, and $2,000 for the third, the committee having the right, in case of a very small number of entries or indifferent performances, to change the prize list as they may think suitable. Entries are received until March 1, at midnight, at the International Sporting Club of Monaco, the fee being $20 per entry.

If dimensions of the apparatus are given when the entry is made, the committee will undertake to erect sheds on the shore to house the flying machines, responsibility for accident being with the owner of the apparatus. Any shed abandoned for twenty-four hours will become the property of the committee, which may dispose of it as it thinks fit. Protests will only be received when accompanied with a fee of $20, and must be handed in the same day within one hour of the close of the day's racing.

Althougb it is not yet known what machines will take part in the competition, it is believed, from the number available, that the entry list will be a satisfactory one. Wilbur Wright having taken up his winter quarters at Pau, and his brother being expected in Europe very shortly, it is believed that both will take part in the Monaco races. Farman and Delagrange are certain starters; others having machines suitable for this contest are Santos-Dumont; Antoinette Company, with several different types of aeroplanes; Voisin Frères, with several machines; Comte de Lambert, Paul Tissandier, and others having bought Wright aeroplanes; Louis Blériot, with both monoplane and biplane flyers; Robert Esnault-Pelterie, with monoplane machines; Moore Brabazon, with a Voisin Frères biplane; Captaine Ferber, on an Antoinette machine; Bayard-Clement Automobile Company, with a biplane driven by a new type of seven-cylinder gasoline engine; Melvin Vaniman, with triplane machines, and Goupy, also with a triplane. The distinct favorites are Wright, Farman, and Delagrange, among whom the contest is likely to be keenly disputed.

QUESTION OF 1909 SALON SOMEWHAT COMPLICATED

PARIS, Dec. 24.—"There will be an automobile Salon in Paris in 1909," declares the committee of the Automobile Club of France. "If there is, we will not take any part in it," declare a group of the most important constructors of this country. Between the two the outlook for the continuance of the annual exhibition in the Grand Palais on the Champs-Elysees is not very promising, for the firms having signed an agreement not to exhibit at any show next year, comprise Renault, Panhard, Brasier, Delaunay-Belleville, Dietrich, Berliet, Mercedes, Germain, Isotta-Fraschini, Bollee, Minerva, Pipe and Darracq. If they remain true to their agreement—and the penalty for breaking away is $10,000—the annual show will next year be either a failure or a second rate affair.

When the matter came before the committee of the French Club last week, there were two parties; the one representing a group of French constructors moved that in the interest of both users and constructors of cars there should be no exhibition next year in Paris or surrounding district, and that in future shows should be held every two years. The opposing party, led by the Marquis de Dion, maintained that the best interests of the industry would be served by holding the show as usual. It was this proposition that was carried by 34 votes to 18, the majority comprising a small number of big constructors and a large number of persons who are but private users of cars. As the minority is more representative of the Frencb industry than the majority, the vote in favor of a continuance of the show is not looked upon as very important.

There is, however, a possibility of the anti-show men shifting their position when it is discovered that London has no intention, either of alternating with Paris or holding a show every two years on same dates. This was foreseen in the proposition of the minority, who put in a clause to the effect that if the show were held it should be of an economical and co-operative nature.

The Automobile Club of France, receiving considerable financial benefit from its annual exhibition, will naturally do its best to maintain it, and will probably succeed by offering to hold the next show on economically commercial lines to suit tbe dissatisfied constructors. So long as it is shown that the exhibition can be a source of profit and not of loss to the exhibitors, French constructors will be willing to come into it. Up to the present it is the club that has taken the plums, the advantage to constructors becoming less and less as the automobile has secured its position as an article of necessity.

In all probability 1908 will be the last of the fancy spectacular shows, and 1909 and succeeding years will see an exhibition in the Palais designed solely for the selling of automobiles.

The Formation of Gasoline-Air Mixtures

By P. J. Tice

BEFORE entering into discussion it should be here stated that wherever mention is made of the proportions of a mixture refcrence is made to the ratio by weight. Volumetric relations in such considerations are confusing and tend toward misleading deductions. Chemical reactions involve a definite weight relationship between the active substances. Combustion is a chemical reaction, and, as such, requires just so many pounds of oxygen for the complete reduction of a certain number of pounds of a given fuel. The weights of the substances can bear but one ratio to each other; while the volumetric ratio of combination may vary almost infinitely, because the factors of temperature and pressure must then be dealt with.

If the maximum temperature of combustion and its maximum pressure are to be utilized in an engine cylinder, its structure must be such that the molecules of the combining substances are in their proper positions relative to each other, *i.e.*, each molecule of fuel closely surrounded by the correct number of oxygen molecules before the occurrence of the ignition spark. This calls for the finest possible division of the fuel and its most thorough mixing with the air.

The Real Carbureter.

The accepted type of carbureter, taken together with its distributing manifold, forms a surface carbureter usually of quite small surface. The manifold walls form the real carbureter, and the device called the carbureter furnishes the fuel to that surface, from which any proper vapor that may exist in the final mixture is carried by the passing mixture of air.

By "typical carbureter" is meant a device in which liquid fuel is brought into contact with a moving column of air by the same pressure depression which causes the air to flow, *i.e.*, it is drawn through a passage by the motor suction simultaneously with the influx of the air with which it mixes to form the explosive mixture.

In the "typical" device, fuel is carried by flowing air from the open end of a passage located in a region of pressure lower than that of the atmosphere to which the other end is open. Lowered pressure without a correspondingly lowered temperature tends to cause vaporization. It is undoubtedly true that vaporization starts at this point as soon as the fuel has fairly left the nozzle. The intensity of this action depends upon the extent to which the pressure is lowered. The pressure reduction about the nozzle may be taken at .5 pounds per square inch, which value increases through the manifold to the valves until it reaches a value of 6 to 8 pounds with some six-cylinder engines.

Under carbureter conditions it is impossible to measure or even approximately estimate the extent of the vaporization, at the nozzle or through the manifold, due to this pressure reduction; but it is known to be very appreciable in its effect. It should be considered as a condition affecting vaporization, at the nozzle end but slightly, but to a much greater extent after the fuel has become suspended in the air.

Distinction in Vaporization.

Vaporization due to pressure reduction is distinguished from vaporization caused by the supplying of heat. In the former action, vaporization can become only partially complete, however far the process of reduction is carried, since the part of the liquid which vaporizes does so through the abstraction of heat from the remainder, which becomes constantly colder, until finally the temperature of the liquid is so low that vaporization ceases until heat is supplied from some outside source. Where vaporization is brought about entirely by heat from some outside source the degree to which it may be carried depends wholly upon the amount of heat supplied, since the temperature of the liquid is being constantly raised to or maintained at the proper point.

In the carbureting device under consideration neither of the above processes is carried to the limit, nor goes forward alone and unmodified. They are called into action simultaneously. The reduced pressure due to motor suction causes vaporization with a lowering of the temperature, and the heat of the air tends to cause vaporization through a transfer of heat from itself to the liquid. Thus it appears that each of these vaporizing actions assists the other—the air supplying heat to the liquid as it is cooled by vaporization under reduced pressure, and the reduction in temperature due to pressure reduction facilitating the transfer of heat from the air to the liquid.

Within the temperature and pressure ranges available, the liquid must present, relatively, an enormous surface to the air if vaporization is to be sufficiently rapid. To this end the passage through which the liquid flows is so formed that the liquid is broken up into a spray by the velocity of its efluxion due to the difference between the pressures existing at the two ends of the passage.

In any one carbureter the perfection of vaporization is proportioned to the fineness with which the liquid is broken up at the nozzle. The shortness of the time within which vaporization must be completed is what causes the above factor of fineness of division to enter. Since the heat transfer between the air and the liquid, or the passage walls and the liquid, is affected chiefly through the agencies of convection and conduction—the former implying a rapid agitation and relative motion between the particles of the two substances, and the latter the exposure by the liquid of the greatest possible surface areas—it is readily seen that the finer the fuel division at the nozzle the more rapid and complete will be the vaporization and the greater the homogeneity of the final mixture.

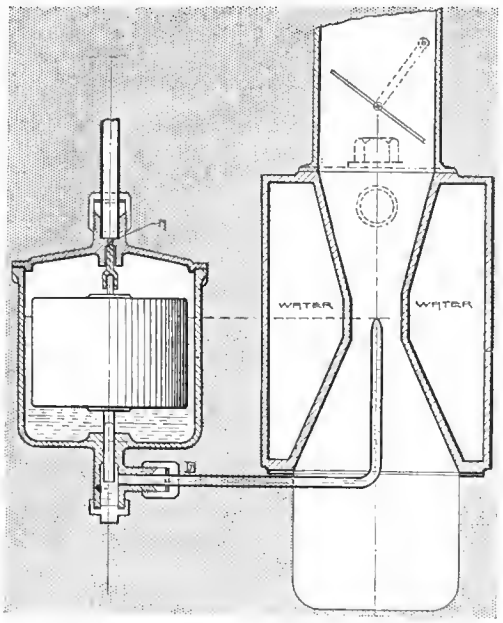
Fuel Division Usually too Coarse.

In the coarseness of the fuel division lies the chief failures of the typical carbureter. This has been proven again and again by any number of experimenters. Those who have constructed transparent mixing chambers for the observance of nozzle action have invariably found that the fuel left the nozzles as a solid stream or in heavy globules and irregular "chunks," not as a fine spray or mist, as it is supposed to do. Improved design and workmanship on the nozzle and needle valve parts will almost entirely overcome this poor action, with an increase in power output and fuel economy; but any nozzle form used will give a wet and sloppy discharge with low engine demands, even though a true spray may be delivered with increased demands.

Whatever form is given the nozzle, the effectiveness with which it can break up the fuel varies as the difference between the pressures at its two ends, and, as this pressure dif-

ference varies throughout the speed range of the engine, the fineness will also vary. At high engine demands the spray will be better and finer than at low; but this is absolutely necessary, since the time allowance for vaporization is less and the quantity of mixture formed is greater.

The nozzle of average performance will, at medium engine demands, deliver a thin conical sheet of liquid. This liquid



Characteristic Type of Float Feed Carbureter.

cone is torn away at its edge and carried on by the air column. Some of the fuel torn away is in small enough particles to be considered as spray or mist, and may be taken as contributing directly to the vapor content of the mixture; but the greater part sooner or later strikes some part of the containing walls, from which it is later picked up in the form of globules. These globules are continually picked up and thrown out by the air stream in its progress to the cylinders, until some of them are sufficiently small to become permanently entrained or have been completely vaporized.

Bends in the manifold passages aggravate the expulsion of the liquid globules, but they also permit of fuel once thrown out being readily picked up again. The persistence of rectilinear motion comes into play and throws out the heavier globules at the turns, they being again picked up by a following portion of the air column. This action is repeated at each.

In the foregoing it may seem that the vaporization accomplished by pressure reduction has been placed on a par with that brought about by the heat supply available in the air and passage walls. It is not meant that such an impression be taken. The rate of transfer of heat from the air and walls to the liquid will, of course, be higher the greater the temperature difference; the lowering of the pressure lowers the temperature of the liquid through partial vaporization, and thus increases the temperature difference. Thus, while vaporization could not go on at a proper rate without such a heat supply, the lowered pressure under which vaporization takes place is an important adjunct, second only to the heat supply.

Fuel Economy in High Velocities.

The fuel economy resulting from the use of air velocities higher than the average, and thus lower pressures, is quite marked. Of course, with high charge velocities the maximum power is not realized above a certain piston speed; but the fuel economy and efficiency will be greater within the range which the high velocity device can supply without too great a loss per cylinder charge. This latter fact is easily demonstrated by making two series of runs with any multiple cylinder automobile engine. One series should be made with carbureter and manifold passages of such areas that an average charge velocity of about 8,000 feet per minute is had at a piston speed of 1,000 feet per minute; and the other series with passages which will give the above charge velocity at between 600 and 700 feet per minute piston speed.

A comparison of the two series of runs will show that up to that piston speed at which the volumetric efficiency of the engine pumping strokes falls off because of too high a charge velocity the power deliveries are approximately equal, the fuel consumption per brake horsepower hour and the thermal efficiency have each been improved. The passages giving the above charge velocity at the higher piston speeds will permit of the development of a greater power at those speeds, and are thus superior from the viewpoints of maximum economy and efficiency at maximum output, which is the condition desired.

The points which it is desired to bring out are: that the greater the pressure drop in the passages the more perfect will be the breaking up of the fuel, the more rapid will be the agitation and internal motion in the mixture column, the greater will be the vaporization due to pressure reduction; and, as a final result, the fuel will be more thoroughly vaporized, and the mixture more homogeneous. There are in present practice several examples of the above utilization of high air velocities and low pressure in the carbureter passages. In the best of these the maximum charge velocity in the manifold and past the valves is kept down to the value given above (8,000 ft. per min.); and the high velocities and low pressures are secured in the carbureter passages through several spraying nozzles, each located in a separate, small passage. These are put into communication with the manifold in a progressive manner in accordance with the engine demand; and thus practically constant, high air velocities and low pressures are maintained, no matter how many or how few are serving the engine.

The advantages possessed by such a device for the vaporization of the fuel are apparent, though it appears that these devices were primarily designed with a view to securing a more automatic proportioning of the mixture.

Heating Usually Necessary.

If the nozzle and the conditions under which it operates are such that a true mist-like spray is delivered into the air column, no recourse need be had to air or wall heating devices providing the temperature of the air is 60° F. or higher. But, since such conditions very rarely obtain in practice, the expedient of heated air or jacketed mixing chamber walls must often be resorted to.

Because all liquid hydrocarbon fuels are variable and unstable, both their chemical compositions and physical characteristics, it is very difficult to formulate their actions or determine the best conditions under which to utilize them. Experimental data are placed at an equal disadvantage with mathematical and theoretical analyses in that the exactitude of either method is impaired by the non-uniformity of the substance. However, serviceable figures are entirely within reason; and as such the writer submits the following.

The hydrocarbon known as motor gasoline, specific gravity between .70 and .73, is a mixture of individual substances, each combining carbon (C) and hydrogen (H) in varying proportions. A small percentage of oxygen (O) is often present (never to exceed 3.5 per cent.), but, because of its smallness and sometimes total absence, it will be neglected. The several substances composing gasoline are all of the methane series, the chemical formula for which is expressed C_nH_{2n+2}. This means that for the entire series, which comprises some eighteen substances, each combines C and H in the proportion of twice as many atoms plus two of H as there are atoms of C.

The first member of the series present in gasoline, pentane,

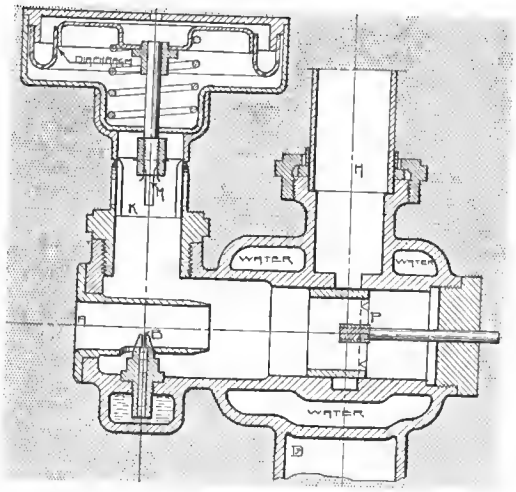
C_9H_{12}, has a specific gravity of .626; the last member, decane, $C_{10}H_{22}$, has a specific gravity of .736. The other members between these two have specific gravities ranging between the two values given and corresponding to their increasing molecular weights. The second member of the series, hexane, C_6H_{14}, is the representative constituent of gasoline, being present in greater quantities than any of the others. Traces of pentane or the members beyond nonane, C_9H_{20}, specific gravity .723, are seldom found in gasoline. Thus, hexane, though much lighter and more readily vaporized than the several heavier members occurring with it, should be used as the basis for any calculations. This use is justified by the high vapor pressure of hexane, as will be explained later.

Chemical Composition.

Taking the chemical composition of hexane, C_6H_{14}, as that of gasoline, its combination with the oxygen of the air to form carbon dioxide, CO_2, and water (or rather steam), H_2O, may be expressed $2C_6H_{14} + 19O_2 = 12CO_2 + 14H_2O$. From the atomic weights of the elements involved, the weight of air necessary for the complete combustion of 1 lb. of C_6H_{14} is found as follows.

The atomic weight of C is 12, that of H is 1, and that of O is 16; thus the molecular weight of C_6H_{14} is $6 \times 12 + 14 \times 1 = 86$; and the weight of the combining oxygen $19 \times 16 = 304$. Thus for the complete combustion of 1 lb. of C_6H_{14}, $\frac{304}{86} = 3.54$ lbs. of oxygen will be required. Since 1 lb. of dry air at 60° F. and 14.7 lbs. pressure contains only .23 lbs. of oxygen, $\frac{3.54}{.23} = 15.39$ lbs. of air are necessary for the complete combustion of 1 lb. of gasoline. This mixture proportion of 1 : 15.4 is known empirically to be that which will develop the highest temperature and pressure in a gasoline engine cylinder with a compression pressure of 70 to 80 lbs.

Before proceeding to the heat necessary for fuel vaporization, it should be determined at what lowest temperature the proportion of 1 of fuel to 15.39 of air, as above, can be maintained. There is a definite limit to the amount of vapor that can exist in a unit volume of mixture at any given temperature. If the



Section of the Krebs Type of Carbureter.

vapors of such substances be treated as gases, because of the then great expansion, the weight of fuel vapor present at any one temperature is proportional to the vapor pressure of that substance at that temperature.

Thus, the amount of gasoline vapor that can exist in a unit volume is measured by the vapor pressure of saturation for that temperature. That is, if air be saturated with gasoline vapor at a certain temperature and pressure, a lowering of the temperature (the pressure remaining constant) will cause a condensation of some of the vapor, and consequently an impoverishment of the mixture. To apply this:

Densities Proportional to Weights.

Since the densities of gases are proportional to their molecular weights at the same pressure and temperature, and the molecular weight of H is 2, that of gasoline being taken as 86, the density of gasoline vapor is to that of H as 86 : 2, or is 43 compared with 1. Therefore the vapor pressure of 1 lb. of gasoline vapor is $\frac{1}{43}$ that of an equal weight of H occupying the same volume. Also, the density of air is 14.44 times that of H; and thus 15.39 lbs. of air has a vapor pressure of $\frac{15.39}{14.44}$ times the vapor pressure of 1 lb. of H occupying the same volume.

Hence the pressure of the gasoline vapor in a mixture of the proportion 1 : 15.39 is to that of the air in the mixture as $\frac{1}{43} : \frac{15.39}{14.44} = \frac{.0233}{1.065}$, or as .0233 : 1.065, from this ratio it follows that $\frac{.0233}{.0233 + 1.065}$ or .0214 of the total vapor pressure exerted by the mixture is due to the gasoline vapor, and that $\frac{1.065}{.0233 + 1.065}$ or .9786 is due to the air in the mixture. If the mixture is under atmospheric pressure of 14.7 lbs. per square inch, there will be exerted by the gasoline vapor a pressure of $.0214 \times 14.7 = .315$ lbs. Tables of vapor pressures show that gasoline vapor can exert a pressure of .315 lbs. at all temperatures above 1.5° F.

It appears that gasoline-air mixtures of 1 : 15.39 can exist at or above 1.5° F. under atmospheric pressure. If the pressure is less than atmospheric, or the ratio of fuel to air is decreased (it will be about 1 : 17 or 18 in average practice), the mixture will persist without a condensing out of any of the fuel vapor at temperatures lower than 1.5 F.

In the above determination of the temperature referred to fuel vapor pressure, the value given is a little high. Only the vapor pressure due to the hexane is there considered. While hexane is the characteristic of gasoline because of its occurrence in great quantities, the total vapor will be the sum of the vapor pressures of the various substances taken at the given temperature. Thus, the two pentanes (iso- and normal), C_5H_{12}, though usually present in insufficient quantities, having higher vapor pressures than the hexane, will tend to raise the vapor pressure, at a given temperature, above that due to the presence of hexane alone. Likewise, the constituents of gasoline heavier than hexane—heptane, octane and nonane—contribute in some part to the total vapor pressure. From this it appears that any error that may be introduced, by the assumption that the vapor pressure and other characteristics of hexane are those of gasoline, is toward an overestimation of the temperature, and will thus fail to effect the results.

Latent Heat of Vaporization.

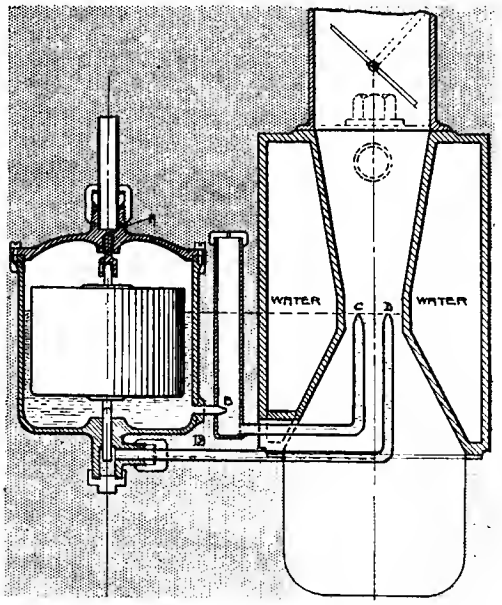
The specific heat or amount of heat measured in B.T.U. (British Thermal Units) necessary to raise 1 lb. of gasoline 1° F. is .500. Hence a drop of 1° F. in the temperature of 1 lb. of gasoline corresponds to the dissipation of .5 B.T.U. The specific heat of air at constant pressure is .2375: and a drop of 1° F. is attended by the dissipation of .2375 B.T.U. per lb. of air. Taking the mixture proportions as 1 : 15.39, as above, the heat available per ° F. of drop in the temperature of the mixture is $1 \times .500 + 15.39 \times .2375 = 4.155$ B.T.U.

Since the latent heat of vaporization is very approximately 210.5 B.T.U., it follows that this 210.5 B.T.U. must be supplied

by the ingredients or by heat from some outside source applied directly to the fuel..

Consider the heat supply in the mixture ingredients themselves. Since the mixture, 1 : 15.39, is capable of supplying 4.155 B.T.U. per ° F. of drop, it will require a drop of $\frac{210.5}{4.155} = 50.66°$ F. in the mixture to completely vaporize the 1 lb. of fuel contained therein. The mixture, 1 : 15.39, cannot exist below 1.5° F., so, it will be necessary that both the air and the gasoline have a temperature of at least 1.5° + 50.66° = 52.16° F. before the commencement of vaporization. If the mixture is 1 : 18, it can exist at -5.8° F., and the initial temperature of the ingredients must be at least 38.3° F.

If the requisite amounts of fuel and air are placed in a vessel insulated from outside heat, the above initial temperature values will hold only when the time allowance for vaporization is unlimited. Compared with the short time in which vaporization must be completed in an automobile engine, the passage of time before vaporization would be completed would be almost



Principle of the Zenith Type of Carbureter.

infinity. However, there are three methods whereby the rate of vaporization may be accelerated: either the fuel may be introduced in a finely divided form; or the initial temperatures of the mixture may be made higher than the above values; or a combination of both methods may be employed.

In any case, the temperature drop can be no more than 45° F. in any mixture of gasoline and air. Therefore, if an increase in initial temperature is resorted to, the final temperature will be higher than that necessary to support the mixture proportions by just the amount that the initial temperature is raised. Suppose an initial temperature of 100° F. and a drop of 45° F. The resulting final temperature in the mixture will be 55° F.

In consideration of the form in which the fuel is presented to the air in the average carbureter, this final temperature will be higher than 55° F. because the total amount of fuel will *not* have been vaporized, and the amount of heat necessary to complete the vaporization will remain in the mixture as a temperature value. But suppose the vaporization to have been completed in two cases with a final temperature of 55° F. in one and 1.5° F. in the other. Since the same amount of fuel is present, the volumes per lb. of the two mixtures, at the same pressures, may be taken as bearing the same relationship to each other as the volumes per lb. of dry air at equal pressures and the two temperatures given. Thus, the ratio of volumes per lb. of mixture may be expressed 1 : .88, for the two mixture temperatures of 1.5° and 55° F. respectively. Therefore an engine can aspirate only .88 the amount by weight of 55° F. mixture as can be aspirated of the 1.5° F. mixture. In fact, the loss in weight of charge will be greater than is here indicated, since the efficiency of the pumping strokes will vary with the density of the fluid.

The power of an engine varies as the weight of charge burned per power stroke, therefore the power delivery will be greater with a lower mixture temperature. Although it is neither desirable nor necessary to aspirate mixture at a temperature of 1.5° F., the above serves to indicate the importance of maintaining the lowest reasonable temperature.

Initial and Final Temperatures.

An initial temperature of 60° F. will be sufficient for vaporization if the nozzle delivers a true spray. This will give a final mixture temperature which is considerably below the freezing point of water, and will thus cause a drying of the air through a condensation of the water vapor present. With perfect spraying and initial temperatures at 60° F., vaporization is still far from instantaneous, and cannot be completed within the carbureter itself.

A temperature as low as 32° F. would not be attained by the mixture within the carbureter and lower manifold, but would begin to be approximated only toward the upper parts of the manifold. The heat conducted from the cylinders by the passage walls is sufficient to obviate a mixture temperature of 32° F. even during the latter part of the vaporization, which takes place quite close to the cylinders. With initial temperatures at 60°, a temperature of 34.5° F. has been observed in a perfectly vaporized mixture just before its entrance to the valve pocket. This seems to show that the heat of the manifold walls entered into the action toward its latter part, and prevented freezing of water vapor while at the same time assisting vaporization. The engine was running at about 950 feet per minute piston speed at full load.

The lowest initial temperatures are determined by the fineness of fuel division, which is determined by several conditions, as mentioned above. If the division is imperfect, a greater heat supply will be needed in order that the vaporization may be complete within the limited time available; but the greater the heat supply, the hotter will be the mixture and the greater the power losses.

In the vaporization of fuel in spraying carbureters it is often found that no air temperature up to 120° F. is efficacious in bringing about complete vaporization within the allowable time. In cases of this sort a change increasing the fineness of the nozzle delivery has always resulted in a more complete vaporization, and where the fineness of delivery has been progressively increased to a possible maximum value it has been found feasible to form a mixture, throughout the speed and power ranges, of perfectly vaporized gasoline and air with an initial temperature of 58° F.

In a typical spraying carbureter the method of application for best results will depend upon the character of the fuel spray, upon the constriction of the mixing chamber, and the form of the manifold passages. If the division at the nozzle is fairly fine, the application of additional heat as an increased initial air temperature will, in general, be of the greater value. This is more particularly true if the carbureter and manifold passages are free from bends. If the passages are tortuous, a heating of the walls will assist vaporization with a less expenditure of heat, and will give an equally good mixture with a lower resultant temperature than will a heated air supply. If the nozzle delivery is very poor as regards division, heated walls will serve best.

The whole question as to which of the two methods is best for any specific case resolves itself into another question—with what is the liquid chiefly in contact after it leaves the nozzle? If the nozzle so divides it that it remains chiefly entrained in

the air column, a heating of the air will give the best results; if the division is coarse, the liquid will be spread over the walls, and a heating of the walls will then be the better method, subject to the same condition of proper temperature maintenance. In conclusion on this matter of vaporization, it must be emphatically repeated that the extent to which fuel division is carried at the nozzle determines the temperature at which the mixture can be formed, and also its character referred to the degree of fuel vaporization and homogeneity.

Viscosity Lowered by Temperature Increase.

The foregoing considerations of temperature and heating effects apply solely to the matter of vaporization of the fuel. However, there is one direction in which temperature assumes a great importance as affecting mixture proportions, *i.e.*, variations in the temperature of the liquid fuel within the nozzle. Gasoline is commonly thought of as having a very low viscosity. This is true, but the viscosity of gasoline is lowered quite rapidly with temperature increases. The comparative weights of gasoline of .71 sp. gr. flowing through the same passage and under the same pressure difference, with variations in temperature, are given in the following:

Temperature °F.....	50°	59°	68°	77°	86°	95°
Weight in unit time.....	1	1.073	1.145	1.212	1.27	1.335

With the fuels of higher specific gravity the increase in quantity with increase in temperature assuredly is higher.

The above change in the weight discharged with change in temperature throws some light upon the tendency of carbureters supplied with heated air from a chamber about the exhaust manifold to "lose" their adjustment. With heated air supplied in this way, it has been repeatedly observed that the temperature of the air entering the carbureter will vary as much as 30° F. under changing conditions of running, the surrounding atmospheric air being at between 70° and 75° F.

Since in most carbureters the greater portion of the nozzle is so placed as to be directly in this heated air column, it stands to reason that the temperature of the nozzle walls, and consequently that of the fuel flowing through, will follow that of the air with a difference of but a very few degrees. If a constant initial air temperature could be maintained through the main air port, it would make no difference what temperature was employed; but with the exhaust manifold as the source of heat, is a practical impossibility, since its own temperature will vary from 300° to over 1,000° F.

Of course, the velocity of the air through the heating chamber will vary so that the higher velocities will be simultaneous with the higher temperatures, and this will tend toward constancy of temperature, but the relationship of the velocity to the temperature cannot be made such that a given temperature will be maintained to within more than 10° or 15° F.

THE BATTLE OF THE BEARINGS IS STILL IN PROGRESS

By CHARLES E. DURYEA, Technical Expert, A. M. C. M. A.

EVER since wheels were invented the problem of how to overcome the friction effects has been before the world's mechanics. Automobile makers have not been limited by the cost, so have been free to equip their vehicles with the best devices possible to secure, and have been certain that among America's wealthy buyers would be found customers for whom the best was none too good. This has resulted in a variety of arrangements of bearings as well as of kinds not ordinarily found in any single piece of machinery.

While for years there have been users of roller and ball bearings, not until the last two years has the problem come before the public in large form. The introduction of a type of bearing known as the annular, which is nothing more than the simplest possible form made up in a most superior manner, set a new mark for auto makers and called their attention to ball bearings quite forcibly. These annular bearings have been fitted to every possible part of the vehicle from the small accessories such as the pump, fan, or magneto, to the most essential parts, such as the wheels, transmission, and even the motor.

Because like begets like, this use of anti-friction bearings has spurred the makers of roller bearings and of the older adjustable types of ball bearings to renewed activity and borne fruit of great value to motor vehicle users generally.

Many people have doubtless wondered why the ball bearing unknown practically before the advent of the bicycle, has become so common and is admittedly so good at the present time; with a variety of forms of roller bearings competing for supremacy. The explanation is simple. Both ball and roller bearings must be well made to be long lived, and it has not been many decades since factories were fitted to turn out such work at prices within reach of the buyers, so the motor vehicle has caused a great forward step in mechanical progress by demanding the best and commanding prices sufficient to permit makers supplying the demand.

If one ball or roller is slightly irregular or slightly larger than the others, it must take all the strain and not only receive damage itself but very likely damage the surfaces on which it rolls. This is why such bearings are all right if they are right, and are all wrong if every part thereof is not right. This is why occasional failure results, and why only the most exceeding care in manufacture and in assembling is necessary if the desired results are to be obtained.

Admitting this perfect workmanship, the question still remains as to which is the better ball or roller, and whether these are to be preferred to the older form of plain, bronze or babbitt bearings, with which the world is better acquainted. On this point designers differ, and each is guided in his selection by the nature of his service, by the conditions surrounding the bearing, by the probable care or lack of care it will receive, the ease or difficulty of lubrication, and largely by the speed of the moving part. In general, bearings designed for high speed and free from shock are of the ball variety, while bearings intended for heavy loads and lower speeds are more usually fitted with rollers, leaving the plain bearings for places where the strain is intermittent or in the nature of shocks such as are received by the bearings of an internal combustion engine. That practices are far from universal in following this procedure is shown by the use of roller bearings to all wheels by the Acme, Glide, Stoddard-Dayton and some of the Lambert models, while ball bearings are used by the American, the Austin-Brush, Chadwick, De Luxe, Gaeth, Gearless, Moon, National, Pennsylvania, Premier, and some others. Other designers have balls at one place and rollers at another, and like the American Simplex and the Marmon, have rollers to the front wheel bearings, and balls to the rear, or like the Mitchell, the Moline, the Olympic and the Regal, have balls to the front and rollers in the rear. In general, the use of roller bearings seems to be increasing, although the users of ball bearings have lost no enthusiasm, and their use is rapidly extending particularly to the smaller parts, where space and weight is of some importance. The fact that the roller gets a line of contact instead of a point renders it more able to carry a heavy load, and thus accounts for a preference in the certain places. The tendency toward the use of ball bearings on the motor shafts seems not to be increasing, although the new Holsman motor employs balls throughout. Unquestionably, the anti-friction bearing will do in future a still larger part of the world's work. particularly at the wheels and axles where loss of power is important and where a saving means greatly reduced gasoline bills. This is a question that must in the long run receive more attention than it has been accorded.

LETTERS INTERESTING AND INSTRUCTIVE

TROUBLE IN STARTING AN OLD-TIMER.

Editor THE AUTOMOBILE:

[1,692.]—Can you help me out through "Letters Interesting and Instructive"? I have a Franklin four-cylinder air-cooled car of the 1904 model, the motor having automatic intake valves. I am having a great deal of trouble with my car lately, finding it impossible to start without priming the cylinders, although it is easy enough to start once the motor is warm. If allowed to cool off, there is always the same trouble in starting. When after slowing down for a street crossing, the throttle is opened up again, the motor seems to choke and sometimes I have to drop from high in order to give the motor a chance to pick up again. I have just ground the exhaust valves and everything seems O. K. I have a good 8-volt, 25-ampere-hour storage battery, fully charged, and cannot understand why the machine should act in this manner. Do you think putting on a Schebler carbureter would overcome the trouble?

Any information that you can give me on this through "The Automobile" will be appreciated. CHARLES B. FRANKS.

Corona, N. Y.

It is nothing unusual to have more or less difficulty in starting any car in cold weather, and priming is commonly resorted to, so that your trouble in this respect would not appear to be particularly serious. The "choking" you speak of is due to a derangement of the mixture by the sudden opening of the throttle and is caused by the failure of the auxiliary air valve to work promptly, as a rule, though some other lack of adjustment may also be responsible in your case. The result is that the mixture is flooded with gasoline before the extra air supply becomes effective. Carbureters have been improved to such an extent since the car you have was built that we should think the purchase of an up-to-date type would be a good investment.

WHO HOLDS THE TRANSCONTINENTAL RECORD?

Editor THE AUTOMOBILE:

[1,693.]—Will you please advise me in "Letters Interesting and Instructive" who holds the record from New York to San Francisco and return, also the time. Is the New York "Times" to hold such a race next Fall, and, if so, by what route? W. C. M.

Poughkeepsie, N. Y.

The only round trip from coast to coast of which there is any record was made by Megargel and Fassett in a two-cylinder 16-horsepower Reo and consumed 285 days from New York to Portland, Ore., to San Francisco and back. No attempt at speed was made. The best time across the continent from San Francisco to New York was made by L. L. Whitman and C. S. Carris in a six-cylinder 30-horsepower Franklin. By running night and day, they made it in 15 days, 2 hours, 10 minutes, and would have bettered this but for an accident. Under touring conditions and carrying a party of seven people, J. M. Murdock crossed in a Packard "Thirty" last Spring in 32 days, 5 hours, 25 minutes. The Thomas "Flyer" in the Paris-New York race made the trip in mid-Winter in 42 days, 2 hours, 5 minutes, to San Francisco, the Murdock record being from Los Angeles.

The New York *Times* has proposed a race to San Francisco and return, but at the present writing the matter is not in such a state that any definite information can be given concerning it.

CARS WITH A LEFT-HAND CONTROL.

Editor THE AUTOMOBILE:

[1,694.]—In your December 10 issue you speak of a number of factories which will place the control on the left of their cars. Will you please give me the names of these makers, as I am very anxious to have their catalogues? J. T. TUNIS.

Lexington, Ky.

At the present writing, so far as we know, the only cars that will be distinguished in this manner during the coming season will be the Ford, Babcock electric, and the Atlas taxicab. The last named refers to a number of these cabs that have been ordered by a New York company for use in the metropolis, and we are not certain that this will be the regular equipment of these cars for cab use.

SOME DATA FOR A TWO-CYCLE DESIGN.

Editor THE AUTOMOBILE:

[1,695.]—Will you kindly give me your advice concerning a two-cycle, four-cylinder engine I am building. Would a two or three-port type be best suited for slow speed work? How would make-and-break ignition do for this style of motor? What make of carbureter would you advise? What size for 2 1-2 by 2 3-4-inch motor? What weight of flywheel would be advisable for a motor for this size having four cylinders. W. B. WATERMAN.

San Diego, Cal.

The three-port type of two-cycle engine is generally considered more simple and reliable than the two-port, though the latter gives very little trouble on slow-speed work, particularly where the load is at all steady. There is no reason why make-and-break ignition should not be as efficient on such a motor as it is on a four-cycle motor. There are so very many different makes of carbureters on the market which the manufacturers list as specially adapted to the two-cycle engine that it is almost impossible to select any one as being the best. Consult the maker whose carbureter you decide to invest in regarding the size. Half-inch would be ample for such a small motor. The weight of the flywheel will depend entirely upon the diameter you intend to make the wheel. If this is to be 16 to 18 inches, 30 pounds, as much of which should be in the rim as possible, would be sufficient.

A BAD CASE OF CARBURETER POPPING.

Editor THE AUTOMOBILE:

[1,696.]—Will you please answer, either by letter or through your next issue of "The Automobile," the following query, as I am sure that any of your subscribers who are owners of the Pope-Hartford 1905 machine have had and are now having the same trouble that I am.

After cranking my machine it will run nicely and continue to do so until I apply the throttle, whether the machine is moving or standing still, it will begin to explode at the air hole of the carbureter and will eventually get so that I have to release the throttle or the entire machine will stop. However, I can run along just as long as I use the sparker (and not the throttle). Of course, I believe my trouble is caused by the engine getting hot, but what is causing that and what is causing the carbureter to, as it were, spit back through the air tube?

I have just attached a new oiler, which is working nicely, am now using the same carbureter that the Maxwell cars have, have put new hose onto the pump, etc., and the circulation of water seems to be perfect. I have at times fed so much gasoline (in the hopes that that was my trouble) that the smoke is perfectly black.

The machine got this way about a year ago and I never could find out the trouble, and I have written the Pope-Hartford people and they don't seem to know the cause. I wish to add that I have just attached a new radiator. WALTER M. DUNLAP.

Rock Hill, S. C.

This is what is commonly known as "popping" at the carbureter, and it is usually caused by improper carbureter adjustment, as seems to be the case with your car. The motor runs well at a certain speed simply because the present carbureter adjustment happens to furnish a mixture that is approximately correct for that speed, but the moment the throttle is opened, the proportions of air and gas in the mixture are thrown entirely out of balance. The result in your case is probably an over-rich mixture, which is accordingly heavily charged with gasoline vapor and is slow burning, so that it is still afire—or, more properly speaking, considerable of the pressure created by the explosion still exists in the combustion chamber when the inlet valve opens to admit a new charge. The pressure naturally escapes through the inlet valve, and as its only outlet is the air port of the carbureter, it rushes out there with a pop. It will be evident that sudden and sharp drafts of this nature through the carbureter in a reverse direction will upset its functioning altogether, and either cause the motor to run very erratically owing to the intermittent and improper supply of fuel, or to stop altogether. Neither the water circulation nor the lubrication would appear to have any bearing whatever on your trouble, which presents nothing more than the usual symptoms.

If there be any question of the carbureter being deranged in any way, dismount it, clean the various parts and reassemble carefully. Open the nozzle valve sufficient to enable you to start the motor, and then very gradually close it until the motor will no longer run regularly upon the supply thus allowed. Reopen again very gradually until the gasoline supply is such that the motor will run constantly. By very gradually in this case is meant merely a fraction of a turn at a time as it is easy to pass by the point of proper adjustment. This will give you as nearly perfect a mixture for slow speed as can be obtained under service conditions. Should the very lowest point at which the motor will run without missing, cause hard starting, it is well to open the nozzle a bit further. Having reached this point, the auxiliary air valve should be adjusted to provide the proper mixture at the higher ranges of speed. Open the throttle slowly and note whether the motor "follows," *i.e.*, speeds up regularly and without missing in proportion to the increasing throttle opening. If the spluttering and popping occurs, accompanied by black smoke, release the tension of the spring somewhat so that more air will be drawn in; if the reverse be the case, the motor missing, due to a thin mixture, tighten the spring. The overheating you complain of and which you seem to have gone to a great deal of trouble to correct has probably been due to the constant use of an overrich mixture, which may or may not have been aggravated still further by running with the spark more or less retarded.

FAULTY TIMING PROBABLY THE CAUSE.

Editor THE AUTOMOBILE:

[1,697.]—I havs a two-cylinder Ford, 1904 model, the engine of whlch does not give the power it should. so I would like to see if you can help me out of my difficulties through "Lstters Interesting and Instructlve." The engine seems to drag and lose power. It will not climb grades on the high and overheats so that it pounds very badly. Do you think the valve timing or the ignition is at fault? How can they be timed correctly? If this is not the probable trouble, what other causes and remedies would you suggest? How can I rebabbit a connecting rod bearing? I would like to make the repair myself, but am at a loss to know how to do it. Have thsre been any articles on ths timing of valves and ignition in "The Automobile" during 1908? If so, in what issues did they appear?

East Orange, N. J. PERPLEXED.

It seems more than probable that the trouble with your motor is caused entirely by faulty valve and ignition timing due to wear. Cams, push rods and tappets all wear more or less in constant service, and this is likewise true of camshaft bearings, so that in the aggregate a slight amount on each would be responsible for a very perceptible difference in the valve timing, which would naturally tend to become later and later. This, in the case of the exhaust valve, would account for the overheating as the waste gases would be retained in the cylinder that much longer, and it would also account for the lost power as the inlet would open much later, preventing the inspiration of a full charge, this also being defeated by the high temperature of the motor.

Before attempting to readjust the timing, examine the camshaft bearings and if they allow sufficient play to have any influence on the valve opening, renew them first. The cams should also be looked to, and as they are undoubtedly pinned to the shaft, they may be replaced if found to be worn badly. Wear on the push rods and valve stems may probably be compensated for by adding slightly to the length of the latter, if necessary.

If the builder of the car has provided a guide on the flywheel for timing the motor, this had better be followed. If not a good timing for such would be about as follows: Open inlet valve 5 degrees past upper dead center, hold open 15 degrees past lower dead center; open exhaust valve, 25 degrees before reaching lower dead center, setting it to close at upper dead center or slightly beyond. This is on the assumption that the motor is designed to run at 800 to 1,000 r.p.m., which is probably the case as the horizontal twin-cylinder motor is not usually a high-speed type. The degrees are measured on the flywheel rim. Ignition should occur about 20 degrees in advance of reaching upper dead center on the firing stroke, assuming that coils and batteries are employed. The timer should be carefully inspected and made good; probably by replacing it with a modern type.

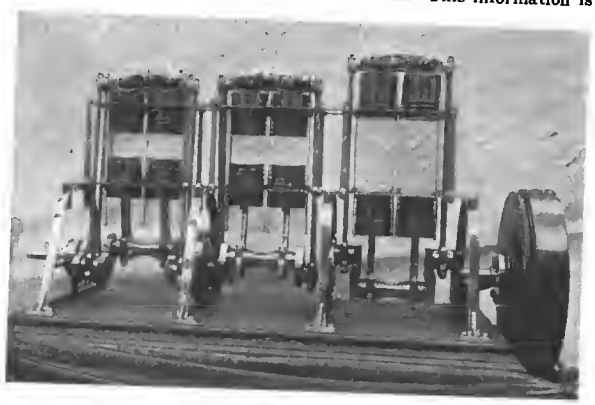
The proper method of timing the valves and ignition of a motor have been described several times under this heading, and a special article on the subject will be found in the issues of October 29 and November 5, 1908.

To rebabbit the bearing, line up the parts in exactly the relation they should bear to one another when working, after having thoroughly cleaned them. The bearing should rest on a block of wood so as to clear the bench all round. Take stiff putty and build a dam to close one end of the bearing, making allowance for the formation of a shoulder when the metal is poured. Make a similar dam at the other end forming a spout at the upper side in which to pour the metal and this spout should be made an inch or two higher than the level of the bearing. Use a high-grade babbit, bring it almost to a red heat, skim off the dross and pour quickly.

AGAIN THE GOBRON BRILLIE MOTOR.

Editor THE AUTOMOBILE:

[1,698.]—In your issue of November 26 you inform ons readsr, in letter No. 1,651, and show in a little design what is called a section of the double piston idea of the Gobron motor. This information is incorrect. The sketch shows the piston idea of the Boudeaux-Verdet motor with differential pistons, while the Gobron system is one of the opposite pistons type. I includs a motel motor photo with glass cylinders, which was exhibited in the Paris Salon, 1907, and it will show the idea in a quite satisfactory manner.



Illustrating the Gobron Motor of 1908.

Berlin, Gsrmany.

LOOK OUT FOR THE SMOOTH-FACED STRANGER.

Editor THE AUTOMOBILE:

[1,699.]—A very good desd which you could do would be to notify your readers warning them against a gentlemanly-appearing crook who drives a 1907 Pope-Toledo touring car. He is a dark-complexioned chap, with smooth face. He stops autoists and pretends to be in trouble, then borrows something in the tool or tirs line. I was charitably inclined and loaned him an inner tube. He gave ms a fake name and addrese—the latter was a church in Brooklyn. This same gentleman has also "bitten" others. He operates mostly around the parks. FRANK ALDEN MILLER.

New York City.

A NEW RECORD WORTH EMULATING.

Editor THE AUTOMOBILE:

[1,700.]—I wish to rscord something different. Last Monday, when all ths horses in Buffalo were suffering from the effects of a snow fall, a "friend in nsed" pulled ons of thsm and his heavy load (the horse had been stalled) with an automobile, and I guess dellvered ths goods. I didn't ses the end of tbe haul.

The friend was George Ulrich, who will be remembered as Mechanic No. 2 in tbe first Glidden tour. Hs wsnt through ths "flood" with Percy Plsrce and the Pierce Stanhope. He is a good fellow, as everybody knows connected with autoing. H. T. DUNKAR.

Buffalo, N. Y.

WHY THE AMERICAN MAKER NOW LEADS THE WORLD

By BENJAMIN BRISCOE, Chairman A. M. C. M. A.

ONE significant feature in connection with the rapid growth of the American automobile industry is a corresponding decrease in the business of the European manufacturer, who until only a short time ago had to be considered America's most formidable rival. As a matter of fact, the French manufacturer has to make preparations to defend his own market from the threatening invasion of the American product.

Even the most ardent desire to pay tribute to the ingenuity of the foreign manufacturer cannot remain blind to the evidence that the American manufacturer has recognized the various problems and possibilities presented by the new conveyance and taken care of them with greater alacrity. It is true that the automobile designer, particularly the foreign one, is prone to follow his engineering ideal to the detriment of the utilitarian side of the question. The American manufacturer, on the other hand—and this is perhaps an attitude characteristic of the American spirit exemplified in other fields—early came to the conclusion to cater to public demand as soon as such demand would assume definite shape. The result of this policy was the low-priced and economically-maintained car.

The American automobile is a nearly perfect car, and this result was attained not only by the use of good material and skilled workmanship, but principally by providing interchangeable parts, so that it is possible to produce units in great numbers with a single setting of machinery during the entire season. In short, the difference in foreign and American manufacturers' methods is that existing between making automobiles and manufacturing them. In the American method everything is interchangeable and in the foreign method it usually is not. It is a well-known fact that has been established to the edification of a New York taxicab concern that it is rarely possible in the French product to take the motor out of one chassis and place it without difficulty and without drilling new holes in the frame of another car. The two principal reasons for the superiority of the American product consists in low price and interchangeability of parts—the one produced by the other. The third factor is the reliability of the American car, and an additional element the much greater field in this country upon which the automobile can show its usefulness.

While the foreign manufacturer suffers from the evils of over-production the more important American makers find themselves in the other extreme, being generally oversold at a time when the yearly production is barely under way. Much of the present popularity of the American motor car is due to standardization and to a condition in which rapid changes are no longer the rule, but the exception.

It may not be too much to say that the precedents established by foreign makers and the ability of the American engineer to avoid the mistakes of his precursors has had much to do with our present advantageous position and our command of the world's automobile market.

That the American market will control the world's automobile demand there is no doubt, and the opportunities for such control are only beginning to manifest themselves.

THE SUPERIOR SPRINGING IN THE CARS OF TO-DAY

By CHARLES E. DURYEA, Technical Expert, A. M. C. M. A.

THE old adage that "details make perfection," is each year being given new life by many details of automobile construction, and in no one of these may it be seen more clearly than in the springing of the present day which will be exhibited at the Grand Central Palace automobile show, the first week in January.

The springs of horse vehicles were the product of a century of growth and development, from the time when the massive coach bodies were hung from four posts by leather straps so that they could sway in almost any direction and thus avoid the jolting of the wheels over the uneven roads of those days. From such crude hanging to the light, flexible and easy riding springs of the modern buggy was indeed a long step, requiring many years of trial and failure, till proper proportions, proper steels, and proper mountings were secured.

The motor vehicle developed a new problem. The earlier makers found it almost necessary to carry the mechanism above the springs in order to protect its many fragile parts from the road vibration, and this necessitated transmitting the power to the driving wheels through some flexible connection such as chains, or universal jointed shafts. Naturally, the makers sought to lessen their trouble by employing springs of minimum elasticity and greatest strength in order that they might the more safely carry the heavy and crude mechanism. As a result of this policy, the earlier motor vehicles were notoriously stiffly sprung and uncomfortable to ride in.

The last year or two has brought about great changes in these respects. Propeller shafts and their universal joints have been lengthened and improved until they are no longer regarded as sources of trouble, and until they permit large amplitude of spring movement both vertically and sidewise, much as does the spring under the usual horse vehicle. While few riders stop to think of the effect of this rolling or sidewise movement of the body, it is none the less true that the vehicle in which this movement is permitted rides more easily and is not affected by any qualities at one side of the road or the other, as is a vehicle less flexible in this direction.

The mechanism itself employed in modern autos has been designed to withstand or to permit greater wheel movement and greater spring action than was true in the earlier construction, so that springs to-day show not only greater elasticity but a greater variety of forms. Steel makers are doing their part by providing steels of better quality, especially adapted to the severe service of automobile work.

A few years ago the semi-elliptic spring fastened to the axle at its centers and to the body at its ends, was the common and almost generally accepted form. This spring permitted a vertical movement, but was practically rigid sidewise, and so served well to hold the axles in line with the mechanism and thus enable chains to follow the sprockets and transmit power in a satisfactory manner.

The full elliptic spring, a most common form on horse vehicles, was not considered so satisfactory in auto work, because it had less sidewise rigidity, while platform springs, the most flexible of all, were not to be thought of.

This year will show a much larger variety as exemplified by full elliptics on the Reo, Regal, Premier, Pennsylvania, Oakland, Mora, Moon, Moline, McIntyre, Maxwell, Marmon, Jackson, Holsman, and others, while some models of these same makers will show semi-elliptic, as will the Acme, the American, the Austin, Chadwick, De Luxe, Ford, Gaeth, Gearless, Glide, Mitchell, and others.

Three-quarter elliptics will be found on the Reo, Pennsylvania, Premier, and Austin.

Platform springs are used on the Stoddard-Dayton, one model of the Pennsylvania, Moon, National, and American. In a few instances double springing is used consisting of one spring within another, whereby one takes the lighter load.

The Finest Automobile Ride in the World

By O. L. Halsey

THE title is true. There are just 14 miles of it, but those 14 miles yield more interest and more indelible impressions than any other 14 miles of road extant. This is the St. Gothard Pass, in the Alps.

It forms a part of the most direct route between Como and Lake Lucerne. It crosses the mountain range whose name it bears and whose highest peak, the famous Galenstock, rises nearly thirteen thousand feet. The pass itself reaches an altitude of 10,000 feet, being anywhere from one to four thousand feet higher than the more recently constructed railroad pass and tunnel underneath.

Such geographical specifications seemingly would insure the pass of St. Gothard to be a famous and well-patronized automobile highway. The contrary is true. The average automobilist, whether home-spun European or imported American, avoids the pass of St. Gothard. It is a road for the daring, and its charms, that are visible from every turn of the road, are well worth the venture.

Occasionally St. Gothard Pass Twists Through a Beautiful Mountain Village.

We were touring Europe in our Packard "Thirty" when we came to the pass. Its grandeur and its difficulties were recounted to us. We decided in favor of the grandeur, and learned that touring Europe in an auto is one thing of which a ride through St. Gothard Pass is not a part, but another and bigger thing.

At the entrance is Airolo, a typical cluster of chalets, plus hospice and railroad station. We reached there late in the afternoon and learned that automobiles may venture on St. Gothard Pass only in the evening and early morning. To be exact, they are allowed on the pass between 5 and 7 P.M., and 6 and 8 A.M. The better part of the permitted two hours is required to make the journey.

We went that evening. With a strange apprehension that was almost timidity we looked up from beautiful Airolo into the snow-coated mountain peaks that hid all but the first few turns of the wonderful pass. Then we started from summer into winter; from a temperature of 82 degrees to a temperature of 10 degrees; from pleasant, comfortable touring into difficult, uncertain, and dangerous mountain scaling; from a prettily set village into stern heights where mere prettiness would be an insult to the view's magnificent portions indescriptive in words.

When this pass was built for the moving of armies, no other purpose was taken into consideration. Seldom is it wide enough to allow the safe passage of two vehicles. In many places, one vehicle has a narrow and precarious footing on the mountainside. For miles it is possible to look over the side of the car, down perpendicular rock walls, to snakelike torrents of melted snow a thousand or two thousand feet below. There is no wall on the outer edge of the pass, the greatest precaution for safety being a slight curb, five or six inches high. Sometimes the road slants downwardly toward the outside.

The prompt ascent after passing the guard house necessitates learning a new kind of automobile driving. The steep grade is a succession of sharp, narrow turns. Some of these angles were so acute that it was impossible to turn them without stopping and backing the car. As we progressed, we learned to negotiate these turns somewhat more easily by swinging just at the right point and just inside of a corner where the pass ended and a vertical precipice began. All the time it was steady, hard climbing on second speed. The motor settled down to an unquivering gait, and there was no break in the even progress except an occasional acceleration at the acute turns where it was necessary to increase speed in order to make them without shifting gears.

We were awed by the dangerous character of the road; by the natural respect which the mountains themselves commanded, and by the occasional glimpse of the ubiquitous Swiss bayonet, thrust over a stone wall or a pile of rocks. In St. Gothard Pass you are always between two evils. You must not stay in the pass more than your allotted two hours and you must not exceed certain speeds to get out of it in that time. However, you are not angry at restrictions. The road is dangerous enough when you are the only traveler on it. It is no place for meeting other automobiles. "Joy riders" should not come here.

Devil's Bridge That Spans a Mountain Stream.

The man behind the bayonet never speaks and you do not answer. Sign language is sufficient. We, in the climbing car, did not even talk to one another. There are some places where conversation is profanation. This is one of the places.

Where St. Gothard Pass Becomes a Pitch Black Tunnel.

Where the New Railway Is Visible from St. Gothard.

The echoing blast of an Alpine horn put us in a quiver. It meant the approach of a skidding stage coach descending with wheels locked. We took no chances in passing vehicles on that road. Fortunately, there is little other traffic than the mail coaches, a few local carts traveling short distances and, in the lower altitudes, herds of sheep.

Once we shot down a sharp and unexpected decline to find ourselves headed for a small black hole in the face of an immense expanse of rock. There was just room to steer the car into it clear of the walls. Daylight was snapped out in the infinite blackness. We were scared, but we did not light the lamps. For what seemed a day, and probably was a quarter of an hour, we drove through this winding tunnel, guided only by the reverberation of the trilling motor against the rock.

When at last we left the streak of night, we found the winding shelf illumined by the mellow lights of evening. Again we climbed, climbed and climbed up the mountain wall. It was cold and we huddled together in the car.

We ran through snow, blown in icy sheeets against our faces. Looking upward, the pass was faintly and more faintly marked at each successive turn it took along the mountain. It seemed an unending journey to the peak above, and when that goal was reached, we saw again the zigzag pathway to the next.

The wonderful background of lurid fires where the sun sank behind the glistening snow caps; the devious road disappearing in the subdued colors of cloud-toned twilight; the great solitude —all of it was awesome, fascinating, overwhelming.

Tensely silent, we rode to the highest point. There the strain was broken by the marvelous beauty of the panorama spread at our feet. We stopped and clambered out of the car for a last look over the valleys and peaks, snow drifts and glaciers, rivers and villages, passes and tunnels of this Alpine region as pictured from the turrets of Galenstock.

For an hour we had not spoken. We were chilled to the bone. There had been no sound except the ceaseless purring of the motor. Our farewell glance upon the scene was a lingering one. The winding four-mile descent to Andermat was begun reluctantly. Once on the way, however, we slid and scrambled down that shelf as fast as we could without going over its side. That was the hardest job of steering I ever have done. It was a case of 100 per cent. accuracy, because there was no allowance at any place along the twisting road for the mistake of an inch.

Afterward, we continued our tour through Europe (some 6,000 miles altogether) but that, to me, is always another story. Whenever I think of those 14 miles on St. Gothard Pass, I immediately forget all of the other automobiling which I have done in deep appreciation of the wonders of this finest of all automobile rides there are in the whole wide world.

PARIS TO HAVE MOTOR-DRIVEN FIRE BRIGADE.

PARIS, Dec. 17.—All horses have to be dismissed from the city of Paris fire brigade and their places taken by gasoline motors. The order has been given by the Municipal Council after two years' close experimenting with mechanically driven engines and fire tenders and would be put into force immediately were it not for the heavy cost. There are at present 76 horse-drawn fire engines in the city of Paris, costing annually a sum of $64,000; if they could all be immediately transformed into gasoline engines the annual upkeep cost to the city would not exceed $17,400. The cost of transformation, about $320,000, will be spread over a period of six years.

Here the Pass Is Between Pastoral Scenes and Peaks.

The Hospice at the Terminal of the St. Gothard Pass.

WHY don't more women drive automobiles? There are, to be sure, a great many women who drive cars as skilfully and successfully as any male driver, and it is an interesting and noteworthy fact that each season there is a considerable increase in the number of women who become owners and operators of motor-driven vehicles. A few years ago a woman driving a car unattended attracted much attention and was viewed with undisguised curiosity by all who saw her. There was only now and then a woman who had the termerity to make an attempt to operate an auto, and, indeed, when one considers the imperfections of the car built a few years ago, one can more readily appreciate the many obstacles that she had to contend with and overcome if she became a successful driver. Cars were then far more complicated, mechanically, than any at present, but even so it was fully demonstrated that there were some women who possessed the ability to overcome these obstacles, and who—probably possessing a tendency toward things mechanical—mastered the intricacies of the gasoline engine and succeeded admirably as operators.

Before leaving home for a trip the car should be carefully looked-over—this will occupy but a few minutes and save much annoyance from troubles on the road. The batteries and coil should be tested, the spark plugs clean, the gasoline and water tanks well filled, and there should be a plentiful supply of lubricating oil. An abundance of oil should always be kept in the crankcase of the engine, the change gear box and the rear axle or differential. Each and every wearing part—the

Before leaving home for a trip the car should be carefully looked-over—this will occupy but a few minutes and save much annoyance from troubles on the road. The batteries and coil should be tested, the spark plugs clean, the gasoline and water tanks well filled, and there should be a plentiful supply of lubricating oil. An abundance of oil should always be kept in the crankcase of the engine, the change gear box and the rear axle or differential. Each and every wearing part—the

Then there are the women whose husbands do not approve of the feminine portion of the family aspiring to the honor of driving the family car. His real reason is without doubt in many cases a wholly selfish one—he fears her proficiency and does not want her to use the car as often as she would wish were she capable of its operation. But in spite of the many cynical shafts of alleged wit that some "superior" men love to launch at feminine autoists, the woman who drives and understands her car has a distinct advantage over the woman who motors without enthusiasm, and who does not know the difference between the spark plug and the rear axle or a Wray muffler from the device which silenced, and there are very many motorists of this type.

Then there is the motor woman who dislikes machinery—who is afraid of soiling her hands or gloves or gown with a bit of oil or grease, and who considers herself of far greater importance and far more elegant when seated like an automaton in the tonneau of the car dressed as elaborately as the pastime will possibly permit, with a miniature powder puff always ready to dab her nose occasionally for fear a little dust may settle thereon.

But the time has come when the ambition of the woman autoist is to be able intelligently to understand the mechanical features of her car and to learn to drive well that she may go about when and where she wishes without being bothered with a professional chauffeur. There are very many women who might enjoy the pleasures and benefits of autoing were it not that they doubt their ability to learn how to drive and how to overcome obstacles. The majority of these same women would be perfectly able to master the modern car after some practical instructions from an expert.

A great many women who could easily manage their car hesitate to do so through mistaken ideas of the difficulties to be overcome. The very first thing necessary for the woman who has decided to become an owner and driver is to select her car. If she is wise she will pick one which is simple in construction, for this is an important factor when she is to drive the car herself. Of course, a car of standard manufacture is always preferable to one little known, and a moderately powered car will answer her requirements perfectly. The first duty after purchasing the car is to become perfectly familiar with it, for the greatest pleasure of autoing is to be able to do all things about the car that exigency may demand.

The first time the woman operates her car alone she will have very little confidence in her own ability. It is always wise to practice turning—backing about and turning around—plenty of room as free from obstruction as possible should be found to experiment in.

One should learn to control the speed of the car with spark and throttle as much as possible and only release the clutcher when absolutely necessary. The low gear should only be resorted to in extreme cases. The spark should be used for speed and the throttle for power. Gradually familiarizing oneself with the operation of the car, the disengaging of a clutch or applying of a brake will become practically automatic.

axle joints, steering gear, change gear levers, brake mechanism, etc., should be liberally oiled.

It is always important that the gasoline should be strained before putting it into the tank—it only requires the tiniest bit of grit or dirt to clog up the carbureter. The two most important factors to look after in connection with a gasoline engine are the flow of gasoline and the electric spark. The ignition system should be watched and gone over carefully from the batteries to spark plug. If an engine slows up the trouble is very likely in the mixture of gas supply or to the batteries running down. When the engine comes suddenly to a stop it is practically certain that the cause is some defect with the ignition system. If an engine slows up and stops and then after a moment starts up again and runs a mile or two, it is a sure sign that the batteries are run down. An engine seldom stops abruptly without preliminary warnings.

Sometimes a mixture of gas is exploded in the muffler by the heat of the exhaust. This is called back-firing and is caused by too great a supply of gas being fed to the engine. As this cannot be fired or exploded it is forced into the muffler with the exhaust gases. A sure sign of too much lubrication is blue smoke coming from the exhaust, and when too much gasoline is being consumed the smoke will be black. An over supply of either oil or gasoline will cause dirty valves and sooted plugs.

A constant buzzing of the coil denotes a short circuit. The coil should buzz only when a spark is wanted. When the coil does not buzz it is an indication of no current, caused either by weak batteries or broken wiring.

After a woman has operated her car for some time she can readily tell by the sound whether the engine is running smoothly and correctly. If there is premature ignition, loose bearings, loose distance rods, any small obstruction in the sprocket or gears, or a broken or loose framework, or, in fact, any unusual sound, it should be immediately investigated and eliminated, if possible, for although one may be able to get home the damage done is quite apt to be expensive to the owner. When the engine has become overheated and the pistons are jammed tightly by lack of water, the cylinders can be tested by sprinkling a little water on them. If the water hisses and immediately dries off the tank must not be refilled until cool. Some kerosene can be poured into the pistons while they are hot. This can, of course, be taken from the lamps. If the pistons have become seized the cooling process will be a slow and tedious one. There are symptoms, however, that indicate overheating, such as a violent pounding of the engine, steam issuing from the filling nozzle, water coming out of the overflow pipe while driving, continued firing after the ignition is off and smoke rising from the engine. If these symptoms are noticed, and kerosene is injected into the cylinder, meanwhile turning the engine by hand, the temperature will go down and the pistons will move freely. The most effective way to cool a heated bearing is to pour water on it until cool. It should be well oiled before attempting to run the car again.

In driving it is quite unnecessary to disengage the clutch or to apply the brake when turning corners. The speed of the car should be lessened by throttling as the corner is approached and opening up when about half way around. Plenty of room should always be allowed in case of the car skidding. In climbing steep grades it is necessary to drive with the spark a little slower and throttle well opened. The engine should never be allowed to race; the moment it begins to race the spark should be retarded. An engine is at its best when run at its highest speed without racing.

A car should never be left standing alone without setting the brake and removing the switch plug. Testing the brakes every day only takes a second and is an important thing.

The woman autoist must have her car positively within control before attempting steep grades. In ascending the principal requisite is plenty of power, while in descending the brakes are an absolute necessity if danger is to be avoided. When the woman is driving she must give all her attention to her work. She cannot look around at the scenery, talk over the latest fashions with her friends or forget her responsibility, for the slightest mistake or a loss of control of the wheel may result seriously if not fatally to herself and companions.

One should at first confine themselves to short trips until they have learned to understand each and every piece of mechanism of their car and the proper function of each. On long trips it is especially necessary to thoroughly know the motor. When that is accomplished longer trips may be taken with perfect safety, especially if a little previous experience will have the effect of instilling confidence, which is an asset not to be ignored.

The woman who is learning should above all else be possessed of the virtue of patience. She cannot expect to learn to know her car at once. Perseverance and patience and time will work wonders and constant association with things mechanical gives one a degree of skill in manipulating tools that will astonish the novice. Common sense is the first principle needed to run a car. Ingenuity is another needed requisite, and with intelligence and the desire to become proficient the average woman may confidently expect to develop into a successful and expert car driver.

TENTATIVE SCHEDULE FOR EUROPE'S BIG 1909 EVENTS

PARIS, Dec. 17.—In accordance with an established custom advantage was taken of the presence of delegates to the Paris Salon to draw up a calendar for automobile events in 1909. At present the dates are only tentative, the interested parties being given until January 15 to make changes or additions. After this time all new events proposed must be on days that do not clash with the program now drawn up.

In January the only important features are the Brussels Show, held from the 16th to the 25th, and the Turin Salon, from January 30 to February 14. During February the Monaco motor boat and aeroplane races will be held; during March there will be a number of events on the Mediterranean coast, but none of them of more than local interest.

There will be a small industrial and taxicab competition in the neighborhood of Paris from April 15 to 25; motor boat races will be held on the Sicilian coast on the 25th and four days later the Sicilian voiturette race will be held.

May 2 has been selected for the Targa Florio, in Sicily.

Moscow-St. Petersburg automobile race will be held on May 26.

Germany and Sweden will both hold industrial vehicle competitions during the month, the exact dates to be decided by mutual agreement.

June 10 to 18 will see the competition for the Prince Henry Cup in Germany. Kiel regatta is fixed from June 24 to July 3 and Switzerland will hold an industrial vehicle competition on the same dates.

The French Grand Prix has been scheduled for July 1 to 3, the first day probably being for weighing-in and the two following days for the voiturette and big car races.

Ostend automobile week will take place from July 13 to 17; and from July 24 to August 2 Amiens will hold an exhibition for agricultural automobiles.

Mont Ventoux will be climbed on September 5.

Italy will have its great race under international rules at Bologna from September 11 to 19; Semmering hill, in Austria, will be climbed on September 19.

Austria will hold a commercial vehicle competition from October 3 to 17, and the Automobile Club of France will have a similar demonstration and test from November 18 to 28.

COMPLEX CHARACTERISTICS OF AUTOMOBILE BODIES

By COKER F. CLARKSON, A. L. A. M.

ONE of the most important branches of the complex automobile industry is undoubtedly that connected with the body. When the first gasoline machines made their appearance, the questions of comfort, appearance and durability in body work were relatively neglected. There were a few American carriage builders with sufficient foresight to perceive the trend of events, banish their prejudices and meet the demand of the automobile manufacturer and user more than half way.

Wood still plays an important part in high-class automobile body work. And if satisfaction is to be given, it is essential to employ none but carefully selected and thoroughly dried pieces.

For the making of automobile wheels on the artillery plan only the most carefully dried wood, without flaw of any description, should be considered. One firm claims that up to the present time no accident arising from a faulty wheel produced by it has been reported.

All the wood is many years old. It is stocked in buildings, ventilated by a special system, and packed layer on layer with joists between, in order that the drying process can continue evenly. The entire stock is examined every year and turned. At least five years elapse from the entry of a piece of wood into the storage, before it is cut up for use.

It is interesting to go through the various departments from the designing rooms to the varnishing hall with its even temperature, excellently arranged lights and dust-proofness.

There is nothing mysterious in good coach work, although it is surprising to find the great number of parts required to build up a limousine or laudaulet, the strength of the iron-work and the tremendous number of coats of finish. The paint on a large limousine body weighs much more than the average man would say; as much as seventy-five pounds or more. The painting and trimming of the car is in material degree specialized work. Good painting cannot be done on other than a good foundation, with the proper graduation of the several coats of paint and varnish.

The strains to which a motor car body is subjected are greater than and considerably different from those in the case of a horse-drawn vehicle. No one engaged in making cabinets, furniture, house or other stationary fittings, could have any knowledge derived from the practice of his own business of what is necessary for the automobile. The framing of the timber, the use of panels, not merely as enclosures, but as trusses supporting the external framing, the hanging of the doors and provision for the clearance for paint, etc., have to be studied specially. The supposition that springs can give ease of riding when comparatively little attention has been paid to the form or material of the body and its trimmings is responsible for much discomfort.

The Mechanical Branch of the Association of Licensed Automobile Manufacturers has held meetings with representative carriage makers, to see whether the latter can reduce the weight of bodies to any extent, and to interchange ideas on other interesting subjects on which the automobile engineer and the body maker are working.

The Carriage Builders' National Association was founded thirty-five years ago, and about twenty-five years ago established a technical school in New York for the instruction of carriage draftsmen. The idea of this school is to turn out men who can take a draft and work from it; or go back to the bench as workmen, their wages being increased by their technical knowledge: or later on perhaps, secure employment as draftsmen to the exclusion of other work.

You can take two men and put them side by side in construction; let one man know his business, understanding just how the thing should be proportioned; he will turn out a body that will be stronger and better than the man at the next bench: and there will be one hundred to one hundred and fifty pounds less weight in the product of the good man.

One serious thing that the automobile and the body maker have been up against is the man who wants to have a body built that will carry one person with the springs riding easily, in which he can pile eight or ten people and have the springs ride just as easily; which is somewhat like making a linen duster and a fur coat out of the same cloth.

The makers of wood automobile bodies will not acknowledge that bodies made of aluminum are lighter than those made of wood; but maintain that the real state of facts is the reverse. By the use of templets practically, some excellent bodies are now being turned out with great rapidity.

The question of metal panels on bodies has another feature besides weight. One of the things that has troubled the carriage manufacturer is cracks and splits in the panels; which aluminum or sheet metal construction eliminates. The extreme heat and cold of a country are factors to be considered. A body built for example, in England, France, Germany or Austria, which have moist climates, different from ours, may last there for years, and give trouble here, in steam-heated garages, etc., by what is called "opening up." This is one reason why it is customary to kiln-dry lumber here, whereas abroad anything but air-dried lumber is rare or unknown. Moreover, the kind of wood generally used in this country has a lower coefficient of contraction and expansion, besides being stiffer.

Some body makers use aluminum-coated steel for panels, to avoid checking in painting and what is known among painters as "graining out."

As a rule automobile bodies are lighter than a corresponding body on a horse-drawn vehicle; for example, the rocker plate and sills of an ordinary landau, which weigh one hundred and sixty pounds, are eliminated in an automobile body.

No doubt people who have built metal automobile bodies up to the present time will in the future use increasingly, processes not dreamed of a short time ago, welding parts to make them integral, doing away with the use of rivets, screws, etc. Of course, there has already been much development in the use of cast aluminum for bodies.

The American carriage builders are now thoroughly aware of the changing character of their trade and welcome the automobile. They appreciate keenly the business of the automobile factories and are willing to work with them in every way. The members of the Licensed Association are pioneers in this co-operative work as in many others. When the automobile started, the average carriage maker pooh-poohed it, and would not take hold. In Europe no automobile maker has ever built a body, except one German firm who built a low-priced one.

MICHIGAN AS AN AUTO-MAKING STATE.

LANSING, MICH., Dec. 28.—The growth of the automobile and allied industries in Michigan during the year 1908 has been enormous, according to the records of the Secretary of State. This in spite of the fact that 1908 was one of the most unfavorable years in the industry. The records show that no less than 22 new corporations were organized for the manufacture of automobiles or motors, the conducting of garages, or the developing of the gas engine. These 22 corporations have a combined capital of $2,400,000.

In addition to the 22 new corporations, 11 more engaged in these industries have increased their capital stock from $2,340,000 to $6,500,000. This makes the new incorporations and additions to capital during the past eleven months in Michigan alone aggregate nearly $7,000,000.

These figures do not include the large organizations of the Cadillac, the Oldsmobile, Reo, Chalmers, Buick, Reliance, Brush, and some of the other important companies. The estimated dividends earned during the year will aggregate $50,000,000.

THE AUTOMOBILE

THE GRAND CENTRAL PALACE SHOW

Displayed to the best advantage possible under the circumstances, the automobiles at the "Palace" are there to do justice to the promises made for them. That the exhibition would be more in keeping with ideals, would be true were the Palace quite double its actual size, but this would add nothing to the quality of the cars or the enthusiasm of the exhibitors and the spectators. There is a distinct tone of rejoicing which is steeped in confidence, and participation is general. The makers recognize the fact that they undertook much in their endeavor to make and deliver a greatly increased number of superior cars at a far lower price, and they rejoice now that the task is substantially completed. The spectators knew full well what was going on and were curious; the public is always on the lookout for an ambush. On this occasion the public are quick to recognize what will go down in history as an agreeable situation.

Makers have been promising that the 1909 automobiles would be full fledged perfected products, at the price which formerly represented the purchasing power of little better than runabout types. Generally such statements are the product of viewing things through rose colored glasses, at a distance so far that the actual state of things would be unrecognizable. As it is, the whole situation is as simple as A, B, C. The products are actually there, they are in such profusion that choice is going to be a difficult task and the worst choice possible to make will land a better automobile than the best that double the money would buy, even one single year ago. It is not that the makers are in a mood to deliver something for nothing; they fully intend to pay dividends; the chances of succeeding are much enhanced.

What is it that crept into the automobile business that thus rendered such a condition possible? Was it because the business fell into the hands of men of more skill? Decidedly no! The whole situation is representative of the old adage, i. e., "practice makes perfect." The time was sure to arrive when automobile co-operation, involving the makers of cars and the fashioners of materials, would result in a perfected product. The countless detached and incongruous ideas were either incorporated, or cast aside, depending merely upon their abstract value. The horde of theories in relation to materials were reduced to a settled few and the process of manufacture was put on a basis involving the duplication of parts, each like the other, all in full compliance with a settled plan.

Harmony reigns supreme, and the direct result is lower prices, better cars, and assured dividends. The purchaser (the intelligent purchaser) is as much interested in the question of dividends, as in the direct question of the quality of the offering. To acquire a car from a company that is about to embrace the "receiver" is to take out a license to pay an enormous price for repair parts, and wait until they are whittled out by hand in a repair shop. This is not all. The product will soon look like an odd number on the road alongside of the outpourings of shops that do keep in the procession; and, on the whole, it is a moral certainty that such a purchase will prove little short of a total loss. The weaklings, of which there were a surprisingly small number, went down last year. The survivors were wise enough to break out in such vigorous profusion as to be too formidable to be captured by any temporary flurry that might come their way. In the meantime, it was realized that a certain standard of excellence did render itself manifest and that anything short of that standard would be unsafe, especially in view of the fact that automobiles have to be built in large quantities before they can be disposed of. In large quantities to influence the price, and in view of the influence of season, and the time it takes to turn them out, to be able to deliver at the propitious time, there is but the one way. Under the circumstances, it would be foolhardy to come on the market with a large quantity of "freaks." No man of business acumen would attempt it, nor can such examples be found at the show.

Let it not be supposed that the cars on exhibition are prototypes of each other. For every want there is a make of car to fill it. The respective makers have selected the *clièntele* to which they propose to cater, the result is a diversity that renders the show of far more than passing interest, and the patrons of the industry will be afforded ample opportunity to display their skill in the process of selection. If it is true that the conventions were observed in the designing of cars, it is equally true that individualism has had ample scope to render itself manifest. The patron with an "ideal" in his mind's eye will find the car to match it if he looks long enough.

NEXT COMES MADISON SQUARE GARDEN SHOW

BUT eight years ago, it was a difficult matter to stretch the meagre amount of available material at hand sufficiently to make even a passable attempt at covering the main floor of Madison Square Garden; for the Ninth National Show, which is next on the boards, January 16-23, the space on the ceiling would be utilized if that were possible. As it is, by planning and scheming, a greater number of exhibitors than has ever before been accommodated by the Garden will hold forth there in a few weeks, the official list of exhibitors showing an increase of fully two score over last year, or a gratifying total of 294.

Standard makes of licensed cars will be grouped for the most part on the main floor, the remainder being on the elevated platform surrounding it, in the café and in the basement, while the electric vehicle exhibits will be confined to the exhibition hall. All the commercial vehicles will be in the basement. A recapitulation shows 47 exhibits of complete cars, 26 motorcycle exhibits, and 221 exhibits of parts and accessories. The exhibitors and the spaces they will occupy are as follows:

Main Floor.

1 Knox Automobile Co.
2 Matheson Motor Car Co.
3 Elmore Mfg. Co.
4 Cadillac Motor Car Co.

W. K. V. JR., TRIES CUBAN ROADS.

HAVANA, Dec. 28.—Governor Magoon, who retires from office January 1, received a sincere compliment together with personal congratulations from William K. Vanderbilt, Jr., and a party of friends who have been motoring through Havana Province. They declare great satisfaction with the new roads built by Governor Magoon, saying that they compare favorably with the well-known roads in France. Cuba is also recommended by this party as a touring place at this time of year, the scenery being beautiful, the aspect of the towns and the character of the people commendable, which, with the smooth roads, make this portion of the country a new and delightful touring ground. Mr. Vanderbilt's party is traveling on his turbine yacht *Tarantula*, and autos are carried along.

PRESIDENT-ELECT TAFT BELIEVES IN AUTOING.

That President-elect W. H. Taft is going to be a good autoist is demonstrated by his continuous use of a White steamer at Augusta, Ga., where he is spending a Winter vacation. Mr.

President-Elect Taft as a White Steamerite.

Taft's family is shown in the picture herewith given, and the commodious car answers for family uses of various kinds.

In the photograph Mrs. Taft is sitting next to the President-elect on the rear seat; the older children, Robert and Helen, are sitting in the revolving seats, and Charlie, the youngest child, is next to the driver, H. N. Searles, who has been in charge of President Roosevelt's White cars for two years.

MICHIGAN CITY TO SUPPLY MUNICIPAL AUTOS.

LANSING, MICH., Dec. 28.—Apparently not to let the reputation of Lansing as an automobile town suffer, the local Council and the manufacturers are designing to furnish automobiles to all the city departments. The new Webb fire engine on an Oldsmobile car has been in use by the fire department for a month now, and it has shown up so well under all manner of difficult tests that there is no question that it will be accepted. In addition to this, the Oldsmobile company has furnished the fire chief with a special car for his use, and now it is reported that the same manufacturers will donate an auto to the chief of police.

D. S. LUDLUM, NEW AUTOCAR MANAGER

PHILADELPHIA, Dec. 30.—Announcement has been made of the resignation of David S. Ludlum as assistant cashier of the Philadelphia National Bank to assume the presidency and general managership of the Autocar Company, of Ardmore, one of the pioneer and best known automobile plants in the country.

Mr. Ludlum's abilities, coupled with his successful business career, qualify him for the responsibilities and duties which devolve upon the manager of so large a concern.

While coming into contact with many great business enterprises of the country, Mr. Ludlum was attracted by the automobile industry as a field of great opportunity for immense development, and particularly that field comprising the commercial side of the industry. This is the field to which the Autocar Company is now devoting the major part of its capacity, having during the past two years perfected a commercial chassis of a special design, of high efficiency and much flexibility, including delivery wagons, town cars, taxicabs, etc.

It is predicted by those who know Mr. Ludlum's personality that he will not be long in becoming prominently known in this promising field of the manufacturing world.

John S. and Louis S. Clarke, who were the founders of the Autocar Company, will retain their positions of vice-president and consulting engineer and continue their present active connections with the company.

POSSIBLE CORBIN REARRANGEMENT.

HARTFORD, CONN., Dec. 28.—Howard S. Hart, former president of the Corbin Motor Vehicle Corporation of New Britain, has made two distinct offers to buy out the concern. The last offer was made a few days ago, but did not prove entirely satisfactory to the controlling interests. Before Mr. Hart retired as president of the company he had things pretty well in hand, so that matters are now quite satisfactory to the stockholders. It is understood that Mr. Hart was to have formed a large company for the manufacture of the Corbin cars in the event of his offers being acceptable. There is a strong desire to segregate the motor car business from the affairs of the American Hardware Corporation, and some time ago a committee was appointed to look into the workings of the Corbin Motor Vehicle Corporation. The directors of the American Hardware Corporation will hold a meeting on Wednesday of this week and a report on the Corbin situation will be submitted in all probability. Mr. Hart has said that there is at present no open proposition on and if any advances are made they must necessarily emanate from the Corbin Motor Vehicle Corporation. The outcome is awaited with much interest.

POPE COMPANY NOW IN COMMAND.

HARTFORD, CONN., Dec. 28.—On Saturday of this week, January 2, the Pope Manufacturing Company will anticipate the payment of $267,000 of its 6 per cent. notes, issued under the reorganization plan and due August 1, 1911. This will leave $533,000 of notes outstanding, of which $266,000 mature August 1, 1909, the balance August 1, 1910. The subscribers to the notes are called upon for the payment of the balance of their subscriptions January 2, 1909.

Vice-Chancellor Howell, of Newark, has authorized the receivers of the company to pay the final dividend of 25 per cent. and 6 per cent. interest to the creditors.

CLAIMS AN ORDER FOR A THOUSAND.

YORK, PA., Dec. 28.—The Hart-Kraft commercial car recently made its first appearance on the streets of York, when a local department store put on the new delivery wagon. The new car made quite a hit with a number of York merchants, and as soon as orders can be filled, there will be a number of the new cars on the streets within a very short time.

AUTOMOBILE ROW OF COUNTRY'S METROPOLIS

"AUTOMOBILE ROW," New York City, extending in Upper Broadway for forty blocks north from Forty-second street, is a livelier scene to-day than ever before in its short history, although the era of removal from the little, old "Row" of five years ago in Thirty-eighth street, only a short block in length, has been completed, and the wonderful expansion in salesroom and garage facilities that occurred in 1906 and 1907 has been succeeded by a temporary lull to allow the normal growth of trade to catch up.

There are very few vacant salesrooms in "Automobile Row," and such as are idle have been so only a short time and are not likely to remain vacant long, notwithstanding rentals are high. The only big garage that has been erected in Broadway this year has just been completed at Sixty-fourth street. It was built by capital outside of the automobile industry and is the largest garage and sales establishment on Broadway. It was erected by Robert Goelet, and is of concrete construction, thoroughly fire-proof and up-to-date. Enough applications for space in the new Goelet building have been received, it is said, to fill it several times over, and it is expected that occupancy will begin early in the new year.

The only other large garage that is vacant stands at Broadway and Fiftieth street and has never been occupied since it was erected about three years ago by the Wendel estate, which has refused many offers from automobile concerns to lease it.

Garages on side streets where rentals are lower, are in active demand by new taxicab operating companies, which have had great difficulty in finding suitable quarters. The New York Taxicab Company, which operates 600 Darracq motor cabs, has just completed and occupied a new fire-proof brick garage in West Thirty-seventh street near Tenth avenue. The cost of construction was about $200,000. During the past Summer and Fall the company was obliged to keep more than 100 of its cabs in live storage under a big circus tent in a vacant lot on Eighth avenue between Fifty-seventh and Fifty-eighth streets. It also has unexpired leases on two old livery stables in West Sixtieth and West Sixty-second streets, just off Broadway, which it has occupied since it started the taxicab era in the Fall of 1907.

Cost of Broadway Garages.

Garages in Broadway range in cost from $100,000 to $500,000 each, and it is estimated that they have a combined capacity to house about 10,000 automobiles. The development of "Automobile Row" has been so rapid that there are few remaining available sites for large garages between Forty-seventh and Seventy-second streets. Three large garages erected by the Century Realty Company at the northwest and southwest corners of Broadway and Sixty-second street were leased at full market rates by the builders and before the completion were sublet by the lessee at almost double the first rentals.

Although five years ago the greatest "Automobile Row" in the world was the Avenue de la Grande Armee, in Paris, New York's "Automobile Row" in upper Broadway now exceeds it in the attractive character of its salesrooms and garages and also in volume of sales. The new Thoroughfare building, occupying the block in Broadway between Fifty-seventh and Fifty-eighth streets, has become a very beehive of dealers in motor car specialties. While little building was done by automobile companies during the past year, the coming year is sure to see renewed activity, since it has been announced recently that the Peerless Motor Car Company has bought a large plot of ground at Broadway and Fifty-seventh street and intends to build a large modern salesroom for its own use; and A. T. Demarest & Co., the carriage builders and agents for several foreign cars, have leased an adjoining plot for the erection of a new building on the immediate corner of Fifty-seventh street. This move is particularly significant of the decline of the fine carriage trade and the rise of the automobile to fill the vacancy thus made.

Plans for new buildings specified as garages filed with the Department of Buildings during the year 1908 had a combined estimated cost of $320,000 for five structures, as compared with $272,000 for nine garages for which plans were filed during 1907. These figures, however, are no criterion of building activity or of value of Broadway garages, since many of the latter are specified as salesrooms and storage, while the smaller garages are for private use.

Enormous Retail Trade of Metropolis.

The extent of the automobile retail trade in New York is so great that it would be a herculean, if not actually an impossible, task to arrive at even an approximately accurate record of sales. This can be done only by the active and honest co-operation of all of the branch houses, agencies and importers through such a central organization as the New York Automobile Trade Association and the affiliated Importers' Automobile Salon. The time for this does not appear to have arrived yet, however, and until the trade has settled down more and managers have more time to devote to the interests of the trade as a whole instead of to individual interests, there is no inducement to establish a statistical department for the keeping of lists of dealers and records of sales.

From the carefully revised lists of "The Automobile Trade Directory" we find that in Manhattan and the Bronx there are about thirty branch houses of American motor car manufactories, about seventy additional agencies for American cars, and thirty agencies for foreign cars. There are seven automobile manufactories in the city itself. In all, there are 125 garages for the care and storage of machines, as distinguished from salesrooms, and thirty of these are equipped as charging stations for electric vehicles. Fifteen shops make a specialty of repairing only. Of jobbers in sundries and supply dealers there are thirty-three. In Brooklyn there are forty agencies for automobiles—nearly all domestic—and there are sixty garages.

Development of the Taxicab.

One of the most remarkable developments of the year just closed is the taxicab business. Very few persons, even in the automobile industry itself, have any real conception of the rapid growth of this new business, which did not exist at all two years ago. The lists show that there are more than forty companies and livery stables in New York City now engaged in operating motor cabs equipped with fare calculating and indicating instruments. While many of these are small and operate only a few machines, it is safe to say that there are half a dozen that are running fifty or more cabs, and that there are now more than 1,000 taxicabs at work in the metropolis.

Sales During the Year.

Sales of cars during the past year in this city can be arrived at only roughly by calculation from State registrations in Albany. A store-to-store canvass would, if anything, be less accurate owing to the unwillingness of many dealers to divulge the exact amount of their business. In New York State the surprising number of 65,000 automobiles have been registered during 1908. Some 15,300 of these are new registrations that did not appear the year before, and, according to the Auto Directories Company, 60 per cent. of these, or 9,180, are from Greater New York. Of this number, 20 per cent. may be assumed to be transfers of second-hand cars, since the State Law requires the issuance of a new license and cancellation of the old one when a car changes owners.

Thus, we find that the actual sales of new cars for the year aggregated 7,340. As New York is the greatest market in the country for high-priced cars, and the branch houses, importers and agents for high-class machines outnumber the medium and

low-priced agencies, it is a conservative estimate that the average price of cars sold is $2,500. Placing the year's sales at the round figure of 7,000, this gives a total volume of business in complete cars alone of $17,500,000. It is entirely out of the question to calculate the money spent in accessories.

Outlook Exceedingly Bright.

Regarding the outlook for business during the coming year, there seems to be but one opinion—that it is better than it ever was and that the volume of sales will be greater by far than ever before. The purchasing public appears to have recovered fully from the influence of the financial depression, and sales during the past Fall and early Winter have been away ahead of sales for a like period at any time in the past. For example, Manager M. J. Budlong, of the Packard branch, says that 400 Packards have been sold through the New York house and that the 1909 output is almost disposed of already. According to W. P. Kennedy, of the Studebaker Company, their business is fully 100 per cent. better than in 1907. Sales have this season continued right up to the end of the year, notwithstanding the proximity of the shows. One promising feature of the New Year's outlook is the increased sales that may be expected as a result of purchases deferred last year owing to general business depression and uncertainty. An indication of the trend of business is the fact that the State registration during the closing months of the year ran 100 a day more than a year ago.

Electric vehicles continue to hold favor as town cars and to supplement the big gasoline limousine and touring car.

In the Commercial Vehicle Field.

During the past year gasoline trucks and delivery wagons have made considerable advance in New York, a field previously recognized as a stronghold of the electric commercial vehicle. Of the twenty-five Packard trucks built and sold during the year, a dozen came to New York, and half of these were taken by the Adams Express Company. Frayer-Miller, Hewitt, and Knox trucks are coming into increased prominence in the streets, together with some Waltham, Rapid, and Lambert machines.

In the electrical field, the Studebaker, General Vehicle and Baker people are most active. It is noteworthy that the Studebaker company purposes to devote its energies in New York City chiefly to pushing its truck business, gradually dropping the electric pleasure carriage trade. Through a corps of special salesmen with an engineering training, it is negotiating with leading concerns whose business is of national and international proportions such as the American Sugar Refining Company. It has been working quietly along new lines, and the results are only beginning to appear, but before the end of the year the local branch expects to be taking orders whose magnitude will surprise the trade. The Baker company anticipates a good business in its new light delivery wagon. After a six months' trial of one of these wagons fitted with express body, the engineer of the American Express Company has strongly recommended the purchase of sixteen of the same model. The General Electric Company, which now owns the General Vehicle Company, formerly the old Vehicle Equipment Company, of Brooklyn, is making careful investigations of the motor truck situation, and is planning a more active campaign with the new models which have been much improved—in fact, almost completely re-designed. The Couple-Gear Company has also entered the field with a local agency.

The tire trade of the Metropolitan district is handled wholly through branch houses which are maintained by all of the leading tire manufacturers of the country and by the Michelin and Continental companies of France and Germany, which now bave American factories.

Changes Among the Agencies.

As usual, many changes have occurred among car agencies during the year, some dealers dropping out, others starting in and still others reorganizing and changing names. Of principal note among those that have quit business are the Garford Motor Car Co., whose business is now handled by Studebaker; the Dragon Automobile Company; A. G. Southworth, who had the Pope lines; the Electric Vehicle Company, which went into receiver's hands; the Rainier Company, also in receiver's hands; the Mercedes Import Company, and the Maja Company, Ltd.; the Palais de l'Automobile, which had the agency for the Delaunay-Belleville, now handled by Brewster & Co.; Archer & Co., who handled the Hotchkiss; J. S. Heller, who had the Zust, now in the hands of a new company called the American Zust Company, with Walter Sykes as president; the McLean Auto Company, which had the Lambert agency; Cincinnati Motor Car Co.; Bouton Motor Co.; Rolls-Royce Import Co.

Altogether, including agencies and garages, there have been forty discontinuances in Manhattan during the year just closed. Against this showing, however, sixty new concerns have been launched, showing a net gain of twenty—which is not at all bad for a panic year. One development of some interest is the opening of an agency for Clement dirigible balloons by Sidney A. Bowman, agent for Clement cars.

Especially notable among the new establishments are the branch houses of the Moon Motor Car Co., of St. Louis, at 2186 Broadway; the Mora Motor Car Co., of Newark, at 1670 Broadway; the De Luke Motor Car Co., of Detroit, at 1633 Broadway; the Babcock Electric Carriage Co., of Buffalo, at 1591 Broadway; the Buick Motor Co., of Flint, Mich., at 1733 Broadway; the Jackson Motor Car Co., of Jackson, Mich., at 1720 Broadway; the Johnson Service Co., of Milwaukee, at 36 East Twentieth street, and the Regal Motor Car Co., of Detroit, at 125 W. Sixty-eighth street. Other important additions are the new local manufacturing concerns, as the Adams Vehicle Co., at 1677 Broadway; Benner Motor Car Co., at the same address; Fulton Motor Car Co., at 370 Gerard avenue; and the Peets Mfg. Co., at 60 W. Forty-third street; also, the new American Automart garage, at 1621 Broadway, the Apthorpe Motor Car Co., with salesroom and garage at 214-18 W. Eighteenth street, and others. Several notable changes have also occurred among prominent dealers, such as the separation of Messrs. Hollander and Tangeman, of the Hol-Tan Co., and the organization by one of the members of the Fiat Automobile Co., formerly controlled by the Hol-Tan Co.; the organization of the Hamilton-Kull Co. to succeed the Kull Automobile Co., and the formation of the Wayne Motor Car Co, of New York to handle the Wayne, formerly sold by the Kull company, and the advent of the Carl H. Page Co. to take the agency for the new Chalmers-Detroit. In losing the Buick agency through the establishment of the Buick branch, the Koehler Sporting Goods Co. gets in its stead the agency for the new E-M-F.

In the ranks of the importers there have also been important changes, as indicated by the entrance during the year of the American Zust Motor Co., at 1989 Broadway; the Benz Auto Import Co., with Jesse Froelich as president; the Delahaye Import Co., at 587 Park avenue; Hotchkiss Import Co., at 1855 Broadway; Isotta Import Co., at 1620 Broadway; Societe des Automobiles and S. P. O. Automobile Co., both at 1966 Broadway, and the Universal Taximeter Cab Co., at 153 E. Fifty-third street, which has just announced the Argyll taxicabs.

Statistics of New York City Trade, January 1, 1909.

MANHATTAN AND THE BRONX.

Branch houses American car factories	30
Agencies for American cars	70
Agencies for foreign cars	39
Local manufacturers of complete cars	7
Total number of garages	120
Electric charging stations in garages	38
Exclusive automobile repair shops	15
Number of taxicab operating companies	44
Branch tire houses and agencies	29

Estimated aggregate value of cars sold	$17,500,000
New salesrooms and garages opened	60
Concerns discontinued or name changed	40

INDUSTRY'S MAGNITUDE IN CHICAGO ASTONISHING

CHICAGO, Dec. 28.—The magnitude of the motor industry in Chicago is not appreciated until one starts in to review the business of a single year, then it dawns upon him that the Windy City can compare most favorably even with Detroit, the heart of motordom. The comparison may not hold good so far as the construction of motor cars is concerned. Detroit certainly has us there, but it is doubtful if it can outpoint us in the other departments, for there are represented in Chicago more concerns that are allied with the motoring industry than are to be found in the Grand Central Palace this week—makers of motor cars, manufacturers of motor buggies and of sundries, parts and accessories by the score. There are exactly 302 manufacturing concerns in Chicago allied to the motoring industry.

Chicago certainly is the center of the motor buggy manufacturing business, for here are made no fewer than ten different makes of the high-wheelers—the Holsman, the Duer, the Reliable Dayton, the Monitor, the Bendix, the Ranger, the International Harvester, the Black, the Bugmobile and the Chicago Motor Buggy Company's product. Here, too, are found such commercial rigs as the Holsman, the Gifford-Pettit, the Monitor, the Randolph and the Fairbanks-Morse, while in the pleasure car line we have the Diamond T, Silent Knight, Falcon, Lauth-Juergens, Triumph, Monitor, Monarch and Pullman. In the electric line there is the Woods Motor Vehicle Co., while the Jay Motor Co. is experimenting with a steam car.

Chicago's Manufacturing Strength.

Touching on the manufacturing industry as a whole in Chicago, it is discovered there are listed 242 different articles made here, ranging from a big motor car down to insulated wire, each and every one contributing its share toward making this city a motoring metropolis. In the allied branches there are five makers of bodies, five of carbureters, seventeen of wind shields, sixteen of tops, fifteen of castings of all sorts, twelve of motors, two of speedometers and so on down.

Turning to the retail end, it is found there are more than eighty different makes of cars represented—eighty-one to be exact, if the writer counted right—while of these twenty-one are represented here by branch houses. There are eight big supply houses, four of which also act as jobbers, while there are fourteen tire concerns represented here by branch houses and several others have agencies.

Still continuing the census and aided by the telephone directory one finds that this city fairly bristles with public garages, which are as hard to locate as it would be to count the livery stables in the city. Most of them are prosperous enough to have a telephone installed, so there is no reason to question the veracity of the directory which gives 118 motor car garages. Many of them are little affairs—old stores or ancient livery stables remodeled for this purpose, but there are a dozen or so places which could stack up against the best in the land and which have every convenience imaginable and house all the way from 100 to 300 cars each.

Motor Livery Business.

In the same line there are motor livery businesses by the dozen. But few of them are of the first flight, the majority having from one to three or four old cars which are used for the renting business. In addition there are half a dozen stands downtown where cars are ranged alongside the curb for public hire. There are half a dozen concerns which can be dignified by calling them motor liveries, and these half dozen have in service some 100 rigs, of which about seventy-five are taxicabs and the rest touring cars. Chicago likes the taxicabs and would have more of them. It will by spring, at which time it is expected there will be three times as many running as there are now. Only one of the taxicab companies fits the taximeter to the rear wheel, and this, it is said, may be stopped by means of a city ordinance which even now is in course of preparation, it being claimed that instruments so attached are liable to run up false mileage.

Season Slow to Open.

So much for Chicago's strength. Now as to the past year. Inquiry in all the trade centers of the town would seem to indicate that Chicago's experience has been about the same as the other big cities. The financial flurry, as we like to term the panic of last Winter, crimped everyone to start out with, and it was late in the Summer before the buyer came out of his cyclone cellar and sat up and took nourishment. Then he made up for lost time and those dealers who had counted on long vacations in the early fall found themselves so tied down by business that there was no chance of getting away. Those who had had any surplus stock on their hands by September found it no trouble at all to get rid of the cars and 1908 goods were selling well even when the 1909 crop was coming in to the market. As elsewhere those who were selling low-priced and medium-grade cars found themselves busy despite the supposed hard times. It would seem as if those who had figured on buying high-priced cars contented themselves with something cheaper when they found their bank account endangered. They had to have the cars, even if hard times did threaten, and in this many dealers found their salvation.

Big Cars Sell Well.

Still it wasn't a bad year for the big fellows, either, and it is more than probable that on the average there were fifty cars of each of the high-priced makes sold in town, which would make from 350 to 400 cars selling at better than $3,000. Foreign machines did not show up prominently because Chicago is not addicted to the European habit, there being only two makes, the Renault and Berliet, directly represented here. The former has a branch, while the latter is represented by the Berliet Import Co., which has the sales right for the United States.

If one should hazard a guess and say 2,000 cars were sold directly in Chicago this year he would not be far out of the way. There are some 18,000 cars registered in the State and undoubtedly one-third of these hail from Chicago. When the city collected the registration fee it had some 5,500 cars on its list, but this came to an end a year ago last July. This leaves only one way to find Chicago's strength and that is through the city comptroller, who counts noses for the wheel tax. He reports some 5,700 cars, but these do not take in the suburbs, where probably a couple of thousand more cars are located which properly come under a Chicago heading. This would make nearly 7,500 cars for Chicago, which would make it about 2,000 new ones for the past year.

Magnitude of Wholesale Business.

But Chicago dealers have not been solely occupied selling cars locally. Most of the dealers have big territories, some of them running into Iowa, Indiana, Wisconsin and Nebraska, and some even taking in St. Louis. Therefore, in summing up the business of the year that has passed through Chicago this must be taken into account. Then, too, there are big branch houses like the Buick, Ford, Rambler and Maxwell which have been passing out cars at wholesale in vast quantities. One of these concerns is credited with disposing of 1,400 cars altogether through the local branch, so it will be seen that during 1908 Chicago has acted as a clearing house for thousands of cars in this territory.

Chicago, too, is a center for the supply business, and one man who keeps a finger on the motor trade pulse declared the other day that five of the supply houses and the garages in the outlying districts had sold goods that totaled $1,500,000. He figured that these garages combined had done just about as much busi-

ness as did the five supply houses whose business he had reckoned in his estimate.

Chicago's motor row is changing every month. Slowly but surely it is moving southward, while the cracks and crannies in the middle are being filled up. Wabash avenue is nearly deserted. The Studebaker is camped there still and so is the Orient, but the Chalmers-Detroit, Lozier and Autocar as represented by the Levy & Hipple Company, is about to join the Michigan avenue colony, while the Dorris already is there. Few new buildings have gone up, though. The Levy & Hipple Company is building near the Stoddard-Dayton agency, the Knox has just moved into a new place between the Buick and Rambler, while the Motor Car Supply Co. is about ready to take possession of a handsome two-story structure a few doors south of its present location. The Dorris is in a new building just south of Eighteenth street, while the new Oldsmobile branch is in a recently-built establishment just north of Walden Shaw's. The Swinehart tire, too, has a new place of its own.

Changes on the Row.

Kaleidoscopic changes, though, have taken place along the row. Some have dropped out and others have come in, so if anything Chicago has gained rather than lost in strength. Of the twenty-one branches now here nine of them have come in during the present year. Palmer & Singer, Oldsmobile, Locomotive, Renault, Meteor, Velie, Babcock, Austin, and the Overland are new. Of these the Locomotive, Overland, Oldsmobile and Kissel have switched from agencies. The Velic is just locating, having taken the store now occupied by the Packard agency, which intends moving to the south end of the row next May. The Stanley is coming in with a branch for 1909.

Agency changes have switched the Premier to Webb Jay, who gave up the Kissel. Shaw gave up the Premier, Reo and Locomobile to handle the Berliet and Thomas, the latter transferred from Coey, who took up the de Luxe. The Reo went to the Reo Automobile Co., while the Chalmers switched from a branch to an agency when it dropped the Thomas. The Bird-Sykes Co. took the Matheson when the Palmer & Singer branch opened with the Palmer & Singer line. Githens landed the E-M-F when the Olds people decided to have a branch Branstetter as representing the Kissel.

New cars that came into town during the year include the E-M-F, P & S, Gyroscope, Waverley, Regal, Brownickar, Austin, French Berliet, Midland, Falcon, Oakland, Pittsburg Six and Velie, while those which have dropped out include the American, Marion, Wayne, Cleveland and National. Of these the Marion and Wayne have gone out of business.

Row Moving South.

Apropos of this tendency on the part of the row to shift to the south where the rents are cheaper, it is stated that some time next Spring there will be a migration on the part of some of the big dealers to the district around Twenty-second street. It is said that some of the representatives of the high-powered cars believe they could establish a colony on Indiana avenue or Wabash avenue near Twenty-first street and do well. It is believe, though, Indiana avenue would be best suited for the purpose. That's where the new Stanley branch is being constructed. Walden Shaw is one block west from this, facing on Michigan avenue. Next door to Shaw is the Oldsmobile branch. The Packard agency is going to move in the spring, but just where it is not stated. At the present time it is on Michigan avenue just south of Sixteenth street, but that its intentions in the matter are sincere is shown by the fact that it has leased its present quarters to the new Velie branch. It is hinted, but the hint has not been confirmed, that the Packard people are looking with favor upon a site still farther south.

The commercial proposition is gaining a strong hold in this city. At first it was slow work because of the condition of the streets upon which business traffic is permitted. Dealers in business rigs, however, say this is no longer so now, because of the wheel tax which the city has imposed and which it already is collecting. This reaches a vast sum, about $700,000, and it is the intention of the authorities to devote it all to the improvement and maintenance of the city streets. Considerable work along this line already has been done, but the job is one of such a vast magnitude that one does not appreciate what has been accomplished. Another year ought to make a difference and by that time the demand for commercial motor wagons ought to be much better.

Many Commercial Rigs.

A conservative estimate of the number of commercial rigs in operation on the city streets at the present time places it at 250 machines, ranging in size from the fleet of little Orients used by Stevens to the big 3 and 5-ton trucks working for the packers. The trucks have made a particularly strong impression at the stock yards and Swift and Morris, two of the leading packers, declare that one of their motor trucks can do the work of five horse-drawn rigs. An instance is cited where one of the Reliance 3-ton trucks working for Morris started in at 7 o'clock in the morning to transport seventy-five tierces of lard, each weighing 450 pounds, to a point six miles away. This represented 33,750 pounds, but the truck was through its work by 3:30 o'clock in the afternoon. Another instance is given where a four-cylinder truck carried 200 cases of beer in one load for Schoenhofen.

As showing the diversified interests using commercial motor trucks in Chicago, the list is made up of such concerns as Montgomery Ward & Co., the big mail order house, one of the earliest of Chicago houses to take up the motor truck; A. H. Revell & Co., the furniture house, which also broke into the game early; the McAvoy and Schoenhofen breweries, Sears, Roebuck & Co., another mail order house; the Price Baking Powder Co., the *Daily News*, Stevens & Co., Frank E. Scott, the transfer man; the David Parker Moving Co., the Harbor Van Co., the Wisconsin Tea Canning Co., Anglo-American Provision Co., Anderson Brothers Teaming Co., the Valvoline Oil Co., Omaha Packing Co., National Lead Co., the public library, the National Casket Co., Lyon & Healy and the Cable Piano Co.

Representatives of these commercial trucks say that their chief difficulty is not with the streets of Chicago, but with the drivers. While there are some good men piloting these big rigs the demand is greater than the supply. It is easy enough to get drivers, they say, but the most of them lack experience and ability. As soon as it is possible to man the commercial rigs properly then the commercial proposition in Chicago will be a good one.

Electric Growing in Popularity.

The electric is gaining a good foothold here because of the many miles of magnificent boulevards, many of them asphalt, affording an easy and luxurious way for the society woman to drive into the business district. Many of the women make a practice of driving downtown morning and evening, carrying their husbands to and from business. The men, too, like the electrics, and many of the electrics are piloted by business men who enjoy the leisurely pace. Especially is this so this Winter when the warm coupé bodies make riding in an electric a luxury. And one travels more leisurely in inclement weather.

Seven makes of electric rigs are now represented in Chicago, two of them branches, the Woods and the Babcock. The Woods factory also is here and the plant is pushed to its fullest capacity to keep up with orders. In addition to these two the Rausch & Lang, Detroit, Baker, Columbus and Waverley are represented by agencies, and it is said it is the intention of the Fritschle to open up here in the Spring.

Statistics From Chicago.

Estimated number of cars sold from Chicago, wholesale and retail	10,000
Number of makes represented	81
Number of branches	21
Number of agencies	66
Number of garages	118
Number of supply houses	8
Number of manufacturing concerns	302
Number of articles manufactured	243
Number of motor buggy makers	10

BOSTON IS NEW ENGLAND'S AUTO HUB

BOSTON, MASS., Dec. 28.—When statistics are given out dealing with motor cars and the motor industry they run into large figures. Sometimes these are really surprising, and it takes much argument to convince the ordinary person and even then with facts and figures there still remains an air of doubt. So when it is said that during the past year—allowing a little more than since the first of January, of course; or to go back to the beginning of the 1908 selling season—that some 3,500 cars were sold in Boston aggregating something like $7,000,000, placing the average at $2,000 a car, the statement is apt to meet with skepticism. Yet that seems to be a reasonable, conservative estimate. Of course, no one expects that each dealer in Boston is going to tell just how many cars he sold. In fact, this air of mystery which surrounds the sales of motor cars is one of the novel things connected with the business. However, there is a way of striking averages which may give some idea of the sales. When it is considered that something like seventy cars were represented in Boston during the year, that would mean an average of fifty cars sold by each dealer

17,000 Cars Registered.

There are 17,000 cars registered in the State. Allow 3,000 as being reregistrations of one owner to another and there is left 14,000. Cut the latter number in two and grant that 7,000 are machines owned by men a year ago; that leaves another 7,000 as being approximately new cars bought within a year. Now there are nearly 3,000,000 people in the Bay State and of that number more than one-third may be found within a few miles of Boston. The eastern portion of the State is, of course, the more thickly settled, so the statement is not too broad to claim that two-thirds of the people live within a radius of twenty-five miles of the Hub. Is it too much then to claim that half of the motor cars sold in the State were delivered by Boston dealers? Certainly not.

Sixty-Five Makes Represented.

There are now in Boston representatives of about sixty-five motor cars. Of these fourteen are branches, while the other fifty-one are represented by thirty-one agents selling on commission, some having two or three cars. All things considered the past year was not a very bad one despite the cry of panic and hard times. There were not so many changes when it is considered that there are so many agencies in Boston. The new cars that come here were not numerous, and those that dropped out or changed hands did not create any great stir.

When the situation is really analyzed it will be found that the new arrivals balance what changes and withdrawals have been made during the year, leaving the conditions numerically about the same, but the industry in a more healthy condition.

Boston should be a very good field for the electric vehicle. Still, there is not the steady growth in these machines that there should be. The city is level, the streets are well kept; there are plenty of places to get batteries recharged, yet the number of electrics seen on the streets is not enough to make one accustomed to seeing them. There are agencies here for the Studebaker, Columbia, Babcock, Baker, Bailey and Columbus and more attention is being given to their sale now.

The Commercial Situation.

Commercially, Boston is taking kindly to the horseless vehicle. To stand now and watch traffic in any one of the busy streets will show an entirely different scene than was presented a year ago. There are all sorts of commercial vehicles in use now. Caterers, florists, hospitals, express companies, furniture men, dry goods stores, banks and even a large undertaking company has within a few weeks joined the list, to say nothing of the dozens of trucks now used by the Edison Electric Co. and the New England Telephone Co. It makes a really striking array and speaks well for the men who have been selling these vehicles. There are represented here, among others, the Rapid, Logan, Knox, Maxwell, Packard, Frayer-Miller, and within a short time there will be some more new ones.

The one thing in the industry that has attracted attention in this city above all else recently is the taxicab service. Beginning with a couple of cabs put in some months ago by E. P. Blake, of the Jackson, there suddenly came into being during the summer companies using dozens of the little vehicles. One of the companies put in a lot of Thomas cabs, and the other put in Berliets. There were also put in some Atlas cabs. Then some of the cabmen purchased one, two or three to make some sort of a showing as they saw their trade falling off. So now there are perhaps about seventy-five of them in the city and the end is not yet. Whether the taxicab business will be overdone is a question that some of the men who have followed the motor game for years are wondering at now. The city is not large and it does not take long to cover it from north to south and east to west, and with a system of tunnels it is easy to make connections in a short time, so with too many of the taxicabs there is apt to be a falling off in receipts. They will be patronized much for some time because of the novelty, naturally, but eventually they will get down to a basis where the dividends on the capital invested may not be as large as expected.

Million Invested in Real Estate.

There is more than $1,000,000 invested in the real estate that houses the motor car agencies alone, not to mention all the buildings now occupied by men affiliated with the industry in the repairing, tires and accessory line. Some of these buildings were constructed especially for the motor industry. There is, for example, the Motor Mart in Park square, in which are housed the Packard, Cadillac, Marmon, American, Buick, Chadwick, Speedwell and a number of other cars. It is a large circular structure right at the very door of the trade, being a sort of a hub from which the spokes go to the west. The greater number of garages is within a section 1 mile long by 1-4 mile wide. These buildings, it must be understood, were not all erected during the past year, but as this is perhaps the first comprehensive review of conditions in Boston it is not out of place to mention them.

Naturally with so many cars in Boston, and all New England to draw upon practically, the tire branches here are more than mere small stores for selling a few sizes. Each concern has an up-to-date branch where all the sizes are kept in stock ready to be sold or shipped quickly anywhere. This means very large quarters, of course. The Diamond, Goodrich, Goodyear, Firestone, Fisk, Morgan & Wright, Continental, Hartford, Dunlop and G & J have long been established here. The Michelin, Dow and Federal are newcomers in the fold here.

It is not to be wondered at that the accessory people are very strongly intrenched in Boston. All the speedometers are represented here; Gray & Davis have just established a Boston office for lamps; the many kinds of shock absorbers have their own representatives, until the owner of a motor car may purchase anything needed and without being forced to go to any one place and held down to one article of some accessory. With all these affiliated branches counted in it proves there are millions in the motor industry in this city alone, just how many is problematical, but $10,000,000 does not seem an excessive figure.

Statistics From Boston.

CALIFORNIA APPRECIATES THE AUTOMOBILE

SAN FRANCISCO, CAL., Dec. 26.—"The past season, though a trying one at the beginning, has in the end been one of the best in the history of the motor car industry in California. The season that we are just about to open will, in my opinion, surpass anything that we have ever had out here.

This brief summary, made by one of the prominent motor car agents of this city, gives a good picture of the situation in this State; in fact, it may be applied truthfully to the whole Pacific coast, if reports brought to this city by the general traveling representatives of the manufacturers are correct. Never before has the outlook in this State been brighter for the motor car men. The financial stress has passed away, and money appears to be plentiful, although it is still true people are holding onto it a little nervously. The peculiarly local conditions affecting San Francisco as a result of the great disaster of 1906 are rapidly straightening themselves out; merchants and business men now know where they stand, and are able to judge their affairs accordingly. The agriculturists of the State, and its horticulturists, are much happier than they were a year ago, for the rains have come that were lacking then. The prosperity of these two great industries of the Golden State means the prosperity of all. And, too, the prosperity of the farmer and the fruit man and the man of the country generally assumes an importance this year that it has never had before. The reason for this is the introduction into the motor car market of the new brands of low-priced cars, which will be turned out by the thousands, and which must in the nature of things find a good part of their market in the country. So far as California is concerned, there seems to be no doubt but that the country will do what is expected of it, and maybe demand more than the manufacturers can supply.

Year a Healthful One.

All things considered, the past year has been an excellent one for the motor car men of this city and State. The start was bad indeed, for the financial depression that put itself like a pall over the country in the fall of 1907 affected California no less than it did the East and Middle West. Perhaps, indeed, the effects were felt a little more out here because of local conditions. San Francisco was just pulling itself out of the disaster of 1906 when in May, 1907, came the great street-car strike, which resulted in the temporary destruction of San Francisco's retail business. Just as this was settled and business was resuming its normal course, there came the financial crash that shut the motor car market down as tight as a drum. Those were bad days for the agents who did not have the strongest financial backing, and it was not long before a dozen or more of them closed their doors, some of them able to pay their bills first and some of them not. It was a weeding out of the mushroom firms.

Gradually, however, with the disappearance of the paper money issued by the clearing houses and the return of confidence, things began to brighten, and before the Summer was well along the motor car market was very appreciably improved. The business of the various houses, while not, perhaps, approaching the heavy volume of the previous season, was still sufficient to float the agents along very comfortably, and in some instances cars that have won popular favor have not been obtainable in sufficiently large quantities to meet the demand. For example, Charles S. Howard, the local representative of the Buick car, has been at the factory at Flint, Mich., for several weeks trying to get some more cars for his territory. Finding telegrams availed him nothing, he packed up and went East with the determination to camp right at the factory until he got what he wanted. Meanwhile the floor of his salesroom here is practically empty, and of the particular model that he wants he cannot get enough.

Scramble to Fill Orders.

Other local agents have found themselves practically in the same position. The few companies that had their 1909 models to show two or three months ago reaped a harvest, while those whose cars arrived late suffered accordingly. Many of them, however, with well-known cars, accumulated a goodly number of orders, and they are now filling these from the shipments that are coming through. California, differing from many sections of the country, is a year-around State. There never is a week that motoring is not pleasant, and for business purposes the motor car is used every day in the year. This is especially true in San Francisco, where the transportation companies have not yet entirely straightened themselves out after the disaster, and getting about rapidly is consequently still a little slow. Motor car buying in California, therefore, never stops for weather reasons. The coming season certainly will be no exception. The reports of the motor vehicle department of the secretary of State's office show that from December 1, 1907, to the same date this year almost 5,500 individual motor vehicle licenses were issued.

Fine New Buildings.

The great fire of 1906 destroyed every motor car salesroom in the city. Since that time practically every dealer in the city has had his salesroom in some kind of a temporary shack, paying exorbitant rates of insurance and constantly in dread of fires, several having been wiped out by flames. This situation is now being remedied rapidly. The Winton Motor Carriage Co., when it established a branch here a year ago, put up a handsome brick and concrete building on beautiful Van Ness avenue which not only houses its own branch, but also two other motor car firms and a tire house. This building cost about $65,000. The White company is now erecting what will undoubtedly be one of the finest garages and salesrooms in the city. It covers a large area, with two stories, and will cost more than $125,000. The Studebaker Brothers Co., of California, has erected in the general wholesale district of the city a seven-story building that must represent an investment of a third of a million.

The Franklin and Pope-Hartford agencies, the Fisk Rubber Co., the Renault, the Oakland Motor Car Co., the Winton and the Diamond Rubber Co. are all now housed in permanent structures, and contracts have been let for several other fireproof buildings, each one of which will house two or three or more motor firms. The building of the Diamond Rubber Co., in the down-town wholesale district not far from the Studebaker house, is an enormous place, representing a very large investment.

Foreign Car Succeeds.

An interesting feature of the San Francisco market has been the success scored by the only foreign car represented here. This is the Renault. A branch was installed here just about a year ago by Paul Lacroix, head of the firm in the United States, and left in charge of a young French ex-army officer, Rene Marx. During that time the branch has sold more than a dozen of the high-grade foreign machines, the purchasers being numbered among the wealthy men and women of the city. In some cases the car has been purchased here and delivery taken in Paris, the new owners touring the continent before returning here. A taximeter cab company has been organized which has already contracted for a number of Renault taxicabs, and it is understood that these will be in actual service within a month. San Francisco at the present time has no taxicab service, and there seems to be no doubt that if the financiers of the project can see their way clear to impose moderate charges, the little cabs will be immensely popular here. Another taxicab company, it is understood, is also in course of organization which plans to use the Thomas taxicab, which car is well known on the "Coast."

Statistics From San Francisco.

Cars sold in California	5,500
Number of branch houses in city	8
Number of motor car dealers	36
Number of makes of cars represented	14
Number of tire agencies	10
Number of supply houses	

AUTOS ARE A NECESSITY IN THE NATION'S CAPITAL

WASHINGTON, D. C., Dec. 28.—There are a number of things that serve to make the year 1908 the most remarkable in the history of the local trade. While the number of cars sold probably was not as great as during the preceding year, the average cost of this year's cars was greater than last year, demonstrating that the demand has been for the high-priced machines. Another striking feature of the year's progress was the unusual number of new agencies that were placed during the year, and especially during the latter part of the present season. Sixteen different makes of cars that have not heretofore been represented on this market were placed with different dealers during the year, as follows: Matheson and Oldsmobile, Pope Automobile Co. of Washington; Brush and Oakland, Brush-Nichols Co.: Stoddard-Dayton and Babcock, L. P. Dorsett Co.; Lozier and Detroit, Dupont garage; Woods H. Carnell Wilson & Brother; Overland, Dewey garage; Premier, Lester D. Moore, Jr.; Chalmers-Detroit, Motor Car Co.; E-M-F, Studebaker, Commercial Automobile and Supply Co.; Regal, George W. Wells. The Luttrell Co. discontinued the Locomobile agency, which was taken by the Belmont garage; the Dupont Garage Co. dropped the Corbin; H. Cornell Wilson & Brother gave up the Elmore agency, which Charles E. Myers took up. This is believed to be about all the changes that occurred during the year.

There are nineteen dealers in the capital city who handle forty-one different makes of cars, thirty-four of which are gasoline and seven electric. It is difficult to figure the amount of money invested in buildings for sales rooms, garages, etc., but it has been estimated at $2,000,000.

Electrics Hold Their Own.

Electric vehicles about held their own during the year, although during the fag end of the season the demand for them was greatly improved. Incidentally it might be mentioned that 1909 promises to be the best year for electrics that the local trade ever has known.

Commercial cars made great strides during the year and this branch of the business is receiving more and more attention at the hands of the dealers, as they are beginning to realize that commercial cars are reaching a point of perfection that insures them a steady and ever-increasing sale. The Federal Government is paying a great deal of attention to the commercial car, and the number owned by Uncle Sam has been considerably augemented since the beginning of the year.

New Garages Built.

Half a dozen new garages were erected during the year and this branch of business is rapidly getting down to a more solid business basis. In former years the garage business was deemed a losing venture in Washington, but this was largely due to the fact that the business was not watched closely enough. There were numerous drains that served to swallow up the profits, but this condition of affairs is being rapidly improved and the garage business may now be said to be on a pretty good basis.

Taxicabs were placed here for the first time this year and they leaped into instant favor. At least a hundred of them are now plying the streets, with every indication of a shortage, and it will be difficult to say just how many more would fill the demand.

Statistics From Washington.

Number of motor car dealers	19
Makes of gasoline cars represented	34
Makes of electrics represented	7
Approximate number of cars sold in 1908	275
Number of tire agencies	10
Number of supply houses	2
Number of dealers handling supplies	6
Approximate capital invested in all branches of industry, including garages	$2,000,000

DENVERITES BELIEVE IN PRESENT AND FUTURE AUTOING

DENVER, COL., Dec. 27.—Name for me a city in the United States of America with a population of 240,000 whose people expended more than two and a quarter million dollars for motor cars during the year 1908, then Denver will take second place in that class. Denver did that, and more. Like every other modern innovation that means progress and betterment of mankind, Denver has taken hold of the motor car with a vim, and having the wealth behind it, the result is going to be that it will never be distanced in the number of cars that will be used nor in the average value of these cars.

It took 1,550 cars—gasoline, steam and electric motors—to satisfy the demand of its citizens. The number is going to be far greater during 1909, for the great agricultural district, growing greater every year, and the mineral, oil and other resources of the State and the contiguous territory of which Denver is the center, expanding with astonishing rapidity, is going to pour into the banks of this city such a flood of the purchaseable necessity that the business of the motor car dealers here will be an enviable one.

Fifty-eight Makes Represented.

Thirty-one agencies of motor cars presented fifty-eight different makes of machines for the choice of the purchasers. These dealers—including two branch houses—sold a total of 1,550 cars for an approximate amount of $3,250,000. Of the totals Denver alone took two-thirds of the cars and expended seven-tenths of the purchase price. The balance went over the State and to other sections taken care of by the agencies and branches. Of the total of 1,270 gasoline cars sold the price ranged from $650 to $8,000. About 36 per cent. of the sales were of cars ranging in price from $1,200 to $1,500.

The operators and owners of some thirty-odd public garages have each a large force of men steadily kept on the payroll. At these places the majority of the cars are kept, the new private garage at the residence of the owner not having grown very extensively, rather has it been a change of the former horse and carriage house into a garage, and these changes have been numerous, adding much to the health and cleanliness of the residence sections particularly.

While Denver has been a splendid patron of the motor car made in various sections of the country, it is crowding this avenue of progress some by coming in with two factories of its own. One, a gasoline motor car, the Colburn, had its first of sales to record this year.

Fritchie Electric Made in Denver.

The Fritchie Automobile and Battery Co. product, one of which recently completed a run from Lincoln, Neb., to Washington, D. C. This factory filled orders for sixty-five cars during the year, more than half of which have been delivered to Denverites and the balance distributed from the Atlantic to the Pacific. These two factories show a capital investment of $300,000, and this added to the moneys invested in the agencies, the branches—Studebaker and Ford—the garages, the supply houses, tire agencies and motor car livery establishments, bring the grand total invested in the industry up to a million and a half.

Statistics From Denver.

Capital invested	$1,500,000
Cars sold in 1908	1,550
Number of agencies	31
Different makes represented	58
Number of tire agencies	13
Number of supply houses	3
Number of public garages	30
Number of factories	2

CLUBS PREPARE FOR WORK OF NEW YEAR

QUAKERITES DON'T WANT CLEAN SCORES.

PHILADELPHIA, Dec. 28.—So many "unofficial" wails have arisen over the impossibility of covering the mountain controls of the New Year's endurance run of the Quaker City Motor Club on a 20-mile-an-hour basis, that the contest committee last week "unofficially" discussed the situation and decided, again "unofficially," to pay no attention to them, on the ground that all would suffer alikc, and that the committee didn't want a superfluity of clean road scores anyway. At the same time, as a matter of justice, it was decided, in view of the extremely narrow road, especially in the mountains, that if a sound car is held up by a broken-down car at one of these narrow places and can't get around, the observer shall "take time out," which will be allowed in reckoning up penalties at the end of each day.

Since last week's heavy snowstorm, there have been many misgivings over the situation, and not a few entrants have sent their cars over the route. Two of them, the Acme and the Stoddard-Dayton, went over the first day's route to Wilkes-Barre and were forced to "buck" drifts for miles on that portion from Stroudsburg to within a few miles of Wilkes-Barre. They were nearly twelve hours on the road and, had the contest been on, would have accumulated upward of 200 demerits each. Another storm before the start will make things decidedly interesting to cars and occupants alike, althougb the members of the Monroe County Automobile Association have volunteered to get out and break the roads in such an event.

Twenty-four cars have been entered up to date with two days' mails yet to hear from. They are: Stoddard-Dayton, Matheson and Mitchell, three each; Winton, Franklin, Maxwell and Cadillac, two each; Peerless, Acme, Studebaker, Elmore, Oldsmobile, Buick and Rambler, one each.

Over the "automobilists' midday lunch" at the Walton there have been many challenges and acceptances for dual combats between various cars, until on Friday last, Manager W. C. Longstreth, the local Maxwell manager, posted $500 and issued a defi to any other entrant of a $2,000-or-under car who thought his machine would total fewer penalties than the Maxwell to cover the amount. The Automobile Sales Corporation, which entered the Cadillacs, has accommodated Longstreth, and there is at least one other that will follow suit.

DENVER MOTOR CLUB IS PROSPERING.

DENVER, Dec. 28.—Two agreeable surprises were sprung upon the members of the Denver Motor Club at the annual meeting when President Ralph W. Smith announced that a downtown clubhouse and also a country clubhouse had been secured for the coming year. The downtown club is at 1407 Cleveland place, and possession of this house was taken the day before Christmas. The new location is an ideal one for a motor club, as it is convenient to the business part of town, and the clubhouse being situated where four streets converge, the members will have ample space to park their cars while visiting the clubhouse. It is also only a short distance from Broadway, which is the automobile row of Denver, and garage facilities will be ample. In addition to these new club quarters, the members of the Denver Motor Club will be granted all the privileges of thc clubhouse at Overland Park, seven miles south of Denver.

With these two clubhouses the Denver Motor Club will be in a position to entertain the Glidden tourists next Summer in a befitting manner, and already preparations are being made.

The annual election of officers for the ensuing year was as follows: President, Ralph W. Smith; vice-president, William D. Nash; secretary, Frank England; treasurer, C. P. Allen: board of governors, S. D. Hopkins, George Tritch, J. Nicoll Vroom, E. F. Dean, Ralph L. Taylor, W. H. Sharpley, and the above mentioned officers.

BUFFALO CLUB WORKS FOR MEMBERS.

BUFFALO, Dec. 28.—The annual election of officers of the Automobile Club of Buffalo resulted in John M. Satterfield being named as president; Laurens H. Enos, vice-president; Harry Thorpe Vars, treasurer, and Dai H. Lewis, secretary. Mr. Satterfield was vice-president and chairman of the Good Roads committee of the club last year.

The report of the retiring president, Frank B. Hower, showed that the expenditures of the year had been heavy, including the promotion of the boulevard from Buffalo to Niagara Falls, and also in connection with fighting thc proposed municipal ordinance taxing automobiles $5 a year; $565 of the club funds were swallowed up in this and $534.83 was expended in surveying and planning the boulevard. An additional $315 went toward starting the club bulletin.

The membership to date was reported at 1,525, a gain of 398 during the year.

The grievance committee reported that of the 66 arrests for speeding during the year only seven were members of the club.

The boulevard committee submitted a report declaring for the laying out of a boulevard from this city to the Falls, starting at Delaware Park and continuing along Ellicott creek, the Erie canal, Sawyers creek, Bergholtz creek and Cayuga creek, terminating opposite the Niagara Power Company's plant. A committee of five lawyers has been appointed to draw up a bill to be presented in the Legislaturc authorizing the appointment of a commission, which will be empowcred to create parks and boulevards leading to the State Park at Niagara Falls.

President William H. Hotchkiss, of the A. A. A., delivered an address explaining the work and aims of the National organization.

Retiring Prcsident Hower was presented with a cut glass punch bowl by his fellow members.

CAMDEN, N. J., NOW AN AUTO CLUB CENTER.

CAMDEN, N. J., Dec. 28.—One of the most enterprising automobile clubs that the State of New Jersey can boast is the new organization known as the Camden Motor Club. Its membership is now close to fifty and every member is a hustler, the work of posting all the principal highways in the western part of the State now being carried out rapidly, while the club will also lend every effort toward the passing of more favorable legislation this Winter. The custom of a carrying a large letter C on their cars has been adopted by the members, and the club is beginning to make its influence felt to a constantly increasing extent. The officers are: President, Dr. H. H. Grace; vice-president, William L. Hurley; secretary and treasurer, G. E. Rhedemcyer. The law committee is composed of the Hon. J. Willard Morgan, Norman Grey and John O. Wilson, while the highway committee is composed of J. T. Dorrance, Frank L. Starr and Harry E. Bodine.

A. C. MARYLAND WANTS GARAGE TIMING SYSTEM.

BALTIMORE, Dec. 28.—Unless Baltimore garage proprietors put in proper timing systems, thc Automobile Club of Maryland will propose a city ordinance compelling them to do so. This action on the part of the cluh members was taken in consequence of numerous instances of "joy riding" and the taking of cars by chauffeurs without the consent of owners.

The club, by resolution, commended Oscar G. Murray, president of the Baltimore & Ohio Railroad Company, for his prosecution of James L. Hild, his chauffeur, who took out Mr. Murray's car without consent. The ride, as stated, ended in the death of one of the riders and the smashing of the machine.

Accidents in Baltimore recently have been entirely too numerous, and the public is inclined to class innocent with guilty.

MASSACHUSETTS COMMISSION SUPPLIES STATISTICS

BOSTON, Dec. 28.—Before deciding to recommend to Massachusetts and the New England States for adoption as a part of a uniform automobile law, a graded scale of registration fees based on horsepower, the Massachusetts Highway Commission made some very careful calculations of the relative cost of registration, liability insurance and tires. The horsepower plan was adopted as the best measure which would represent cost, speed and weight, or the wearing effect of an automobile on the roads. As the registration fees go into the State treasury for use in road maintenance, each fee represents the contribution of the automobilist towards good roads, which are perhaps the most important item in his enjoyment of the motor car.

Looking at it in this way the commission has figured out that on a horsepower basis the automobilist will be required to pay for good roads only less than one-fourth what he pays for liability insurance, which is also graded according to the horsepower of the car, and one-tenth what he pays for tires. Furthermore, by contributing to the improvement of the roads the motorist will greatly reduce his tire cost. The commission has compiled detailed figures on this subject and has found that for a 10-horsepower car the registration fee would be $5. the liability insurance cost $32 and the tire cost $71.44. On a basis of 3,500 miles traveled, the average life of a tire, the commission figures the cost of registration for a 10-horsepower car at .0014 cents a mile, of insurance at .0091 cent a mile and of tires at .0204 cent a mile. On a 5,000-mile basis, the maximum life of a tire, the figures are .001 for registration, .0064 for insurance and .0143 for tires. For a 40-horsepower car the registration fee is figured at $20, the cost of liability insurance $80 and the cost of tires $198.58. The relative cost per mile on a 3,500-mile basis would be .0057 for registration, .0228 for insurance and .0557 for tires. On a 5,000-mile basis the corresponding figures are .004, .0160 and .0397.

The commission also has some interesting figures to back up the inclusion in the new law of the Massachusetts plan of investigating accidents and punishing reckless and other improper driving. These figures show that last Summer there were 18,000 automobiles registered in Massachusetts and in the three Summer months there were 280 collisions in which automobiles were concerned. Although the number of accidents was larger than for the corresponding period of 1907, the number of people injured was one-third less, the figures for 1908 being 222 against 313 for 1907. The number of fatalities was reduced more than two-thirds, the figures for 1907 being 41 against 13 this year. This, the commission concludes, shows a reduction in reckless driving in Massachusetts.

THE LINCOLN MEMORIAL HIGHWAY.

YORK, PA., Dec. 28.—That the Lincoln Memorial Highway bill fathered by Congressman D. F. Lafean, of York, may pass Congress at its present session is the belief of Senator Philander C. Knox, who presented the measure in the Senate. Mr. Knox is greatly interested in the proposed improvements. He stated that he had talked with a number of Senators about the project, and finds a surprising sentiment in favor of it. This is by no means confined to the Senators in the States in the region through which the proposed highway would pass. Senators in the far West have told Mr. Knox that they are for the bill and would like to see it become a law.

In the case of the proposed highway from Washington to Gettysburg, strong reasons of sentiment give the project support.

GOOD ROADS AND AUTOS, BOON COMPANIONS.

TRENTON, N. J., Dec. 26.—The report of Road Commissioner Frederick Gilkyson to the Governor to-day will be of interest to autoists in view of the great fairness of his contention, that while automobiles rip up the road, they influence for good roads in a manner that cannot be denied. The report goes on to say that despite the advanced state of road building, it is far from perfect, and experiments now going on in Jersey will have much to do with the future of road building. In repair work the Commissioner points out that too much care cannot be taken to "scarify" the road after it is resurfaced, and he insists upon the removal of all foreign substances before adding new stone. After the stone is applied it is then important to apply a competent binder before tolling.

GRAND PRIX OF FRANCE SEEMS TO BE DOOMED

PARIS, Dec. 24.—Thirty-three cars are needed, and needed within the next week, to make the French Grand Prix possible. At present the total entries are seven in number, the cars supplied being one Guillemin Le Gui, three Cottin-Desgouttes and three Mors. The Porthos has given intimation that three of their cars will be entered, but until the cash is forthcoming the Sporting Commission refuses to take any notice of the entry. Thirty-three cars never have been obtained within seven days for any European race, and it is absolutely certain that the number will not be forthcoming for the 1909 speed test originally scheduled for the month of July in Chateauland. So poor are the prospects that the Anjou committee, which undertook to raise a subvention of $20,000, has given intimation that those having contributed to the amount should carefully preserve their receipts in provision of a reimbursement.

It might be imagined that as the Grand Prix is a considerable source of profit to the club, there would be an effort on the part of the organizers to maintain it. But no intervention of this nature is likely to be found, for the simple reason that the club and the car builders are one and the same person. The eight members of the Racing Board represent six of the French firms having the greatest interest in and being the strongest supporters of racing; with these having unanimously decided to abstain from racing, there is no hope of the Grand Prix being carried through.

It has not yet been decided what will be done with the other races announced in various parts of Europe, the most important of which are the Ardennes in Belgium and Brescia in Italy. The probability is that they will all have to be dropped for lack of entries, and that 1909 will thus be a sportless year, so far as Europe is concerned. England finds it utterly impossible to hold a race; Germany has no pretentions towards a speed test; Italy would like to repeat the Brescia events of this year, but will find it exceedingly difficult to do so with no large firms building cars; Belgium announces its Ardennes meet, but has so little hope of securing entries of genuine racing cars that arrangements have already been made for replacing the speed test by a touring car competition. As the aeroplane will come prominently before the public as a sport during the year 1909, it is very probable that when automobile constructors come back to road races in 1910, as promised, there will be nobody to take any interest in their performances.

PERCY OWEN, BRIARCLIFF CHAIRMAN.

In the opinion of those interested in racing, there is now probability that a second race for the Briarcliff trophy will take place next Spring in the vicinity of New York City. On Monday last a meeting of the committee of manufacturers interested in the event was held, at which Percy Owen, well known as one of the pioneer drivers of racing cars, was selected as the chairman. It is understood that C. F. Wyckoff, the temporary chairman, asked to be relieved of his duties.

Sidney B. Bowman, Joseph S. Josephs and H. A. Lozier have been designated as a finance committee, and the Wagner-Field Company will take care of the secretarial work.

Of the eleven representatives present at the meeting, seven definitely announced their intention of entering at least one car in the contest. As to whether the rules have been definitely and finally decided upon without any further revision will await the decision of Walter M. Law, the trophy donor, as to his consent in making the event for what must be considered restricted racing cars, instead of touring cars as originally planned.

LATEST RULING OF COLLECTOR OF CUSTOMS.

WASHINGTON, D. C., Dec. 28.—The Collector of Customs at New York has been advised that the regulations of the Treasury Department of November 27, 1907, providing for the allowance of drawback on automobiles manufactured by Brewster & Co., of New York, with the use of imported parts and materials, have been extended to cover the exportation of automobiles manufactured by the members of the Association of Licensed Automobile Manufacturers, with the use of imported parts, in accordance with their sworn statement, dated September 23, 1908. This statement is now on file in the office of the Collector, together with a list of the members of the association.

The regulations provide, however, that no drawback is to be allowed on horns, lamps, odometers and other attachments which may be readily detached from the automobile, and which do not form a permanent part thereof.

LATE NEWS FROM TIRETOWN.

AKRON, O., Dec. 28.—The new tire on which Frank A. Seiberling, of the Goodyear Tire & Rubber Company, has been granted, is described as a sort of hybrid between a solid and pneumatic. It is designed to be used on both pleasure cars and trucks, and will be constructed in different sizes and thicknesses. The air chambers of the tire will extend laterally across the tire from side to side and will contain air at normal pressure. The walls will be thick and heavy. The advantage of this tire is to afford the resiliency of a pneumatic with the firmness and freedom of a solid tire. The new tire has not yet been placed on the market, but manufactured for experimental purposes only.

A new tire manufactured by the Buckeye Rubber Company and marketed by the Consolidated Rubber Company, of New York and Akron, is being exploited through one of the most extensive advertising campaigns ever undertaken. The new tire bears the same name as the solid and cushion tires previously manufactured by the same companies—the Kelly-Springfield. The tire is made in three standard types, with the flat, round, and Bailey treads.

The Goodyear Tire & Rubber Company is pleased over the result of the long distance run of Oliver P. Fritchie in an electric of his own make from Denver to New York in 30 days' time. Fritchie averaged 100 miles a day, and his machine was equipped with Goodyear long distance electric tires, a type which the company has had on the market a year, and which is designed to consume as little current as possible. Fritchie had one puncture in Chicago, but drove the other three tires the entire distance, arriving in New York with Denver air.

O. L. Weaver, formerly of the Cincinnati branch, has been placed in charge of a new branch established at Atlanta, Ga., by the Goodyear Tire & Rubber Company.

ROSY FACTS ABOUT THE T. C. F.

PARIS, Dec. 15.—Three years ago the membership of the Touring Club of France was 98,000. At the annual meeting held in Paris last week President Ballif declared that the figures had now mounted up to 115,000, the largest number of any similar club or association in the world.

The income for the year had been $221,718, and the net balance in hand on the year's work no less than $37,353.

During the past two years a total of $2,400 has been given in subventions toward the construction of paths for cyclists in the neighborhood of Paris, and $6,000 have been contributed to the work of repaving the main roads leading out of Paris. This task has been undertaken by the government at a total cost of $600,000, with financial aid from the Touring Club and the Automobile Club of France. When completed the present roughly paved highways out of the capital will have been replaced by perfect smooth granite-paved roads suitable for heavy automobile traffic, and giving easy access to every part of France.

The club awarded its gold medal to Henry Farman for the first cross-country flight by aeroplane, this being, in their opinion, the most important action of the year tending toward the development of travel. One of the 115,000 who had written a violent article against the automobile was held up to scorn.

FIGURES AUTO CHEAPER THAN HORSES.

A Western man, T. H. Proske, whose farm is near Denver, Colo., and who travels daily to the city, decided to test the expense of an automobile as compared with horses for this use. He bought a 28-horsepower Franklin, and after 18 months' use compiled these figures, based on a daily average of 35 miles:

One set of tires	$130.00	
Less credit for old on taken in exchange	35.00	
		$95.00
One overhauling and varnishing		35.00
Average cost of gasoline, oil, and batteries per month, $12; 18 months		216.00
Original cost of motor car		3,040.00
Total		$3,386.00

Selling the car for $2,250 cut the cost down to $1,136, or a little more than five cents per mile.

Being satisfied that the first cost of horses and carriages would exceed the cost of the machine, he figures the upkeep as follows, making no allowance for repairs, depreciation or death of horses:

Feed for two horses per month, $35; 18 months	$630.00
Coachman, boarding himself, per month, $75; 18 mos	1,350.00
Total	$1,980.00

"It will be seen," he says, "that even if there was no sickness, death or depreciation I am still $844 ahead."

This result is reached by deducting from the $1,980, maintenance of a carriage, the $1,136 which the automobile actually cost for 18 months. The cost of upkeep of a new 42-horsepower automobile does not exceed by more than 10 per cent. that of a 28-horsepower machine.

FARMERS LIKE DETACHABLE TONNEAU.

GRAND RAPIDS, Mich., Dec. 21.—Western Michigan dealers expect to push hard this coming season the sale of delivery autos to farmers. Grand Rapids is in the center of the fruit belt, and is already famous as a market. More than 50,000 bushels of peaches have been sold by farmers in a single day since the new market was built, many of the farmers making one or more or as many trips as they can a day. Owing to the necessity of handling their crops with rapidity, the more progressive farmers are adopting automobiles, and so many inquiries are coming into the manufacturers now for delivery cars that many of them have demonstration cars in the city now and are making frequent demonstrations to farmers who will be in the market in the spring. The detachable tonneau car, the dealers declare, made to sell for from $1,200 to $1,600, seems to be the most in demand for this sort of use.

BALTIMORE DEALERS WELL SATISFIED.

BALTIMORE, Dec. 28.—While the tightness of money during the early months of 1908 had its effect upon the local automobile trade, most of the dealers announce that their business during the past twelve months has been at least as good, if not better, than during 1907. The last three months have been splendid ones, and they predict that 1909 will undoubtedly be the banner year for the sales of cars in this city and throughout Maryland.

There is every reason to expect this prediction to be realized, for horseless vehicles are becoming more and more popular here every week. Then, the General Assembly of Maryland has appropriated $5,000,000 which will be used for improved highways in the State; the voters of Baltimore will cast their ballots for or against a $5,000,000 paving loan either next spring or at the following fall election, while a $2,000,000 annex paving loan is being utilized at present for improving the thoroughfares on the outskirts of the city. All of these things are favorable for the increase in the number of automobiles in this city in the near future.

Baltimore has not been much of a field for commercial cars in the past, but these, too, are gradually making inroads. Several of the breweries, wholesale drug companies and other large business houses have put gasoline trucks into service. A number of the department stores, too, are testing electrics for delivery purposes, and these trials have been successful.

A new factory has recently opened up in Baltimore. This is the Carl Spoerer's Sons Company, who are making various types of Spoerer cars. This makes two factories now located here, the other one being the Sinclair Scott Company, makers of the Maryland car.

Licenses have been issued for 1,701 cars from January 1 to December 1, 1908. Forty-one of these were issued in January; 42 in February; 111 in March; 164 in April; 133 in May; 323 in June; 183 in July; 185 in August; 187 in September; 201 in October; 131 in November.

BIG TAXICAB PROFITS IN NEW YORK CITY.

NEW YORK CITY, Dec. 28.—A pamphlet issued by one of the local taxicab companies for private distribution among possible investors, shows that the present profits from the cab service are enormous. This pamphlet showed first that an estimate of an income of 46 per cent. is ultraconservative. The pamphlet goes on to say: "Our own records show that the cabs average 45 miles per day, with two and a half hours' waiting time chargeable to patrons, giving an average gross receipt of $22 per cab per day."

On basis of $22 per day, 360 cabs will earn per year		$2,890,800
Tire charges on this basis	$162,607	
All other charges, including depreciation	448,560	
Chauffeur's 20 per cent. of earnings	578,160	
		$1,189,327
Available for dividends		$1,701,472

This figures out 113 per cent. profit. The pamphlet continues with the statement that the chauffeurs being paid entirely on a percentage basis, only $4.55 per cab per day need be earned in order to pay all expenses and lay aside 25 per cent. for depreciation, so that all above this amount is available for dividends.

FRANKLIN'S ALCOHOL MOTOR CAB.

NEW YORK CITY, Dec. 28.—The agitation of the past year relative to the use of alcohol as a fuel culminates very properly in the production of a motor cab with an engine designed and proportioned for the use of alcohol fuel exclusively. This latest product of the H. H. Franklin Mfg. Company, of Syracuse, N. Y., while not differing in appearance from other 18-horsepower Franklin cabs, has a high compression and a special carbureter to allow the engine to make use of this fuel, which is slower burning ordinarily, but when highly compressed, say to 100 pounds per square inch, burns rapidly enough for a motor speed of 1,000 r.p.m.

GENERAL MOTORS COMPANY AN ACTUALITY.

LANSING, MICH., Dec. 28.—The fact that the General Motors Company, incorporated for $12,500,000 in New Jersey last week, is not alone a reorganization of the Olds Motor Works, but also includes the Buick interests, has led to a renewal of the rumor of a general combine of the producers of low-priced cars which first had its origin last Summer. When talk of the Buick entering the new combine was first heard, it was vehemently denied, but when seen in Detroit to-day, W. C. Durant admitted that "If the report comes from an authentic source, it must be so." Frederick L. Smith, general manager of the Olds Works, states that the change will not affect the business of his company in any way, except that it is anticipated that the merger will enable the product to be marketed more economically, and that the volume of business will be increased. "The Olds Works are now in the most prosperous condition they have ever been in, employing the largest number of men in their history," said Mr. Smith.

The fact that the capitalization of the General Motors Company, divided into $7,000,000 cumulative preferred, and $5,500,000 common, is to be issued in shares of a par value of $1, shows that it is for "popular consumption." One of the promoters is said to be Curtis R. Hathaway, an associate of Ward, Hayden & Satterlee, a New York firm of lawyers, who are reputed to have been connected with rumors of several motor mergers in the past that involved Wall Street financing, but regarding which no definite information was ever obtainable. At one time or another, the name of practically every producer of low or medium-priced cars has been mentioned in connection with the merger, but nothing tangible has ever developed except now where Buick and Olds are involved.

WOMEN'S NEW YORK-PHILADELPHIA RUN.

One of the latest publicity promotions is that of a women's run from New York to Philadelphia and return, scheduled to take place in the near future. Originally intended for this week, the condition of the roads brought about a postponement, with the probable dates during the week of January 10. The list of participants is announced to include several of the fair sex who have demonstrated their ability at the wheel. Entertainment is to be supplied at Newark, New Brunswick, and Trenton on the way to Philadelphia, where the Hotel Walton will be the official stopping place. The return journey will include a run across Staten Island, with courtesies extended by the Richmond Country Automobile Club. A statue of Galatea is among the prizes to be awarded for the most proficient performers.

REVIEWS OF LATE BOOKS.

Motor Car Mechanism and Management.—This book, by W. Poynter Adams, is the second part of a work, the first installment of which deals with gasoline vehicles, while that under review is devoted entirely to electrics and "petrol electrics," this being the Britisher's term for the combination gasoline-electric vehicles that are now receiving considerable attention abroad. It treats of the subject from an elementary point of view and after giving the basic principles of electrical action, goes on to describe the various parts of an electric car and their functions, this being supplemented with chapters on the care and management of each essential of the vehicle. Besides this some types of British electrics and combination cars are illustrated and described. The J. B. Lippincott Company, Philadelphia, are placing the book on the market in this country.

A Manual of Oil Motors and Their Uses.—The author of this work is G. Lieckfeld, and it was originally published abroad, the J. B. Lippincott Company, Philadelphia, issuing it in this country. It is a résumé of past achievements, and presents uses of the internal combustion motor, trather than a work on design, showing the development of the automobile and marine motor from its inception, as well as the development.

News in General

The Premier in the Shadow of Mount Hood.

Through the mountains of Northern Oregon the roads are changeable and frequently quite difficult, but there are compensations in the rugged magnificence of the scenery.

Dayton After Detroit's Laurels.—The number of automobile firms in Dayton, O., has recently been augmentcd by the addition of the Lexington Motor Car Company, with a capital stock of $50,000. This concern will turn out a high-grade four-cylinder car of five and seven passenger capacity in both touring and runabout styles, to sell at from $2,500 to $3,000. Work has been started and material contracted for, so that deliveries may be made within a short time of the first of the 250 cars to be built in 1909. The company has as one of its stockholders Fred N. Coats, who left the position of assistant salesmanager of the Dayton Motor Car Company to act as secretary and general manager.

Rambler Gets Record.—Probably the most frequently bröken and one of the most coveted records in the West is that between Los Angcles and San Diego. Recently this honor changed hands once more when the Rambler fractured the mark previously held by the six-cylinder Franklin. In so doing L. B. Harvey gained possession of the coveted Chanslor and Lyon trophy for the second time. The distance between the two cities and return is 320 miles, and this distance was made in 10 hours 32 minutes, which is 45 minutes better than the old mark. Ralph Hamlin, the Franklin man, announces that he will go right after the new mark.

Rapid Makes Big Addition.—The Rapid Motor Vehicle Co. of Pontiac, Mich., has recently completed two additions to its plant which will nearly double the present facilities. One of these is a new third story added to the office building, adding a space 60 x 80 for administration purposes. Besides this a new steel and concrete structure 60 x 300, two stories high, has been added to the machine shop. When the machinery is installed the present force of 275 men will be fully doubled.

Herz & Company to Move.—Herz & Company, New York City, are about to removc their office and factory to the Puck Building, 303-305-307-309 Lafayette street and 35-37 Houston street, where they will occupy the ground floor now being fitted up to suit their requirements. The new quarters will have double the floor space of the present factory and will be equipped with the latest machinery and devices for the manufacturing of automobile supplies.

A Mitchell Put to a New Use.—Who ever heard of the automobile as the advance agent for a railroad? Sounds rather unique, but that is about the work which was cut out for a Mitchell recently in Texas. The *San Antonio Light* was pushing a new railroad in that section and sent a party out in the car through a part of thc country entirely new to such mode of travel. They covered over 250 miles and returned after two weeks with bonuses of over $800,000.

Still Another Aeroplane Enthusiast.—Among the latest additions to the ranks of the aerial navigators is Lewis Strang, who has been engaged by J. H. Tyson to make a trip to France, where he will receive instruction in the latest flying methods. It is reported that an aeroplane of the Delegrange type has already been purchased and Strang is to bring it back to America if his lessons at the new game are successful.

Mason Enlarges.—The Mason Motor Car Co. of Des Moines has becn reorganized with a capital of $250,000 and the factory capacity will be doubled. The company will hereafter be known as the Mason Automobile Company. A local banker, A. B. Shriver, is prominent in the new company, but E. R. Mason will remain as salesmanager and F. S. Dusenberg as superintendent.

Changes on the Coast.—George W. Shugars, former manager of the Durocar Company's factory on South Los Angeles street, Los Angeles, Cal., has resigned as manager and director. For the present W. H. Pendelton will act as factory manager while the duties of salcsmanager will be looked after by Walter Sahland.

Columbia Works Running Full Blast.—It will surprise many to know that the Electric Vehicle Company, Hartford, Conn., has a force of 400 men turning out from three to five of the formerly well-known Columbia cars. These are about equally distributed between the "30" gasoline and the electric phaeton.

Thomas Gets Hurlburt.—It is rumored in New York City that upon the termination of the contract between the E. R. Thomas Motor Co. and the Harry S. Haupt Company, the latter will be replaced by a factory branch in charge of William B. Hurlburt, former president of thc Garford Motor Car Company.

Uncle Sam Gets Another Steamer.—The first of the new 40-horsepower Model "M" White steamers to be shipped from the factory was delivered a few days ago to the purchaser, the United States War Department. The car has been assigned for the use of the general staff in Washington.

Medal Awarded Holsman.—As winner of the class A, for motor buggies, at the Algonquin Hill Climb, the Holsman Automobile Company of Chicago has recently received the medal for this event. The design is of silver, framed in green velvet and encased in a green leather box.

IN AND ABOUT THE AGENCIES.

Franklin Agency Appointments.—The H. H. Franklin Manufacturing Company, of Syracuse, N. Y., announces the following new agencies: B. H. Byrne Garage Company, West Pearl street, Jackson, Mich.; Amos Post, Catskill, N. Y.; Seattle Automobile Company, Tacoma, Wash.; Easton Automobile Company, Easton, Pa.; F. F. Morrell & Son, Riverhead, Long Island; L. N. McCarter, Norristown, Pa.; Hugh H. Lewis, Fort Worth, Tex.; E. R. Wilson, Ishpeming, Mich.; Elizabeth Automobile Company, Elizabeth, N. J.; L. B. Russell, Jr., Comanche, Tex.; Corsicana Motor Car Company, Corsicana, Tex.; Charles Denegre, Birmingham, Ala.; H. B. Sproul & Company, Staunton, Va.; N. N. Steffes, Winona, Minn.; W. B. Jernigan, Pine Barren, Fla.

Marion, Indianapolis.—The Marion Motor Car Sales Company, with offices at 238 Massachusetts avenue, Indianapolis, is the name of the new selling concern, organized to sell the entire output of Marion cars, which will consist of three styles, but all using same chassis. The new Marions have 35-horsepower motors and list at $1,850. B. F. Meixell, for the last eight years with the Fisk Rubber Company, is salesmanager of the new company.

Knox, Philadelphia.—The North Philadelphia Auto Station, 3425 North Broad street, has secured the agency for the Quaker City and adjacent territory of the Knox car. The Knox was formerly represented there through a branch house, and later the Foss-Hughes Company looked after the Knox commercials, but for some time past the company's product had been unrepresented in Philadelphia.

Stromberg Branches.—The Stromberg Motor Devices Company, of Chicago, has opened a branch at 319 Columbus avenue, Boston. It has also appointed the Standard Automobile Company its Pittsburg agents and the Auto Equipment Company agents for Philadelphia and vicinity.

Allentown Changes.—The Hamilton Auto Company, of Allentown, Pa., has absorbed the Hamilton Peatty Company and will open up new sales rooms and a garage on the Rink property. This company already has the Ford agency.

Knox, Chicago.—The Knox Automobile Company, of Chicago, will remove to 1458 Michigan avenue as soon as the nccessary repairs can be effected. A five-year lease has been procured on this property.

New Company in New York City.—The Howard & Company Auto Exchange has leased quarters at 1666 Broadway, where it will handle high-grade foreign and domestic cars.

Oldsmobile, Newark, N. J.—The Oldsmobile Company, of New York City, has established a branch at 88 Washington street, Newark, N. J.

Crawford, Newark, N. J.—The Mitchell Automobile Company, Halsey street,

Newark, will also sell after January 1 the Crawford car, made at Hagerstown, Md.

Chalmers-Detroit, Allentown, Pa.—Lawfer Automobile Company, of Allentown, Pa., has taken the agency for the Chalmers-Detroit.

Elmore, Santa Ana, Cal.—D. J. Bastanchury has taken the agency for the Elmore car at Santa Ana, Cal.

White, San Diego.—F. C. Fenner has been appointed agent for the White steamer in San Diego, Cal.

PERSONAL TRADE MENTION.

Kyle Wallace, the former assistant superintendent of the Maxwell-Briscoe Company's plant at Tarrytown, N. Y., has accepted the position of superintendent of the works of the Colburn Automobile Company, at Denver, Col.

J. A. Tuthill, sales agent for the Dayton Airless Tires for New York City and vicinity, has located at 1966 Broadway.

W. E. Knight, formerly with the New York Leather Belting Company, has joined the H. H. Franklin Mfg. Co.

OBITUARY.

Arthur W. Tobin, president of the Continental Motor Mfg. Co., of Muskegon, Mich., died December 13 at the Augustana Hospital, Chicago.

RECENT INCORPORATIONS.

Prospect Heights Automobile Company, Brooklyn, capital $125,000, to manufacture automobiles. R. L. Kelly, F. F. Reilly and L. C. Howard were named.

West Medford Automobile Company, Medford, Mass., capital $20,000, to do a general automobile business. President, A. E. Kenney, and treasurer, C. E. Hall.

Morgan Motor Car Company, Wilmington, Del., capital $500,000. E. L. Squire, K. M. Byrne and J. A. Byrne are interested.

Atlantic Motor Company, Greensboro, N. C., capital $25,000, to manufacture and sell motors, engines and machinery.

Bell Carbureter Company, 305 Garfield avenue, Aurora, Ill., capital $12,000, to manufacture auto attachments.

G. H. Dunham Company, Boston, capital $25,000, to do a general automobile business.

TAXICABS AND TRANSIT.

Motor Railway Cars Replacing Steam. Pennsylvania railroad officials have ordered several Union Pacific gasoline motor cars, one of which will be placed in service on the Indiana branch between Blairsville and Indiana, replacing all other steam-drawn passenger trains. Tests will be made with the others in the Pittsburg district on the main line between Pittsburg and Pitcairn, as well as on the Conemaugh and Monongahela division. If these tests prove the suitability of the cars for this work a number of them will be ordered.

Lansing, Mich.—The fire chief of this city recently tested out the combined automobile fire engine and hose wagon. The test was a complete success, but six seconds being required to start. A speed of 40 miles per hour was shown and a stream of water was pumped 20 feet above a six-story building. The capacity of the machine is 700 gallons per minute.

Atlantic City, N. J.—Louis Kuehnle, Edward Bader, Dr. B. F. Coll, Charles Gondolf and William Harris have formed a company for the purpose of supplying the City-by-the-Sea with taxicab conveniences. Twenty machines have been ordered, the first of which arrived last Friday. The company has decided to fix the price basis at 40 cents a mile.

Modesto, California.—A new road in the West running from Modesto to Empire, Cal., has just been completed. This will be known as the Modesto Interurban, and will be operated exclusively by gasoline motor cars. If the service connecting with the Santa Fe at Empire is successful it will be extended to Oakdale, where it will connect with Sierra railway.

Covington, La.—The St. Tammany & New Orleans Railway & Ferry Company has received its first gasoline railway car. This, an open body, 50-passenger car, will be put in service immediately, running to and from Covington, La.

Placerville and Lake Tahoe, Nev.—The stage line between Placerville and Lake Tahoe, made famous by Mark Twain's story of Horace Greeley, is to be brought up to date by the use of motor buses.

Reading, Pa.—A company is in process of formation which will operate a system of taxicabs in Reading. Two of the vehicles are already at work.

Yellowstone Park.—The old stage in Yellow Stone Park is being replaced by a modern Franklin air-cooled touring car.

GARAGE NEWS OF ALL KINDS.

Los Angeles, Cal.—The Los Angeles agent for the Thomas, Renc A. Brassey, operating under the corporate name of Thomas Motor Car Company, has completed plans and started the construction of what will be the finest garage and salesroom in Southern California. This new building, which will be located at 646 South Olive street, will be of pressed brick, 70 by 165, and will cost upward of $100,000. In addition to this up-to-date building, Mr. Brassey has engaged, among others, Montague Roberts, the famous Thomas racing driver, to assist him.

Wilmington, Del.—A new garage has been opened at Wilmington, Del., by the Wilmington Automobile Company, who will handle the Franklin. The garage building adjacent to the new Avenue Theater at Delaware avenue and Tatnall street, is 83 by 114 and two stories high. The first floor provides machine and repair shop as well as storage space. The second is given up to storage entirely.

Terre Haute, Ind.—John Cox, who retired as manager of the Terre Haute (Ind.) Automobile Company some time ago, will erect a garage at 222 South Seventh street, and under the firm name of Cox & Company will compete with his former employers. A modern building 67 by 100 will be erected.

Omaha, Neb.—The Coit Automobile Company is preparing to build a reinforced concrete garage on the corner of Farnam and Twenty-third streets, in the midst of the automobile district. The building will have a frontage of 72 feet and a depth of 132 feet.

Harrisburg, Pa.—The Central Pennsylvania Automobile Company is reconstructing the building at Fourth and Chestnut streets, Harrisburg, Pa. A fireproof oil and gasoline room will be a feature. They handle Locomobile, Franklin, Oldsmobile, Buick and E-M-F cars.

Bakerfield, Cal.—The Bakerfield Garage Company has purchased property fronting on Nineteenth and Twentieth streets, where it will erect a complete garage and repair shop at an expense of about $50,000.

Portsmouth, O.—W. J. Friel has just taken possession of his new garage and repair shop at 14 West Fifth street, where he will be able to do a large volume of work of the class that makes for future success.

Fort Smith, Ark.—A new garage has been opened in Fort Smith which will handle the White steamer and Oldsmobile. This is the Ward & Harris Automobile Company, North Tenth and B streets.

Des Moines, Ia.—A syndicate composed of W. J. Riddell, R. R. McCutcheon and R. Parry has recently purchased the property at 1011-1015 West Walnut street for the purpose of building a garage.

Perth Amboy, N. J.—The Perth Amboy Garage Company is moving into its new building on Madison avenue and will soon be ready for business. Alex. Conquest will be in charge.

Orlando, Fla.—B. C. Abernethy, manager of the Cook Auto Company, has just let the contract for a new large garage next to its present location to handle the increased business.

Long Island City, N. Y.—The Packard Automobile Company has purchased land in Long Island City and will erect a large building for a garage, salesroom and repair station.

Scranton, Pa.—The Standard Motor Car Company is building a new two-story concrete garage in Dupont court, which it expects to occupy about the middle of January.

New Haven, Conn.—George W. Curtis, superintendent of the Holcomb garage, New Haven, will erect a new building at Orange and Audubon streets.

Cincinnati.—The Eagle Automobile Company has leased the property at 3139 Reading road, where work will start at once on the erection of a concrete garage.

Redfield, S. D.—E. C. Issenbuth is building a garage which he will rent to T. P. Blaine, who will carry on a garage and automobile supply house.

Farmington, Me.—The F. E. McLeary Company, Farmington, Me., will build a two-story brick and frame garage with concrete floors.

Jacksonville, Fla.—Fred Gilbert has bought the property at the corner of Church and Laura streets and will erect a four-story garage.

Beloit, Wis.—The contract has been let for the mason and concrete work on the new garage for C. Mattison & Son, Fourth street.

Kansas City, Mo.—L. A. Robertson, agent for the Franklin in Kansas City, is erecting a new garage and salesrooms on Main street.

Maywood, Ill., now has a garage, G. T. E. Fuller having recently opened a large building at Lake street and First avenue.

Wilmington's (Del.) Newest Garage.

An Industry's Progress of a Decade

By Thos. J. Fay

Thos. J. Fay

THE mother of invention should be mighty fond of the most youthful of her progeny, the automobile; as well she may. A decade ago the motor-driven car was but the dream of pioneers, out of which they awakened to be smote by the sunlit dawn of a new era. To scan the horizon of human endeavor but a few years ago would have disclosed the automobile as the merest speck, shrouded in mystery, and stayed by prejudice.

It would be to dip deep in the brine of lore, therein to find a theme wonderful in its ramifications, with never a chance of reflecting the splendid possibilities the future holds for this geocentric product, vastly portraying the genius of man.

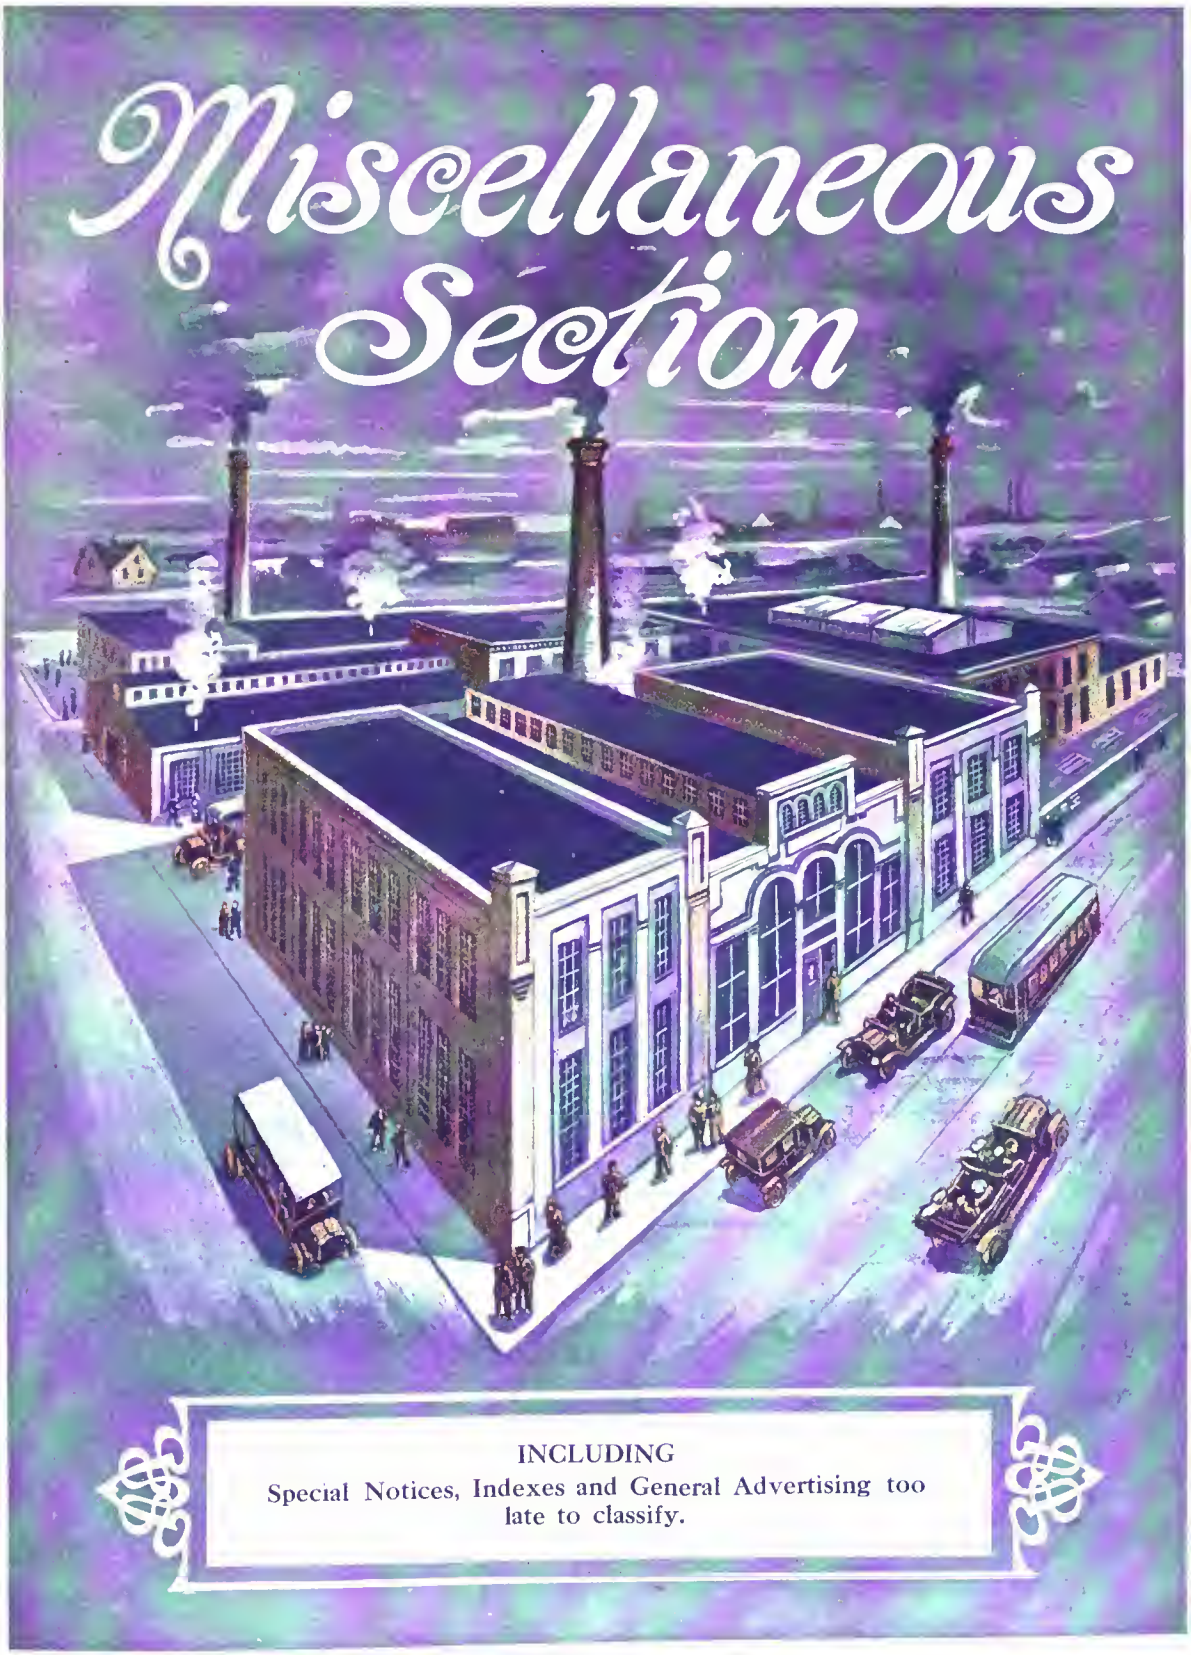
With an abiding faith in the future of the automobile, considering well the dizzy height attained, the treacherous pathway, and the stragglers that ever bestrew the onward march of progress, it will not be amiss to render up an accounting of the assets, to countermarch that splendid galaxy, and thereby to lend confidence to such further efforts as progress dictates, agged on by necessity.

A résumé of current events, something by way of encouragement, and a stray remark, will scarcely be too much. In the pages to follow, then, the aim will be to discuss the automobile as it is, with perchance a reflection or two portraying the future trend and a resting place for mile stones.

SPECIAL SHOW ISSUE GRAND CENTRAL PALACE, N. Y. **PRICE, 25 CENTS**

THE AUTOMOBILE

WEEKLY NEW YORK THURSDAY, DECEMBER 31, 1908 CHICAGO 25 CENTS



REG. U. S. PAT. OFFICE

TRADE **SIRENO** MARK

Pat. Feb. 4, '08. Pat. July 28, '08

OTHER PATENTS PENDING

ANNOUNCEMENT for 1909

TWO NEW MODELS

SIRENO
HALF-SIZE
PRICE, $35.00

The **SIRENO** adapted for large cars.

The **SIRENO JUNIOR** for Runabouts and Small Touring Cars. Recent improvements make the **SIRENO** more flexible in operation—STARTING INSTANTLY and STOPPING the moment the push button is released. This latter improvement (Pat. applied for) is absolutely AUTOMATIC and "FOOL-PROOF."

The **SIRENO JUNIOR** is a smaller type and is bound to spring into favor—operates in the same manner as the **SIRENO** but has not the braking feature. The volume of sound has a carrying range of one to two miles on country roads.

Both types have BALL-BEARING MOTORS

and

Operate on SIX VOLTS.

SIRENO JUNIOR
HALF-SIZE
PRICE, $25.00

New models exhibited at all the shows. Get our new printed matter. Circular "A" describes these models and other accessories for 1909.

Dealers, don't fail to get quotations and cuts for your catalogue. It will pay you, Address us

AN ELECTRIC VICTORIA in fine order; batteries nearly new; demonstration; using gas car; reason for selling; cost $1,375; price, $500. Address E., room 1004, 261 Broadway, New York.

ANNOUNCEMENT.—SWEEPING REDUCTION in used White Steamers. During the paet year we have taken in exchange for newer models, a considerable number of used cars.

We must make room for the new stock, therefore these cars will be sold at ridiculously low prices in order to close them out quickly.

Every car we take in—regardless of how much or how little it has been run—is put through our repair shop and overhauled from engine to rear axle, every working part that ehowe wear is renewed and the bodies are painted, and so far as practical purposes are concerned, the cars are as good as when they left the factory new.

In buying from us you are dealing with the makers direct, and not with individuals, or second-hand dealers, who have nothing to lose by misrepreeentation.

White Steamere from $300 up.

Write for further details and don't delay if you wish to take advantage of this opportunity. The White Company, Broadway at 62d St., New York City.

A PIERCE-ARROW car, 40-h.p., 1907 model, full equipment, regular Pierce top, and glass front. The car is in first-class condition. For further particulars, address George A. Driggs, Waterbury, Conn.

DON'T PAY TOO MUCH or too little for a slightly used or second-hand automobile. Extravagant claims are made for automobiles at your own price. We have 150 to 200 types and models of various makes of automobiles at a full dollar of automobile value for every dollar of price. Much detailed information of great economic interest to prospective purchasere is here for you; and you will be truly grateful after investigating by a personal call or through the medium of our price list. International Auto Co., 542-544 Wabash Ave., succeesors to Chicago Auto Warehouse and Chicago Auto Commission Co., Chicago, Ill.

WE HAVE NEW YORK'S REAL AUTOMOBILE SHOW—With the largest garage in New York and a floor space of over 60,000 feet, crowded with new and second-hand cars, the majority on conelgnment, we offer more inducements to the man seeking a good automobile at a low price than any automobile show can present. We have over 250 cars for quick sale, at prices from $150 to $4,000. The following will give you some idea of what we can offer:

Panhard touring car, fully equipped....	$1,000
Rochet Schneider, like new, fully equipped	1,450

American More Tourabout, 1908.....	950
Knox air-cooled runabout.....	350
Franklin air-cooled runabout.....	350

We are different from any other houee in New York and can offer distinctive values. Our business necessitates quick sales, and to secure the latter low prices must be offered. We sell cars on 5 per cent. commission basis, acting as the brokers for the owners. Those who purchase here escape paying a profit to the dealers. This system gives ue the choice of all the desirable cars. Our patrone practically come in contact with the owner and get the car at the figure he is willing to accept. It would take pages to describe the many cars here, and as there are new arrivals daily, the best plan is to come and inspect; 'phone or write for bargain list. We are two blocks from Broadway. This means many hundreds saved in expenses and is one reason why our prices are so much lower than others ask. Ours is a practical system which appeals to the intelligent and explains why we are America's real largest dealers. Manhattan Storage Company, 334-340 West 44th St., New York City, two blocks from 42d St. Station 9th Ave. "L."

TIRES!
TIRES!!
TIRES!!!

We can sell you any make, any size or styla tira or tube for less money than any dealer anywhere in the United Statas.

Wa have contracts with the leading makers of automobila tires to sell for them any quantity of surplus stock, enabling us to quote these at 60% to 70% discount from the regular price. Do not buy tiree until you get our prices. Bargains in all makes of tires and tubes.

CLINCHERS
DUNLOPS
QUICK DETACHABLES

We guarantee these brand new, clean, fresh 1908 stock. This lot includes Morgan & Wright, Ajax, Diamond, Continental, Ennis, Pennsylvania, etc. We are selling the lot while they last.

Siza.	Casings.	Tubes.
28 x 2½	$7.00	$2.50
28 x 3	11.00	3.00
28 x 3½	15.00	3.50

By securing a vary largs quantity of these goods, we are enabled to quote you these extraordinery low prices.

EXCELSIOR TIRE CO.
1777 Broadway
New York

(Special Notices continued from page A-7.)

OLD ESTABLISHED garags for sale; repair business and two well-known agencies; sales per year, about 20 cars; town, 6,000; 20 miles from New York. For particulars address "S. B. H.," care The Automobile.

RADIATORS and lamps repairsd by expsrts. Ship to us and follow with lettsr. Auto Rebuilding Co., 1349 Michigan Ave., Chicago, Ill.

RUMBLE SEATS and "baby" tonneaus, for Ford, Maxwell, Buick, Cadillac and other csrs, fenders, radiators, hoods. We are the big mail-order rebuilding house. Send for catalogue. Auto Rebuilding Co., 1349 Michigan Ave., Chicago, Ill.

SAVE DOLLARS!—Charge and renew old batteries; formula, 10-cent coin. Box 204. Waterloo, Ia.

SHINEBRIGHT METAL POLISH is absolutely the best on ths market; sample and quotation furnished upon requsst. Shove & Gage Co., Inc., Providence, R. I.

STEAM CAR OWNERS—Send for sample of engine and pump packing. R. A. Robbel, 221 East 31st St., Chicago, Ill.

THE AUTOMOBILE HANDBOOK.—By L. Elliott Brookes. Over 10,000 copies sold. This sale guarantees absolute authority. This work was written to supply practical information to automobile owners, operators and chauffeurs, including road, motor, carbureter, ignition, battery, clutch and starting troubles, with information of value in automobile mechanics. Pages, 480. Over 180 illustrations. Leather bound, $1.50. Frederick J. Draks & Co., 214 Fisher Bldg., Chicago, Ill.

THIS IS THE TIME of ysar to send in your old tires and have them put in A-1 shape for spring servics. Ws ars not the largest, but the best, tire repair company in the country. We also supply and sell all makes of solid vehicle tires; also all makes of new auto casings and tubes. We have on hand a full line of second-hand tires and tubes, at one-third the list price of new tires and tubes. This is not hot air. Give us a trial and be convinced. Chicago Tire Repair Co., Michigan Blvd. at 35th St., Chicago.

TIRES REPAIRED.—Automobile owners, do you want your tires repaired or recovered by the people who know how? Give us a trial and be convinced. Inner tubes vulcanized at short notice. Jungkind & Vogler, 158 Chambers St., New York City. Telephone, 3286 Cortlandt.

U-AUTO POLISH will keep the varnished parts of your automobile or carriage in excellent shape. Address Shove & Gage Co., Inc., Providence, R. I., for sample.

TIRES REPAIRED and retreaded.—All work guaranteed. Ws have the largest and best-equipped tire repair shop in the West, and experienced men do the work. Best matsrials and workmanship only. A complete line of Morgan & Wright tires carried in stock. Auto Tire Co., agents Morgan & Wright, 605-7 East 15th St., Kansas City, Mo.

TIRES.—Model Vulcanizing Co. tires. Have your tires repaired and vulcanized by rsliable experts. All work guaranteed. Let us save you money on new tires. We repair all types of Clincher motor cycls casings and tubes, and also repair and apply solid vehicle tires. Our motto: Right and rsasonabls. Model Vulcanizing Co., 1547 Michigan Ave., Chicago. Ill.

TWO TWIN-ENGINE Indian Motorcycles; one 8-horsepower Minerva. H. E. Corysll, rear 353 Main St., East Orange, N. J.

Protect Your Automobile Improvements with Solid Patents

We can handle your business properly, as we are familiar with all types of Autos, are automobile owners and have had twelv years practice before the Patent Office. Send sketch of your invention for free report as to patentability. Book "How to Obtain a Patent" and "What to Invent" sent free.

THE BLUE BOOK CAR AND CREW No. 2

The Official
Automobile Blue Book

is the only recognized road directory in America.

¶ It has never had competition—only weak imitations and incomplete copying—and in no instance has it ever been approached in point of accuracy, radius of action or size. ¶ The Automobile Blue Book has a staff of trained map makers and routers, who are almost constantly upon the road, extending routes, simplifying detail information and improving and enlarging the volumes. ¶ We show here a reproduced photograph of one of the Blue Book cars, which alone has covered nearly 40,000 miles. ¶ **This is just to illustrate the fact that all sections of this road guide are mapped, mile after mile, right from the cars, by men who know how to do it.** ¶ If you contemplate touring this summer, send your order NOW for any section or sections noted on the opposite page.

Price $2.50 per volume.

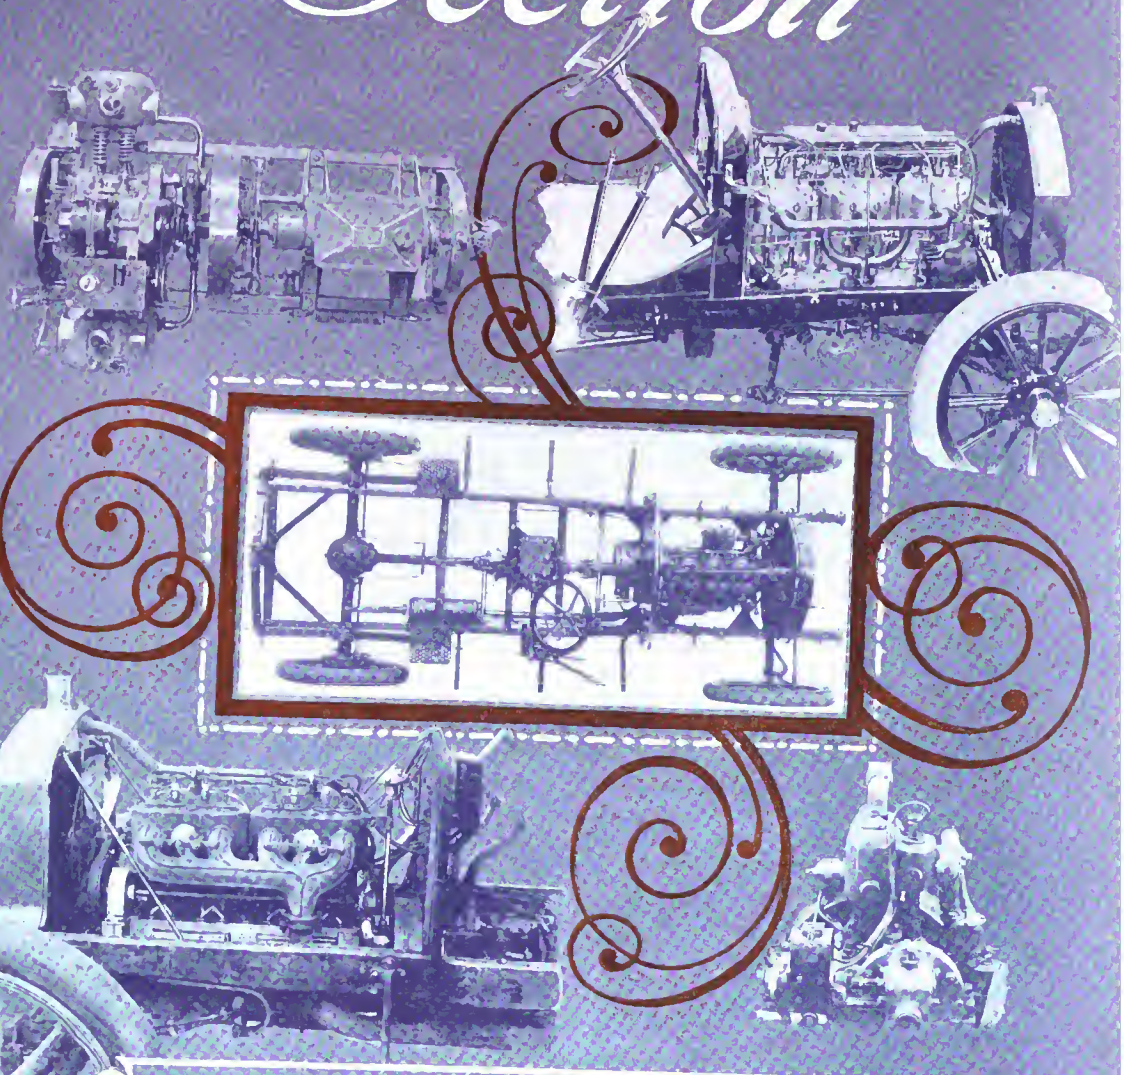
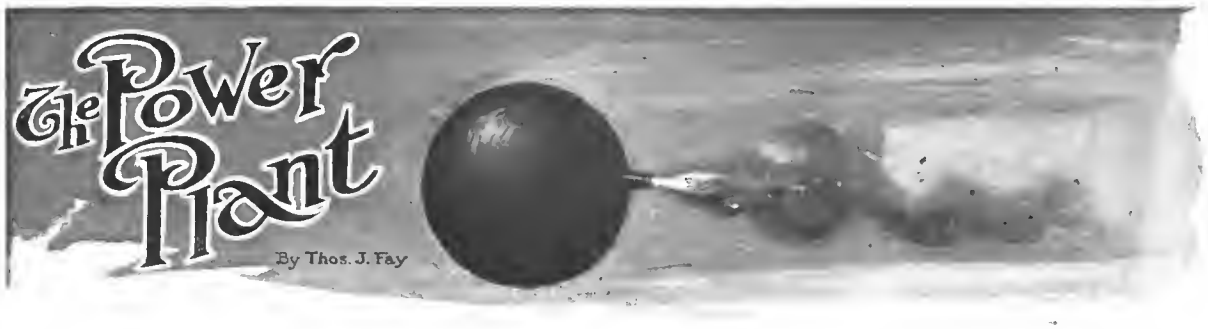
Power Plant Section



INCLUDING

Carbureters, Crankshafts, Crank and Gear Cases, Transmission Gear Sets, Cooling Systems, Mufflers, Protecting Aprons, Hoods, Cylinders, etc.



CANDIDLY, the progress made within the last year by way of improvement in the power plants of automobiles was so diversified and in many ways so given to detail as to preclude a thorough attempt at reiteration. There were no radical departures from the beaten paths, however, nor evolutions beyond the pale of conservative practice. The several types of motors in their respective spheres of influence maintain that sturdy and growing importance which is servile to lawful manipulation, and is more nearly invincible to re-occurring and unpleasant happenings than even the most optimistic might have anticipated.

At the beginning of the year the single cylinder motor was looked upon somewhat less favorably than its true merit warranted. The double opposed motor was threatened by the four-cylinder type, and the four, in turn, seemed crowded by the many and undeniable advantages of its flexible neighbor, the six. These apparent controversies proved as chaff before the wind—to be forgotten—in the demand for cars, typical of each of the types of power plants and characteristic advantages.

It seems assured that further experience has established the facts that the earlier defects incidental to the several types of motors were due to vagaries of design, faulty materials and indifferent construction. This last year was one of noteworthy events, due in a measure to the threatening financial situation, which, however, augured for good, in that it produced the incentive ending in a thorough house cleaning.

The live concerns eliminated the faults of which they had become cognizant, revised their methods and evolved among other things power plants for their cars that would seem to spell finality. The earlier complaints were duly weighed, the question of the duplication of parts was rendered more nearly an accomplished fact, and the production of repair parts, both in point of cost and utility, were afforded the due measure of attention to which they were entitled.

The Trend of Motor Improvement.

To fully appreciate the situation it will be necessary to subdivide the power plant and discuss the respective features by themselves. The motor, for illustration, as an abstract proposition, can receive treatment, irrespective of the number of cylinders, since the question of improvements will be the same.

Cylinders Were Perfected.—From the start the cylinders proved to be rather troublesome, and it is to the everlasting credit of the makers of cars that they finally produced motor cylinders quite as free from troubles of any sort as any reasonable person can possibly expect. The improvements did not take root by way of adding weight, indeed; the whole situation can be summed up by saying *they added quality instead.* But this was not an easy matter; the foundries had to be educated up to the exacting requirements, and in the earlier times they refused to stand for the ducking, excepting at a price, which perspicuity was not with a definite assurance from them that the quality of the cylinders would be up to a fitting standard. Time wrought changes, and the last year was the one of marked advances, from the foundry point of view.

In the meantime, patterns were more nearly in accord with the needs of the occasion, and between the more suitable pattern work, the better foundry practice, and the clearness of precision of designers, cylinders were produced in quantity, of great strength and suitable for their respective purposes, whether they were to be water cooled or by an air draught instead.

Crankshafts Are Die Forged.—It was just about a year ago that the crankshaft question was most agitated, for then it seemed inevitable that slabbing would have to be resorted to, in order to make crankshafts of the quality demanded in service. In the meantime, the threatened invasion did have its effect, and the drop forging interests made experiments leading up to what is now commonly termed *toughened drop forgings*, in which the materials have properties imparted to them by special heat treatment, such as were never before known to the automobile or any other industry.

The process was found to be most exact, cheapening in its trend, and fortunately propitious in the time of its coming. This process lends itself equally to such other parts as connecting rods, cam shafts and multitudinous small parts, of which automobiles seem to have a liberal share.

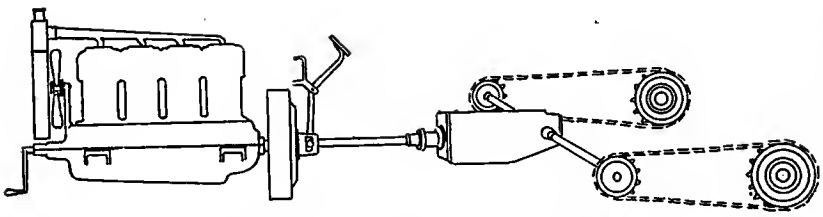
Crankcase and Bearings Related.—Strides have been made in the testing of aluminum, thus rendering it safe and profitable to employ this light and, on the whole, very desirable metal in work of this character. This improvement is one of the distinct advances of the year. In earlier times the aluminum castings were good in the main, but they were not used by some of the makers of cars, because manganese bronze is considerably stronger, but it is considerably heavier as well.

It will be proper to discuss the question of bearings in connection with crankcases, since a bearing *per se* would be of no utility, without a resting place of considerable stability. It matters not at all if the bearings are the one or the other of the available types, when reference is had to alignment, and during the last year this problem was solved to a double purpose. It was noise that brought about the change, for in trying to eliminate noise it was discovered that thin castings defeated the project, in that they were largely responsible for much of the remaining noises in cars, as they were a year or so ago.

To thicken the walls seemed to be a necessity, and this thickening process was of course possible, in view of the very light weight aluminum and, too, in view of the extended use of die (drop) forgings, in that the noises were subdued, and the bearings were kept in more perfect alignment, since the increased thickenss of the shell resulted in increased rigidity of the bearing supports and absence of trouble.

Ball and Roller Bearings.—It was pointed out how the process of eliminating noise resulted in a more stable housing for the bearings. In relation to the bearings, it might be well to observe that the tendency is in the direction of ball and roller bearings up to the limit of the ability of designers to eliminate plain bearings, with their shorter life.

That designers have pursued a sensible and conservative course is rendered manifest by an inspection of the cars of the year; they have not, for illustration, attempted to put ball or roller bearings on connecting rod bearings. When it comes to crankshaft main bearings, they have been guided by broader considerations than the mere question of the utilization of ball bear-



Outline Design of Typical Side Chain Drive Power Plant.

ings for the sake of being able to say that they have them. Such of the cars as employ ball bearings on the crankshaft main bearing position were evidently justified in taking advantage of the excellent qualities afforded. In the types of motors involving plain main bearings for the crankshafts, there were considerations that outweighed the advantages of ball bearings, and the finer qualities of main bearings were employed instead.

When it comes to the transmission gearset, there are few or no examples of plain bearings. The spindles are centered in nearly every case on either ball or roller bearings. When ball bearings are found, they are almost invariably of the radial type; and when it comes to roller bearings, they are largely of the conical type.

Likewise in the axles, the plain bearings are scarcely to be seen at all, while the ball and roller bearings are in great profusion.

The Principle of the Three-Point Suspenaion.—This principle has been extended during the present year to include cars in general. The question of bearing alignment was a strong argument in favor of resting the power plant units on three points, or the equivalent, instead of depending upon the rigidity of the side frames. The mode of the application of the principle is not the same in all cases, but the dominant idea is uppermost in each of the several examples. In some cases the uninitiated would fail to discover the principle of the three point suspension, because in resting the units on more than three points there is an apparent diversion from the principle involved; and the uninitiated would fail to discover that *rigid ties are limited to three points only.*

Speed vs. Power.—In the old days, motors were run at a low speed, and the power was a minimum for a given weight. Gradually the question of increasing speed took a hold, and within the last year this matter was crystalized into short stroke high speed motors, in which the weight efficiency is very high indeed. Remarkable as it may seem, the fuel consumption diminished considerably, although some forecasts were to the opposite view.

The short stroke motors are light; the strength of the component parts would naturally increase because in such motors the parts are short and relatively thick. The deflections diminished and the mechanical efficiency increased as a natural sequence. The mere decrease in the length of the stroke did not at first promise so much as after events disclosed. On second thought it would have been rendered quite plain that increased mechanical efficiency would follow any increase in rigidity, since the way to make a thing rigid is to make it short and thick.

Valves and Timing.—While it is true that the valves are not made of greater area than of the previous practice, it is equally true that the relation of the areas of valves to the areas of cylinders has undergone a change. This change in relation is assignable to the fact that the bore of the modern short stroke motor for a given power is less than the bore as is obtained under the old conditions, but in reducing the bore of the cylinders a corresponding reduction in the area of valves did not follow, hence the change in relation in favor of an increased volume of mixture or power and better cooling conditions.

Dual Ignition Systems.—The new products are so thoroughly fitted out with ignition devices as to preclude any change of justly conducting any of the old line of strictures. The magnetos of the present time are thoroughly scientific, well made and deliver a spark of great energy at the proper instant. They serve every purpose required of an electrical system, excepting for lighting, and it is to be regretted that the magneto system does not seem to lend itself to this important matter.

It is almost unnecessary to point out that the "rotor" of the magneto must change in speed because the magneto must synchronize with the speed of the crankshaft, which shaft rotates at a variable speed. The magneto then cannot deliver a constant electromotive force such as would be required in lighting work. A speed regulator is complicated.

The direct current system of ignition, using a small dynamo, is of course available for the double purpose and is preferred by many on that account. In these days, with the new types of coils, equipped as they are with the "master vibrator," the petty objections to coils are wiped out, and the direct current systems more nearly lend themselves to the problem than ever before. In conjunction with the coil systems, the modern storage batteries make combinations a good second to the magneto, and most cars are fitted out with the dual system. In some cases, because of the splendid advantages of the master vibrator, in conjunction with the coil system, it is the practice to use the storage and the dry cells to the exclusion of the magneto. This scheme is reliable, economical, and the first cost is the minimum for good results.

The Fuel Systems.—At the beginning of the year the question of alcohol was *hot off the grid,* but gasoline is the fuel upon which reliance is placed, with small chance of a change for some time to come. As long as gasoline can be had it will well serve the purpose, and its price will have to more than double perhaps to afford other fuels a chance to compete.

It is pleasant to note that the cars of the present date are fitted out with good and sufficient copper gasoline tanks, of excellent workmanship, involving sweated and riveted joints. It is also observed that, as a rule, a water pump is provided, and baffle plates are placed to prevent the surging of the gasoline in the tank. The fastenings of the tanks are also strong and securely placed, as they should be.

Piping and Fittings.—The new cars, without respect to price, are provided with suitable gasoline piping, which appellation can well be applied to the oil and other piping in and about the cars of the present time. The chances of a stoppage are remote, and the strength of the piping is well within bounds. The fittings are strong, light, tight and of the ground joint class; one may quickly remove a section and, after blowing the same out, replace it without fear that a tight joint will not be made.

Carbureters Reduced to Practice.—The float feed type is still with us, carrying many improvements, mostly in point of detail, to be sure. The trappy, loose jointed and mysterious affairs, once the master of us all, can no longer be found on automobiles. Under the new conditions the needle valves, for illustration, are more nearly tight, and flooding is controllable.

The copper or cork floats are nicely constructed, not likely to become loggy, and means are provided for scavenging the various recesses of the carbureter of such jelly-like aggregations as would of course lend trouble were they allowed to remain.

The float feed type of carbureter is not alone in the field, since there are illustrations of the Krebs idea, and in certain classes of work, notably in connection with the two-cycle motors, injectors are making headway, promising overmuch.

It may be well to call attention to the growing use of the hot water idea of eliminating the refrigerating effect due to the evaporation of gasoline; it works well.

Spark Plugs in Profusion.—Spark plugs were improved in so many ways in recent times that it is a little difficult to specifically enumerate any considerable number of them. Autoists will be interested to know that the grade of porcelain is now up to a standard such as will practically exclude the annoying

ignition failures, once the bane of the spark plug. The packing around the insulation, which may be of porcelain on the one hand and mica on the other, will not be the cause of cylinder leakage in the well-made spark plugs now to be had.

The A. L. A. M. standard thread for spark plugs is now quite extensively adopted, and from appearances it would seem as if the matter will simmer down to one standard thread for all spark plugs, insofar as American cars are concerned. While standards, speaking generally, are difficult to establish, the fact remains it is an important matter when reference is had to spark plugs; an autoist would be able to replace a defective spark plug from the stock of any supply house, however remote from the marts of trade, which facility can only be brought about if a standard thread is adopted.

The Utility of Mufflers.—In the earlier examples of mufflers, if the noise was dampened, so was the power. It required a good deal of effort and some ingenuity to eliminate the noise of exhaust without suppressing the power of the motor. Modern mufflers accomplish this, and they are provided with muffler cutouts, mostly to make a noise.

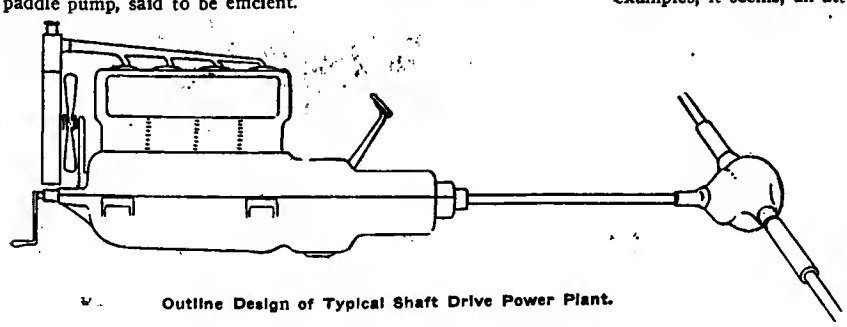
The Cooling Systems.—During the cut and try period it was the system of water cooling that had full sway. Air cooling seems to have been retarded somewhat, possibly because it is a more difficult engineering feat, or, better yet, due to the absence of reliable data on the subject. The splendid service rendered by air-cooled motors, despite the obvious difficulties that beset the earlier designers, has resulted in an astonishing growth of this branch of the industry, contrary to forecasts on the part of those who failed to observe sufficiently close. That the air-cooled situation is on a healthy basis is so well known as not to require comment.

Referring to the air cooling situation, there are two dominant ideas, the one of which involves a direct air blast, while the other affords a greater volume of air over a greater surface, under conditions not so pronounced in point of air pressure. There are differences in details of design of the cylinders, valves and other details, when reference is had to the air cooling method.

Water Circulation.—In this connection there are two fundamental ideas, the one of which takes into account the "thermo-syphon" system of water circulation, while the other involves forced circulation by means of a pump. In the thermo-syphon system the circulation is natural, due to the difference in weight of hot and cold water. The cooler should be somewhat larger if the thermo-syphon system is used, and the propeller blades of the air fan should be most carefully proportioned. That these matters have been taken care of is proven by the fact that the thermo-syphon system is backed up by a horde of enthusiastic autoists, who lay stress upon the absence of the water pump; and such complication as its presence would naturally dictate.

By way of coolers (radiators) there are splendid examples of the respective generic types to be seen at every hand. The cooling ability has been reduced to a fine art, and the weight factor is approximately two-thirds of what it was a year ago. The stability of coolers has been accentuated, and, on the whole, this phase of the situation is truly up to date.

Water pumps are much improved, and among them will be found the centrifugal type, the paddle wheel modification thereof, the gear pump, and of late something by way of an oscillating paddle pump, said to be efficient.



Outline Design of Typical Shaft Drive Power Plant.

Clutch and Flywheel.—These members, while they perform separate functions, are usually in conjunction with each other. The flywheel absorbs the surplus energy and gives it back again when the motor is least capable of delivering power. In this year's products ample provision is made in this respect. The clutch problem, on the other hand, is one involving the control of the speed of the car, with the motor running continuously. This problem is met in diverse ways, prominent among which are (a) multiple disc clutches, (b) leather faced cone clutches, (c) the same with cork inserts, and (d) flat band clutches, with metal to metal. In some of the examples of disc clutches (submerged in oil) cork inserts are used, while in other examples the oil is dispensed with.

Transmission Gear Set.—The gears are of alloy steel in nearly every case; three speeds and reverse holds the center of the stage, and the selective system is very popular indeed. Direct on the high gear dominates the situation, and the entire absence of noise is a conspicuous feature *in high gear*. As a rule, the cars are light enough to stand for high gear on all but the most unworthy roads and on grades, with occasional exceptions, so that the fourth speed is not missed. Certain types of cars are provided with the fourth speed, and in such cases the direct drive may be on third or fourth speed, depending upon the dictates of the designers.

Propeller Shaft.—The shaft drive is most conspicuous, and in the light touring cars of moderate power it is almost to the exclusion of the chain drive. The propeller shaft lines up almost for a straight-line drive, so that the universal joint is not required to transmit at any considerable angle. Radius rods are strong and work on very nearly true centers, so that "cramping" of the rotating parts is conspicuous for its absence.

Jack Shaft.—The differential is on the jack shaft (as usual) and in the side-chain drives, within the gear set housing. In the shaft drive cars the live rear axle takes the place of the jack shaft, and the year's crop of live rear axles are excellent illustrations of the advances made. The floating type is well represented, but the greatest advances were by way of stiff trusses, in the examples of live rear axles using them, although it is worthy of note that the trusses are dispensed with in some cases, involving expanded tubes.

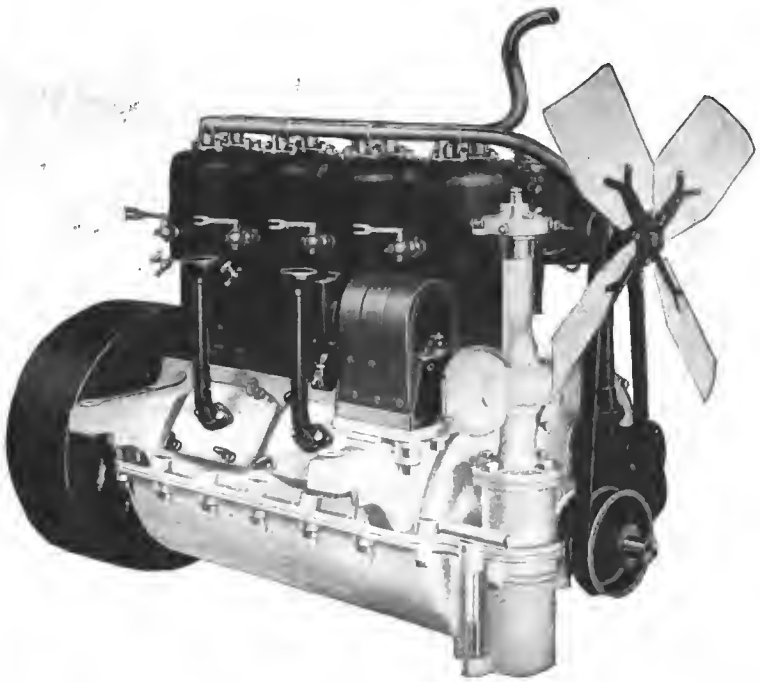
Provisions for Oiling.—This important subject was purposely withheld, since it relates to the whole power plant rather than to the motor alone. Forced feed lubrication is now common, whereas last year it was in isolated cases. A single "tell-tale" is frequently used, and the oil is fed to the vital parts of the motor, to the universal joints, the gear set and, in fact, to every place requiring liquid lubrication, in the best examples.

In place of a small hole, to receive mud *all the time* and a drop of oil *occasionally*, grease cups are used in some profusion, and the saving in repair accounts should be considerable in consequence. The hard lubricant is extended to the gear set and the universal joints. Indeed autoists are fast becoming acquainted with the virtues of grease as a lubricant, not to forget that graphite has its strong adherents as well. It is lubrication that saves repairs, and the makers of cars have put it up to users this year by ways adequately provided for the contingency.

Protection from Mud.—This phase of the question never did receive proper attention until very recently. In the present examples, it seems, an attempt was made to compensate for past neglect.

Perfect Ease of Control.—With the selective speed changing system, clutches free from spinning proclivities, splendid brakes, precision of timing, perfected carburetion, and a nice relation of the motor power to car weight for speed, the autoist is provided with every requisite essential to the control of the present type of cars, whether or no he counts among his accomplishments great skill in the process.

The RUTENBER



1909 Models

4 Cylinder, 4 x4, 25-28 h. p.
4 Cylinder, 4½x5, 30-35 h. p.
4 Cylinder, 4¾x5, 40-45 h. p.
6 Cylinder, 4½x5, 50 h. p.

FITTED WITH OIL-PAN BASE AND EQUIPPED FOR MAGNETO ATTACHMENT

Rutenber Motors were the first four-cylinder motors made and offered for sale in the United States, and met with immediate recognition and have held popular favor ever since and today are the standard multiple cylinder motors with an unprecedented demand, taxing the ability of an immense plant, one of the largest in the country, working night and day, to keep pace with orders. Rutenber Motors are unequalled for power devoloped, smoothness of running and general efficiency. Early arrangements should be made to secure Rutenber Motors in quantity for next season.

Cylinder Castings Our foundry capacity is such that we can handle large orders for cylinder castings promptly—finest castings, uniform, clean and true to pattern. We solicit correspondence from interested manufacturers.

The Lockwood Primer

When you start your car in the morning, do you crank your head off?

The man who is tired of needless work on the dangerous end of an automobile is the man we want to talk to.

If you were sure you could start your motor so easily that it would be a positive pleasure, you woldn'nt hesitate in having a primer put on.

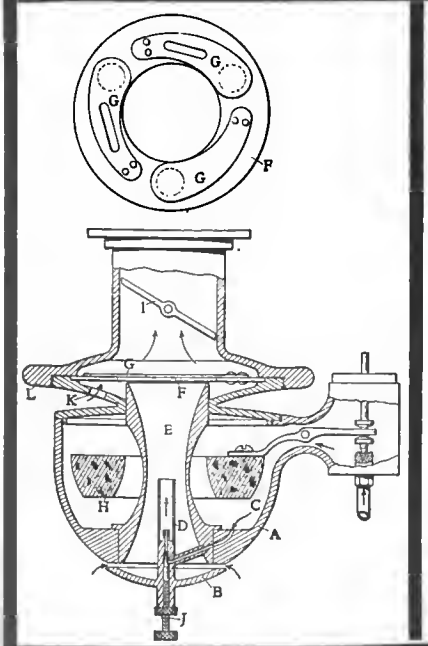
We will guarantee to satisfy *you*, and will give you 30 days to try it. If it doesn't come up to your expectations. return it, and we will refund your money.

Now, Mr. Man, this is not "Bunk." We know it will work to *your* entire satisfaction on *your* car.

If for any reason you do not want it, all you have to do is return it inside of 30 days and you will get your money by return mail.

LOCKWOOD BROS., 103 Pearl Street, Jackson, Mich.

THE BOWERS CARBURETOR



MODEL "G"

A LIGHT, compact carburetor of the Venturi type, designed for use on Automobile, Marine or Stationary engines. It will make engine easy to start, will show good power and speed, smooth running and quick acceleration. It is very simple in construction, having but one adjustment, and is of the highest grade of manufacture. We are willing to submit carburetor subject to inspection and trial and will guarantee its action to be absolutely satisfactory.

We furnish our Model "G" Carburetor in 1 inch, 1¼ inch and 1½ inch sizes, with either vertical or horizontal outlet and flange connection. We are in position to make prompt deliveries in any quantities.

Special prices to manufacturers.

PRICE, complete, 1 inch and 1¼ inch sizes . . . $10.00
1½ inch size 12.00

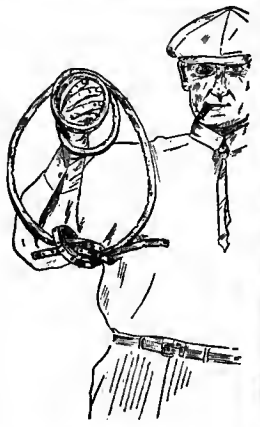
A.S.O. FAN BELTS FOR AUTOMOBILES



"The Perfect Belt"

No slip, positive in action; heat, oil and waterproof; made in all sizes, both flat and V shape; thousands now in use on **Packard** and other high-grade cars.

You take no chances, we guarantee the A. S. O. belts to give perfect satisfaction. Clutch troubles are eliminated by using our chrome tanned leather which we guarantee will not slip and is impervious to water or oil conditions. A. O. S. leather is used by the leading makers of American Cars.

The A. S. O. Transmission belt for motor cycles

makes the cleanest smooth running transmission to be had; it will hold, it wont stretch out and need continual tightening. It is proof against trouble from water or oil; is long lasting and not costly in the first instance. May we send particulars?

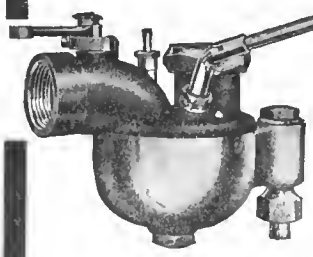
THE DASHBOARD ADJUSTMENT

OF THE

Holley Model W Carbureter

An automatic carbureter is one that adapts the gasoline feed to the air velocity, so that the correct mixture is produced under all conditions of speed and throttle opening. Such a carbureter is the single-adjustment **Holley Model W**—the simplest automatic carbureter in the world.



But the best automatic carbureter cannot adapt itself to changes in gasoline density, or in humidity, or to the gradual warming up of an engine started from "cold." If you would have your motor tuned to concert pitch always, slight day-to-day adjustment of the carbureter is essential.

With the single adjustment HOLLEY, this delicate tuning for maximum power is done instantly—while the car is running—without guesswork or experiment. A rod connected by universal joint to the needle valve passes through the dash, and ends in a graduated, ratchet-held dial. You bring the car to road speed—or on a hill if you prefer—and turn the dial handle a little to right or left till the motor pulls strongest—and the trick is done.

There's no "maybe" or "perhaps"—no speculating as to whether it's the spring tension or the spray opening that needs changing—no trial setting followed by a run to find whether it is right or not—no uncertainty about any point of the procedure. The float level, once set, is never changed; and the needle valve is the ONLY other thing about the carbureter to adjust.

Importance of High Grade Accessories

INTELLIGENCE displayed in the operation of automobiles should be by way of the use of proper accessories. Nothing but hands with which to cope with some unruly part of a car, under conditions remote from the haunts of the repair man, is pretty nearly sure to end with nothing but a borse to move the car. Conceding that automobiles are less prone to troubles than they were during the constructive period, it is well to be prepared when a difficulty does arise and emphasizes the need of good facilities.

Something by Way of a Tool Kit.—When it comes to the selection of the small tools to go into the kit for road work, quality should certainly take precedence of quantity. Wbile it is to be hoped that no man will ever again own an automobile so designed that it will be impossible to get at the adjustments, the fact remains that the tool kit should include the very tools best suited to the given automobile. If socket wrenches are desirable in a given case, care should be exercised to select a substantial set. At all events a complete set of "S" wrenches will be found desirable and a good-sized pipe wrench will be necessary under certain severe conditions. A tool kit would be incomplete without a selection of monkey wrenches, snips, pliers, chisels, punches, drills, a dog or two, perhaps a heavy pattern pin-vise and a variety of files. A set of taps and dies, with a selection of bolts, an assortment of rivets, some solder and a blow lamp must all be included in an equipment if the autoist is to be confident and independent.

Fittings and Tools for Coping with Tire Troubles.—The ordinary "necessaire" included with cars is not sufficiently complete to enable an autoist to cope with tire troubles on an extended basis. The tire irons should be of good material and adequate section and the shape should conform to the requirements, differing somewbat on tires used. In former times a malleable iron "toothpick" lent zest to invective when autoists attempted to remove a tire case, especially if it had been in place long enough to adhere to the rim. The irons (toothpicks) were not long enough or strong enough or shaped for the work to be done. These details have been corrected to a very considerable extent, but it is always well for the individual to equip himself in a manner to suit his especial requirements. By way of repairing punctures, there are special patches to be had and fine grades of cement to be used with them and an "acid cure" that will aid to a marvelous extent by way of a permanent repair. Patches put on without any vulcanizing at all will not stay on if the tires heat up, which they do. In addition to these facilities there are tire chains that increase traction on these severe conditions and there are repair facilities such as enable the autoist to get home on a casing after a blowout. Of jacks there are a great variety and there is no gainsaying the fact that a jack is of the utmost importance. Moreover, it is well worth while to provide tire-saving lifts by which cars may be lifted off the tires when they are on storage. Tires are damaged if they stand in one position for a considerable time unless they are permitted to assume their natural shape during tbat time if it is long.

Means for Inflating Tires.—The mileage that can be attained on the tire depends primarily upon the quality of the tires and the weight of the car in relation to the tire dimensions. These are matters to be settled in selecting cars, but after the selection has been made there is the further question of the inflation of the tires sufficiently for the purpose. An ordinary bicycle pump will not do at all, nor can it be said that a fair-sized "compound" hand pump will be up to a fitting standard for larger sizes of pneumatic tires. Makers, realizing the need of the occasion, had introduced divers forms of air pumps that are light and suitable for the purpose, including automatic engine-driven pumps attached to frame of car. Then again the compressed inflating gas tank has come into vogue and it serves for inflating the tires to a very satisfactory degree. The inflating gas may be carbonic acid which is in the liquid state of abregation in the tanks; this liquid will be under a pressure of approximately 1,200 pounds per square inch, which pressure changes with the temperature of the cylinder. As the surrounding temperature increases, so does the pressure, and for this reason it is always desirable to keep the tank in a cool place. The fact that carbonic acid is stored in liquid form is an assurance that the capacity of a relatively small tank will be capable of inflating a set of tires a considerable number of times.

This idea is a little new and tires are sufficiently expensive to engender caution when it comes to anything that might tend to deteriorate the fabric or the rubber. Autoists when they take to the use of tire inflating tanks are a little prone to question the qualities of inflating gases, due to the fact that carbonic acid, for illustration, will seep through rubber at a rate somewhat faster than that of air. In the absence of definite knowledge upon the subject, they naturally become perturbed and hastily arrive at the conclusion that the tubes are damaged in the process. Not so; the carbonic acid will stay in for a sufficient time to render the process practical and the concensus of opinion of tire makers (whom the author has consulted in relation to this matter) may be reduced to a few words as follows: Carbonic acid is just a little less likely to damage rubber than is atmospheric air. True, it will not stay in a tube as long, but it does not alter the structure of the rubber in its passage through the walls. As before stated, this is a matter of no great moment because the carbonic acid is inexpensive and obtains in the tanks in the liquid form under such high pressure that it is perfectly easy and simple to inflate the tires to the requisite hardness with but little effort.

The inflating tanks are made sufficiently strong to insure a large factor of safety and, again, the control of the exuding gas is not difficult because the liquid will not burst into gas at a high rate of speed. The idea, then, that the tires might be damaged by an inrush of gas at a high pressure is without foundation. Moreover, the needle valve is suitably designed with a very small orifice. which is a further assurance of safety as

against excessive pressure in the tires. On the other hand, it would be the height of fallacy to turn on the gas and go away; obviously the pressure would increase sufficiently to disrupt the tire within a short time.

Accessories to the Fuel System.—Gasoline is hungry for water, but the water should be separated out in the process of filling the fuel tank; foreign substances should also be removed. Funnels are made for the purpose, including a fine mesh sieve and a chamois skin water separator. The chamois skin will permit gasoline to pass through readily; not so with water. Likewise with the water-cooling system, foreign substances should be excluded if the chamois skin is demountable; the same funnel plus the sieve will serve to exclude foreign substances from the water.

The Utility of Shock Absorbers.—Classing shock absorbers as accessories it is even so desirable to emphasize their utility. No matter how good the spring suspension may be, there are conditions under which shock absorbers will pay for themselves by aborting spring breakages. And they have other advantages, among which we might mention a greater average speed on ordinary roads and more agreeable conditions of riding. Then, again, tires are not subjected to such great strains if the bouncing of the body is restrained. It is difficult to estimate the saving in tires due to the presence of shock absorbers. Shock absorbers are made in a variety of types, and it would seem from the extended use of the several types that utility resides in all. It would be reasonable to assume that the application should be consistent with the requirements and wisdom indicates that the conditions be considered as preliminary to the selection of the particular type of shock absorber.

Importance of a Signal System.—The approach of a car should be heralded in a suitable manner, and this is only possible if a siren, horn or other suitable equipment is provided. Ethically too much noise is objectionable, but there are conditions under which the right kind of noise in considerable volume will be justifiable. This important branch of the automobile accessory situation is admirably represented in divers ways with sirens, horns, etc., in great profusion. It is not believed the muffler cut-out should be regarded as a suitable noise system because it is not specifically placed with the idea of signaling the approach of a car and pedestrians might not pay attention to the noise of a muffler cut-out because of its non-specific character.

Measurements of Speed and Distance.—It is extremely important to be able to ascertain the speed at which a car is traveling. The autoist cannot tell if he is violating the speed laws if he has no means by which he can determine the speed at which the car is going. Barring instinct, it is impossible to estimate the distance in which the car can be stopped without knowing how fast the car is traveling. The distance in which motion can be arrested, if a traction system is involved, follows a natural law; in other words, the motion of a car can be arrested within the distance a car can be accelerated if the maximum tractive force is a maximum during the period of acceleration. Obviously the accelerating rate cannot exceed a certain point because the tractivity of wheel is limited. Equally true, the rate of minus acceleration is limited by the ability of the traction wheels. Instinct serves very nicely in the absence of instruments of precision with good judges of distance, but the automobile is used by people who are not good judges of distance, and it is desirable that they utilize the speedometers in order that they will know how fast they are traveling at any given time. It is also well to know the accumulated distance the car may have traveled, and it is a decided advantage to be able to ascertain at any given moment the distance traveled on a trip. These matters are all taken care of by competent speedometers geared to the front wheels of cars with the dial of the instrument located to intercept the eye of the autoist.

Accessories to Personal Comfort.—Until wind shields are made a regular equipment in connection with bodies of automobiles they will have to be classed with accessories. As a matter of fact, these same wind shields come pretty near to necessities, and it is pleasurable to note that they may now be had in several forms, serving well their intended purpose.

Coming down to the more nearly personal questions, there is the question of goggles. They should be close fitting, easily adjusted, and they should stay adjusted. There are divers forms of goggles, some of which embody the mask idea, and the selection is largely up to the personal ideas of wearers.

There is one other question which is probably overlooked by autoists of no great experience, *i. e.*, the matter of wraps and robes. The way to keep comfortably cool on a hot summer's day is to ride at a fair rate of speed in an automobile, but under conditions of inclement weather it is plain to be seen that the very fact that one can keep cool on a hot day indicates that one will be cold on a cool day. Lap robes and other wraps are, therefore, extremely important and, strange as it may seem, the old conventional idea in connection with the horse-drawn vehicle were found valueless for the purpose. The wearing apparel in connection with automobiles was not reduced to its present form merely at the behest of a style maker. It was found necessary to depart from the conventions in this respect in view of the conditions wrought. Rain seems to have the special property of getting through everything but a thatched roof, and this property of rain is much accentuated when reference is had to automobiles in a storm of this character. A provision by way of storm curtains and waterproof wearing apparel is something that is overlooked sometimes, but it is of the utmost importance, and it is a matter that has been given exceeding attention by designers of accessories of the automobile.

There is one other matter that augurs for personal comfort, *i. e.*, a timepiece is generally placed on the dashboard so conveniently situated as to enable the occupants of the car to tell the time of day at will. This may seem to be a matter of no great moment in view of the universal use of watches, but it must be remembered that a watch is rather inaccessible under a top coat, especially if one has gloves on. It is much easier to glance at the timepiece on the dashboard. In town cars and in limousines the timepiece is placed flush in a case accommodating letter paper, pens, ink, blotter, etc.

In some notable instances cabinets are included.

Everything but the auto includes a vast list, the mention of which requires a catalogue. In the meantime it is fair to say that some of the accessories, so-called, are as necessaries. Windshields, for illustration, can be regarded as accessories, and yet without them speed is even disagreeable. On a rainy day without a windshield it is impossible to keep dry, and if the road is dusty the windshield is necessary to safety. If goggles are used, and they are of a suitable design, the question of "insects" reduces to the tolerable, although windshields and goggles are more nearly in accord with the requirements.

If the day is cold, steering becomes a task, since the wind will make its way up one's sleeves in the absence of gloves, or with them if the gauntlets are not so shaped as to go over the coat sleeve. Storm and cold protectors are to be had in the various designs as dictated by experience, which, together with fur-lined "over-pants" and such other means as are now available, renders winter touring pleasurable. Coats with flaps and button edges serve well their purposes, and military chestcoats are as good for the autoist as they proved to be in the service of the military.

If the weather is inclement, or if the roads are bad, it is then that tire chains show well their advantages. In the absence of, or even with chains, the several forms of "non-skid" covers are well worth the careful attention of the discriminating autoist.

But if it is desirable to be able to travel in bad as well as in good weather, over rough as well as poorly kept roads, it is equally well to know how far you go. The available instruments of precision to be had are as reliable as any device can be and they serve well the intended purpose. They not only tell the tale of the total distance for the car, but they tell of the individual trips and give the instantaneous value.

Price Auto Gloves

The Price Automobile Gauntlet possesses a number of exclusive points of superiority over other makes. Longer in both gloves proper and gauntlet cuff, the latter is not only wider when closed but is, as well, fitted with a folding gore which unclasps to admit the most bulky overcoat. It is the only gauntlet made which is specially reinforced where the wear comes—between the fingers and around the thumb. The wrist has a solid leather snap-strap. Lined or unlined. Price, from $2.00 to $10.00 per pair.

The Price Short Length Automobile Glove is a favorite for drivers who do not want a gauntlet cuff. It is fitted with a solid leather snap-strap at wrist and may be had either lined or unlined. Price, $2.00 to $4.00 per pair.

The Price Ventilated Automobile Gauntlet is made with a special ventilated back which effectually protects the hand of the wearer from the discomforts of perspiration. The greater part of the natural warmth of the hand is retained and still sufficient ventilation is allowed to permit the entrance of a cool, dry air, thus maintaining the normal body temperature. Made in horsehide with gauntlet cuff. Has folding gore equipped with two clasps and solid leather wrist strap with our special snap. Price, from $3.00 to $4.00.

WHAT are the points for which you look when you go to buy a new pair of auto gloves?

First and foremost comes quality, doesn't it?

And then there's style and comfort.

How about it—have you discovered the gloves that exactly fill all of these requisites?

If you haven't found the glove you want, you haven't tried Price Automobile Gloves.

Price Automobile Gloves are made by particular people for people who are particular.

Stop a moment and think that over.

Then let us explain just what it means.

First, there is the question of quality.

Price Automobile Gloves are made from genuine washable Horsehide leather.

We picked Horsehide for a reason—it is the leather we would use for gloves for our own personal use and it makes gloves that we are not afraid to back up with our reputation.

If you realize what our reputation means to us, you will realize how good Price Automobile Gloves are.

There's no cape nor sheepskin stock in them, no paper linings. There's nothing but Horsehide — straight Horsehide all the way through.

But Horsehide affects more than the wearing quality of a glove; it has a whole lot to do with the fit as well.

Wet weather or rain won't affect Horsehide. There is no shrinking nor stretching. Price Automobile Gloves hold their shape.

Just figure on the importance of that.

And then there is the matter of style and comfort.

Space here won't permit our telling about these points in detail. But we might just say that Price Automobile Gloves are made to the shape of the human hand and are as dressy as it is possible for gloves to be made.

What's more, their style is of the type that has to do with full lengths in the parts of the hand where it is needed. You will find Price Automobile Gloves models of comfort.

The Price One-Finger or full Mitten, for example, is one of our favorites. It allows the hand all necessary freedom, and being lined with extra heavy Imported Lambskin, is exceptionally warm for winter wear. Price, **$2.00** to **$8.00** per pair.

Price Automobile Gloves are tanned in reindeer, pearl, black, tan and buckskin colors—in the exact color you want.

They can all be had lined with Imported Lambskin or Blue Rabbitskin. Incidentally, it might be mentioned that our Fleeced, Knit Lined Seamless Finger gloves—practically one glove within another—are mighty warm and comfortable for winter wear.

On request we will be glad to send our catalogue showing the complete line.

TO DEALERS: We want reliable dealers to handle our line. Write for special proposition to the trade.

Triumph Valve Remover

HERE IT IS IN ACTION
No waste of time
No broken finger nails. Fits any Gasoline Engine.
Patented April 14, 1908

Enables you to remove valve key or valve spring with no side strain or bending of valve stem. Price, $1.00 each. Discounts to manufacturers and jobbers. For sale by supply dealers throughout the United States. If your dealer cannot supply you send us P. O. Order for $1.00 and the Remover will be sent you postpaid.

Manufactured by
MECHANICAL & ELECTRICAL MFG. CO. 50 N. Desplaines St., CHICAGO

Adjustable Ball Joints

for throttle and spark levers, connecting carburetor and timer with levers on wheel steer, eliminating all lost motion and giving a more perfect control to these levers at all times Easily and perfectly adjustable.

PRICE, 40c
Cut shows exact size

Adjustable stock size, steel, 40c ea. Adjustable stock size, brass 50c ea. Non-adjustable stock size, steel, 20c ea.

The Practical Gas Engineer. What to Do and How to Do It. A book of 150 pages, neatly bound in cloth. Sent postpaid for $1. Address Book Department, The Automobile, 231-241 W. 39th St., New York.

SHAWVER CO., Springfield, O.

HOFFECKER

"STEADY HAND"

SPEEDOMETERS

are made for very particular people, those who want nothing but the best, whatever it may be. While being the best—deliberately designed and constructed to be so—it is not high priced. It costs less than some, more than others. The price is very reasonable and, service considered, little enough. The Hoffecker is built to last and to be true as long as it does last, to be first-class all the time. To own a Hoffecker Speedometer is to declare yourself to be one who knows what is right and indicates good taste and judgment.

The Hoffecker shows you plainly and accurately: how fast you are going, not in hops and jumps forward and backward, but steadily; how far you have gone on your trip, and can instantly be set back to zero for the next trip's record; the total mileage of the season's run. It is positively accurate at all speeds and under all conditions, governed wholly and truly by the speed of the car. "The Steady Hand" is exclusively a Hoffecker feature, making all indications without fluctuations and keeping an unwavering indication over the roughest roads. The Hoffecker carries an unrestricted guarantee as to reliability, durability and efficiency. It is something in which you should immediately interest yourself. May we send you a catalog—worth your while to look over—to-day?

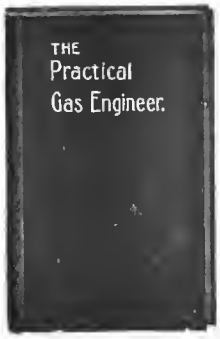
To Know What to Do and How to Do It

When your gasoline motor or gas engine gets stubborn, can be quickly learned by owning a copy of the



A Book of 172 Pages Neatly Bound in Cloth Sent postpaid on receipt of price, $1.

Practical Gas Engineer

By E. W. LONGNECKER. Twelve years' constant experience with Hydro-Carbon Engines.

SIXTH EDITION JUST OUT and selling rapidly. First and Second Editions exhausted in thirteen months. Special Chapter on Automobile and Motor Engines

How to start, how to operate, and how to care for all classes of explosive motors or engines using gas, gasoline or similar fuels.

A full and exhaustive chapter on electric and other systems of igniting.

Also chapters covering in a thorough manner troubles and remedies encountered in operating engines in motor vehicles, launches, shops or on the farm.

Every line tells something.
Every page full of interest.

231-241 W. 39th St., New York

Self-Propelled Vehicles

By JAMES E. HOMANS, A.M.

A practical treatise on the theory, construction, operation, care and management of all forms of automobiles, with upwards of 500 illustrations and diagrams, giving the essential details of construction and many important points on the successful operation of the various types of motor carriages driven by steam, gasoline and electricity. This is probably the best comprehensive treatise published in simple language, so that the contents may be readily understood by the intelligent reader, especially if he has a machine to which he can refer for demonstration of many points discussed. For one who desires to understand automobiles, it is an excellent work to begin with before going deeper into the subject along highly specialized lines.

Automobile Catechism

For the Use of Owners and Drivers of Cars Fitted with Internal Combustion Motors

By

FORREST R. JONES, M.E.

President of the Manhattan Automobile School

Size, 4½ x 7 inches. Pages, 134. With Drawings.
Price, in genuine Morocco Cover, gilt edges, $2.00, including postage.
Order from the publishers

The Class Journal Co.
231-241 W. 39th St., New York

The Automobile Catechism is the most practical, up-to-date work on the subject in the English language. It is published in pocketbook form, with high-grade leather cover, and printed on especially tough paper, as it is intended to be the inseparable companion of the autoist when on tour. Not a line is wasted on obsolete constructions or descriptions of unfamiliar apparatus. It treats of the automobile in modern form and of all the troubles that may arise in the course of ordinary use and that may be remedied by the driver himself. It is written in plain language and is the most helpful, authoritative, and comprehensive manual that has yet appeared. The subject matter is in the form of question and answer, and an exhaustive cross index makes immediate reference possible in any particular case.

Gas Engine Manual

This volume just published gives the latest and most helpful information respecting the construction, care, and management of *Gas, Gasoline, and Oil Engines, Marine Motors and Automobile Engines*, including chapters on *Producer Gas Plants and the Alcohol Motor*.

Each chapter is illustrated by diagrams which make it a thoroughly helpful volume, containing 512 pages, 156 drawings, printed in large clear type on fine paper, handsomely bound in rich red cloth, with gold top and title, measuring 5 1-2 x 8 1-2 inches and weighing over two pounds.

The book is a practical educator from cover to cover and is worth many times the price to any one using a gas engine of any type or size. Price, $2.00 Postpaid.

The Automobile Business in all its Phases

Krausz's A B C of Motoring

Presenting the information in a fascinating, concise, and comprehensive manner. Different types of autocars lucidly described, the anatomy of the gasoline mechanism clearly explained, and chapters on the care of the automobile, the art of driving, automobile etiquette, and troubles of the road, etc., etc. Instructive, Convenient, Reliable, Racing Statistics, Rules of Associations, Frontier Regulations, Speed Tables, Automobile Laws of the States, and numerous other matters important to the autoist.

Preface by the President of the American Automobile Association. The endorsement by Mr. John Farson is a guarantee that the work is up-to-date and of practical value to all automobilists.

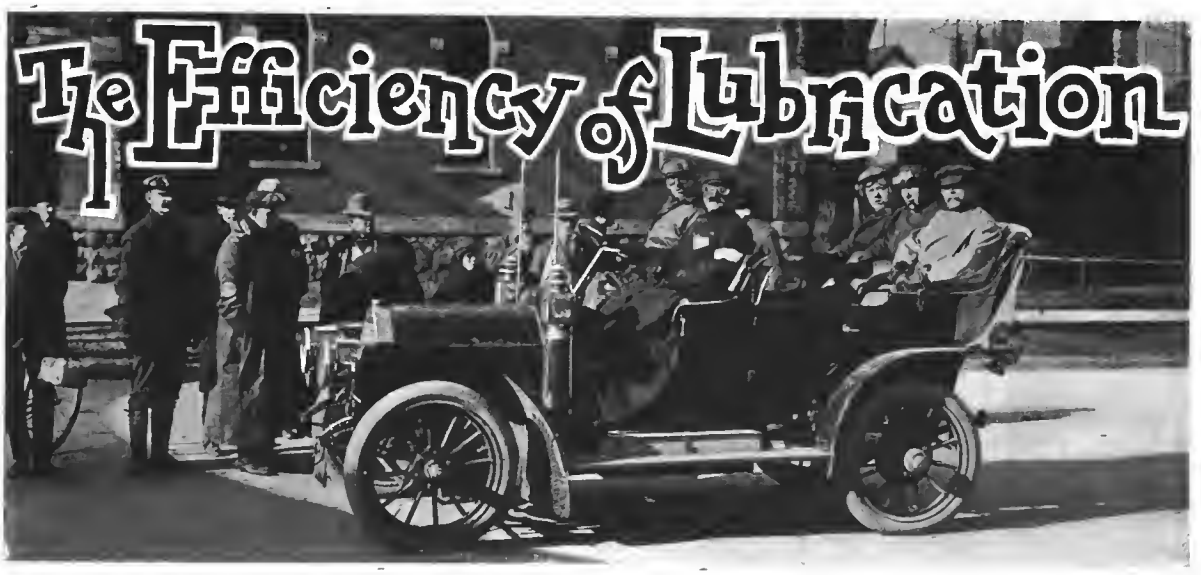
The Efficiency of Lubrication



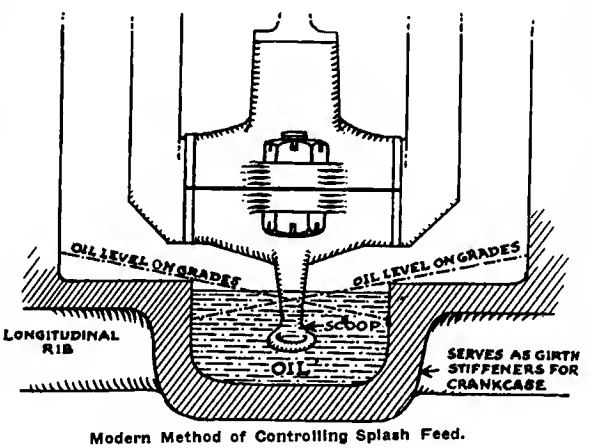
IF the thickness of an oil film is one thousandth of an inch, a single drop of oil will cover about two square inches of surface. This drop of oil will, while it stays on the surface, do all that can be done by way of affording the slippery surface wanted, and prevent the metals from contacting. No quantity of oil can do more, and good oiling facilities consist essentially in the device that will replace that drop of oil when it ceases to extend the unctuousness desired or if it is squeezed out of place. On this basis, a cubic inch of oil will lubricate over a thousand square inches of surface, or replenish the supply on a square inch of motor bearing surface once for each revolution for a minute of time.

Lubricating products are valuable on two accounts, *i.e.*, the cost of good lubricants is high, and the cost of repairs, if lubricants are not good, is higher.

Splash Systems of Lubrication.—There is nothing much to be said in favor of the old-fashioned splash systems of lubrication, but the modern splash system is not the crude proposition that those who do not keep abreast of the times would seem to think. In the modern system the connecting rod does not splash the oil at all; on the other hand, a little scoop dips into the trough of oil and scoops up a small quantity. The trough is kept full by a single circulating (gear) pump, and the overflow goes to the "sump"; in other words, the well.

The Force Feed System.—This is the system that positively replaces "the drop of oil" as it wears away under the pressure to which it is subjected. This system consists essentially of snap piston (plunger) pumps, as many as there are places to oil. The pistons are drawn back against the spring, and when the "suction" or "flooding" stroke is completed the plunger is cast free, and under the impetus of the stored energy in the spring the plunger snaps back, forcing a definite measure of oil directly to the surface to be lubricated. Great reliance is placed on this system, and it is much used.

Feeding Oil Under Pressure.—In this system an oil container is connected by a system of piping to the bearings to be lubricated. Pressure is put on the container and the flow of oil is regulated. If good oil is used—and it should be—the system works.



Modern Method of Controlling Splash Feed.

Vacuum System of Lubrication.—In this system the oil is held in a chamber adjacent to the crankcase, and by a system of piping a balance is so maintained that atmosphere is admitted as oil flows out. The oil chamber is held at a partial vacuum. As in the pressure system, if good oil is used, the system is not likely to clog up.

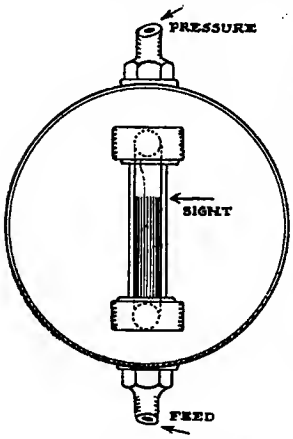
Feeding Solid Lubricants, Grease, Etc.—Solid lubricants are placed directly in the transmission case, wheel hub caps, timer cavity, and universal joint housings. The small bearings are provided with grease cups. In some cases the solid lubricants are fed through a system of piping, under pressure.

Characteristics of Lubricants.—Unctuousness is the prime property. If the oil will not afford a slippery surface, it is of no value, unless to act as a "dog in the manger" while the bearings heat up and "freeze." Anything in the oil that supplants unctuousness is detrimental, since it displaces the very property for which oil is used primarily; soapstone, chalk, talcum, or any other (so-called) body maker is, therefore, an adulterant that can have no honest place in a lubricating medium. Body, next to unctuousness, is of importance, since oil has a duty to perform aside from furnishing a slippery surface. The metals must not be allowed to come into contact with each other, and the requisite body must be there to enable the oil to sustain the pressure. Mobility is also a property that should be well regulated, in view of the arduousness of the service, and, too, the mobility should be constant. If the oil lacks mobility it will flow sluggishly, and may not be able to flow freely into the surfaces to be lubricated. Mobility should not be much affected by temperature changes. Acidity in lubricants is the bane that leads to grief. The costly ball and roller bearings are ruined by acids, and in plain bearings the polished surfaces of the spindles and journals are ruined. Acidity may be due to a faulty process, or it may be the product of reaction in the materials used. Heat and light in the presence of atmosphere seem to be all that is necessary to render the average "animal fat" acid in its reaction within a short while after it is compounded.

A residue after combustion is very undesirable; nor does it matter if the residue is carbon

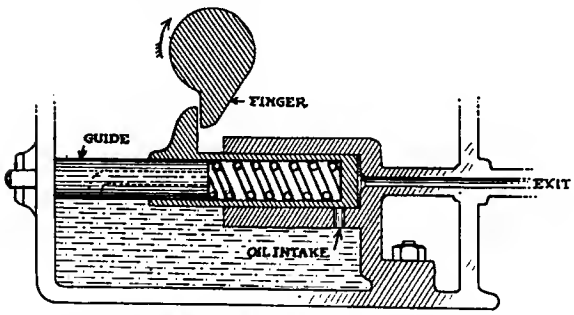
alone, or carbon and other "ash" producing elements. Cylinder oil is ultimately burned, and the products of combustion should be gases, not solid non-combustibles.

Jelly is troublesome, and jelly-forming constituents are much to be avoided. What is wanted, then, are unctuousness to the maximum, body regulated to suit the conditions, and a constant mobility unaffected by temperature. Solid lubricants should only differ in body; they should not lack in unctuousness, nor should they change mobility under temperature changes. What we do not want are acidity and residue. Pure mineral lubricants seem to be the right products in automobile work, and, fortunately, there are producers, of honesty and skill, catering to the automobile trade, who have made a study of the automobile, and who fully realize the desires and the reasons.



Customary Pressure System.

It is to be hoped that lubricants will not be rendered acid by the addition of substances of an acid reaction, in order to impart a sweet-scented odor. Autoists do not use lubricants as pomade. It is equally objectionable to reduce the degree of unctuousness by any clarifying process whatsoever. A good lubricant with a bad color is superior to any of the "æsthetic blends," in which the value of the qualities for lubrication may be a diminished quantity. The automobiles of to-day are less noisy and lower in cost of maintenance because grease cups are used in great profusion where once a hole was drilled and dirt was free to enter, there to mix with an occasional drop of oil, to make abrasions that soon increased the lost motion and the rattle.

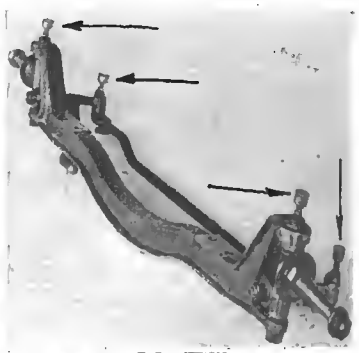


Section of a Conventional Force Feed System.

Oil Piping and Fittings.—The need for a sturdy system of piping has been felt keenly in the past, and, fortunately, the builders of automobiles are alive to this fact. Piping is now more stable, and, besides the better grades of annealed copper tubing, there seems to be a demand for "flexible metallic hose." This product is easy to install, remains tight, and is free from breakages in service. Valves and fittings are with ground joints and are stable in maintenance. Graphite, in its several aspects, is widely used in connection with both the hard and liquid lubricants. With graphite care must be exercised with the piping to prevent clogging.

Influence of Good Oil on Maintenance of Cars.—It is not certain that this phase of the subject was so very well understood by even the builders of cars until very recently. At all events, taking the evidence available, it would not be far from wrong to say that there was not a sufficient display of oiling devices on cars until it was adequately proven that the life in service is dependent upon the care with which the oiling is done. This does not mean that a crankcase full of oil will do all there is to be done. A body of good oil laying in the crankcase will scarcely serve to oil the multiplicity of small parts that will soon cry for lubrication in a most distressing way, and if it be denied the car will reach the "noise" stage long before it is ready to "scrap," unless it is true that noise alone is sufficient cause for not wanting a car. A little grease cup on the dozen-and-one small bearings that cannot be oiled in any other way will do a world of good, and the builders of cars now recognize this fact. Users of these same cars will do well to note the fact, and they will be wise if they regard the grease cups in the light of utility devices of a high degree.

It would not be too much to say that a grease cup on a shaft or a spring, as the case may be, will do more to prevent rattle and defeat depreciation than all the polishing of bright work and varnish that can be done during the life of a car. But if it is important to keep the cups full of good grease, it is doubly so to supply a continuous film of the finest lubricant to the rotating bearings. A feast and a famine will do about as much good as no oil. True, there may be a chance of putting off the evil day, but not for long. The one sure way to avoid any trouble at all is to see to it that the oil is not only good, but that it reaches the spot. The builders of cars of the kind that an autoist of experience will be likely to choose have done their part when they provided the devices and protection from "grit." It must be understood that protection from "grit" of the road depends upon profuse oiling, as well as upon such mechanical protection as ingenuity will evolve. The underlying principle is one in which oil going out assures that grit is not passing in. Chains, for illustration, if kept well lubricated, even if they are in actual contact with the dust of the road, will take care of themselves to a marvelous extent, contrary to a popular superstition. This, too, is for the reason that the oil on the surfaces will not allow the grit to get to them. As long as the grit is warded off the situation is healthy. A run of a century on a dry chain is likely to do more damage than ten such runs on a chain provided with enough oil to coat the surfaces. What is true of a chain is equally true of all the other parts of a car, and it is not assured that autoists fully understand this important matter. If they do, it is also important to look out for impure lubricants, such as animal grease in which acid abounds, or the compounds that will become rancid in time, which is not uncommon.



Characteristic Use of Grease Cups.

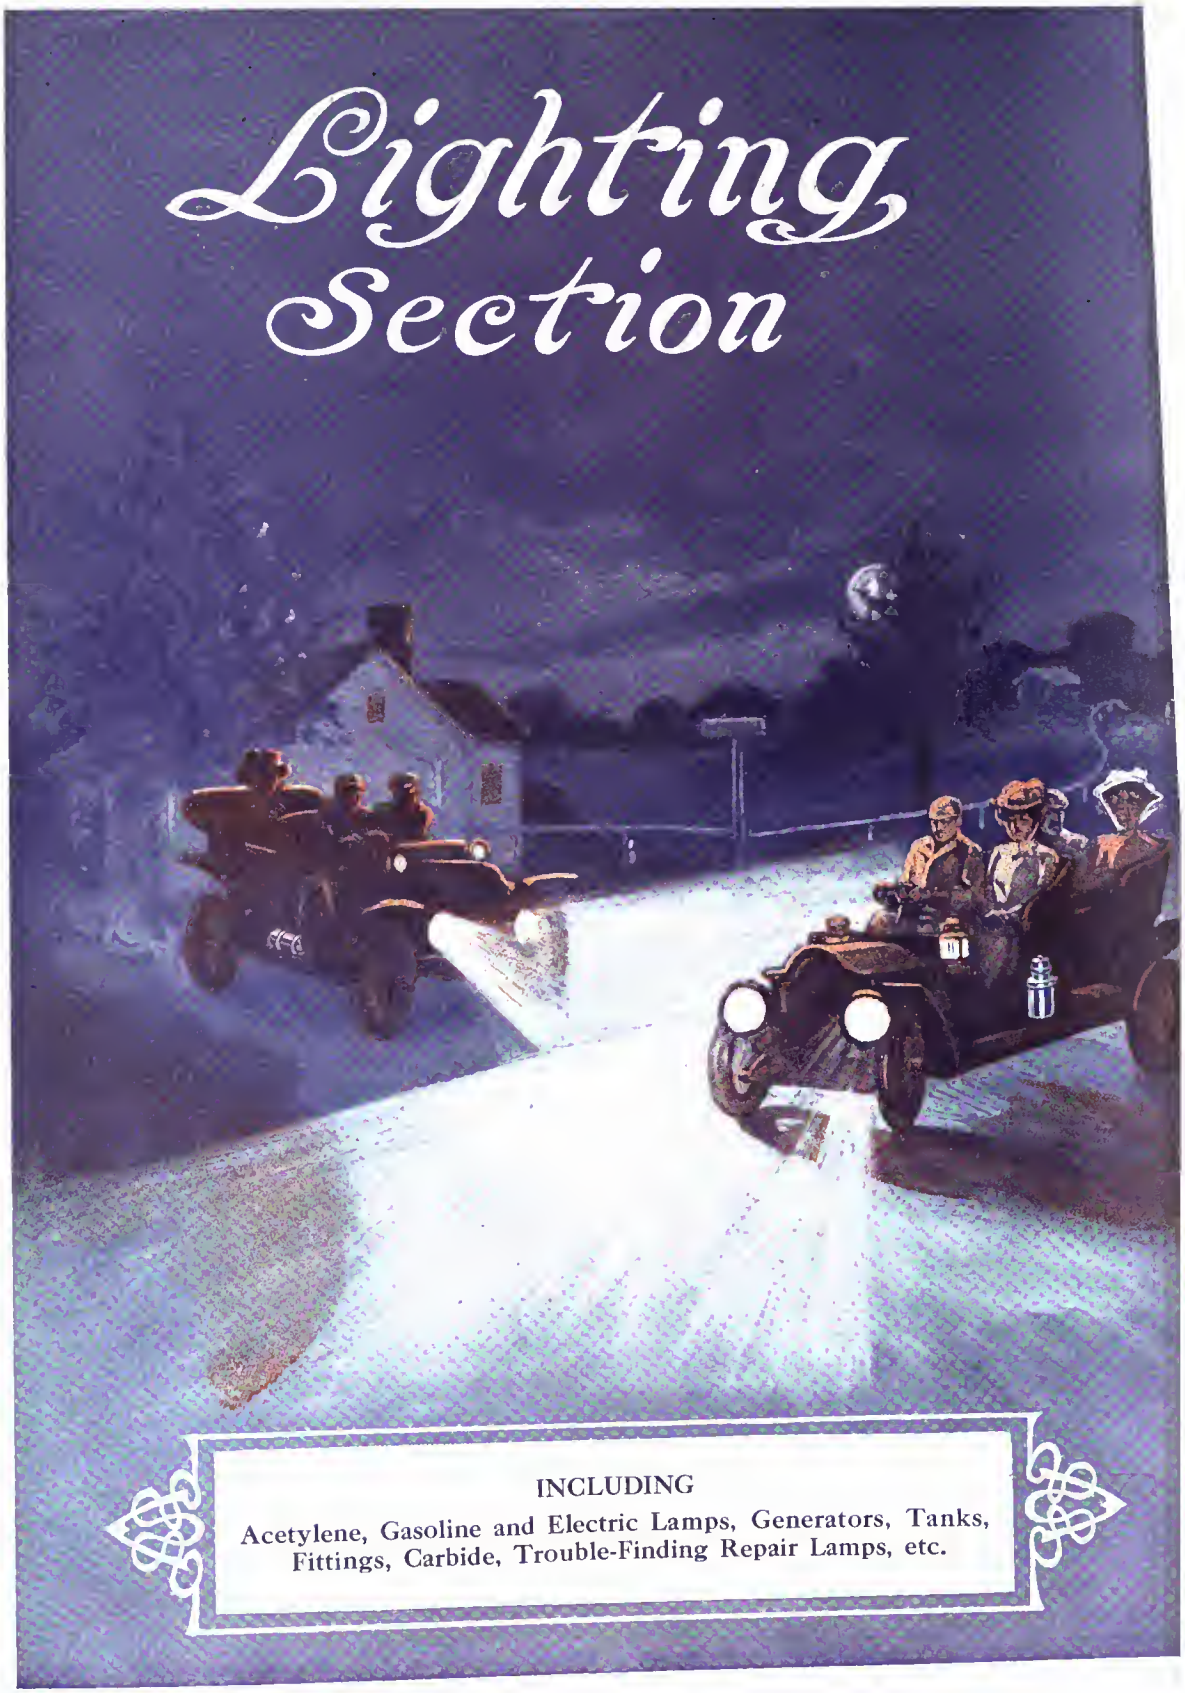
Lighting Section



INCLUDING

Acetylene, Gasoline and Electric Lamps, Generators, Tanks, Fittings, Carbide, Trouble-Finding Repair Lamps, etc.

The Necessity of Adequate Lighting

THIS is a matter in relation to which it will be fair to say the equipment can scarcely be too good. In the early days lighting facilities were rather crude and the memory of the average autoist is a little raw when lighting is the subject. Fortunately the experience gained has been put to good account and the lighting equipment now to be had is up to a high standard.

Legal Requirements.—The oil sidelights and a tail-lamp must be used to conform to the law. These lamps are usually of such good value that they serve for lighting "about town" without having to utilize the gas system. The trend in oil lamps is toward more thorough work and greater security as against the loss of parts on the road. The brackets of die forged steel are more substantial than were the castings (bronze) of the past.

Great Variety in Gas Lamps.—The gas lamps to be had are in great variety and efficient in the extreme. The lenses are in sizes up to 12 inches, designed in divers ways to suit conditions. If a concentrated "beam" of light is wanted lamps are made to project the same, or, if a scattered illuminating effect is to be included, then, too, are lamps to be had. The efficiency, as measured in candlepower for a given acetylene consumption, is remarkably high.

Source of Gas Supply.—The gas supply is available in two ways, viz.: (a) from tanks of acetylene under some pressure; (b) from generators in which the calcium carbide is used direct. The acetylene tanks are of convenient size and the principle of the storage of the gas may be briefly stated as follows: Asbestos wool is put into the tanks and a measured quantity of acetone is added. The acetylene gas is thereafter communicated with the tanks and the quantity of acetylene that each tank will hold is very considerably increased because of the presence of the acetone, which has an affinity for acetylene. These tanks are made in various sizes and are in strong demand.

Considering the direct generators, they are in divers form and in sizes for every possible requirement. These generators are generally made in brass, avoiding seams as much as possible, and in some cases a water jacket is provided around the carbide chamber with a view to equalizing the temperature, it being the case that dissolving carbide generates heat. A constant temperature is desirable in any case, and the best way to accomplish this end is to provide a water jacket and afford a means of regulation such as will assure the generation of gas exactly in accord with the needs. In cold weather the water is likely to freeze, and this is a disadvantage to consider.

Means of Regulating Pressure.—Since gas burns under conditions involving pressure on a basis of from two to four inches water equivalent, means must be provided in connection with the acetylene tanks to maintain the constant desired pressure. The tanks are so arranged as to afford this constant pressure throughout the entire range from a full tank down to the last pound. In connection with the direct generation of gas from calcium carbide, regulation is afforded by limiting the supply of water that drips into the carbide. This water supply is automatically cared for by the pressure and means are at hand for shaking the ashes out of the carbide.

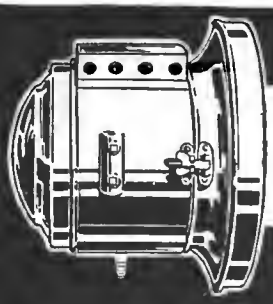
Some General Features.—It is customary, and a good idea, to place the gas tank or the generator, as the case may be, in a very accessible position not influenced by temperature changes. The running board seems to be the logical location, and the security traps or brackets, as the case may be, are generally arranged for quick undoing. While the finish is in brass, as a rule, there are oxidized effects that are well worth considering, since they present less striking appearance and greater permanence. Bright work looks extremely well if there is not too much of it and if it is maintained bright. These conditions do not always obtain.

Incidentals of the Lighting System.—The piping from the generator to the lamps is generally a small annealed copper tube with rubber hose flexible terminals. This piping serves very well if it is not too small, although it is true that a certain surface accumulation is of an explosive nature, which accumulation is the result of chemical action between the acetylene and copper. This detail does not seem to be a matter of any great moment, because the little explosions oftentimes go unnoticed and never are of any great force. Besides copper tubing in the ordinary form, there is a line of flexible metallic hose in both copper and steel that serves very well indeed, although it is considerably higher priced.

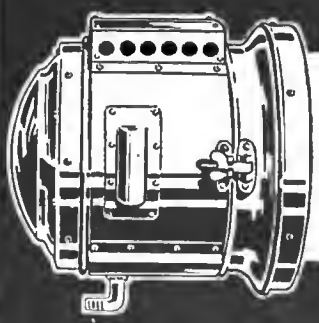
Installation of the Lighting Systems.—If autoists have any complaint to make in connection with lighting systems it is to point out the absence of care in running the piping. Suitable fastenings are not always provided, and piping adrift is likely to cause a rattle, even if it is not damaged at points of contact. These complaints are not general, and in the better class of cars of the present time the piping work is nicely done. As a matter of fact, the tone of the work throughout lighting systems has been considerably enhanced all along the line.

The use of electric lights on the electric types of vehicles was always an attractive feature, and it has always been the desire of autoists to get away from the ills of inferior means. In recent times this question has been agitated at considerable length, and the storage battery has been so thoroughly improved as to lend itself perfectly to the purpose, thus taking care of the lighting as well as of ignition work. The batteries are small, compact and durable. They give a suitable length of service on a single charge, and the facilities for charging are now thoroughly good in every way. The systems are worked out to a nicety, and the cost is well within the means of even autoists who do not complain of a fat purse. In the early days, the batteries were not so good, and, unfortunately, the means were wretched, if not outright bad. The men who were at hand to take charge of the process knew nothing about batteries or electrochemistry, and the batteries being delicate, suffered in consequence.

In some of the systems means are provided for charging the batteries without removing them from the cars, and in the hands of autoists of the least bit of skill they are well worth while. True, many autoists prefer not to do any of the work involved in the upkeep of their cars, and with them it is more to the point to have the work done in a garage fitted out for the purpose. There are just such places everywhere throughout the land, and the scheme has the advantage of assuring one that the batteries will be handled by men skilled in the art. To what extent electric lights will be used remains to be seen.



WHICH GIVES THE LIGHT—



THE LENS MIRROR OR THE FRONT DOOR?

The lens mirror, of course! An extravagant front door is only of value to make a small lamp look big until it is sold. When the purchaser lights the lamps after dark he forgets all about their front doors.

There is not, and there never was, one bit of sham about Rushmore Searchlights and Headlights. They are built for service first, last and all the time; and their outward appearance is simply the artistic expression of their inward excellence. When a man has once used Rushmores of proper size, and has learned what genuine after-dark lighting efficiency is, he is never afterward content to be virtually restricted to daylight use of his car.

1909 RUSHMORE PRICES

are so low that to accept substitutes is simply a waste of good money. An output three times as great as a year ago, combined with modern factory economies everywhere, enables us to-day to sell the best lamps in the world at prices actually lower than those of the nearest imitations.

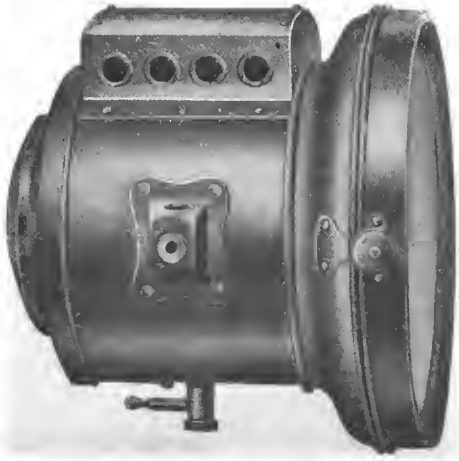
'09 Corcoran Lamps

You Don't Have to Experiment with Auto Lamps and it isn't necessary to Spend a Powerful Lot of Money to Get the Best.

CORCORAN LAMPS

have been made by one concern for nearly a hundred years and think you that in this time that anything good in the lamp way has ever gotten past "CORCORAN." Before you were born, very likely, "CORCORAN" Lamps were good lamps and down to the succeeding years they have been good lamps and for years to come they'll be good lamps. Besides being good lamps (none better are made, anywhere by anyone), they are lamps that cost you but little. Years of fine lamp building has pointed economical methods of manufacture; the economy so acquired, the saving we make we divide with you, so you get as good lamps—better than most—at a very low cost. Is there any reason why you should set up a search for Auto Lamps when you don't have to, when you can come to us and be assured of complete and lasting satisfaction?



In any event it won't hurt and it won't cost anything to find out and we feel sure that you will be well pleased with the results of any investigation you set on foot.

CORCORAN LAMP COMPANY

Cincinnati, Ohio.

There is a clever profit in CORCORAN LAMPS, as the dealer who handles them will quickly realize. Dealers:—Ask for the CORCORAN profitable proposition.

HAM'S "COLD BLAST" AUTOMOBILE LAMPS

Beautiful in appearance. Made very strong of the highest grade, heavy gauge brass and producing a brilliant light. Guaranteed not to blow or jar out. Ham's are without a doubt the finest burning automobile lamps on the market.

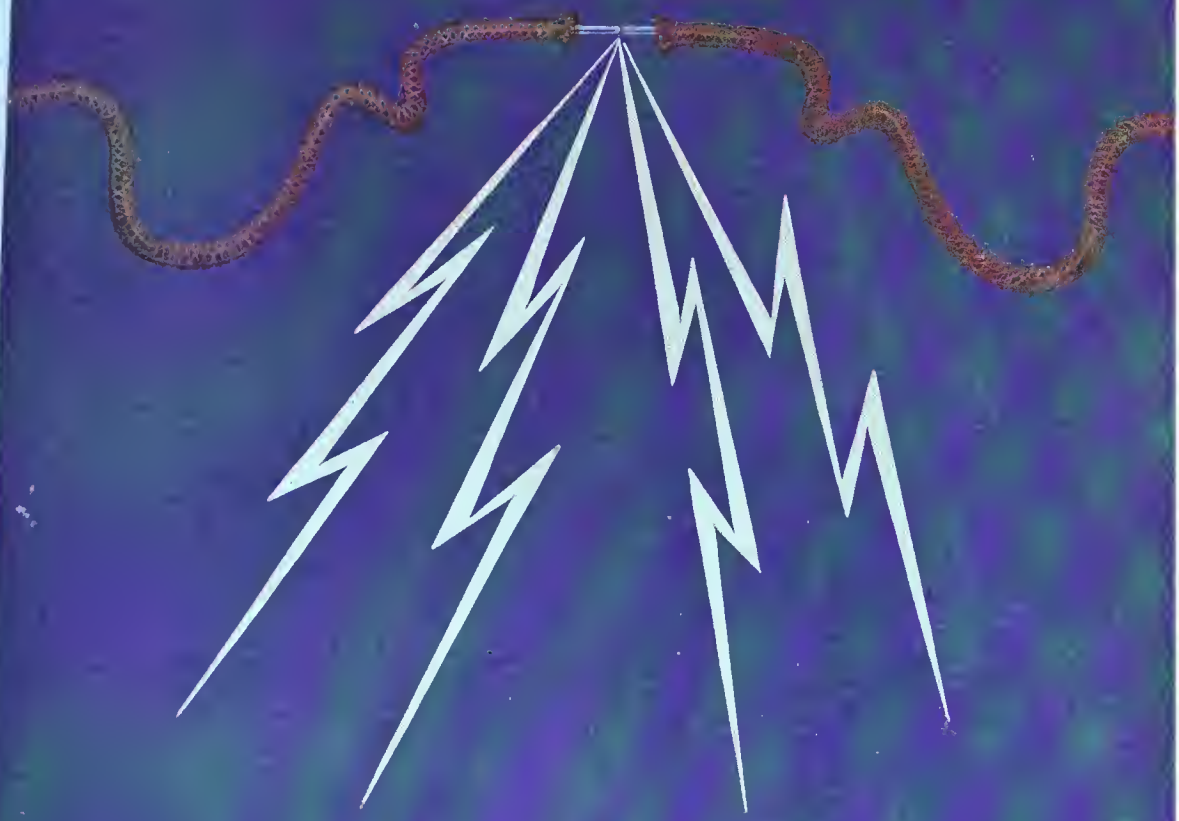
Ignition Section



INCLUDING

Magnetos, Spark Coils, Timers, Spark Plugs,
Batteries, Electrical Fittings, etc..

This is the Magneto that Stands the Most Abuse—See it at the New York and Chicago Automobile Shows

The Remy High Tension Magneto is designed especially for American Automobiles. The broadest margins for abuse—both electrical and mechanical—are afforded on the Remy. It is "fool proof."

Positive firing is assured by the Remy under conditions of oil, dirt and water that puts its competitors out of commission.

It will fire the motor properly running at a lower speed than any other Magneto in the world. This is a big point in cities where cars must be run at low motor speed as often as high motor speed.

Anybody can install a Remy whether he is a skilled mechanician or not.

This is the Magneto without brushes. No brushes to wear out, give trouble or be replaced.

The Remy

1909 High Tension Magneto

Double ignition with one set of spark plugs is another Remy feature originated by us.

Starting may be done from the seat of the car without cranking—with the greatest certainty of any system starting from the spark.

We have sold on minimum Specified deliveries over 17,000 Magnetos for 1909 cars. More of these Magnetos are already sold than all other makes combined.

With automobile manufacturers continually striving to build better cars than their competitors, there is a reason for their adopting the Remy Magneto.

It is designed by engineers who have been connected with automobile work since its beginning and embodies ideas suggested or approved by the largest manufacturers.

Our factory was built especially for Magneto manufacturing and is the largest of its kind in the world.

In the hill climb endurance run—speed contest—in all kinds of tryouts everywhere, the Remy has more victories to its credit than all other makes combined. The Buick, equipped with the Remy Magneto, led all American cars at Savannah.

This is a sample of the letters we receive daily:

Boston, Mass., Sept 30, 1908.
"Remy Electric Company.

We have recently entered several racing events and our cars, equipped with your ignition apparatus, have all made wonderfully good records.

At Montreal, our Model 5 had captured eight out of nine events beating Christy and Barney Oldfield's machine and tieing for the fastest half mile track in 1:12 This car was equipped with your Magneto and as the report shows, ran faultlessly throughout the several events.

Buick Motor Company,
Boston Branch,
H. K. Hoyes, New England Mgr."

Write us for illustration and full description of our new high tension Magneto. We are building them in such large quantities that we can make you very attractive prices. We furnish fittings for attaching these Magnetos to many of the old models of the different American cars.

Write us today. Address Dept. 12.

Remy Electric Co., Anderson, Ind.

Extreme Importance of Reliable Ignition Systems

IF there is any one point in relation to automobile motors that influences for good or ill, according as the system is noteworthy or not, it is the ignition. If the carbureter does not work very well, it is the ignition system that will disguise the fact if the same is of a high order of merit and in good working order. With a good ignition the mixture will scarcely have to be up to a point of high inflammability, whereas if the ignition is not efficient even good mixtures will ignite with difficulty. Under the circumstances it would be by far better to do without some luxury with the idea of purchasing the best possible ignition devices, which, however, would be to no purpose were they but poorly installed.

That a "dual" system of ignition is well worth having is not to be denied, which is not to say that some parts of the system may not be in common. The practice of using a single timer, for illustration, the same to serve for both the magneto and the coil, is not one to be condemned. On the other hand, there is no objection to separating the systems in such a way as to possess two complete and independent ignition systems. Some of the modern low-priced cars are provided with a magneto in conjunction with a "transformer," battery and timer in common. Certainly this is better than the earlier practice, in which a coil and dry battery constituted the whole ignition proposition.

The superior grades of magnetos are rather costly, and it goes without saying that the very low-priced cars can scarcely stand the expense, especially if a dual system is provided. In making a choice it is not far from right in such cases to select a magneto, and some means for starting. At all events, the whole situation is much improved over what it was in the past with divers choices for autoists of discernment.

Magnetos Moved Up to First Place.—That the magneto is now regarded as of the first importance can be taken for granted, which point is adequately illustrated in numerous of the automobiles to be seen at every hand. In one case the magneto is built into the flywheel, thus becoming a part of the motor as it were. In many of the important products the magneto is regarded as finality, if a dual system is used, and in some cars the magneto is considered adequate for the purpose, irrespective of the fact that a dual system of ignition may be provided. In other words, the time has passed when it will be proper to consider the magneto in the light of an auxiliary to the coil system. It is the coil system that has reverted to second place in the onward march of ignition systems.

If magnetos have advances in utility, it is equally true that the coil systems have made strides also. In the old days coils were not quite up to a fitting standard, primarily because the bundle of wire in the magnetic circuit was not of a high magnetic permeability. The lag of the spark was not at a constant rate, and the same lag was overmuch. The result was that the regulation of the spark was beyond the ability of the operator of the car, unless at the lower speeds of the motor. Maximum power of the motor could not be expected under such conditions, nor was it realized within a considerable margin.

The "high tension jump-spark," as compared with the "low tension wipe-spark," it is futile to take space to discuss relatively. The users of both swear by them, and each user backs up his statements with evidence such as cannot be refuted. The probabilities are, both systems being so thoroughly good as to serve well the purpose, it is purely "hair splitting" to discuss the relative merits with a view to finding a difference.

Magnetos have other differences mostly as respects the details of the magnetic circuit, and in placing of the secondary windings as well as the condenser. When reference is had to the quality of the materials in the permanent magnets, there may be differences, since the materials do not all come from the same hole in the ground. As respects the utility of the respective qualities of materials used in the permanent magnets, it is quite another matter to differentiate. It would take a long series of tests to establish the facts, and the cost of the investigation would be out of all proportion to the benefits likely to be derived. In other words, all the materials used are so thoroughly good as to serve well the purpose, and from the point of view of the users of cars it would be a task to try to discriminate. The makers of cars can be relied upon to keep an eye on this phase of the question, since it is to their advantage to see to it that the magnetos they use are provided with permanent magnetos of a stable character. On the whole, the magneto situation is on a very thoroughgoing basis, leaving little to be desired.

Situation in Relation to Coils.—The slight reference made to coils was indicative of improvements in the magnetic circuit windings and insulation, and if coils are better in these ways, it is true of them also that they are improved in all ways. Take, for illustration, the "unit trembler," in which any number of coils are under the control of one trembler only. Certainly it is far less trouble to adjust one trembler for several cylinders than it is to try to adjust one trembler for each cylinder. Then, again, there is the scheme in which one coil is used in common for all the cylinders, taking into account a high tension jump-spark distributor, which coil can be with or without a trembler.

In this class of work, if no trembler is used, the timer is so adjusted as to afford a very short period of contact, thus delivering but one spark at a time; and delivering the same at the propitious moment. One good spark at the right time is what is wanted in any case, and any system that will deliver the one "high energy" spark will serve well the intended purpose.

This is not to say that there is any disadvantage in delivering a series of sparks, as in the coil with a trembler, for there can be none. Indeed, if assurance could be had of delivering a series of sparks so timed as to ignite the "mixture"—(a) at the propitious instant; (b) as many times as possible thereafter—the rate of flame propogation would be greater, and, within limits. it would be an advantage. If no guarantee can be had of de-

livering a series of sparks on the basis as above outlined, the next best thing is one spark at the right time. Fortunately, the several systems are so thoroughly perfected as to perform their functions to a degree of perfection leaving little to be desired.

There are still to be had the class of coils in which a trembler is used for each coil. Some autoists claim that the compression differs in the respective cylinders enough to demand recognition. In other words, they claim that by adjusting the separate tremblers for the respective coils and cylinders, they realize more uniform results; and they probably do. The only point is, it takes a little more skill than can be expected from a novice, and, besides, it would be possible to adjust compression as well as the spark in a case of this sort. These same autoists set up the contention that absolutely independent ignition systems for each cylinder would be an advantage in case of a break down of any coil. There is a good deal in this, since coils are extremely difficult to repair. On the other hand, it is a fact that of all the equipment in cars, coils seem to hold out the best; indeed, it rarely ever happens that the coils fail in actual service. When they do, it is because of positive abuses and much exposure to the elements under sharp variations in temperature.

Advantages of Various Types of Batteries.—The storage battery ranks first because of its higher voltage on open circuit, its lower internal resistance, and its consequent higher "watt" efficiency. Of the storage battery it is also possible to say the actual available energy is considerably higher at a higher rate of discharge. If these are characteristics of storage batteries, it is also true of them that they are "wet" and the "spillage" is diluted sulphuric acid. True, the batteries are very effectually sealed, and the spillage does not amount to anything at all in the cases in which the batteries are accorded a fair measure of attention. If storage batteries are charged at regular intervals, and the electrolyte is maintained at its right strength, they serve well their intended purpose, and well repay the autoist.

Dry batteries are used extensively and in the larger sizes, excepting when they are used as seconds, in which service it is not expected of them to do more than answer to an emergency call. There is no denying the fact that if dry cells are used, it pays to employ the larger sizes. They last far longer and during their life they afford a better result, since the internal resistance is lower and the amount of depolarizer is in far greater excess. In the earlier times the battery connectors were something of a nuisance, but this is of the past owing to the improvements wrought in this direction. It is now possible to purchase batteries of the "dry" variety in boxes of great utility, so arranged that the connections are made automatically.

As between the two types of battery, choice depends upon the point of view. If one cannot have the storage battery charged at regular intervals, it is a waste of money to buy it, in which event the dry battery has many points of superiority. If the coil is economical, the dry battery serves very well in any case. If the battery is for emergency work only, the dry battery will do.

Besides storage and dry batteries, there are primary batteries that should have a place in this class of work. They are good current givers, and the replacement of the "charge" is attended with little or no difficulty. These batteries are of the "wet" description, and on that account may not be preferred by some. To seal them should not be a great task; sealing is effectual in the storage battery work. The difference between a primary and a storage (secondary) battery lies in the fact that with the primary battery the elements are wasted away, and have to be replaced when they give out. In a secondary (storage) battery, the elements do not give out during the natural life, and to recuperate the battery it is but necessary to recharge the same.

Battery boxes are to be had in wood, highly finished, and in pressed steel; under lock and key, if desired. They are made in a variety of sizes to fit on the running-board or under the seats. Batteries are made in certain sizes, and the makers of boxes have taken this fact into account. This automatic cooperation has resulted in the lowest possible first cost, quick deliveries, and the highest possible quality of the respective products.

Something About Chemicals Used in Batteries.—Storage batteries are provided with a solution of sulphuric acid in distilled water. The strength of the same is 25 degrees Baumé. The water must be distilled in a tin-lined equipment and must be free from iron, chlorine, nitrates, mercury, copper, arsenic, and such other ingredients as might introduce undesirable chemical action. A storage battery will last for a long time if it is not allowed to become contaminated by some one of the elements or compounds such as will induce chemical action. There is nothing that will so quickly reduce a battery to a useless state as iron, chlorine, or nitrates. Any of these ingredients can come from the water or from the surroundings. Electrolyte can be purchased from the chemists, guaranteed pure and of the right strength.

Dry batteries do not have to be replenished unless they are allowed to dry out, in which event it is possible to recuperate them by spilling water into them, in which water a little sal ammoniac will serve a useful purpose. Primary batteries may require caustic soda or what not, depending upon how they are made. In any event, it is desirable to use pure chemicals from a reliable source.

Electrical Conductors, Terminals and Fastenings.—However a good coil or a magneto may be it is of no practical avail if the insulation on the secondary winding is below the requirements. It is not far from right to claim that the electromotive force in the secondary circuit of a modern "transformer" will reach the enormous instantaneous value of even 40,000 volts. The wave is an irregular saw-tooth, and the electrostatic strain is so very great as to require an extra thickness of the finest insulation to sustain under such conditions. It is a simple waste of time to use anything but the superior grades of insulated wire in secondary circuits, and the manner in which the terminals are made up is a matter of some moment. Fortunately, suitable grades of insulated wire are to be had and builders of automobiles are alive to the needs of the service. In repair work, or in going over a car, it is not unusual to see repairmen make splices in the wiring. The secondary wires should not be spliced, because it is not easy, if possible, to maintain the high insulation resistance of the wire that should and does obtain when the insulation is new and not spliced.

The primary wiring does not have to transmit high electrical pressures, but the joints have to be good because the voltage is low. With a low voltage, if a joint is not good, the resistance becomes so great as to defeat the aim. Terminal connectors should be used, and in every possible case the joints should be soldered. There are divers forms of terminal connectors to be had; they all answer the purpose to a greater or less degree, and none of them is so inferior as to warrant going back to the simple expedient of twisting the bare wire around the terminal screw.

Of Spark Plugs There Are a Plenty.—The spark plug situation is in good shape, with a considerable selection at the disposal of the autoist. The underlying idea is the same in most of them, but there are considerable differences in point of detail. Of insulators, there are the porcelain tubes on the one hand, and mica on the other. Porcelain is so much improved in modern spark plugs as to give almost no trouble at all, while mica, if it is well selected and nicely put together, will last for a very ong time. The details of finish of spark plugs are much more refined than they were in the past, and the question of the standardization of the thread in the cylinders is receiving a due measure of attention. Ofttimes the trouble experienced with spark plugs is due to ill-fitting threads that allow the plugs to screw in more than they should, or a leak is developed around the plug. In some cases in the past, the plugs were not located in the most efficient zone, in view of the uncertain nature of the mixture in the cylinders. If motors are with a high compression, the question of the location of the plug is not a matter of so much moment provided the sparking equipment is suitable for the purpose in view of a high compression, it being the case that the higher the compression the greater the resistance.

If you want the best, simplest and most reliable Ignition System, install a

K-W Magneto and K-W Coil

and Forget You Have Any Ignition

YOU CAN PAY MORE BUT YOU CAN'T BUY BETTER

The New Model "G" K-W Magneto, $50.00

GEAR DRIVEN AT ENGINE SPEED
and works with a vibrating
coil and timer.

GUARANTEED TO START WITHOUT BATTERIES.

The model "G" K-W Magneto was designed with the sole purpose of replacing the complicated High Priced High Tension Magnetos of other makes that go wrong. It has standard base and will fit in place of Magneto you take off, or in place provided for Magneto on your motor.

READ THIS:

Minneapolis, Minn., Dec. 1, 1908.

Gentlemen—Wish to say that I have a K-W Magneto installed on my Pierce-Arrow car and there are no words too good to use in connection with this outfit. It is giving perfect satisfaction, and in fact giving much better results than it was possible to obtain from a high priced Magneto which has been installed and taken off from the car in question. Enough said.

Yours very truly, (*Signed*) S. S. JOHNSON.

We can show thousands like this. It's what they all say.

The K-W Magneto is simple and efficient because it is designed right; reliable and durable because it is built right; cheap because it is simple. No complicated traps and triggers to go wrong—no moving wires or brushes or contacts. Runs in Ball Bearings and is built to last, and does last.

The New K-W Coil

Do you know that the average quad coil contains a tablespoonful of water after winding. We take all this out by the advanced K-W system of coil building, giving an anhydrous coil and a coil with a quick time constant—a coil you cannot break down.

The K-W coil is the best that can be made at any price and the price is extremely low for such a high-grade coil. No unfair discounts but true value:—

Plain box coils (Marine coils or unit coils)	$6.00
Single cylinder mahogany dash coil with switch	12.00
Double " " " " "	18.00
Three " " " " "	24.00
Four " " " " "	30.00
Six " " " " "	42.00
For synchronized coils, add to above	10.00
For Synchronizer or Master Vibrator alone in mahogany dash box and switch	15.00

The K-W synchronized coil is like the regular K-W coil, and has an extra unit which contains the Synchronizer or Master Vibrator, and has a shunting device on the individual vibrators so you can use either the Master Vibrator or the individual vibrators at your will, thus giving two systems in one—either of which is better than you are now using. Its advantages are too numerous to mention here. Write to-day.

We make Magnetos for both make-and-break, and jump spark ignition in belt, friction and gear drive, and are constantly adding to our line. Get our catalogue now.

We want live dealers to handle our line in every city. If you can't see us at the show, write us.

WATCH FOR THE NEW K-W HIGH TENSION MAGNETO WHICH WILL BE EXHIBITED FOR THE FIRST TIME AT THE SHOWS. IF YOU WANT TO SEE THE MOST ADVANCED TYPE OF HIGH TENSION MAGNETO—THE BEST ONE YET—SIMPLE, DURABLE, RELIABLE, LOOK US UP.

IGNITION RELIABILITY

is, in the last analysis, simply the ability to ***keep going,*** coupled with ease of repair and adjustment when wear occurs.

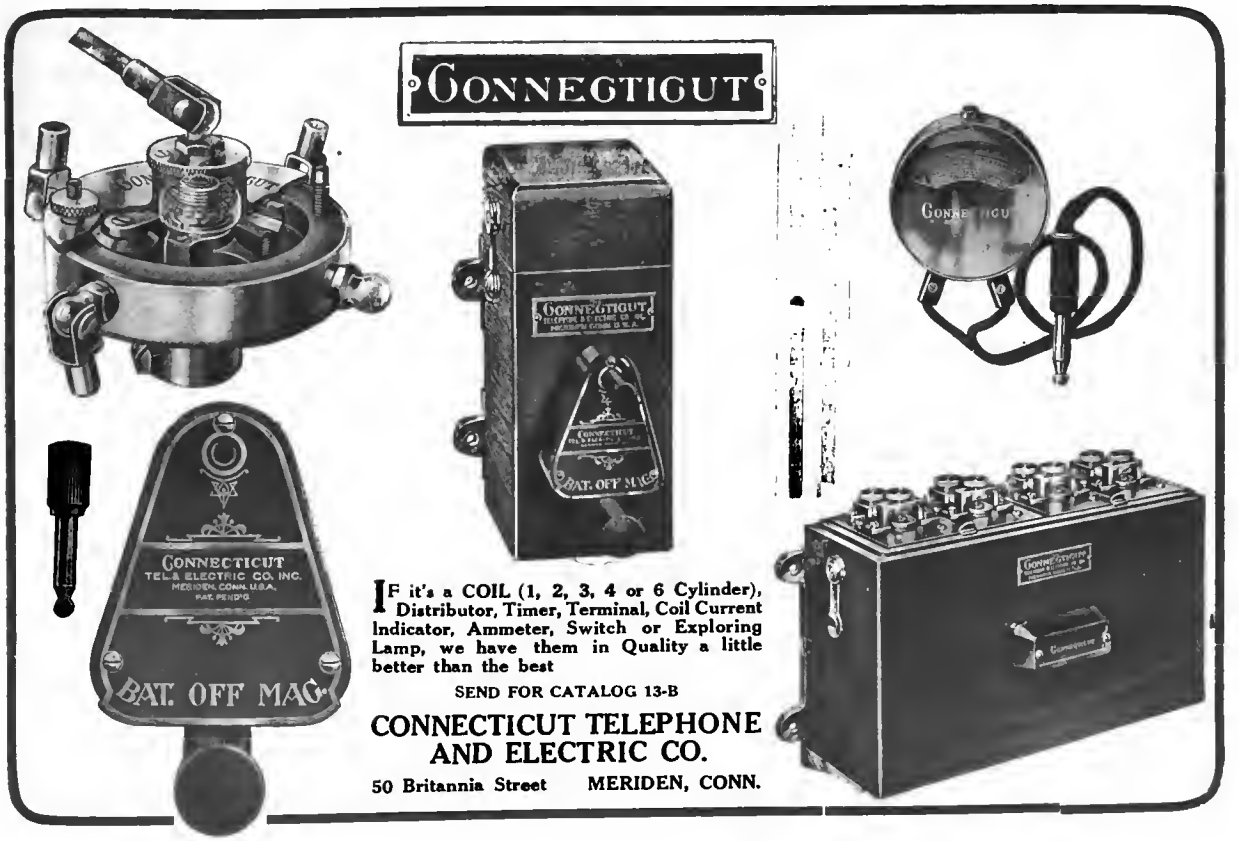
But how long should it "keep going," and what degree of ease in repair is requisite? The standard of Ignition Reliability in the past has been very moderate; and to spend an hour or two a week on the various ignition elements has not seemed unreasonable.

The time is coming when the ignition system will be required, in any reputable car, to do its work with as much uniformity, as little demand for tinkering, adjustment and expert skill, as the valves or the ball bearings.

That is the sort of reliability which users of the Atwater Kent Spark Generator are learning to expect of ***their*** ignition system—and they are getting it.

The Atwater Kent Spark Generator is a high-tension ignition apparatus for multi-cylinder engines. It has a positive mechanical make-and-break, so designed as to run for years without appreciable wear. The moving parts are exceedingly light, and are glass-hard. One spark is made per ignition, and the duration of contact—regardless of the engine speed—is as short as will permit the coil to "build up." Six dry cells last 1500 to 2000 miles. The coil, distributor, spark advance and cylinder cut-outs are as carefully worked out as the contact maker.

Atwater Kent Manufacturing Works 44 NORTH SIXTH ST. PHILADELPHIA, PA.



IF it's a COIL (1, 2, 3, 4 or 6 Cylinder), Distributor, Timer, Terminal, Coil Current Indicator, Ammeter, Switch or Exploring Lamp, we have them in Quality a little better than the best

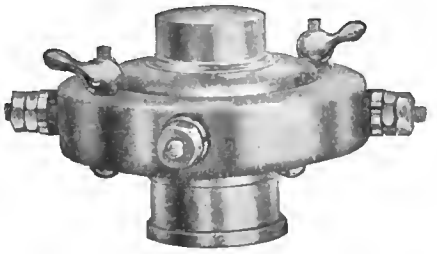
KINGSTON



SPARK COILS
SPARK PLUGS
TIMERS

Larger Output—Lower Cost for 1909
1,000 Coils a Day

Will be our capacity for the next year. This immense output means great reductions in cost of manufacture and a still greater reduction of the selling cost, since every sale of KINGSTON goods sells more without any expense—the high quality of our goods makes friends everywhere—to try them is to use them and to use them once is to use them regularly. The great reduction in cost of production, together with economy in selling end, entitles the user to greatly reduced prices; therefore a new list price for 1909 has been arranged, showing greatly reduced prices on the entire line of KINGSTON IGNITION SPECIALTIES

The KINGSTON line includes Spark Coils for every purpose; Dash Coils; Plain Box Coils; Magneto Coils, specially fast; Motorcycle Coils; Make-and-Break Coils; Mica Spark Plugs, and Timers, all high grade, but at prices based on a reasonable manufacturing cost. The

KINGSTON Line Is RIGHT
High Grade
Reasonable In Price

It is easier to sell a high-grade article at a fair price than a high-grade article at a high price or a low grade article at any price.

We want live dealers in every city and town to handle our goods. Write for new quotations and full information. Booklet descriptive of the entire line for the asking.

A WOMAN CAN MAKE QUICK TIRE CHANGE WITH NADALL DEMOUNTABLE RIMS

THE operation is so simple and easy. Nothing is needed but a wrench to loosen or tighten four bolt-heads which release or clamp the felloe to your tire-rim. In five minutes the old tire is off and the new one in place. No need of fumbling in the dark or cold for nuts and other detached parts. There are no loose parts to a Nadall Demountable Rim. Nothing comes off but the tire and rim.

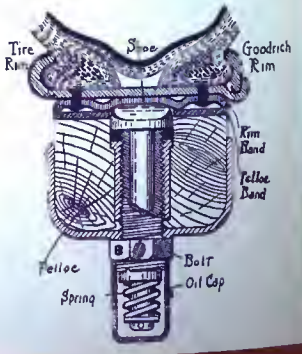
Only DEMOUNTABLE Rim used with a Quick DETACHABLE Tire

This combination is what people must have to avoid delay and trouble for tire trouble on the road. Clincher tires are a nuisance to handle. The detachable tire with a demountable rim requires no effort or mechanical skill and no tools but a simple wrench in the hands of anybody—man, woman or child.

See Our Exhibit at Madison Square Garden, New York, and Coliseum, Chicago.

How the Nadall Demountable Rim Works

Two to four expanding shoes protrude through the felloe rim and fit into grooved depressions on the inside of the rim. By applying a wrench to these bolt-heads the shoes are tightened or released without effort, and the rim quickly secured or released. So securely do these shoes hold that the wheel must break before they could be dislodged. The tire can thus be changed without detaching a single part. An oil cup on bolt-head serves to keep it in perfect condition.



Responsible Agents Wanted to Handle the Nadall Demountable Rim. Address

NADALL MFG. COMPANY

1225 Michigan Ave. **CHICAGO, ILL.**

THE wheelmaker's art is as old as the hills. And there are a good many points in relation to wheels entitling them to more than passing notice. In the first place, the rim speed of a wheel of an automobile reaches the high maximum of approximately two and a half miles per minute. With the idea of illustrating just what this means, it is to point out that the rim speed on the flywheel on a 5,000-horsepower steam engine would be limited to one mile per minute. Wheels for automobiles must be nearly devoid of flywheel effect, and this is an extremely difficult matter, unless the felloes are of wood and of small section. Fortunately, wood exhibits rare qualities under the condition in which it is used in wheels, and the felloes and spokes can be of small cross-section without trespassing upon the desired factor of safety.

The Camber in Wheels.—The better grade of wheels are provided with at least ten spokes for the front and twelve spokes for the rear and the spokes are set at an angle, giving a "dished" effect. This is not with a view to enhancing the appearance, but with the idea of enormously increasing the ability of a wheel to sustain against side strain. The amount of camber given the wheels is enough so that the spokes are appreciable longer than the radial distance from the hub to the felloe. Because of this distance and its influence, a wheel cannot be "dished" by an outside force out of the plane it is given at the time of its construction unless the rim and the felloe part. The reason for this lies in the fact that all the spokes are in compression and all share the responsibilities equally. It is not necessary, then, to have spokes of large section and great weight, whereas, on the other hand, resiliency is imparted to the wheel if the spokes are not of such great section, especially if they are whittled down in such a way as to make them rigid in the sheer plane only. This year's cars have decidedly improved wheels, both as respects the design and in that the diameters are greater than they were in the past. There never was any question as to the undesirability of some of the low diameter wheels used in the past. The wheels lacked resiliency and the tires used were too small to do the work. These matters have been corrected very largely and an attempt is being made to maintain the high standard of second-growth hickory, long the standard wood for wheel-making, and now growing more scarce year by year, thus introducing a considerable wheel problem. This is one of the reasons why steel wheels are used quite extensively, although it is true that steel "disc" wheels are chosen for their great strength, as well as the fact that the service in which they are used demands heroic treatment. Indeed, it is a question if steel wheels may not become very popular in the near course of events.

Hubs in Modern Wheels.—The trend is entirely in the direction of ball and roller bearings for wheels and the hubs are accurately machined from steel castings or die forgings, as the case may be. Provision is made for keeping the lubricant within the hub cavities so that the ball or roller bearings are profusely lubricated. Hub flanges are wide and a suitable number of bolts of good diameter are used to bolt the woodwork into secure relation. There is decided tendency also to have the spokes at the miter very accurately fitted and fastened by glue, so that it will be readily feasible to dissemble the wheels at any time for whatever purpose as, for illustration, a new hub might be substituted at will for one damaged in service.

Something About Rims.—While the clincher type of rim has been long and favorably regarded, the fact remains that the average autoist rarely feels capable of coping with the tire trouble that might arise because of the difficulties involved. Demountable rims came into vogue because there was a demand for means by which tires could be changed by men of ordinary strength under unfavorable conditions. The demountable rims are, apparently, just as secure as the clincher type, and certainly it is much easier to change tires if demountable rims are used. At the present time rims are made of the finest grades of materials and the joint is rendered strong by the electrical welding process. There are several schemes by which the demountable feature is rendered practicable, and experience rather goes to show that any choice is purely as a personal matter.

Improvements in Tires.—The first great improvement in the tire situation came by way of a reduction in price, thus enabling builders of cars to use wheels big enough for the purpose. It would not be far fetched to say that the smallest runabout would have tires as big as we find on the largest touring car to-day, price permitting. The life of a small tire on a big car, in which speed and weight are considerable factors, is too short to be regarded from a commercial point of view. If larger tires are being used at the present time it is also a fact that experience has lent zest to the undertaking and the quality of tires is on a higher plane.

A visit to the tiremakers' plants would show the use of better materials, a more discriminating selection of rubber and refinements in the progress that can only end in better tires. These same refinements and the quickening of the process were, of course, largely responsible for the cut in price, which cut, in turn, as before stated, enable builders of cars to select tires big enough for the purpose. Tires are made in the several well-known standard sizes; they nearly all seem to be of the wrapped tread variety and the non-skid feature is properly cared for just as in the past.

Use of Solid Tires.—Of solid tires and the special forms of rubber tires now much in use a book could be written extolling their well-known virtues and the last word would not even then be said. In trucking work to do without the "solids" would be equal to choosing to do without the trucks. It is quite out of the question to maintain the present pace with trucks considering the use of anything but solid tires or special forms of tires of rubber independently of the well-known pneumatic tires excepting in special cases.

Tire-Filling Compounds.—In certain classes of work the pneumatic tires are filled with a compound instead of air. It will not be possible at this time to discuss the compositions in detail more than to say that they do serve a very useful purpose, and it is due to their use that automobiles are regarded as much improved by the utilization of the compounds in certain classes of service in particular.

Run on Ball and Roller Bearings.—The old types of plain artillery hubs are no longer to be seen. Ball and roller bearings have proven their worth, not only because they "slay" friction, but by reason of endurance as well. The types of bearings available are in such great profusion as to render discussion here futile unless to reiterate their fine qualities.

Continental Ready-Flated Tires

THESE **popular** tires with **Continental Demountable Rims** will be **exhibited** at **both New York Auto Shows. Every** car manufacturer in America recommends them as the **most** perfect and **economical** tire equipment when the carrying of **spare tires, already inflated,** is desired. **Cheerfully demonstrated at all of our sales offices and orders filled three days from time wheels are delivered.** We know **you** will **want** them on **your new** car, and to avoid delay **you must specify early. Many** present motorists are already "wise"—with them the **fear of tire troubles is a thing of the past. Remember one investment only** covers **all** expense—and **any clincher tire** and standard tube **will** fit. Our beautiful brochure "Continental Ready-Flated Tires" forwarded at your request.

It doesn't take the automobiling public long to learn which tires are giving the best service.

G&J TIRES

are made to give the automobile owner his full money's worth in service—and that they have made good is evidenced by their ever increasing demand. You will make no mistake in specifying them on your new cars.

Yes, we shall exhibit at both the New York Shows. If you will be there, call and see us; if not, write for a copy of our new catalogue.

What Good Tires Mean to You

Throughout the world Morgan & Wright tires are known as good tires—because they **are.**

To the motorist this statement of **demonstrated** quality means much, for—

It is a guarantee against wholly unnecessary repair bills—against **all** repair bills, in fact, except those necessitated by accident or natural wear;

It stands for **protection to the car,** which can be secured only by the use of tires that are built to withstand **emergency** tests as well as ordinary service;

It's an assurance that you will be spared the exasperating inconvenience which always attends breakdowns of **any** kind—especially those against which you **could** be protected.

MORGAN & WRIGHT TIRES

have literally **won over** hundreds of motorists by reason of their protective quality—the quality that makes them absolutely safe under **any** condition.

Whether this protection is secured through the grade of materials used, or through our method of tire-building, or as a result of extremely rigid inspection which every tire undergoes before it is permitted to leave the factory, is comparatively unimportant to the user.

The vital consideration—and the only one that appeals to the experienced motorist—is this:

These tires actually stand up day in and day out under every condition of both load and road, as only tires can that are made as MORGAN & WRIGHT tires are.

And it is because users of these tires have repeatedly found this to be true, that we invite **all** motorists to give them an impartial comparative test.

There is no method of making friends
equal to the method of **making good.**

MORGAN & WRIGHT, Detroit, Michigan

Republic Tires

THAT Staggard Tread is the only satisfactory answer to skidding problems. Other anti-skidding devices (chains, steel studs, etc.) are only for temporary use in wet weather. This tire is for continuous use and is especially valuable in cities where the sprinkling of the asphalt produces dangerous conditions even on fair days.

The Staggard Tread also means longer wear on account of the increased thickness. In fact, the tread is usually the last part of these tires to wear out, since these big studs do not tear off like the small protuberances of dotted treads.

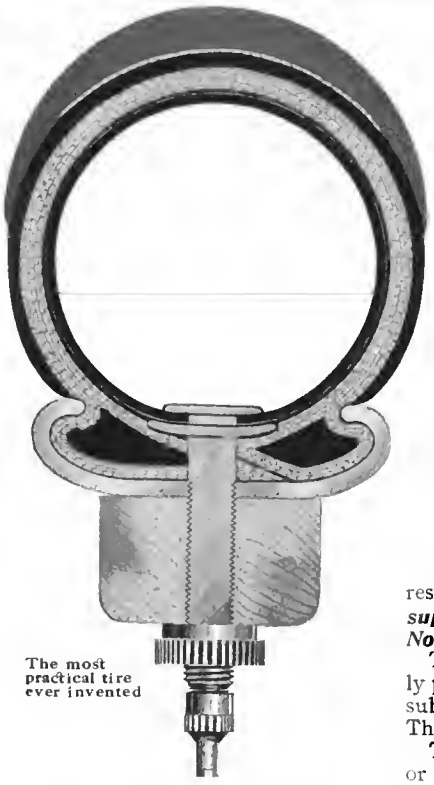
GENESEE MECHANICAL CLINCHER AUTOMOBILE TIRE



The most practical tire ever invented

The Genesee Tire is the *Only* Clincher Tire in the World with the improvements here shown and described.

Speaking broadly, all tires ***except the Genesee Tire*** are of a like construction, differing only as to ***quality.***

Look at this sectional of a Genesee Tire—note the exclusive and ***natural*** wedge lock—and ***mechanical*** lock formed by valve. Not a lug needed—not a bolt needed to secure tire to rim.

Genesee Tires cannot creep. The full, firm foundation is locked to rim by means of valve. The improved formation of it provides ample foundation for itself, and for the inner tube to rest upon. A perfect and complete ***support*** for tire and for inner tube. ***No other make can have this.***

This Genesee construction absolutely prevents water, dirt or other foreign substance from entering the tire. There is no possible space for it.

The inner tube cannot be pinched or chafed, because the inner edge of tire in this construction, as you notice, is ***flush*** with the entire inside surface, thus forming a continuous, naturally round tube. No chance for inner tube to get caught between lugs—there are no lugs.

The entire volume of inner tube is always ***above the rim,*** thus securing the benefit of ***all the air space,*** which means the maximum of resiliency and speed.

The inner tube is supported equally on all sides, which devides the strain evenly on every bit of its area, adding durability and greatest possible mileage.

The Genesee is the only perfectly balanced clincher tire. That is, the weight of the outer edge or circumference exactly equals the weight of its inner edge—the part next the rim. All tire experts have known the good of this principle of weight distribution, but none others have succeeded in carrying it out practically. This feature makes for the maximum of mileage.

This equal division of weight also places all side strains on that part of tire best able to resist unusual strains, and at the same time renders the Genesee Tire absolutely safe against accidentally being stripped from rim.

Tire with Highest Quality

To say nothing of the maker's responsibility, so good a principle embodied in it demanded that the Genesee Tire be as near perfection, in quality of material and workmanship, as human effort could make it.

The very best grade of Old Fine Para Rubber, specially selected; and best obtainable grade of Sea Island Cotton, specially woven to our order; these are the only materials used.

To make good, reliable tires demands a high type of sober, skilled and ***loyal*** men. Our factory located in the heart of the tire-making industry, we know the best men in the business. They are in our employ.

Nothing but the high-grade Gensee Tire is made in this factory. The best thought and undivided energy is being devoted exclusively to the manufacture of this Tire alone.

To the dealer—you can make no mistake in pushing this tire with your trade this season. The quality and construction is first-class in every respect—write for prices.

How To Bring Up A Tire On A Bottle In Thirty Seconds

Goodyear Air Bottle Means No More Tire Pumping

NEVER hear of bringing up a tire on the Goodyear Bottle? Sure! It beats the old-fashioned way of bringing the tire up by hand "all hollow." Not one-tenth the trouble.

And tires brought up on the Goodyear Bottle are well brought up too,—better behaved—more healthy—live longer—do a good deal more work—save you a lot of money.

It's such a big success that we are going to give every motorist in the world a chance to try it free for two years—charging only the nominal cost of the first bottle.

The Goodyear Air Bottle is a small steel bottle charged with pure air (not gas). It is usually carried under the seat or on the running-board of an automobile.

When you want to inflate a tire, you simply attach the rubber tube from the Air Bottle to the tire—open the valve and let 'er fill.

While you stand by and comfortably watch the performance until time to shut 'er off.

Doesn't look much like your old familiar job of giving an imitation of your wash lady in the midst of her Monday morning exercise, does it? Doesn't feel like it, either.

No more back-breaking, hand-blistering tire pumping! That grim task which robbed motoring of its pleasure can be crossed *off your list of troubles.*

Any woman or child can inflate a tire with the Goodyear Air Bottle—it's so simple.

And the beauty of it is that the tire can be brought up to just the right pressure.

This is important. It makes tires last 50 per cent longer. Under-inflated tires give out quickly.

By inflating to *exactly the right pressure* with the Goodyear Air Bottle, rim-cuts and other tire troubles are avoided. Ninety per cent of tire troubles come from under-inflation.

If you have Goodyear Detachable Auto Tires on Goodyear Univers l Rims, the Goodyear Air Bottle will enable you to be on your way a few minutes after the puncture occurs.

And with *any* tire, it cuts out half the work and drudgery.

Any motorist in the last Glidden Tour can tell you what a blessing the Goodyear Air Bottle is. A big truck loaded with Goodyear Air Bottles met the tourists from day to day at the various points of the tour.

All contestants who desired the Free Goodyear Air Bottle service were supplied, regardless of the kind of tires they rode.

Every day the empty bottles were taken back and replaced with fully charged ones.

Thus, the Glidden Tourists always had a fresh filling for a deflated tire right at hand—no delay—no labor.

Altogether the Goodyear Air Bottle was voted the best thing that had happened since the Glidden Tour began.

Write us for our "The Care of an Auto Tire," which gives valuable information about the care of tires and the exact pressure to which each size of tire should be inflated to give the longest service.

Our Offer to all Motorists— Free Air for Two Years

The Goodyear Air Bottle costs only $15 for the small bottle designed to carry under the seat, or $20 for the larger bottle, which is designed for carrying on the running board, filled with compressed air—no gas to ruin the tires, corrode the valves, or condense within a few hours, leaving the tires soft, thus making it necessary to constantly repeat the operation to maintain the desired pressure.

The first cost is the only cost for two years, thereafter we may make a nominal charge for refilling. But for two full years, when the bottle is empty you simply turn it in at any Goodyear Branch or listed agency and receive a new bottle, ready charged.

You do not have to wait. You exchange the empty bottle for a new charged one instantly. Each small bottle will fully inflate four to eighteen clincher tires—according to their size—and each large bottle from six to thirty-five. They will partially inflate many more. The bottles will inflate approximately 15 per cent fewer Goodyear Detachable Tires than Clincher Tires of corresponding size, the reason being that the GOODYEAR DETACHABLE TIRE IS 15 PER CENT OVER SIZE.

Regardless of what others may claim we still have over five acres of floor space in our factory.

THE SPRAGUE UMBRELLA CO., Norwalk, Ohio, U. S.

FROM the rear entrance tonneau to the elaborate creations of two or three years ago were as echoes from abroad. The makers of bodies in America ultimately reached the conclusion that utility and stability ought to have something to do with the project. The side entrance is an American idea, but it did not reach the point of its full significance until American designers interjected a little common sense. The swanlike curves and fantastic configuration so dominant in the late creations have given way to straight line work, comfortable seats, and the requisite amount of foot room. It is no longer possible to induce an autoist, or, for that matter, a builder of automobiles, to consider any scheme of design that savors of the proverbial sardine box.

In bodies of the past the distance from the top of the cushions to the deck ranged from 16 to 18 inches, while in bodies of the present time the average distance is scarcely more than half of the value above given. In the earlier types of bodies the distance from the seat panel to the dash, or between seats, as the case might be, ranged around 20 inches, while in modern work the minimum distance is about 25 inches. In the old days, when designers wanted to know how high to make the seats, they measured the height of a chair from the floor, while in the new bodies they took into account their experience in automobiles. In the course of time it dawned on designers of bodies that racing drivers insisted upon seats very close to the deck, and they seemed to be able to maintain their positions under strenuous conditions for hours at a time, whereas autoists perched high in the seat were much fatigued in a hundred miles of travel. The influence of racing is to be seen in bodies at every hand.

The Several Types of Bodies Extant.—Runabouts, roadsters, five-passenger touring, seven-passenger touring, limousine, brougham, victoria, landaulet, cabriolet, surrey, taxicab, and the types of commercial bodies, as delivery and truck. From the runabout to the seven-passenger touring car, inclusive, the bodies are practically all straight-line effect, and special mention should be made of a comparatively new type of body known as the "close-couple," in which a rumble seat is placed over the rear axle and behind the rear seat proper, thus affording seating capacity for six in cars of a wheelbase length to take a seven-passenger touring body. In the close-couple design the idea is to afford a place for the chauffeur during the time when the owner holds the wheel, and thus the owner is allowed the pleasure of driving the car and greater privacy is offered the party by seating the chauffeur in the rumble seat. This close-couple body has other advantages, among which it might be mentioned that the occupants of the rear seat within the body proper will not be jolted to anything like the same extent as they would be were the rear seat located over the rear axle.

With a view to the greatest possible convenience, numerous of the runabout types of bodies are provided with a folding or rumble seat on top of the tool box in the space available at the back. The little cars are, therefore, more commodious, and they certainly present a better appearance.

Offerings in Runabout Types.—Numerous of the runabout types of bodies are provided with a folding or rumble seat on top of the tool box in the space available at the back. The little cars are, therefore, more commodious, and they certainly present a better appearance, eliminating the "dinky" effects so abhorrent to owners of small cars. These bodies are, of course, prototypes to a smaller scale of the roadster type of bodies to be seen at every hand.

The builders of cars now consider the body question and the space needed to a far greater extent than they did in the past, and in side entrance cars the width of the entrance is generally about 22 inches, far enough towards the front to permit the door to be opened wide without interfering with the rear mud guards. In the shaft drive types of cars the sprocket wheel fender is absent and the side entrance is unobstructed. These improvements naturally indicate an increased wheelbase over cars in the past, and the new drop frame idea has permitted the body makers to drop the sills of the side entrances in the average about six inches, without interfering with the spring play, which is about five inches in the good examples of cars.

Town Car Body Work.—In town car bodies and bodies for taxicabs, the driver's foot room is reduced to the minimum. The motors are made as short as possible, and the wheelbase is made within a hundred inches, yet even so the side entrance is provided with a wide door and the space for the occupants is roomy, with spacious seats, while easy riding qualities are assured through having the seat to the front of the rear axle.

When reference is had to artistic effect and distinctive elegance, it would be a fallacy to assume tbat the straight line types of bodies are at the expense of art, and while it is impossible to say that art cannot exist without utility, it is a fair assumption that utility does not exist to the despair of art. These requisites can reside in harmony, and they do. The modern body maker has solved this difficult problem, and it will not be possible to charge him with spreading out too thin because he has made a residence for symmetry in all the cars from the runabout type to the most luxurious types of town cars.

Materials Used in Body Work.—These bave changed but little in the last two or three years, unless it is to note a more extended use of sheet steel. In some cases this sheet steel is aluminum coated or otherwise suitably protected as against the formation of oxides. At all events, metal bodies are looked upon with much favor; they are very prevalent, and aluminum is still used extensively. The framing work is invariably of wood and the center of gravity is held extremely low. Coming down to the finish proper, there are two fundamental ideas, one of which takes into account painting along lines consistent with machinery practices in which pure lead and zinc ground in pure linseed oil form the basis, while the effects are due to color. If more than the natural luster is desired in this class of finished work, the requisite quantity of varnish is added. A high finish can result from this practice, and bodies so treated will stand a vast amount of washing and rough usage.

For the more costly types of bodies in which the finish is to be the limit of the carriage maker's art, the old standard practice is maintained, stopping off at from 18 to 21 separate applications of finish. The upholstery in the better class of bodies is in hand buff leather of the best selections, with occasional examples in suitable cloth fabrics, notably in town cars. For the less expensive types of cars machine buff cowhide obtains.

BOOKS AND PUBLICATIONS

on Subjects of Interest to Those Who Make and Use Automobiles

A. B. C. OF MOTORING. By Sigmund Krausz.
A manual of practical information for layman, auto novice and motorist, containing dictionary of terms, types of cars, anatomy of the automobile, motors, carbureter, ignition, cooling, tires, transmission, etc. Care of the machine, art of driving, troubles of the road, etiquette of automobiling, racing rules and statistics, foreign travel, clubs, manufacturers, trade papers, speed tables, and complete digest of motoring laws of thirty-five States and names of those having no laws. Morocco cover, $2.00.

ACCIDENTS AND EMERGENCIES. By C. W. Dulles, M.D.
A convenient little manual, containing suggestions and instructions for the care of sick or injured persons in emergencies. It covers such subjects as drowning, removing foreign bodies from the eye or ear, burns and scalds, dislocations and fractures, wounds and hemorrhages, poisons and poisonous plants, supplies for emergencies. Size 5 by 7 1-2. Pages, 209. With illustrations. Canvas boards, $1.00.

ACETYLENE. By F. H. Leeds and W. J. A. Butterfield.
A useful, practical handbook on the production, purification and subsequent treatment of acetylene for the development of light, heat, and power Size, 5 1-2 by 8. Pages, 276. With illustrations and tables. Cloth bound. $2.00. Postage, 10 cents additional.

AUTOMOBILE CATECHISM. By Forrest R. Jones, M.E.
This ie a thoroughly practical, modern work, published in pocketbook form. Size, 4 1-2 by 7. Pages, 134. With drawings. Genuine Morocco cover, $2.00.

AUTOMOBILE DICTIONARY. By Sigmund Krausz.
An American pocket reference book, containing automobile technical terms in English, French and German. Sizes, 4 1-4 by 6 1-4. Pages, 129. Flexible leather, with flap, $2.00.

AUTOMOBILE RECORD. By Sigmund Krausz.
Expense account of fifty-two weeks, with columns for cost of gasoline, carbide, kerosene, repairs, replacements, daily runs, chauffeur's salary, garage expenses, speed record, starting point, destination, motoring laws uf thirty-five States and names of others having no laws. Torals ot expenses and runs for any period shown at a glance. Morocco cover, $1.00.

AUTOMOBILE TRADE DIRECTORY.
A classified list of the manutactnrers of automobiles, commercial vehicles, motor boats, motor cycles and of all makers of parts, accessories, machinery, tools and automobile shop equipment. Also tables and data for automobile engineers and other pertinent information. Size, 7 by 10. Pages, 466. Published quarterly. Subscription price, $5.00 per year. Single copies $1.50, postpaid.

OAS, OASOLINE AND OIL ENGINES. By Gardner D. Hiscox, M.E.
A practical work on gas, gasoline, kerosene, and crude petroleum engines and producer gas plants. Size, 6 by 9 1-2. Pages. 442. Witb 351 illustrations. Cloth bound $2.50.

OASOLINE ENGINE IGNITION. By E. J. Williams.
A new work written for the information of the novice especially. Size, 5 by 7. Pages, 94. With 37 illustrations. Cloth bound, $1.00.

INDUCTION COILS. By H. S. Norrie.
A practical work on how to make, use and repair coils. Size, 4 3-4 by 6 3-4. Pages, 269. With 78 illustrations. Cloth, $1.00.

LUBRICATING OILS, FATS AND GREASES. By Georga H. Hnrst.
A book written with the object of supplying oil dealers and users with information as to the various oils which are used for the purpose of lubricating machinery. Size, 5 1-2 by 8 3-4. Pages, 317. With illustrations and tables. Cloth bound, $3.00. Postage, 10 cents additional.

MODERN OAS AND OIL ENGINES. By Frederick Grover, M.I.M.E.
A reference book intended chiefly for the Information of mechanical draftsmen engaged in the design of internal combustion engines. Size, 5 by 7 1-2. Pages, 372. With 178 illustrations, $2.00.

MOTORS AND MOTOR DRIVINO. By A. C. Harmsworth.
This is one of the English series of works on sports known as the Badminton Library, and is intended to include the whole field of automobiling in an interesting discussion for the information of the novice. Size, 5 1-2 by 7 1-2. Pages, 456. With many illustrations. Decorated covers, $3.50.

MOTORS AND MOTORING. By H. J. Spooner, C. E.
A very instructive little book, dealing chiefly with the how and why of motor construction and operation. Size, 5 by 7 1-4. Pages, 99. With 20 illustrations. Cloth boards, $1.00.

MOTOR IGNITION APPLIANCES. By T. H. Hawley.
A treatise on the application of electricity in the production of the ignition spark in internal combustion motors. Size, 6 by 9. Pages. 137. With 34 drawings. Cloth bound, $1.50.

MOTOR POCKETBOOK. By Mervyn O'Gorman, M.I.E.E.
A very useful reference book, written for the owner and driver. Worth a place in every automobile library. Size, 4 1-2 by 6 1-2. Pages, 387. With many drawings. Flexible leather, $3.00.

MOTOR VEHICLES AND MOTORS. By W. Worby Beaumont.
It treats entirely of modern machines and methods, devoting chapters to the gasoline touring car, English, Continental and American. Size, 8 by 11. Pages, 677. With 500 illustrations. Cloth bound, $10.00. Express charges additional.

MOTOR VEHICLE FOR BUSINESS PURPOSES. By A. J. Wallis Taylor.
A practical handbook for those interested in the transport of passengers and freight. Sze, 5 1-2 by 8. Pages, 298. With 138 illustrations. Cloth bound, $3.50.

MY AUTOMOBILE.
A well-bound blank book, in whicb to record dates, runs, time, distances, weather, roads, cost of repairs, fuel, entertaining, and all the other information about tours that interests the autoist. Size, 4 3-4 by 7. Pages, about 270. Cloth bound, with pocket for map, $1.00.

PETROL MOTORS AND MOTOR CARS. By T. Hyler White, A.M.I.M.E.
A handbook for engineers, designers and draftsmen. Size, 5 1-4 by 7 3-4. Pages, 187. With 44 drawings. Cloth bound, $1.50.

SELF-PROPELLED VEHICLES. By James E. Homans, A.M.
A practical treatise on the theory, construction, operation, care and management of all forms of automobiles, with upwards of 500 illustrations and diagrams. Size, 5 1-2 by 8 1-2. Pages, 652. With drawings and halftones. Cloth bound, $2.00.

SMALL ACCUMULATORS. By P. Marshall.
An elementary handbook for students and beginners, discussing theory and practice in the construction of small storage batteries. Size, 4 3-4 by 6 1-2. Pages, 80. Cloth boards, 50 cents

THE AUTOMOBILIST'S DAILY RECORD OF RUNS. By Jarrett and Letts.
A blank book, with ruled pages, in which to record the log of any run made. Size, 5 by 7 1-2. Pages, about 300. Cloth, stiff covers, $1.00.

THE AUTOMOBILE HANDBOOK. By L. Elliot Brookes.
This work was written to supply practical information to automobile owners and operators, with additional information of value to the automobile mechanic. Size, 4 1-2 by 6 3-4. Pages, 320. Over 100 illustrations Popular edition, full leather, limp, $1.50.

THE AUTOMOBILE POCKETBOOK. By E. W. Roberts, M.E.
The purpose of the author in writing this book has been to place before the designer and operator, in a concise manner, a few general notes on the design and operation of the gasoline automobile. Size, 3 1-2 by 5 1-4. Pages, 329. With many drawings. Flexible leather, red edges, $1.50.

THE COMPLETE MOTORIST. By A. B. Filson Young.
A practical volume devoted to the history, construction, use and care of motor cars, and to the subject of motoring in America. Size, 5 3-4 by 8 1-2. Pages, 372. With many illnstrations. Cloth bound, $3.00.

THE COMPLETE MOTORIST. By A. B. Filson Young.
This is an American edition of an English book, which is described in a subtitle as being an account of the evolution and construction of the modern motor car. Size, 5 1-2 by 9. Pages, 338. With many illustrations. Cloth bound, $3.50.

THE GAS AND OIL ENGINE. By Dugald Clark, M.I.C.E.
It discusses the theory of the gas engine and the general application of that theory in practice, and deals extensively with modern gas engines and with the oil engine. Size, 5 1-2 by 8 1-2. Pages, 588. With 288 drawings. Cloth bound, $4.00.

THE OAS ENGINE. By Frederick Remsen Hutton, E.M., Ph.D., Professor of Mechanical Engineering in Columbia University.
A treatise on the internal-combustion engine using gas, gasoline, kerosene, or other hydrocarbon as source of energy. Pages. 483. With 300 drawings. Cloth bound, $5.00.

THE GAS ENGINE HANDBOOK. By E. W. Roberts, M.E.
A very useful manual of information about American practice in the construction and operation of stationary gas engines, for the use of the designer and engineer. Size, 3 1-2 by 5 1-4. Pages, 264. Flexible covers, $1.50.

THE HAPPY MOTORIST. By A. B. Filson Young.
The author, who is n well-known English writer, describes the purpose of the book as "an introduction to the use and enjoyment of the motor car." Size, 5 1-4 by 7 3-4. Pages, 230. Decorated covers, $1.50.

THE OFFICIAL AUTOMOBILE BLUE BOOK. Four Complete Volumes.
Published under the official endorsement of the A. A. A.

No. 1.—New York State-Canadian Section, with principal trunk lines to and from the Middle West.

No. 2.—New England States Section, with extension routes into the Provinces.

No. 3.—New Jersey, Pennsylvania Delaware, Maryland, District of Columbia and Virginia Section, with principal trunk lines to and from the Middle West.

No. 4.—Middle West Section, covering Ohio, Indiana, Southern Michigan, upper and central Illinois and lower Wisconsin.

Over 70,000 miles of American roads carefully described and illustrated with superior maps. Each volume, complete in tself leather bound $2.50 postpaid.

THE PRACTICAL GAS ENGINEER. By H. W. Longanecker.
A manual of practical instruction on stationary internal combustion engines. Size, 4 by 6 1-2. Pages, 143. Without illustrations. Cloth boards. $1.00.

FOR SALE BY **THE CLASS JOURNAL COMPANY,** Publishers of "THE AUTOMOBILE" 231-241 West 39th Street **NEW YORK**

SUPPLEMENTARY
SPIRAL SPRINGS
Eliminate all Spring Troubles
Insure Comfort and Safety
Save Repairs---Save Tires

Supplementary Spiral Springs commence where the side springs stop—any inequality in the road calls the **Supplementary Spiral Springs** into instant action. relieving the car and its occupants from jolts and jars so unpleasant to passengers, trying to the mechanism and disastrous to the side springs.

Supplementary Spiral Springs add very much to your comfort and reduce repair bills; the saving in repairs alone in a year will repay their cost many times over.

Supplementary Spiral Springs (thousands now in use) are applicable to all cars (see illustration in margin), and are efficient on all types of Runabouts, Touring Cars, Limousines or Heavy Trucks, and cost about one-half the price asked for complicated and inefficient devices.

Supplementary Spiral Springs are also furnished in combination with specially constructed full-elliptic or semi-elliptic double-leaf side springs, an ideal spring equipment. See illustrations below. Correspondence with auto-manufacturers invited. Send for illustrated booklet and testimonials—free on request.

Prevailing Chassis Features

IN the automobile it would not be out of place to refer to the frame as a chassis, nor is it a stretch of the imagination to include the accessories of a frame as springs, etc., together with the axles and the wheels on which they roll. It seemed far fetching to include the power plant, and so it has been discussed separately, and the wheels, the products of an ancient craft, are excluded from this discussion, as they are entitled to separate consideration.

For the present, confining the discussion to the chassis proper (frame), it may not be out of place to lay stress upon the features of the most importance, but the least discernible. A casual observer from the paint that covers the frame might pronounce the frame as good, if perchance the finish makes it look good. The modern automobile maker has the happy faculty of seeing things as they are, and frames of cars as they abound are no longer of cold pressed, mild Bessemer plates. It is the present practice to use fine grades of steel, the quality of which is fairly represented in the mere statement that it will stand in the cold bending test 180°, and, flattened down, without showing signs of distress under a twenty to one glass.

Prevailing Shapes in Frames.—The channel section seems to spell finality, but wood has its strong points. Mathematically, this section holds forth the promise requisite to the occasion, and, practically, this same section lends itself readily to the process. Because of the fine materials and the willingness of the channel section to conform to intricate shapes, the drop frame has come into vogue, thereby rendering it possible to lower the center of gravity, besides facilitating entrance and egress of the car. This same readiness to conform to shapes renders it feasible to fashion the lateral members in a manner agreeable to machinery equipment.

The most recent products are to the gradual elimination of castings at any point on the chassis, and in some of the examples it is to note the presence of pressed steel instead of parts by the drop forging process. The object of resorting to the use of pressed steel fittings instead of forgings is with a view to decreasing cost without suffering a diminution of quality. In the abstract steel plates are of greater strength and in better condition than drop forgings. In the process the pressed steel parts would retain their quality, assuming the riveting is given a due measure of attention. That the builders of cars are fully alive to the advantages of the respective methods is a matter that can be easily settled by merely glancing at the products. They use drop forgings where they will best serve the purpose, and they resort to the use of pressed steel to a marvelous extent.

A Strong Differential Bracket.

Spring Suspension in Automobiles.—There is no one detail of such great importance or so difficult to manage as that of evolving easy riding qualities and longevity of the supple members. The quickest way to break a piece of steel is to subject it to alternating deflections in reverse. Springs have to sustain under these conditions, especially springs in automobiles. They have to be worked to a point near the elastic limit to engender easy riding qualities, hence kinetic ability must be the marked characteristic of the steel employed for this purpose. The improvements wrought in spring steel and in the treatment of the same can scarcely be adequately described in a word picture. In the old days steel that would stand up to half a million of vibrations under the stress of half the elastic limit was said to be good enough to place in a safe deposit vault, but the automobile makers of to-day are making strenuous efforts to exceed one million six hundred thousand vibrations at half the elastic limit. The value stated is extremely high.

It is now a fairly well established fact that the quality of steel, the features of design, and the mode of treatment are the factors of importance rather than the mere question of the types of the springs adopted. Types of springs can be adopted to suit the general features of cars, and the level platform, so much to be desired, will mostly depend upon the other factors.

Practice in Axle Construction.—Front axles are very largely of the "I" section, while knuckles are of divers designs, as Elliot, Lemoyne, Mercedes, etc., with splendid proportions of the steering mechanisms and a special reference not only to liberal bearing surfaces, but adequate means of lubrication. When reference is had to rear axles, the types diverge, depending upon shaft or side chain drives. In the cars utilizing the side chain drive, the "I" section axle is in full force, and it is not uncommon to observe the distance rods of the same section, primarily because of its strength.

With live rear axles there is still a considerable amount of featuring in various directions, but it is plain to be seen that all designers are in favor of increasing the ground clearance under the different housings and increasing stability by the use of more stable truss rods, if they must be used at all. There is a prejudice in favor of the elimination of truss rods, and there are a few examples of rear axles in which

A Characteristic Sub Frame.

autogenous and electrical welding methods are resorted to with a view to the fashioning of the enlargement of the members to accommodate the differential housings in this class of axles.

Semi-floating types of rear axles seem to be very common, and designers are pretty evenly divided between transmission sets in conjunction with rear axles and the same transmission sets as separate units swung on the frame, excepting in the self-contained power plants, in which the transmission sets are integral therewith. Of materials, it is to note the same degree of improvement along consistent lines.

Some Ruling Dimensions.—The advent of the long wheelbase has brought about specific reforms by way of stiffer frames, an increased number of laterals, and better ties. It is now a fairly established fact that the chassis frame should be relatively heavy, if a level platform is desired. Road inequalities, as they affect the springs, will react with a consequent secondary motion of the lightest series. If the chassis frame is heavier than the parts below the springs, the motion will be imparted to the parts below (axles, wheels, etc.), rather than to the frame itself. The law says "a mass will be diverted from its habitual direction to an extent inversely proportional to the weight," etc. Result, if the axles, wheels, and parts below the springs are lighter than the mass above, the excess motion will be imparted to the series below. The cars of to-day are in harmony with the laws, and the builders of automobiles more nearly understand how to bridle the forces.

Improvements in Materials Demanded by Service.—There is no part of the automobile that has undergone so much change in so short a time as the materials used in the various parts of the chassis. The earlier examples of cars had side members of regular structural shapes, as T's, L's, and, for the heaviest work, channel sections. The material used in these products was substantially mild steel in which the mettaloids were held at quite high values. The introduction of the pressed steel frames in irregular channel sections was not at first attended by the utilization of fine material. It was soon found that alignment was conspicuous for its absence after a little road service, because the materials of which the side frames were made had not the requisite rigidity in the first place, and no attempt was made to countcract the ills of sagging.

Discriminating designers soon reached the conclusion that special grades of material would be necessary, and that sagging would have to be fortified against by some means or other. Some of the more ingenious of the designers proposed to put an initial sag in the side members by merely shaping them in the press with an upward camber and in the later process subject them to sufficient pressure to bring on a permanent set, incidentally eliminating the upward camber, hence straightening them out. This practice was resorted to in notable cases, and frames so constructed rarely, if ever, gave any trouble at all.

Other improvements were by way of deeper channel sections and a greater width of flanging at critical points, but the greatest gain, aside from the matter of correct design, came from the use of the finer grades of alloy steel. In some notable instances nickel steel, quite low in carbon, was adopted, and silicomanganese products have found a wide application. A goodly number of the frames, however, are the product of spring steel of the low carbon genera. Certainly the materials that would serve well in springs would logically serve as side members, because while it is true that spring steel has certain properties requisite in springs, it is at the same time a product of a high initial rigidity. This is not to say that the conventional spring steel of the market as ordinarily used in railroad car springs would be valuable for this purpose.

Rear Spring Suspension, with Side Chain Drive.

Some of the best examples of cars employ "government inspected" boiler plate in side frame members. This is, of course, fine material to work, and it seems to stand every test, as well as the exigencies of service. Its underlying characteristic involves the use of fine grades of ore in the O. H. process, limiting carbon to about ten points. There are special lines of side frame material to be had, but it is doubtful if they differ very much from what are generally known as the better grades of flange steel, or, for that matter, of the boiler plate above referred to.

At all events, irrespective of the exact grades of materials used in the different cars, there are none so poor as to support the ordinary grades of steel as found in the cold pressed side members of even two or three years ago. But this is not to say that unsatisfactory service was due to materials even in the majority of cases, since some of the earlier designs looked as if they were fashioned for the specific purpose of failing in service. Of course they were not; the problem was new, and designers lacked experience. A controlling factor was oftentimes a distinctive appearance.

It was not at first supposed that lateral supports would prove to be of any great advantage by way of stiffening the chassis as a whole. It was soon found, however, that the examples in which the lateral members were well designed seemed to do the best work, affording the greatest measure of rigidity.

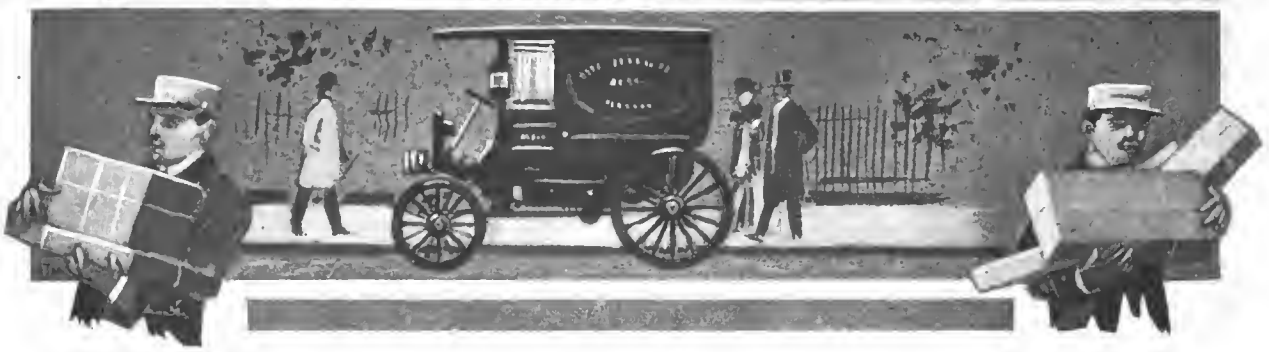
The Automobile in Commercial Work



PLEASURE, then profit, seems to be the logic of the autoist. At all events, the pleasure types of automobiles were perfected first, and the commercial types were the product of necessity. The automobile as a mode of motion and a means of transportation can no longer be denied its place at the head of the line, nor will it be subdued in its onward march until it stands in the light of "lock, stock, and barrel."

Of the commercial automobiles, there are steam, electric, and gasoline, named in the order of their coming.

Steam is widely the underlying principle in tractors and heavy trucks, with a growing tendency in the direction of the lighter trucks and delivery wagons.

The electrical automobile long dominated a certain zone, which, for brevity, can be set down as the "short haul" of the electrical commercial, they range from heavy trucks down to light delivery wagons.

The gasoline commercial was slow in coming, but from appearances it will persist in staying. The gasoline automobile may now be seen in divers forms as trucks, tractors, and deliveries. There seems to be no limit as to capacity, nor is the nature of the merchandise to be transported, of necessity, taken into account.

The trend is away from the old practice of trying to impress a touring car chassis into commercial work, and account is now taken of the conditions that surround the work to be done rather than to placate the forces of the shop in which the automobile may be constructed.

It would be very nice, were it possible, to make one chassis serve in all zones of activity. It is very discouraging to try and fail. In all cases thus far, failure (certainly not success) has attended the effort.

This fact probably had more to do with the retarded use of the commercial automobile than any other dozen of conditions The labor problem and the personal equation generally is even now a retarding factor; much improved, however, partially because the automobile has been simplified, and, again, due to the education of men generally in the ways of the automobile. The especially devised commercial automobiles of the present time are so perfectly simple and devoid of delicate parts as to assure freedom from harassing and costly interruptions, if only the operators will confine their attentions to the simple process involved in running the cars. The screw driver, the monkey wrench, and the squirt-can may be left in the garage, and the cars will serve well their respective purposes.

The commercial automobile situation, as it may be regarded at the present time, includes the divisions as follows:

(1) taxicabs;
(2) heavy trucking;
(3) suburban express;
(4) general delivery work;
(5) utility-pleasure automobiles.

In addition to the sub-divisions above set forth, there are divers uses to which the automobile may be put to that will not be elaborated upon here, since the cars do not have to be especially devised for the purposes. In other words, within certain limits, a given model can be used for several commercial purposes, and serve well.

Characteristics of Taxicabs.

In a general way, taxicabs differ but slightly from town cars The town car in private service is maintained on a little higher plane as respects appearance than the taxicab in public service. The underlying mechanical features would be common in the two types of cars. The body work would be a little more stylish and a little less stable in the town car proposition, whereas the taxicab service body should be of neat design, but of great stability. The taxicabs promising most at the present time are of moderate power, short radius of turning action, and easy on tires, which is brought about by way of the elimination of unnecessary weight and good spring action.

Taxicabs are especially economical in the use of gasoline, and, with the customary supply of this fuel, they have a wide radius of action. The cost of maintenance on the whole is extremely low, and the operator is not expected to be able to make any repairs at all. It is but rarely that taxicabs become disabled in the street (accidents accepted), and it is better, in view of this fact, to do without the class of labor that would turn every side street into a repair shop. There is nothing that would retard the patronage of taxicabs so much as the spectacle in its disagreeable aspect represented by a man of no great skill tinkering with a taxicab that refuses to run.

Growing Field of Heavy Trucking.

"The seventeen mule team" hitched to a "prairie schooner" is the best illustration of the stupidity of man that can be found in any land. It is slowly percolating through the centers of intelligence of those who require goods to be transported that the automobile truck is here, and is available for use for every purpose of goods transportation without any limit whatsoever and on a basis of decreased cost per ton mile of the goods transported. If the automobile truck has appeared to be backward in connection with the work in question, it has been through lack of appreciation on the part of merchants rather than lack of ability of the trucks. These outside retarding influences were unfortunate, in that they made it impossible to acquire a full measure of experience, and on this account improvements seen to-day at every hand may be regarded as tardy.

In this zone of activity honors are pretty evenly divided, although in the past the extremely heavy work was done by the "steam lorry," while the average commercial undertakings were partial to electrical trucks. Gasoline trucks did not come into vogue to any great extent until very recently, mostly because the builders of gasoline cars had about all they could handle in pleasure work. A few of the companies handled the commercial situation as a side line, merely converting their

chassis into light trucks, and delivery wagons. This was more a misfortune than anything else, due to the great difference as between pleasure cars and cars required in the transportation of commercial lines. The gear ratio in such cases would scarcely lend itself, and many failures were directly traceable to the use of sprocket wheels with as few as eight teeth. A given motor cannot drive a car as fast as possible and haul a load as big as possible at the same time.

The High Speed Transportation of Goods.

If the heavy trucks are confined to a certain class of work at a slow speed, the modern delivery automobiles make up for any loss of time in connection with suburban express and general delivery work. A single delivery wagon, as they are designed to-day, will make from three to four trips per day, as against one trip with a span of horses. The automobile will do this work "rain or shine" and in the extremes of temperature. These special cars are provided with a commodious platform, are no more limited in load capacity than any other vehicle, and will make as high as 20 miles per hour, as against a quarter of this speed with horses. The same men who formerly handled the horse-drawn delivery wagons can be, and are, used, in automobile service. The labor item is reduced to about one-fifth of that in connection with horse-drawn vehicles, while the advantage of quick deliveries by way of satisfied customers is difficult to estimate, and is rarely ever adequately taken into account.

There are advocates of the automobile delivery wagon who are firm believers in the future of the automobile to the extent that it will displace every other means of transportation in local hauls. Any one who will take the trouble to trace the ramifications through which a small package will have to go in transit from a store in a city to a purchaser in a suburb, not 20 miles away, will quickly reach the conclusion that a single handling and a direct automobile transport is inherently economical. It is the inherent economy that will obtain in the long run, retarded only for a time because of the compactness of commercial organizations so busy conducting a complicated system that they have no time to recognize the merits of a direct method.

Utility-Pleasure Automobiles.

Merchants in a small way are fast becoming used to the idea of displacing the single (horse) delivery wagons in favor of automobiles, so designed as to serve in delivery work during the week, to be converted into pleasure autos on Sundays and holidays. This very large field is being exploited by small cars of considerable merit. The cost of this service, under suitable conditions, compares favorably with the cost in the old way. Runabout types of automobile with suitable body modifications serve well the purpose, especially in the cases in which tires are afforded a reasonable measure of intelligent attention.

High Wheel Types of Delivery Wagons.—In this connection it may be well to mention the advances now being made in high wheel cars in which it appears, some of them at any rate, are finding their way into commercial work, especially for use in the grocery trade and in the service of small merchants generally. This class of cars are of low cost, simple to operate, and they can be converted into pleasure vehicles at will, at a moment's notice. In the towns and villages throughout the land the roads are not so good as to be easily negotiated by cars with a low clearance, especially in the winter time, if there is much snow on the ground. The buggy type seems to serve well the purpose under such conditions, which is a guarantee in itself that the same type is not limited, since if it will do under adverse conditions there is nothing to prevent its working under favorable circumstances. In whatever service the type will serve, it is bound to impress itself, primarily because the first cost is low and in view of the ease with which it can be converted. The simplicity of the type is an assurance that the users will be able to master the same even though skill may be at a low level from the mechanical point of view.

On the whole, the experimental side of the commercial situation passed off smoothly, and the absolute failures were few and far between. They consisted, for the most part, in ventures of a most shady sort, ventures in fact that could only end in losses, as almost anyone of reasonable knowledge of the industry might have predicted. Inventing to fill a long-felt want, which is a practice not uncommon, is always attended with dangers, and it was mostly along such lines that the industry stubbed its toe, so to speak. As the automobile accumulated stability, which was a matter of going slow enough to imbibe of experience, the commercial situation expanded, and to-day there is no chance of failure, nor can it be said that much less than signal success will attend efforts to utilize commercial automobiles in every single instance in which merchants have goods enough to transport to an extent that would keep a hand-cart overburdened.

The old idea of using the automobile as an advertisement is a dead issue. There are now too many of them in use to enable any user to "stand out" as more enterprising than a hundred dozen of his equally prosperous competitors. To-day the commercial automobile is used because it will do more work, and more prompt work, than can be done in any other way. By more prompt work, it is to say, the given quantity of merchandise can be moved in less time. A canal boat will serve to transport goods by wholesale, only time is taken in the process. A railroad will transport the same bulk in far less time. It only pays to use the canal if time is no object. In a big store time is money, because the rent and the other charges are enormous, and they go on, measured only by the tick of the clock. With a canal boat, if the goods are not in immediate need, they are purchased on a low market, and the time taken in their transportation is an advantage, since storage charges will not have to be paid in the meantime. The low freight rate, coupled with the "free storage," renders canal methods especially desirable, which, however, represents a mode of procedure that is foreign to the merchant, whose customers want the goods they order the day they are ordered.

Comparison of Transportation Cost, Auto vs. Horse.

There has been a good deal of discussion in relation to the question of the relative cost of goods transportation, considering animal-drawn vehicles on the one hand and automobiles on the other. Much of the discussion was without good foundation in that the comparisons were not fairly presented. A biased advocate is bound to disregard the side he does not intend to represent, and he is prone to misrepresent the side he espouses. Such presentations are damaging to both sides of a case, and reliance must be placed on the good judgment of those who are the unwilling audience in such instances. In any event, the proof of the pudding is in the eating, as they say, and the merchants who sampled the commercial automobile must have liked the flavor, since the industry has grown and prospered.

Notwithstanding this growth, there is still much opposition to overcome, due in no small measure to the presence of "horsemen" in charge of the transportation of goods for merchants. They know all about horses; they like animals; their knowledge of the automobile would be great if they knew as much about them as they do about "spavins." This loyalty to the horse is commendable in the extreme. Loyalty is a virtue. When it fades away, or when merchants put automobiles in the hands of the men who will appreciate their needs and the conditions under which they will render the best service, then, and then only, will the records of costs be worth taking into account.

It will occasion no great alarm, even if these conditions do obtain to quite some extent, for two reasons at least. In the first place, if merchants really knew how thoroughly good automobiles are for the purpose of transporting goods they would not use horses at all, and the change would come so suddenly as to discommode the breeders of horses, and the wagon builders, whose investment would be destroyed. In the second place, the requisite number of skilled men in the automobile industry would be difficult, if not impossible, to provide.

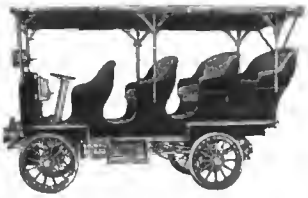
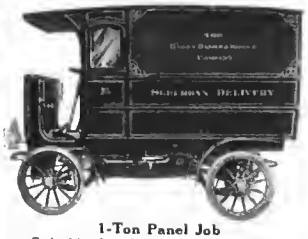
The Rapid Agency Proposition



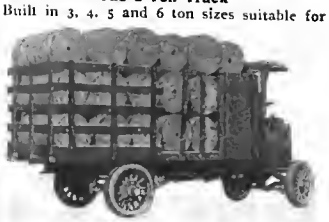
12-Passenger Pullman
For the profitable business of sight-seeing hotel work, summer and winter resort work, etc.

1-Ton Open Job
For all kinds of carting purposes.



1-Ton Panel Job
Suitable for dry goods and general delivery work.

The 5-Ton Truck
Built in 3, 4, 5 and 6 ton sizes suitable for



flour mills, breweries, lumber companies, coal companies and any line of business requiring a heavy-duty power wagon.

HERE is a proposition for the one best man in every city—for the broad-gauge business man or agent—a proposition full of opportunities—one which means more money for the agent during 1909 than ever in the past; namely, *representing* and *selling*

Rapid Commercial Power Wagons

We want agents—hustling business getters—men with financial backing—not chauffeurs or demonstrators—and to the one in each locality who secures the agency for **Rapid Commercial Power Wagons,** we will put behind him one of the greatest selling and advertising campaigns ever put behind any commercial power wagon proposition.

More money, more new plans, more legitimate aids will be given the agent for **Rapid Commercial Power Wagons** than ever before.

Write to-day for our agency proposition.

The Rapid Line for 1909

comprises models ranging from 1,000 pounds up to 6 tons, as follows: **Rapid Commercial Power Wagons** for *any line of business* in ½, 1, 1½, 2, 3, 4, 5 and 6-ton sizes.

Motive power: engines of the two-cylinder opposed 24 to 30-H.-P. type, up to four cylinders, 60-H.-P., vertical, heavy duty motors.

The **Rapid** line for 1909 offers the largest selection of models ever manufactured.

Therefore every user of one or more horses represents a prospective buyer of **Rapid Commercial Power Wagons.**

There are no theories represented in the Nineteen Hundred Nine **Rapid Commercial Power Wagons.** All mechanical and other details have been proved correct by over ten years of actual service in the hands of hundreds of users in oyer fifty different lines of business.

We have spent *over a quarter-million dollars* to bring **Rapid Commercial Power Wagons** up to their present state of perfection and efficiency.

The agent who handles **Rapid Commercial Power Wagons** will have a line that can back him up—a line that has "made good"—one that has met the requirements of commercial motor wagon practice, and needs no apologies.

A word about the **Rapid Motor Vehicle Company:** It is the largest and oldest in the commercial car business—and makes nothing but Rapid Commercial Power Wagons, which are **"BUILT FOR BUSINESS."**

The agent who "ties up" to our organization gets backing which means a great deal, not only in influence, but in protection and fair treatment; a factory which can stand back of its product with a guarantee that means just what it says and a factory which helps its agents in every way possible.

Just to remind you—write to-day.

See us at the New York, Boston and Chicago Shows.

We Are the Oldest Makers of Commercial Cars in the United States

We have been pioneers in all improvements and design. We have had the experience that must be had in order to build successful commercial cars. The many little kinks in the design and construction of our cars are results of practical operation, a development that overcomes all faults in commercial cars. Our cars have proven themselves; they have been in service for years and have always proved satisfactory.

Now isn't it better to come to us who know and have the **proven goods,** than 'tis to mix up in experiments, that may or may not be right?

We show a few types of our cars here. You will note that there is an element of fine finished design to all of them. While being strong and sturdy, they also carry a pleasing appearance.

In the matter of sight-seeing cars we have built more than any other manufacturers, simply because each last car has been a clean, satisfactory car in efficiency and operation.

We are making a six-cylinder truck that is pronounced by disinterested people as the finest thing of the kind in the world.

Our hotel Omnibuses have gained especial distinction because of their freedom from repair costs, and their reliable operation under any and all conditions.

We have executed the largest orders for commercial cars in the United States; orders where price was of secondary importance to quality. We have the facilities, we have the men, we have the disposition to make these cars better than any one else, and we are disposed to sell them at a reasonable price.

We shall be pleased to have your inquiries and correspondence. They shall have prompt attention.

THE AUTO-CAR EQUIPMENT CO., BUFFALO, N. Y.

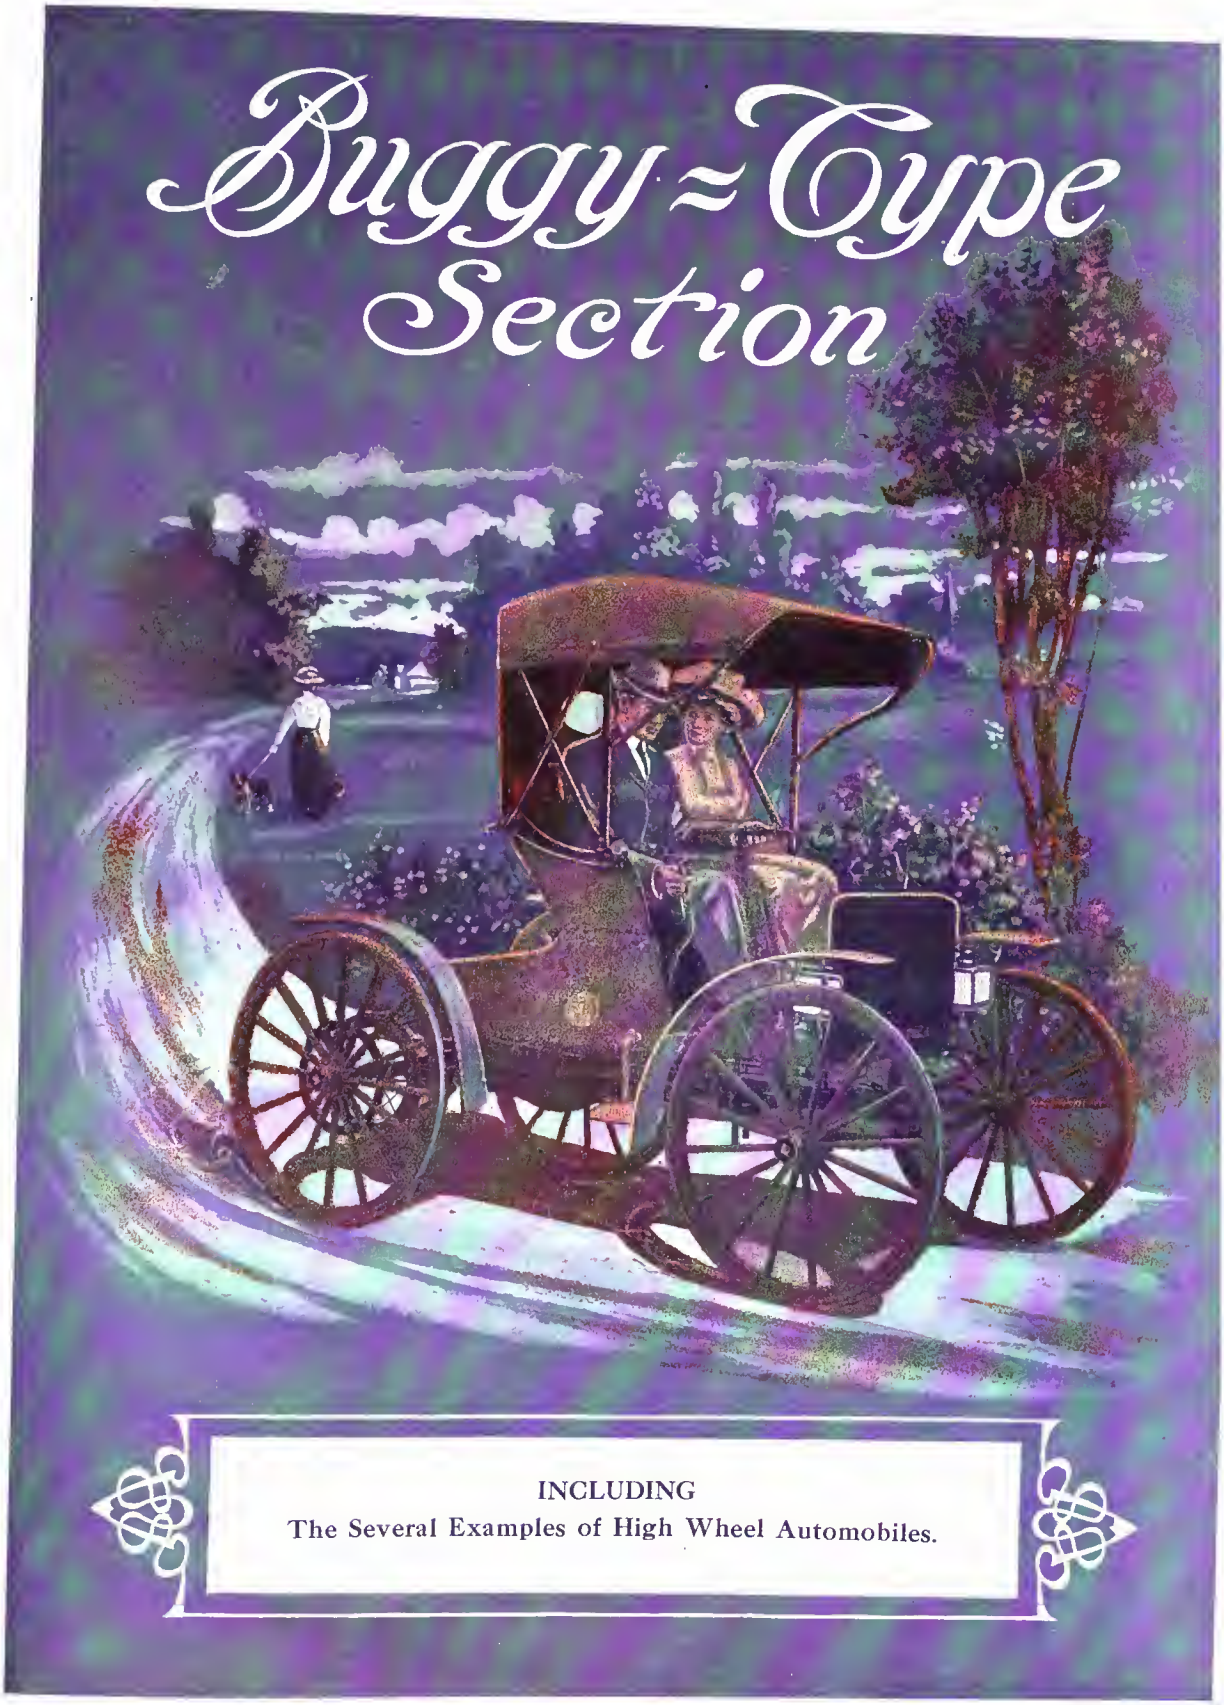
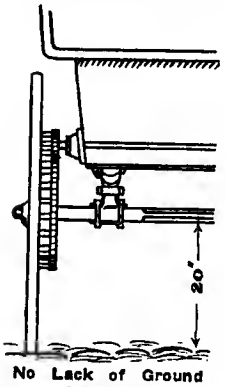
Buggy-Type Section



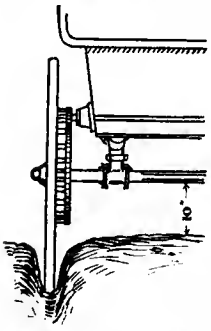
INCLUDING
The Several Examples of High Wheel Automobiles.

High Wheel Types of Automobiles

EARLIER examples of automobiles were, in point of general appearance, close in point of resemblance to animal-drawn vehicles of every kind. In the evolution of the car the pneumatic tires were found to be very desirable (having been tried out in bicycles), but the cost was found to be so very great as to debar the use of pneumatic tires with wheels of such diameter as were found on animal-drawn vehicles. Result: the diameter of the wheels was reduced to a point low enough to bring the cost of pneumatic tires to a commercial basis.



No Lack of Ground Clearance.

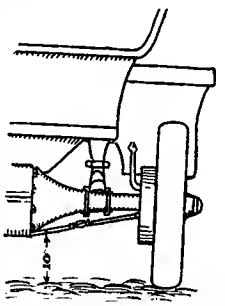


Makes Way in the Mud.

The automobile of to-day, then, is the evolution of the high-wheeler, primarily brought about because of the high cost of pneumatic tires. True, the automobiles were resolved into a distinct machine, involving a low center of gravity, a certain compactness, indicating high speed, great mobility, and all the other factors so well known, among which we must include reasonably good road beds. As the automobile developed along lines requiring good roads it was rendered more apparent every day that there was a legitimate zone of activity involving the high-wheel carriage type of mechanical car. When the high-wheeled vehicle made its re-appearance among the community there were many who regarded it as a mere adaptation of a horse-drawn vehicle for the sake of cheapness, independent of utility to any marked degree. Predictions of this sort were wide of the mark, since the designers of the high-wheeled vehicles had in view the negotiation of impassable roads (from the point of view of the automobile, with a low ground clearance) and they realized that the so-called buggy could make headway under conditions such as would be utterly impossible to any other type of vehicle. The mud roads of the Mississippi bottom developed types of vehicles peculiarly suited to roads in which, if there was a bottom, nothing ever seemed to reach it.

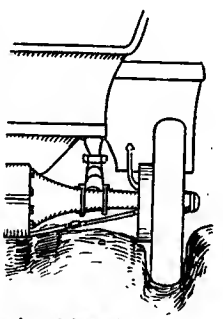
The advocates of the high-wheeled type of car were well experienced in relation to the road conditions, and they kept uppermost in mind the features of construction along lines consistent with the requirements. They could not well improve upon the general features of the conventional buggy, and they were wise in that they did not bow to the clamor of the "pack," who would be most pleased if the automobile were to resemble an "Atlantic" type of locomotive.

While it is true that the high wheel, with a view to increased ground clearance and with a certain symmetry of shape, renders it possible to negotiate bad roads, it is equally true that the long spokes render the wheels pronouncedly resilient, and were we to put this by way of a law, we would say that the desirable properties of the spokes would be proportional to the cube of their lengths. This is equal to saying that a high wheel with long spokes has many, if not all, of the properties of a pneumatic tire. If pneumatic tires are used on wheels of less diameter, it is because the wheels have not the requisite properties, and they must use a pneumatic tire; whereas, with the high-wheel types of cars, the resiliency that resides in the wheels renders it unnecessary, to a large degree, to add further resiliency by way of pneumatic tires.



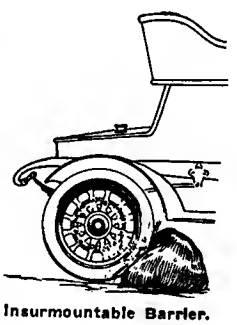
Usual Clearance of a Runabout.

There was a certain definite limit to this reason, but the high-wheel types of cars are confined within that limit, and their utility is by no means reduced to that involving country roads in bad condition. These cars do excellent work on other than bad roads; indeed, it seems almost unnecessary to point out that if they will serve on bad roads, there is nothing to prevent them from excelling if the road conditions are improved. There is a certain economy from the point of view of maintenance in taking advantage of the resiliency of the high wheel to the exclusion of costly pneumatic tires, and it is a fortunate circumstance that the solid tires work better with a limited section than they would on a more extended basis.

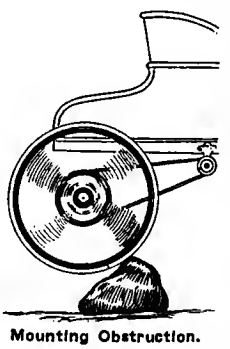


Lacks Adequate Ground Clearance.

Utility is the first consideration, and there is utility in the automobile on good roads, or the high-wheeled mechanical car on the roads not available for the standard types of automobiles. A thing is good if it looks good, and an automobile stuck in the mud does not look good, nor is it good. On the other hand, a high-wheeled type of car wading through that very mud does look good, and it is good. The incentive, then, is there; the car has its utility; it is cheap to build, because there is not so very much of it, and the builders of such cars are in a position to take advantage of the years of experience of the carriage makers.



Insurmountable Barrier.



Mounting Obstruction.

It is not to be supposed that the high-wheeled type of car will lend itself to enormous speed, nor can there be any good reason for wanting to go at racing speeds in cars that are designed to make reasonable headway on country roads. These cars are provided with 18 to 20 horsepower, as a general proposition, so that it cannot be said of them that they are inade-

quately provided with means of locomotion. Instead of being geared for high speed, they are geared to negotiate bad roads, which is a matter of considerable power and a high gear ratio. Even so, the average buggy-about will make 20 miles per hour on good roads, and under pressure it may do considerably better. This speed, in comparison with numerous runahouts of the past, compares very favorably, indeed, and for a doctor (for illustration) it is so much faster than anything possible with horses that the doctor will be justified in taking to the high-wheeler for good and all.

The Question of Tires.

It was pointed out how the automobile of the conventional type came to wheels of a small diameter (a matter of dollars). The high-wheel type of car became possible with the introduction of solid tires (ruhber), the cost of which was not so great as to limit the diameter of the wheels below the diameters customary with carriages. There are one or two points in relation to this phase of the question that will bear discussion, as, for illustration, the tires used on the high-wheeled types of cars are of quite small section, and it is possible that many critics will labor under the impression that this is a matter of dollars, too. But it is not. When solid tires are used they should be of the smallest possible section consistent with the fact that they will flatten out and elongate if the stresses exceed the ability of the rubber to sustain. If, on the other hand, the tires are of liberal section, the rubber will not be sufficiently stressed, and a bouncing effect, most disagreeable in its action, will be the result. When it comes to solid tires, then, the smallest possible section will be the best for use, because the car will stay on the ground, and perform smoothly within the limits bounded by its legitimate sphere of influence. There is just this difference (fundamentally) between the pneumatic tires on the one hand and the solid tides on the other: The pneumatic tires should be as large as possible, and the solid tires should be the reverse.

The Transmission System.

Whatever the difficulties are when it comes to gearing a gasoline motor at a high speed to the rear wheels of an automobile, the latter at a lower speed, these difficulties are much accentuated in connection with the high-wheel type of car, because of the fact that the wheel is of great diameter and one revolution of the wheel means a considerably greater distance on the road than will obtain from one revolution of an automobile wheel, the latter of comparatively small diameter.

In transmitting the power of the motor, involving the high-wheel type of car, devices have been taken advantage of that may not have looked quite so mysterious as are the devices in connection with conventional automobiles. There are, perhaps, a great many people who may have labored under the impression that the transmission devices to be seen on the buggy-about are merely so designed to avoid cost. They can disabuse themselves of the idea, and were they in the position of the designer of the high-wheeled type of car, they would be subject to the same stress of circumstances, and they would have to bow to the same existing conditions. The difficulties are extreme, and the wonder is that the details of the transmission were so nicely worked out in so short a time, and that they worked out so well. While in some isolated instances the details of the transmission are in process of evolution, with strong hopes of evolving means of far more than ordinary merit, the fact remains that the industry on the whole is crystallized, and the patrons who require high-wheeled vehicles were well considered during the process of designing.

Body Work as It Relates to High Wheel Types.

The experience of a century of carriage building is worth something and that the result of this experience still clings to the cars of the subject is to be expected. Naturally there were influences to he considered such as would hring the cars up to date and to the requisite extent allow for the presence of machinery. That the machinery naturally would have to be taken into account is not to be lightly thrust aside, but it was a process that did not result in destroying the fine points in bodymaking as they relate to the buggy type of automobile. In the high-wheel types it is necessary to have strength, but it is also important to eliminate weight. Indeed, if it is important to keep the weight down in automobiles in general, it is of far greater importance to depress the weight in this type.

Experience has taught the builders of this type of cars how to retain strength and at the same time avoid weight, which condition is contrary to the general expectatlon, from the point of view of the design of structures. In general it is the custom to expect weight if great strength is to he a factor. Under these conditions it will he a mistake to assume that the buggy body is used because it is low priced or for any other commercial reason, not taking into account the consideration involving appropriateness as the first requisite. In this service the several types of bodies are used just as in the automobile in general, in which room is afforded for from two to seven passengers, and space is included for the storage of tools or whatnot.

Some General Considerations.

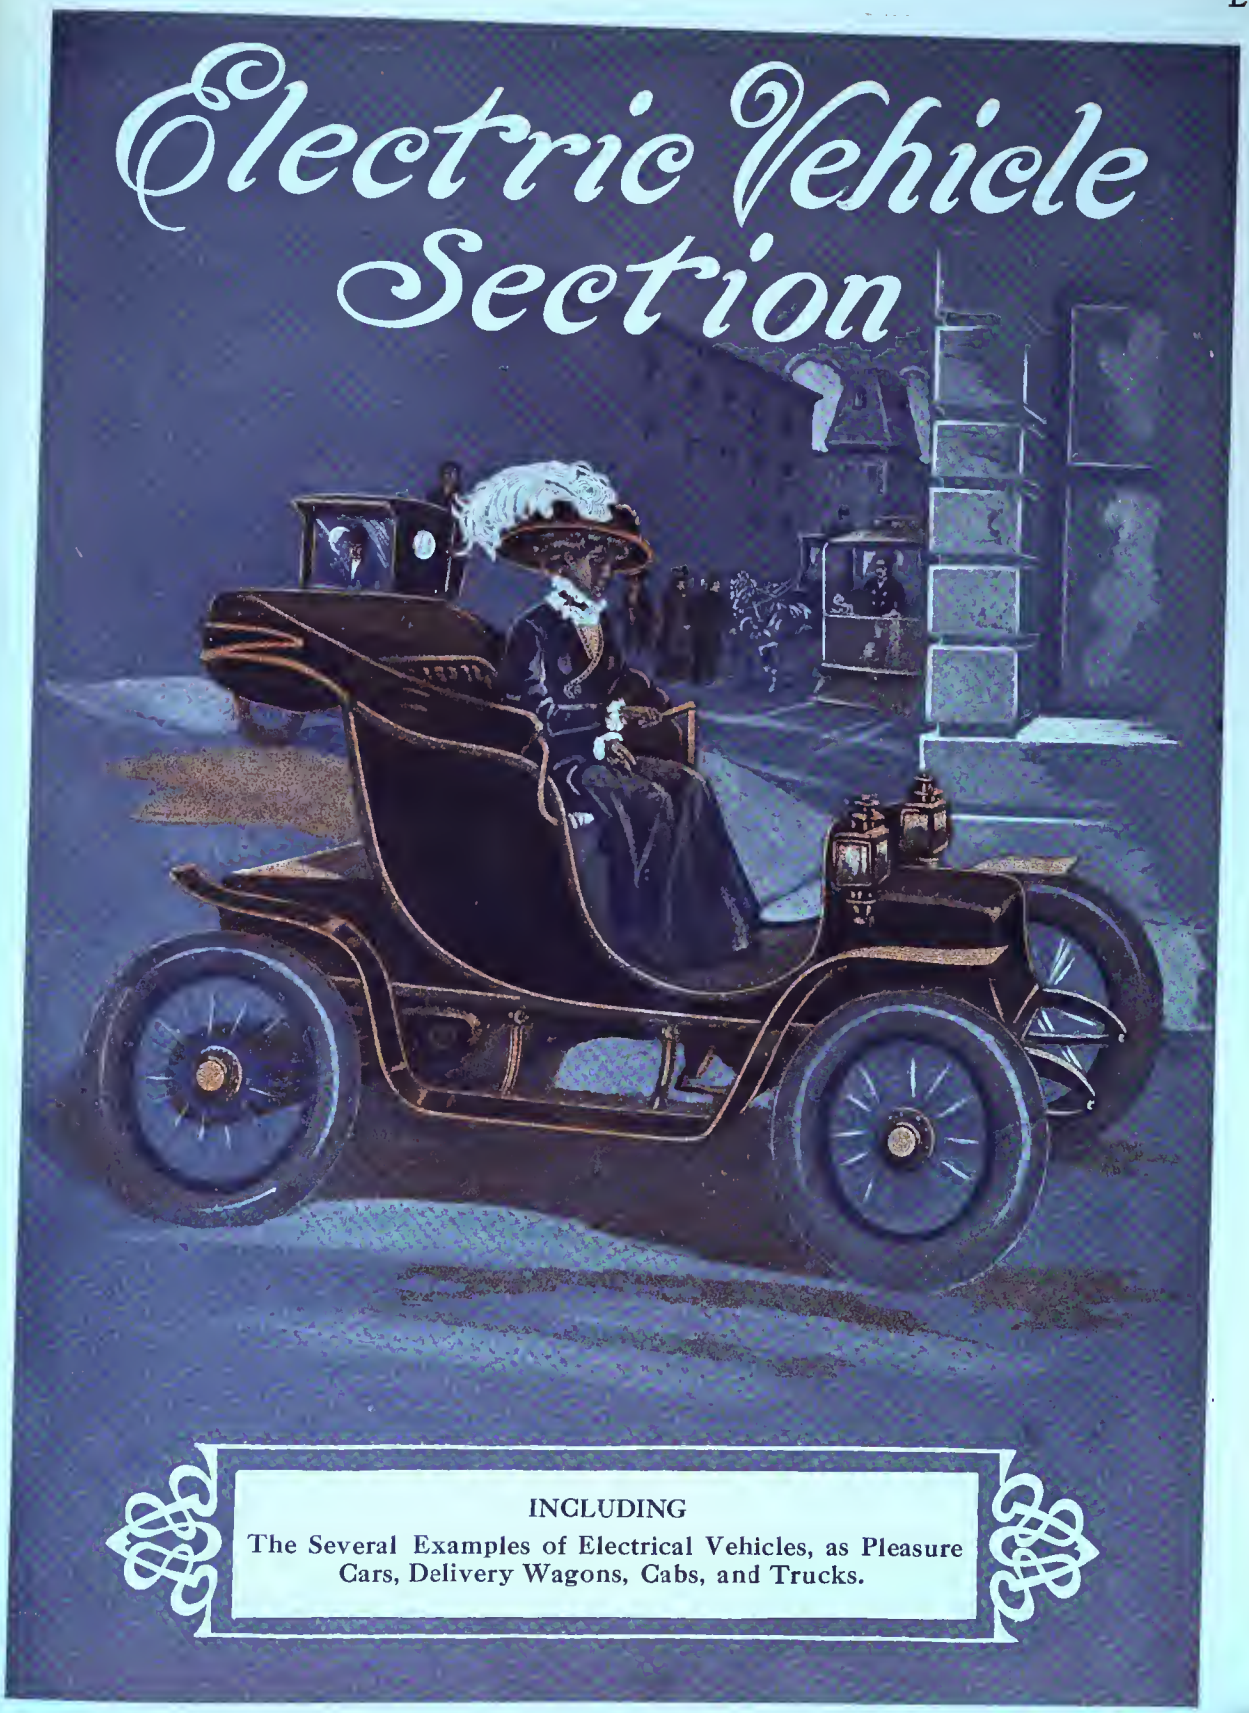
Simplicity in a high-wheel car should be as natural as a duck in a mill pond. This same simplicity augurs for the entire absence of every possihle device for whatever purpose that will not defeat the operation of the car. In this field the air-cooled motor makes it possible to eliminate the radiator, the water pump, and the piping. But if a water-cooled motor is preferred, then the thermo-syphon system of water circulation (the natural water system) renders unnecessary the use of a water circulating pump and such complication as will result from its use. When it comes to the ignition system, it is highly improbahle that a magneto will be necessary, because the motors used are adequate in point of power, without having to squeeze the last drop out of them. It is even possible that an ordinary kick-coil would well serve the purpose, and hy its use do away with the vibrator, which does seem to trouble a great many people with periodic frequency. If the ordinary kick-coil (known in modern and more elegant language as a step-up transformer) will serve on cars of some pretence, costing vastly more than the high-wheel type of cars, it is not too much to say they will prove decidedly advantageous on the cars in which extreme simplicity is worth paying extra for The trend is in the direction of this extreme simplicity and the builders of these cars are staying awake o' nights inventing simplicity instead of complications.

Taking Into Account the Cost of Maintenance.

The first cost of the high-wheel car is low. Interest on the investment is low. Repair parts can be had at low cost. The tire situation is healthy. The utility of the car is assured. These five statements are as a word picture that tells the whole tale to the man who may have had anything to do with the subject at all. It is nothing short of utility that demands just what the high-wheel car affords. It is all very well to own and run a pleasure car of the conventional type under pleasurable conditions, but it is not all right to try to do the work of a buggy type with anything else but a buggy. Cost must be taken into account in the long run, and there are a horde of users of cars at the present time who find in the huggy type the very car they require. This is a fortunate circumstance, in which the low cost of the buggy type, coupled with its naturally low cost of upkeep, are fitting factors.

From the fuel point of view the huggy type has always stood out as all that can possihly he desired by conservative man. In spite of this fact the available power is adequate, in which the power for weight is at least up to general practice. In hill climbing the huggy type has done so well that it surprised the average autoist, who, in his egotistical way, failed to keep abreast of the times. He failed to note, for illustration, that the first automohile in which the motor is arranged to deliver power direct to the rear road wheels is of the very type he was so prone to despise. He failed to take into account the fact that the reason his wheels were not high was because he had not the inclination to pay the price to procure them.

Electric Vehicle Section



INCLUDING

The Several Examples of Electrical Vehicles, as Pleasure Cars, Delivery Wagons, Cabs, and Trucks.

CONCOMITANT with the advances in electrical vehicles were the improvements wrought in storage batteries. The success of the electrical vehicle depends almost exclusively upon the obtainable success of the battery. The question of the chassis was settled in common for the several modes of automobiles. The electrical motors as used in vehicles of this class were refined in connection with street railway and other work. In the early days, before the perfection of the chassis and the details of the electrical system, the problems were more diverse in their characteristics and far more difficult to solve.

The tire problem was more acute in connection with electrical vehicles, because the weight of the battery mounted up to a considerable figure. In some of the carlier types of trucks it was not uncommon to observe a weight of two tons in the battery alone. Gradual advances in battery construction resulted in a very material reduction in the total weight, and this reduction, in view of improvement wrought in tires, resulted in the elimination of what was long termed "impossibilities" in connection with electrical vehicles. True, there remains what is called the tire problem, but it has been reduced to a commercial basis, in that the electrical automobiles do so much and such good work as to earn excellent returns on the investment, besides settling for tires and the remaining costs.

In the early days of the electrical automobile the facilities for charging the batteries were so crude as to be indescribable. A battery follows very well-known, and fixed, chemical laws; it must be manipulated by a man who appreciates the significance of these laws, and every violation of any one of them carries with it a penalty. There was a time when experts in this line worked continuously with the idea of evolving types of battery, less in point of weight on the one hand, and of greater stability on the other. In the long run reliance was placed on the batteries as they are to-day, and when it was found that relief was to come by way of more careful attention to details, rather than through the good office of some revolutionary invention, things looked up a bit and the batteries thrived.

Carrying Capacity of Electrical Vehicles.

As a general proposition an electrical automobile will carry the equal of its own weight. The motor equipment is of such a character as to deliver the requisite torque under the most severe conditions of service. An electrical delivery automobile, then, will make headway on bad roads, up steep grades and in deep snow. They are not vehicles for speed, and while they are relatively slow, they are sure. Because of this reliability, electrical vehicles lend themselves to commercial work, especially to heavy short hauls, and if they are used continuously, as they should be, the batteries will serve best and earn for the owner of the car in every case the price of a new battery, plus a fair return, ere the battery wears out.

Electrical Pleasure Automobiles.

There is nothing that looks more pleasing than a little "piano box" type of electrical runabout, picking its way through busy streets or on boulevards with a lady at the lever. These little cars are perfectly simple to manage; they obtain a speed of from 12 to 18 miles an hour and they rarely ever get out of order if the batteries are managed by persons of fair skill. These cars can be handled by almost any one at all and in connection with other automobiles in a well-equipped private garage they are extremely useful. There are other types of electrical automobiles that are well worth mentioning as, for illustration, town cars as broughams, victorias, landaulets and a type of cabriolet.

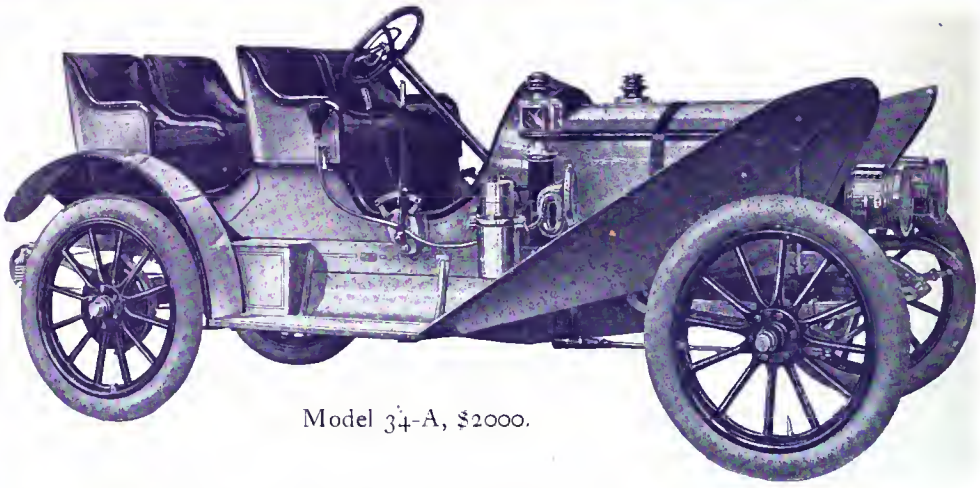
In the Service of a Busy Practitioner.

Medical doctors, in their practice, especially in the winter time, particularly appreciate comfortable and sure means of transportation. The first year that the brougham type of electrical automobile was introduced in the City of New York seventy-two doctors adopted this type of car for use in their service. Some of them complained that the cost was rather high, but none of them made complaint because their radius of travel was increased and their zone of activity brought them better returns. In the long run they tired of complaining, but they stuck to the brougham and, from all accounts, the quality of the service was improved from year to year until to-day it represents much of all there is of sturdy, reliable service and comfort in the extreme without defeating stability.

Wide Range of Uses Outside of Professional Zone.

In private service the electric vehicle may be in divers forms. From the little car with the "piano-box" body to the most luxurious type of town car is a long way, and space forbids a detailed discussion. Moreover, the subject is well threshed out. Even so, it may not be far fetched to say a word or two by way of calling attention to the fact that in various ways consistent with the well-known abilities of the "electric" the service has been on the increase to a very great extent. From early morning to late at night the cars of this class can remain in constant service, beginning with the safe and comfortable delivery of the master of the house to his office in the morning, by which time madam will command the attention of the car for a shopping expedition. In the afternoon the same car will be available for calls or a roll on the "boulevard," unless it is that some special function intervenes. In the opera season the car will be in much demand, in which service it has long riveted the attention of autoists. The time was when the service that a battery would render did not permit of a schedule such as this. That time is past; the batteries now embody the requisite qualities, which was very adequately proven recently, when a car of this class made a touring trip from Colorado to New York, under its own power, over roads such as were long looked upon as entangling propositions for even pretentious touring cars.

Facilities for Charging.—In the early days the question of charging the batteries was so formidable as to retard progress. This phase of the subject made enormous strides until to-day batteries can be charged in garages in every hamlet in the land and in dozens of stations in the large centers. These battery charging stations are beehives of industry.



Model 34-A, $2000.

A BIG RAMBLER YEAR

Dealers who have shared the Rambler success of the past year—a big Rambler year—know of the absolute satisfaction the new Ramblers have given.

No other make at anywhere near Rambler prices approaches the Rambler in quality and exclusive features. The line to be exhibited at the Rambler show, 38-40 W. 62nd St., New York, includes some new models never before shown. These will interest every live dealer in open territory.

Rambler

The Car with the Offset Crank Shaft

Have you seen the Rambler Spare Wheel operated? Call at the Rambler show and we will demonstrate to you how it can be substituted for the regular wheel within three minutes.

During all New York shows Ramblers will be shown and demonstrated at the new Rambler Branch, 38-40 W. 62nd Street, New York. Telephone Columbus 4511; give your address and we will call for you.

Thomas B. Jeffery & Company

Main Office and Factory, Kenosha, Wis.

Utility of the Runabout

WITH the final separation of the runabout from the light touring car, the runabout as a type stands alone, and is limited in its application to just the service it was originally intended to satisfy. This is fortunate for the runabout, because its reputation has sustained severe injury in every case in which the little car has been compelled to "tote" a tonneau.

In a way, the extra service imposed upon the runabout types has augured for advancement in that the wheelbase and other essential dimensions were increased from time to time, in the evolution of the runabout, in the direction of the ligbt touring car. The wheelbase should be more than it was in earlier times, because easy riding qualities do not abound in conjunction with speed and a contracted wheelbase, although it is true for every wheelbase lengths there are limits of speed wherewith the car will perform satisfactorily.

It is not now uncommon to find runabout types of cars with even four-cylinder motors rated at approximately 20-horsepower, while double opposed motors of from 15 to 20-horsepower are common, and the single cylinder motors are designed to be from 10 to 14-horsepower, so that tbe power available in nearly every single instance indicates that the wheelbase should be long. Fortunately, for the patrons of the industry, designers have not been stingy in this direction.

The earlier examples of runabout types of cars were designed with a wheelbase even as low as 60 inches, wbile to-day it is not uncommon to observe cars in which the dimension referred to even exceeds 90 inches. There is all the difference in the world in the performance of a car with a 90-inch wheelbase as against the performance of a car with even 80-inch wheelbase, and when it comes to the performance of a car with a 60-inch wheelbase, the speed is absolutely limited to a point far below that at present attainable.

Relations of Speed, Weight, and Power.

If a car is too light, it will be limited in speed in considering easy riding qualities, because it will not stay on the ground. On the other hand, if a car is too heavy, considering the power of the motor, it will not attain speed. There is a very intimate relation, all things considered, between the power of the motor, the weight of the car, and the obtainable speed. To reflect the entire situation, it will be necessary to call attention to the fact that the attainable speed is a matter involving the diameter of the wheels as well.

The more recent products come very close to perfection in these respects, and designers are alive to the fact that it is useless to add power without affording the conditions essential to the utilization of the same. The same designers learned that it is futile to add weight if the addition is in the vertical plane instead of through the good office of a lengthened wheelbase, and they fully realize that the weight of an automobile should be measured in pounds per foot of lengtb, which is not to deny that fully 60 per cent. of the total weight should be concentrated at the point of contact of the driving wheels.

The Transmission and Means of Control.

It is in the runabout type of car that the planetary gear is in its right element. It is sometimes said of the planetary gear that it is "fool proof." This appelation is not only crude, but it fails to represent the splendid qualities of the planetary type of gear. Among the noteworthy virtues of this type of gear will be recorded its absence of any considerable weight in pounds, the small space it occupies, and the fact that it can be stowed away in a more or less obscure situation, because it is completely housed in and there is no occasion for getting at it while it is in working order, nor would it be an advantage to be able to get at it were it out of order. The planetary type of gear has all the virtues of a chronometer. When it works, which it does for a long time, it requires no attention whatsoever, unless to keep the cavity more or less full of oil, and when it wears out, to replace it is the natural thing to do. This type of gear is much used on the runabouts at the present time, and it is even used on some touring cars, which is an indication of its ability quite in excess of the needs in so far as the runabout type of car is concerned.

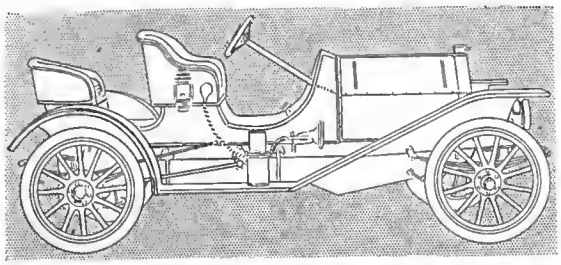
This type of gear gives two speeds and reverse. In the high speed, the gears and pinions remain still, and the whole unit revolves. The gears thus locked are noiseless; equally it is true, they are subjected to no actual wear at all. The cars are light enougb considering the power of the motors, so that it is a very bad road indeed requiring the use of the low gear. The control is so perfectly simple, and so free from any complication, such as would make it possible for the system to get out of order, that it is easy enough to account for the appelation of "fool proof."

The runabouts are not all of the shaft-drive genera, although the shaft drive is more predominate in connection with runabouts than it is with cars of more power. The length of the propeller shaft is invariably a maximum, because the planetary gear is short, and the motor, too, takes up a very little of the available longitudinal distance. Even if sliding gears are used, to which there can be no possible objection (on the ground that they even work in the very largest types of cars), they will not take up a great length in the runabout types, because they do not have to be designed to transmit a large amount of power. It is a matter of expediency, as between the two types of gears, the shaft or the chain drive, the live rear axle or not. Each of the types are represented and merit resides in the cars of the respective methods of construction.

The Utilization of Space.

If the motor is under the bonnet in front, and the front line of the cooler is even with the center of the front axle, which is true in most of the cases, the front edge of the seat comes about 48 inches back of the center line of the axle. Considering the proper depth of the seat and depending upon the wheelbase, the free space back of the seat approximates 30 inches. This space can either be used in connection with a rumble seat, or it affords a very roomy platform or place for a box of light construction for any utility purpose. The rumble seat is much in vogue at the present time. It is positively a great advantage to have one, and if the gasoline tank is located elsewhere, a space under the rumble seat becomes at once available for a tool box.

In the past very little attention was given to the utilization of the available space; in many cases it was even difficult to find a place in which to store such tools and accessories as positively must be taken along with the car. In the best examples of the



Typical Roadster Type That Has Won Popularity.

runabout type of cars to be seen to-day the small details are adequately cared for and the cars of the type under discussion will serve many useful purposes. They become the ideal doctor's rig, increasing the radius of practice, assuring ability to keep appointments, and they perform the service at a cost below that of the horse-drawn carriage.

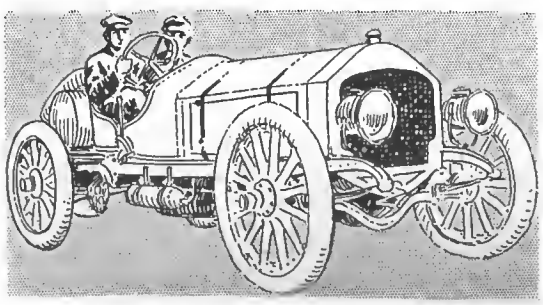
The Fuel Consumption.

The best types of single cylinder runabouts will make from 20 to 30 miles on a gallon of gasoline, and the quantity of lubricating oil required per mile is almost negligible. Increasing the number of cylinders seems to have the effect of increasing the fuel consumption for a given travel, the reason for which lies very largely in the fact that with increasing power the obtainable speed is greater, and reasonable autoists must expect to pay for a little more fuel if they attain a considerable increase in speed. Under certain conditions it is economical to use more gasoline, because with increasing speed more distance can be covered, which is an advantage that can be measured in dollars. When the advantage in dollars considerably exceeds the cost of the increased fuel, it is high time to fix the conditions requiring the increased fuel.

In some of the earlier examples involving the double opposed motor, the fuel consumption was augmented through the imperfection due to the use of a carbureter for each cylinder. This defect, like a great many other minor imperfections, has disappeared, and in the most up-to-date type of these cars as seen to-day a further fuel economy may be anticipated because of improvements in the ignition system.

The Spring Suspension.

The runabout types of cars with the positively short wheelbase were rendered easy riding through the use of "concord" (buckboard) types of springs, but with increasing length of the wheelbase the concord types of springs were abandoned, in view of the difficulties involved resulting in sagging on an unequal basis. It took some little time to design half elliptical and even full elliptical springs, such as would afford a certain suppleness of action without coming down on the axles. Like everything else, it as a problem that has been fairly solved, and the spring action of the runabout types of cars is up to a fairly high standard at the present time. Referring to springs in the "roadster" types of cars, it is to note practices more nearly in accord with the spring suspensions as they obtain in touring car work. As a general rule, the roadsters are of the high power class and the body weighs more than in runabouts; the result is the springs have to be wider, have more leaves (plates) and the length of the springs are greater. When roadsters are merely runabouts with roadster bodies, then, of course, the springs do not undergo change. Probably the greatest advance in relation to springs is in the use of much finer materials for the purpose than any before known, in or out of the automobile zone of activity. The old idea of high carbon steel has been superseded by products in which the carbon content is relatively low.

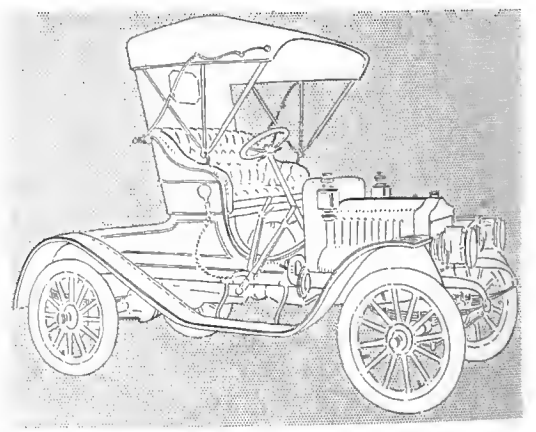


High Powered Type of Roadster—a Fast Goer.

The Body Work.

It is pleasing to note that the bodies of the runabout types of cars are now on a high plane. It finally became a recognized fact that the runabout types of cars filled a niche on a utility basis, and that they were more for utility than they were for pleasure. Under such conditions, the bodies have to stand more washing, the cars are more likely to be out in inclement weather, and the cheaply constructed wooden affair would scarcely serve for any length of time with such arduous work.

The new types of bodies have a certain straight line effect that is positively agreeable in contrast with some of the earlier phantasies, and if they are made of wood they are put together in a definite way, rather to the exclusion of glue and putty. Many of them are made of metal, and on the whole they will stand inclement weather, the washing, and the service. Another point in relation to the finish: the idea of the high carriage finish is a little out of place on a runabout, and a very sensible practice of using a fine grade of paint made of lead with a little zinc and pure oil, colored to suit, is taking the place of an expensive carriage finish, and properly so. The finish on the latter-day cars has the virtue of costing very much less, of looking better in the long run (service considered), and the paint acts as a preservative for the body, preventing the wood from checking and the iron from rusting.



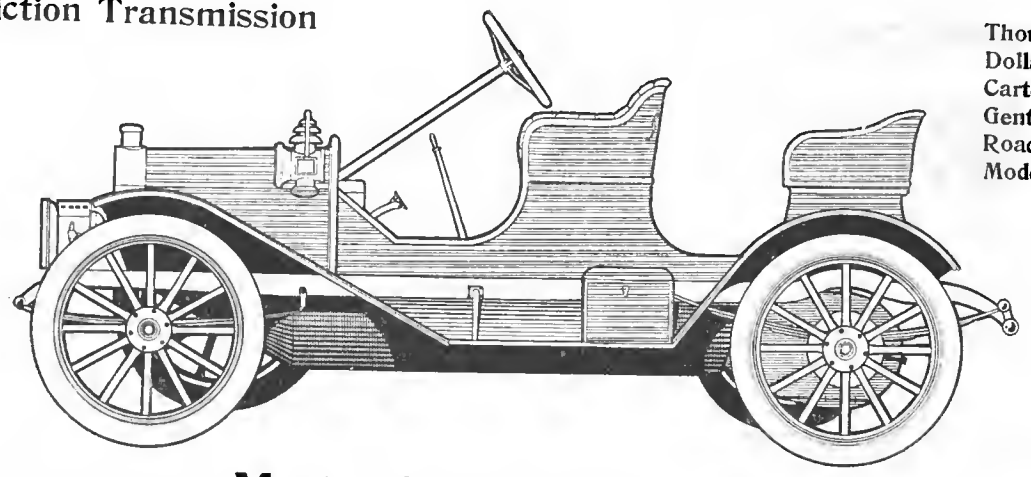
Doctor's Runabout—a Type Popular with Physicians.

The Last Word.

In a hundred ways, the details of the runabout types of cars are on a far higher plane than they were before. A reflection of the trend of the runabout industry would seem to indicate that it will be one of the largest and most important branches of the automobile trade in the not far distant future. These cars are economical to maintain, they are speedy enough, they are a utility proposition in divers ways. No matter how many big automobiles an autoist may have in his garage, he cannot afford to be without a runabout any more than a battleship fleet can afford to be without torpedo boats. The runabout types of cars are, as it were, the "mosquito fleet" of the automobile squadron, and they are just as necessary (because of their nimbleness and utility) as any of the other cars.

Friction Transmission

Thousand Dollar Cartercar Gentlemen's Roadster Model "H"



Become a Motorist Without a Motorist's Troubles

Many have come to believe that "troubles" are a necessary part of motoring—

The thorns that come with roses.

Their experiences have never been different.

The clutch — the geared transmission — the universal joints—the bevel gears—the water pump—all have come in for their share of "trouble."

The Cartercar eliminates troubles by doing away with the troublesome parts with its Friction Transmission.

It is a simple car—so simple, indeed, that there is hardly anything to get out of repair.

It has no clutch to slip—

No gears to strip—

No grease packings to renew—

No water pump to clog—

No noise to annoy—

And only one control lever.

If you have driven other automobiles you will better appreciate what this means.

The Cartercar has a thousand speeds. You can travel from zero up to forty miles per hour.

You can follow a loaded truck on a crowded street without danger of stalling the motor, or speed to your heart's content.

The Cartercar will travel any road any automobile will travel and many that others will not.

It will climb a 50 per cent. grade with a full load.

With our patented aluminum housing the chain runs in a bath of heavy oil, protected from dust and dirt.

It makes it absolutely noiseless, and in connection with our Friction Transmission, is the smoothest running drive yet invented.

The fundamental principles in the Cartercar have always remained the same. Changes have been of a refining and modernizing nature.

It is not an experiment nor the untried product of an overconfident engineer.

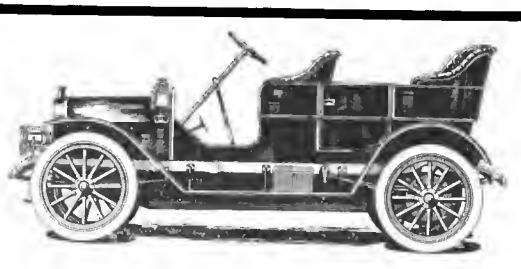
The Cartercar is a high-grade, practical automobile of the finest type.

If you are already an automobiliist—if you are about to become one—Be a Motorist Without a Motorist's Troubles.

Agents who have sold the Cartercar year after year to their nearest friends will tell you about it.

They will tell you of those who have driven over 4,000 miles and have spent only $3.00 for repairs—of 4,500 mile trips without even tire trouble—of 7,000 miles in six months for less than $100.00—and of boys who take all the care of the cars in their father's garage.

Write and we will give you the nearest agent's name and forward literature about our Model "C" Delivery Car, Model "E" folding Tonneau, Model "G" Roadster, Model "H" Thousand-Dollar-Runabout or Model "K" five-passenger Touring Car, Taxicabs, Coupes and Landaulets.



New Model "K" 5 Passenger Touring Car, $1350

It is a beautiful, high grade car with handsome lines conforming with the latest ideas of comfort and class.

A strictly family car for city use or extended touring. It is light in weight, roomy, and the easiest riding car ever produced.

It has our simplified, double-opposed 22-24 horsepower motor.

Carbureter, commutator, etc., easy to reach and adjust.

Lubricator under the hood over motor, avoiding dirt and grease.

Carter patented Friction Transmission, one lever control, noiseless chain drive in dust and oil-tight aluminum housing.

Pressed steel frame of arched pattern giving great spring action.

Long, easy riding springs.

Large, quick detachable tires, 32 x 3½ inches.

A wheel base of 103 inches.

Equipped with three oil lamps, horn, mats, complete set of tools, and tire repair outfit.

Price, $1350, f.o.b. Pontiac.

See us at the Grand Central Palace Show, New York, December 31 to January 7.

Chicago Automobile Show, February 6 to 13.

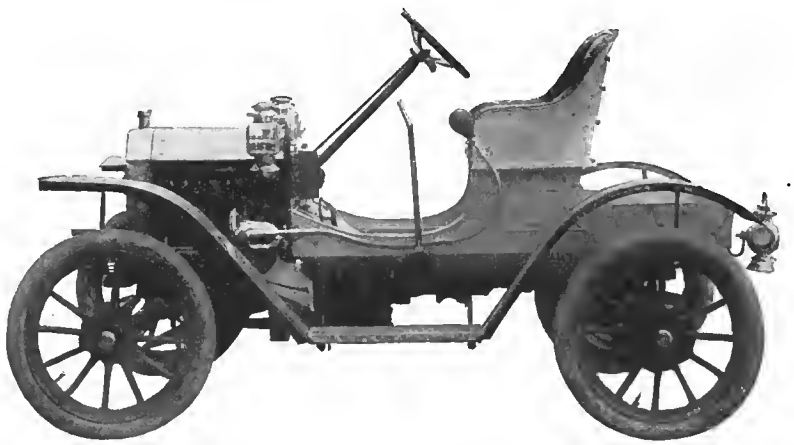
BRUSH RUNABOUT



Model B
$500
$550

Delivery Wagon
$600

See us at the Palace Show, New York, Dec. 31-Jan. 6

In a certain Michigan town of 1200 inhabitants a live business man took the Brush Runabout agency last August. So far we have shipped him 12 cars and have (at this writing) his order for another carload of 6.

A Western dealer contracted 100 cars for his town for the balance of this Fall and all of next season. Up to December 15 we had shipped him four carloads of 10 each, or 40 cars, with more on order.

Another dealer has taken 60 cars since September.

A small car is a much harder engineering and manufacturing problem than a big car. We have been through the mill. Since the start there have been four years of effort put on the Brush Runabout—one year of experiments, one of designing and testing, one of manufacturing organization and public tryout and one of general use.

It is no dream or hope. We need no dogs to try it on.

The car is right because people who drive it find it so. The price is not going up nor the quality down, because we KNOW our costs, basing that knowledge on actual past experience in quantity production of THIS CAR. We CAN AFFORD to make every piece in it good. The car sells. Note we don't say "will sell." IT IS SELLING. The profit STICKS TO THE DEALER because he doesn't have to spend it all in free repairs.

Do YOU want territory on it? Some of the most prominent dealers are selling it. It is the BUSINESS MAN we wish to tie up to.

BRUSH RUNABOUT COMPANY, Detroit

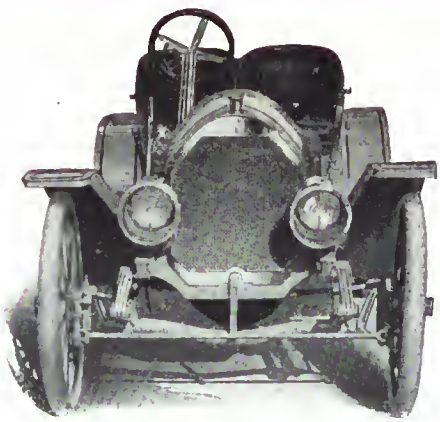
PETREL

PETREL "6" ROADSTER $2,500.00

Motor—6-cylinder, 4¾x4¾.
Ignition—Double, with U & H Magneto, with self-starting attachment.
Cooling—Water Centrifugal Pump.
Drive—Waite Friction, Double Chain.
Frame—Pressed Steel.
Wheels—Salisbury Artillery.
Tires—36x4.
Gasoline—Tank Capacity, 20 gallons, Gravity Feed.
Upholstery—Plain Imported Patent Leather.
Wheel Base—116".
Standard Color—English Violet with Black and Gold Striping. Piano Finish.
Equipment—Full set Electric Lamps with special 6-80 battery, 50-hour capacity; Horn, Speedometer, Tool Kit, Trunk with two suit cases.
PETREL "6" TOURING CAR—Same specifications with 5-passenger body, no trunk, $2,500.00.



PETREL "4" ROADSTER $1,350.00

Motor—4-cylinder, 4¾x4¾.
Ignition—Battery and coil, Jump Spark.
Drive—Waite Friction, Double Chain.
Frame—Pressed Steel.
Wheels—Salisbury Artillery.
Tires—32x3½.
Gasoline—Tank Capacity, 20 gallons, Gravity Feed.
Upholstery—Plain Imported Patent Leather.
Wheel Base—106".
Standard Color—English Violet, with Black and Gold Striping.
Equipment—Full set Lamps, Horn, Trunk with two suit cases.
"PETREL 4" TOURING CAR—Same specifications, with 5-passenger body, 115" wheel base. No trunk, $1,500.00.

"Petrels" are Silent, Sure, Swift. Get There. Look and Sound Well While They Do It.

PETREL MOTOR CAR CO., Kenosha, Wis.

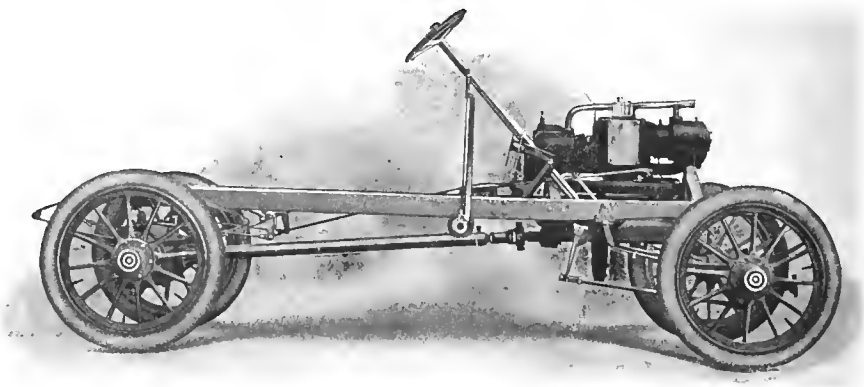
THE GYROSCOPE CAR

The Simplest Automobile in the World

After the initial cost of a car, the possibility of extending and repeating sales depends most on the upkeep.

The Gyroscope Car Has the Lowest Cost of Upkeep of Any Car on the Market

AN IDEAL CAR FOR PHYSICIANS



THE GYROSCOPE CAR HAS

No Clutch. No Change Speed Gear. No Crank. Starts from the Seat. Horizontal Fly Wheel, giving Gyroscopic Stability in Running. No Skidding. Takes Turns at Any Speed. Friction Drive. Absolute Control. 16 H. P. 35 Miles per Hour.

Runabout, $750. Tourabout, $800. Touring Car, $850. Taxicab, $1250.

GYROSCOPE AUTOMOBILE COMPANY (Inc.)

GENERAL SELLING AGENTS AND DISTRIBUTORS

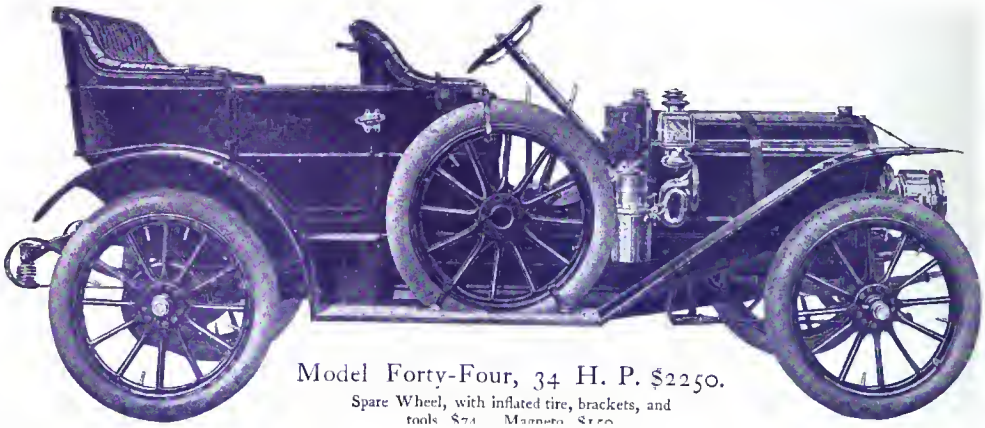
Touring Car Section

INCLUDING

Light and Standard Designs, in Shaft and Side-Chain Drives.



Model Forty-Four, 34 H. P. $2250.

Spare Wheel, with inflated tire, brackets, and tools, $74. Magneto, $150.

Some Features of Touring Cars.

FORMERLY it was taken for granted that an automobile seating more than two passengers constituted the essentials of a touring car. No attention was paid to the question of the power plant, the strength of the *chassis*, or the accommodations for passengers beyond the seating capacity. It was not uncommon to note a single-cylinder motor mounted in a light frame, on wheels of small diameter, with a body for five passengers weighing more than all the rest of the car combined.

The present trend of the industry is in the direction of the harmonious relation of the *chassis*, power plant, and the line of markation between strictly runabout types and touring cars The runabout types are highly developed, specialized cars, serving definite ends, and are of sufficient importance to entitle them to a separate discussion.

Light Touring Cars.

Instead of overburdened runabouts, we have to-day light touring cars, differing from the standard touring products only in that they are equipped with motors less powerful and fitted out with bodies to seat five passengers. The light touring cars of the present time are more commodious by far than the imported creations of two or three years ago, masquerading as touring cars and all the rage. These light touring cars, in some cases, have a wheelbase of 110 inches, seat five passengers comfortably, and are superior in every way to anything by way of a touring car of two or three years ago. The relation of the ability of the power plant to the total weight is nicely adjusted in that the motors are of the four-cylinder conventional types rated at from 20 to 30 horsepower, as a rule. The total weight of these cars is well within a gross ton, in the most severe examples, and with increasing weight it is customary to increase the power of the motor, holding in nearly every case to the ratio represented by at least one horsepower to one hundred pounds of total weight. These same light touring cars are provided with wheels of more liberal diameter than were wheels heretofore, and it will not be out of place to state that increasing the diameter of the wheels within certain limits is equal to increasing the power of the motor.

While it is true that the shaft drive is very predominate in light touring cars as they obtain to-day, this is not to be construed as indicating any stricture on the side-chain ability, since in all truth, both methods are well represented in the cars of the subject and both methods are competent. In the cases involving the side-chain drive it is not necessary to take into account the angularity, and a point to be made here is that in the shaft-drive cars of the present time the propeller shaft is long and the angularity of the drive is substantially zero under normal conditions of operation.

The universal joint is in every case protected from dust, and in nearly every case provision is made for lubrication, so that the old strictures in relation to this phase of the type of touring car in question have lost their potency. The machinery in all its details is open to inspection, and arranged in such a way as to afford ready access in case of the need of road repairs. This phase of the situation is pleasantly unusual, because there was a time in connection with the light car when to get at any of the adjustments was extremely difficult, if not impossible.

The light touring car has taken on the dignity of an individuality all its own; it bears no relation to its old prototype, and is in no sense a runabout, but, broadly speaking, it is a five-passenger touring car of standard characteristics, differing in no wise from the more pretentious touring cars, excepting that it is lighter, has less need of power, hence a smaller motor, and is geared to speed at about two-thirds of the speed of the larger types of touring cars.

Standard Touring Cars.

If the new crop of light touring cars may be regarded as roomy five-passenger cars, weighing less than a gross ton in almost every case, and equipped with motors capable of delivering at least a horsepower per 100 pounds, the standard touring car differs in degrees.

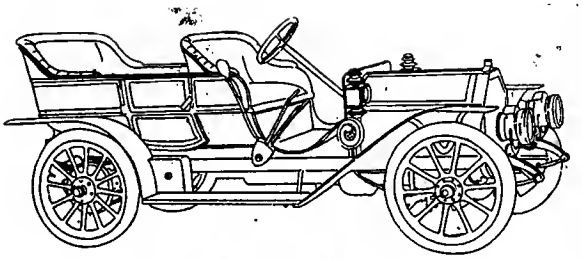
In the standard touring cars seven-passenger bodies of the most roomy description are afforded. The motors are four or six-cylinder types, and the power is on an increased basis, not only because the weights of the cars are greater, but in order to afford a greater ratio of power per hundred weight than the power available in the light touring cars. Obviously, then, the big cars (so-called) go faster, carry seven passengers instead of five, negotiate more difficult roads, because they have more power, wheels of greater diameter, and other parts to match.

In the standard touring cars, the price being considerably higher, there are essential differences which cannot be seen on the surface. Since the motors deliver more power, and since the resistance is greater at every point, the materials must be either initially of greater ability, or the heat treatment to which they may be subjected must be more nearly in accord with the arduousness of the service such cars would necessarily be expected to thrive in.

It is perfectly apparent that to increase the size and the weight of the car, and to increase the motor as respects its horsepower ability in mere direct proportion, would result in a heavier car with a falling off in the speed because the increased weight would sink the tires deeper into the road bed and the road resistance would demand more power for a given speed.

Wheels of Greater Diameter.

Prior to the introduction of the drop frame there was an attempt to placate the ideas of patrons who were quick to see the advantages of a low center of gravity. This attempt took shape by way of a reduction in the diameters of the tires used (diameter of the wheels). The cars looked low, but the center of gravity was about the same as it would have been were the wheels



Characteristic Chain Drive Standard Touring Car.

of greater diameter, all other things remaining constant.

In the modern touring cars the drop-frame idea has rendered it feasible to use wheels of suitable diameter without having to use deception with a view to making the center of gravity look lower than it really is. The standard touring cars of the present time, then, are comparatively low in this respect, notwithstanding the fact that they are more commodious than were cars at any previous time.

The Length of the Wheelbase.

For the standard touring cars in which the motors are of great power, hence of some length, in which a seven-passenger body takes the place of five, the wheelbase distance is, naturally, considerably more than would obtain with the light touring car. In the standard car, then, the wheelbase distance ranges between 110 and 140 inches. The lower dimension would scarcely accommodate more than a five-passenger space, whereas the higher dimensions given take into account seven passengers.

Systems of Control.

If brakes and other means of control are important in cars in general, they are of the utmost importance in touring cars. Touring cars have a wide radius of action, must negotiate country roads of indifferent or even bad construction, and frequently the roads are passed over in the night time under conditions of fog or rain. It is plain to be seen that the brakes must be easy to manipulate and positive in their action. It is equally plain that the new cars more nearly satisfy the exacting demands than they have been satisfied before. The brakes are with larger drums, wider faces, more nearly indestructible linings, and lever systems, laid out to actually accomplish the task imposed upon them.

In the past it was not uncommon to have the speed-changing levers stick on small provocation. This matter has been afforded painstaking care in pretty much all of the line of cars to be seen to-day, probably because all designers realize the necessity of smooth action in speed-changing levers. It is not now possible to find a car in which two separate speed-changing gears could be meshed simultaneously. Fortunately, there never were many cars so imperfect in point of design as to include this defect. One more point, close enough to this phase of the subject to warrant mention, lies in the care with which designers of the present cars have prevented the accidental meshing of the reverse pinion under a misapprehension that a forward speed was being engaged. True, the reverse pinion would refuse its mate, excepting at coincident speeds, or nearly so. A wrecked transmission gear-set is pretty nearly sure to follow the accidental engagement of the reverse gear when the car is driving ahead at even a fairly low speed. Again, in the old days, to motor in costumes of any value was to depreciate the value of the costumes, if grease, grime, or oil would accomplish such destruction. As it is now, the oiling is done by a suitable force-feed oil pump, remote from the space reserved for the occupants of the cars. Under such conditions it is possible to keep the seats, decks and entrances clean.

Some Potential Factors for Safety.

Standard touring cars are essentially capable of speeding; and to speed with safety is a matter of first importance. The modern production requires greater measures for safety because of the greater power of motors used and the increased efficiency of the transmission, thus ending in a greater maximum speed, with a given weight of car and a given expenditure for gasoline. The effect on the parts of a motor is greater for speed than it is for weight (tires excepted). Since cars are lighter to-day than they were before, better materials and superior designs are necessary to insure safety. To assure safety, the vitals of the new cars are properly nested behind less essential heavy parts. The steering linkages, for illustration, will be found above and to the rear of the axles, or in equally protected locations. This is in considerable contrast with some of the cars of ancient vintage in which the steering (drag rod) was the lowest down, and the parts which, if they intercepted an obstruction, would result in the greatest damage.

Designers have taken advantage of experience, and while they have evolved cars with a greater ground clearance, they have at the same time lowered the center of gravity. This means that the parts are closely nested and situated at a near approach to the ground clearance line. This is true in almost every case, whereas a year or two ago there were (only) possible exceptions in favor of a high clearance and a low center of gravity.

Features Indicating Increased Comfort.

The standard touring cars, besides affording luxurious space, are upholstered in a manner befitting the service to be rendered. The cars are heavy enough to maintain a level platform, in view of the improvements wrought in spring suspensions; with such a balance of the relation of the weight of the bodies to the weight of the passengers that the absence of one or more passengers will not seriously affect the easy riding qualities, once a pronounced disadvantage in automobiles.

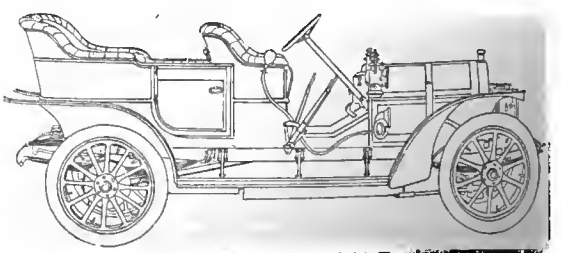
The various noises previously regarded as the most serious drawbacks to cars in touring service are now conspicuous for their absence, not alone as respects the exhaust, but in connection with the linkages and other parts.

Some Special Features.

In touring the question of what to do with the chauffeur, were the owner to drive his own car, as most owners would like to do from time to time, has been very definitely settled by what is now known as the close-couple body. This provides a seat over the rear axle for the chauffeur at all times when he is not actually at the wheel. In his comfortable berth to the rear of the body proper he can neither be seen, nor can he hear what the occupants of the car may be talking about.

The close-couple body brings the side entrance so far in front of the rear wheel as to permit the use of a very wide opening. The shaft drive, if considered in this connection, disposes of the sprocket-wheel housing that always did seem to be in the way. Up to very recently the shaft drive was not regarded as sufficiently rugged to withstand the severe usages incidental to touring. This year's cars would seem to indicate that the shaft drive is not limited by any such considerations at all.

There are numerous other examples in which the side-entrance is quite up to the requirements from the best point of view. Looking at the whole question from any angle, it is to observe a very decided display of ingenuity, the purport of which is to afford to the patrons of the industry the conveniences they express a preference for without in any way defeating the ends from the point of view of necessity, allowing that the design demands cannot well be compromised, even to afford comfort.



Characteristic Shaft Drive Light Touring Car.

The 1909 ROYAL TOURIST

Speedier, longer, roomier, stronger, easier riding and more readily accessible, the Model "M" is without doubt the most permanent car in every particular that has yet been presented to the motor world.

The Model "M"

NEW FEATURES

MOTOR

Chief of the new improvements is the motor, with a larger bore and stroke, the new dimensions being 5½ inches by 6 inches, giving greatly increased power and a range of from 5 miles to 65 miles on high gear. The enlarged motor demonstrates the acme of excellence to be obtained in smooth running and reliability.

CARBURETER

An improved carbureter, actually unique as a fuel saver, *insures* positive service with the minimum of effort and expense.

IGNITION

The improved and independent double ignition system is greatly simplified, does away with much wiring, and is a distinct advance over any system heretofore devised.

LUBRICATION

Two separate force feed oiling devices of increased capacity and efficiency are incorporated.

TRANSMISSION

The selective type of transmission, giving four forward speeds and one reverse, is employed.

BRAKES

Five distinct brakes give perfect security to the Royal Tourist user.

AXELS

The front axle is of I-beam construction and the rear is of the readily demountable floating type.

WHEEL-BASE AND TONNEAU

A considerably lengthened wheel base—the new model being 126 inches—an extra roomy tonneau, accommodating six persons, and luxurious appointments throughout, are features of the Model "M" which will commend themselves to the discriminating.

ACCESSIBILITY

Every innovation, every change and every improvement has been so made as to render it possible to easily remove any part without disarranging any other part.

Nothing has been omitted and everything has been done to make the new Royal Tourist the most dependable car on the American market for years to come.

The Royal Tourist Car Company, Cleveland, Ohio

THE TEST OF SERVICE IS ALL WE DEMAND MEMBERS OF A. L. A. M.

CHADWICK STOCK RUNABOUT, STRIPPED FOR RACING

New Models, to be known as the

"PERFECTED" GREAT CHADWICK SIXES

will be shown for the first time

at the

Grand Central Palace Show, New York

We have abandoned yearly models and standardize The "Perfected Car" which will be exhibited in Touring Car, Tourabout, Runabout and Chasais.

The above illustration is of the victorious test car.

This car made its initial appearance in the Wilkes-Barre Hill-Climb, May 30th, 1908, at which time it shattered all records. Since that time it has won all the big hill-climbs of 1908 in which it was entered, and would easily have won the Vanderbilt Cup Race had it not been for a crippled magneto in the seventh lap. Thus we have tried and tested the new perfected models, exact duplicates of which with the various bodies are being initally exhibited.

IMPROVEMENTS

Note the following improvements in the "Perfected" **Great Chadwick Sixes** initially exhibited at Grand Central palace, New York

WHEEL BASE—Seven-passenger Touring Car and Tourabout, 130"; Racing Runabout type, 112".

BRAKES—Four very large and improved brakes, equipped with air-cooled shoes 1¼" in thickness, instantly adjustable.

CLUTCH—Improved internal expanding type. The band can be entirely removed for inspection in 30 seconds.

DRIVE—The only ABSOLUTELY SILENT chain drive in existence—sprockets and chrome nickel steel chains are so constructed and contained in oil-tight cases that chain noise is completely eliminated in the new model.

MAGNETO—Improved Bosch high tension, equipped with perfected advance device, which insures easy starting on quarter turn without use of the battery system.

HORSE-POWER—An absolute increase of 35 per cent in power; this great increase is obtained by refinements and improvements, while the bore of 5" and stroke of 6" remains the same as in 1908 model.

LUBRICATOR—Improved; the flexible sheft hes been replaced with a direct shaft drive.

COOLING—A most efficient type of Honey-Comb Radiator is used in place of the celluiar type.

TIMING—Hardened chrome nickel-steel time gears, cam shaft and cams accurately ground by special grinding machines, valve lifts readily adjustable.

SPRINGS—Exhaustive tests of the improved suspension have demonstrated greatly increased resiliency and stability.

STEERING GEAR—New Chadwick system of gear, instantly adjustable with large heavy steering post and 19" wheel. The new steering device is made of chrome nickel eteel throughout. The band sectors on wheel controlling the gas and spark are of a new and perfected type.

CONTROL—The gear shift lever, segment and locking device are much heavier and the design is improved. The emergency brake lever is also heavier while clutch, foot brake and foot accelerator are all adjustable for position and refined in appearance.

BODIES—The bodies are much larger, while the workmanship and material are the very best that careful attention and unrestricted expenditure can obtain.

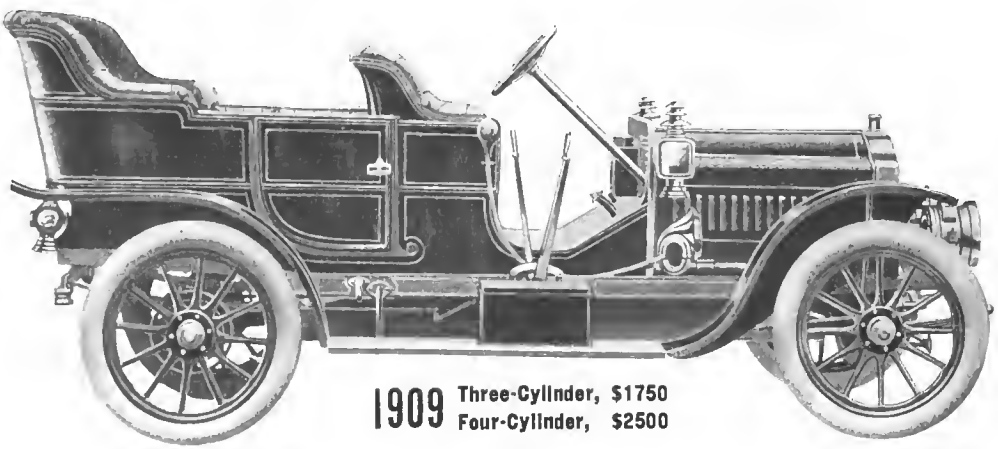
CHADWICK ENGINEERING WORKS

POTTSTOWN, PA., U. S. A.

Your Purchase of Any Four-Cycle Car Is Your Perpetual, Unbreakable Contract with Troubles—Troubles Entirely Unknown to the Elmore Owner



1909 Three-Cylinder, $1750
Four-Cylinder, $2500

Right now you are most likely considering the purchase of some four-cycle car.

The question that vexes most is whether it shall be one with a four-cylinder or a six-cylinder engine.

But that which seems so important to you shrivels to insignificance before the greater question of four-cycle or two-cycle.

For on the latter—**entirely** on the latter—depends your future satisfaction with the car you buy.

Yes, the very life of the car itself is prematurely shortened, or prolonged, by the principle of its motor—four-cycle or two-cycle.

If you understood the Elmore valveless two-cycle car, there could be no question in your mind. Your decision in favor of the Elmore would be a foregone conclusion.

You would know why the Elmore runs and runs and runs, with never a bit of unnecessary trouble or exasperation or expense—just as every present Elmore owner knows.

You would realize what you don't know now—how all-powerful is the influence of valves.

The Elmore engine has no valves; it produces the smooth, constant rythm of power known as continuous torque—something that no four-cycle engine, no matter how many cylinders it has, can do.

These differences are comprehensively explained in the 1909 literature. Get it and study it until you are perfectly familiar with the Elmore valveless two-cycle engine.

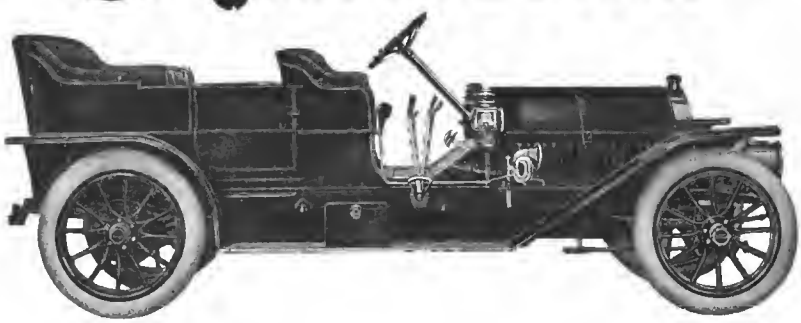
Then seek the Elmore dealer and a demonstration of the car. The dealer has been allotted as many cars as he can obtain, so you realize the necessity of deciding without delay.

THE ELMORE MFG. CO., 1304 Amanda Street, Clyde, O.

Member Association of Licensed Automobile Manufacturers

THE ELMORE WILL BE EXHIBITED ONLY AT THE MADISON SQUARE GARDEN SHOW, NEW YORK, JANUARY 16-23. STUDY IT THERE.

National



Just as Faultless as It Looks

The following specifications should appeal to those experienced motorists who appreciate a car of irreproachable character

MODEL 9-35

Mntor—Four cylinder, 4½ x 4½ inches vertical, cast in pairs, mounted on main frame. Mechanical valves, exhaust and admissioa on opposite sides aad interchangeable. Ball-bearing crank shaft and ball-bearing cam shafts. Tapered nipples used on intake, exhaust and water pipes in place of packing. Extra long Parsons white bronze bearings on connecting rods. Gear driven distributor. Divided aluminum crank case. Iaterchangeable parts.

Clutcn — Self - contained alumiaum cone, leather faced, spring cashioned.

Transmission—Sliding gear selective type. Three speeds forward and one reverse, direct on high. Self-contained annular type ball-bearings on main and counter shafts. Gears run in oil.

Wheel Base—115 inches.

Drive—Bevel gears through ball-bearing propeller shaft and flexible joint to rear axle of improved design.

Beabings—Annular type ball-bearings throughout.

Wnebls—Wood, artillery pattern, ten 1½-iach spokes front and twelve rear.

Oilinn—Crank case, coastant level fnree fecd oiler. Oiling all working parts of motor.

Ignition—Two separate, complete systems. One a gear-drivenhigh-tension. Bosch magneto. The other a storage battery, single coil and distributor. Each system has a separate set of spark plugs.

Gasoline Capacity—15 gallons.

Tires—34 x 4. Diamond, G. & J. or Michelin.

Brakes—Two systems. Two internal expaading metal to metal hub brakes and two band brakes on outside of rear wheel drums. Hand lever applies one set. Poot push pedal applies the second set.

Frame—Pressed steel 4½-iach channel sectioa firmly riveted and braced and curved up over rear axle. No sub-frame.

Paont Axle—I-beam, steel forging

Raaa Axle.—Compound construction. Inner axle used only as a driver Wnecls turn upon double annular type ball-bearings on hollow axle which carries all weight.

Finish—Coach carmine or national red; black stripes.

Booy—Straight liae sheet metal, side entrances. Divided front seats. Carrying capacity, 5 passengers.

Steraing System—Eighteen-inch hand wheel, inclined post. Worm and gear, non-reversible chuck. Ball joint connections to steering knuckle.

Contanl—Single lever at driver's right controls all speeds. Three forward and one reverse.

Springs—Hslf-elliptic; 40-inch front, under frame; 48-inch rear, outs de of frame; 37-iach cross on rear.

Equipment—Two 8-inch Rushmore searchlights with generator; side and tail lsmps. Storm aprons, horn and tools.

Paice—$2,750.00, F. O. B. Indianapolis.

MODEL 9-40

Mntoa—Four cylinder, 5 x 5 inches vertical. iadividually mounted on sub-frame. Mechanical valves, exhaust and admissioa on opposite sides and interchangeable. Ball-bearing crank shaft and ball-bearing cam shafts. Tapered nipples used on intake, exhaust and water pipes in place of packing. Extra long Parsons white bronze bearings on connectiag rods. Gear-driven distributor. Divided aluminum crank case. Interchangeable parts.

Clutch.— Self - contained, aluminum cone, leather faced, spring cashioned.

Transmission—Sliding gear selective type. Three speeds forward and one reverse, direct on high. Self-contained aanular type D. W. F. ball bearings on main and counter shafts. Geara run in oil.

Wneel Base—125 inches.

Daive—Bevel gear through ball-bearing propeller shaft and flexible joint in rear axle of improved design.

Beaaings—Annular type D. W. P. ball bearings throughout.

Wneels—Wood, artillery pattern, twelve1¼ iach spokes front aad rear.

Oiling—Cnak case, constant level force-feed oiler. Oiling all working parts of motor.

Ignitinn—Two separate, complete systems. One gear-driven, high-tension Bosch magneto. The other a storage battery, single coil and distributor. Each system has a separate set of spark plugs.

Gasoline Capacity—17 gallons.

Tires—36 x 4½. Diamond, G. & J. or Michelin.

Baakes—Two systems. Pour dust-proof iaternal expanding metal to metal hub brakes. Hand lever applies one set. Foot push pedal applies the second set.

Faame—Pressed steel 4½-inch chanael section—with sub-frame—firmly riveted and braced and curved up over rear axle.

Paont Axle—Seamless, cold drawn steel tubing, heavy gauged, forged yokes, or I-beam steel forging.

Rear Axle—Compound construction. Inner axle used only as a driver. Wheels turn upon double annular type D. W. F. ball bearings on hollow axle which carries all weight.

Finisn—Coach carmine or national red; black stripes.

Cntanl—Single lever at driver's right controls all speeds. Three forward and one reverse.

Spaings—Half elliptic; 40-inch front, under frame; 50-inch rear, outslde of frame; 39-inch cross on rear.

Equipment — Two 9-inch Rushmore searehlights with generator: side and tail lamps. Storm aprons, horn and tools.

Price—$3,700.00, F. O. B. Indianapolis.

MODEL 9-50

Mntoa—Six cylinder, 4½ x 4½ inches vertical, in pairs, mounted nn sub-frame. Mechanical valves, exhaust and admission on opposite sides and interchangeable. Ball-bearing crank shaft and ball-bearing cam shafts, Tapered nipples used on intake, exhaust and water pipes in place of packing Extra long Parsons white bronze bearings on connecting rods. Gear-driven distrlbutor. Divided aluminum crank case. Iaterchangeable parts.

Clutcn— Self - contained, aluminum cone, leather faced, spring cushioned.

Transmissinn—Sliding gear selective type. Three speeds forward and one reverse, direct on high. Self-contained annular type D. W. F. ball bearings on main and counter shafts. Gears run in oil.

Wneel Base—130 inches.

Daive—Bevel gear through ball-bearing propeller shaft and flexible joint to rear axle of improved design.

Ignitinn—Two separate, complete systems One a gear-driven high-tension Bosch magneto. The other a storage battery, single coil and distributor. Each system has a separate set of spark plugs.

Oiling—Crank case, constant level force-feed oiler, oiling all working parts of motor.

Gasoline Capacity—17 galloas.

Wneels—Wood, artillery pattern twelve 1¼-iach spokes front and rear

Tires—36 x 4½. Diamond, G. &, J. or Michelin.

Baakes —Two systems. Pour dust proof internal expanding metal to metal hub brakes. Hand lever applies one set. Foot push pedal applies the second set.

Pramb—Pressed steel 4½-inch channel section—with sub-frame—firmly riveted and braced and curved up over rear axle.

Faont Axle—Seamless, cold drawn steel tubing, heavy gauge. forged yokes, or I-beam steel forging.

Reaa Axle—Compound construction. Inner axle used only as a driver. Wheels turn upon double annular type D. W. F. ball-bearings on hollow axle which carries all weight.

Bnny—Curved line cast or straight line sheet aluminum side entrances. Divided front seats. Carrying capacity. seven passengers. (Two on folding seats in toaneau.)

Finish—Coach carmine or national red; black stripes.

Bearings—Anaular type D. W. P. ball-bearings throughout.

Sterainn Systrm—18-iach hand wheel, inclined post. Worm and gear, non-reversible chuck. Ball joint connections tn steerinrs knuckle.

Control—Single lever at driver's right controls all speeds. Three forward and one reverse.

Spaings—Half-elliptic; 40-inch front; under frame. 50-inch rear. outside of frame 39-inch cross on rear.

Equipment — Twn 9-inch Rushmore seareh-lights with generator: side and tail lamps. Storm aprons. horn and tools.

Paice—$4,200.00, P. O. B. Indianapolis

MODEL 9-60

Motar—Six cylinder, 5 x 5 inches, vertical, individually mounted oa sub-frame. Mechanical valves, exhaust and admission on opposite sides and interchangeable. Ball-bearing crank shaft and ball-bearing cam shafts. Tapered nipples used on intake, exhaust and water pipes in place of packing. Extra long Parsons white bronze bearings on connecting rods. Gear driven distributor. Divided alumiaum crank case. Interchangeable parts.

Clutcn—Self - coatained aluminum coae, leather faced, spring cushioned.

Transmission—Sliding gear selective type. Three speeds forward snd one reverse, direct on high. Self-contained annular type D. W. P. ball-bearings on main and counter shafts. Gears run in oil

Wheel Base—137 inches.

Daive—Bevel gear through ball-bearing propeller shaft and flexible joint to rear axle of improved design.

Beaarings—Annular type D. W. P. ball-bearings throughout.

Wneels—Wood, artillery pattern, twelve 1¾-inch spokes front and rear.

Oiling—Crank case, constant level force feed oiler, oiling all working parts of motor.

Ignitinn—Two separate, complete systems. One a gear driven high tension Bosch magneto. The other a storage battery, single coil and distributor. Each system has a separate set of spark plugs.

Gasoline Capacity—20 gallons.

Tires—36 x 5. Diamond. G. & J. or Michelin.

Brakes—Two systems. Four dust proof internal expanding metal to metal hub brakes. Haad lever applies one set. Foot push pedal applies second set.

Prame—Pressed steel, 5-inch channel section—with sub-frame—firmly riveted and braced and curved up over rear axle.

Prnnt Axle — Seamless, cold drawn steel tubing, extra heavy gauge, forged yokes—or I-beam steel forging.

Rear Axle—Compound construction. Inner axle used only as a driver. Wheels turn upon double annular type D. W. P. ball-bearings on hollow axle which carries all weight.

Bony—Curved line cast aluminum, side entrances, removable tonneau, platform type. Divided froat seats. Carrying capacity, seven passengers (five carried in tnnneau).

Finish—Coach carmine or national red; black stripes.

Steering System—18-inch hand wheel, inclined post. Worm aad gear, non reversible chuck. Ball joint connections to steering knuckle.

Control—Single lever at driver's right controls all speeds. Three forward and one reverse.

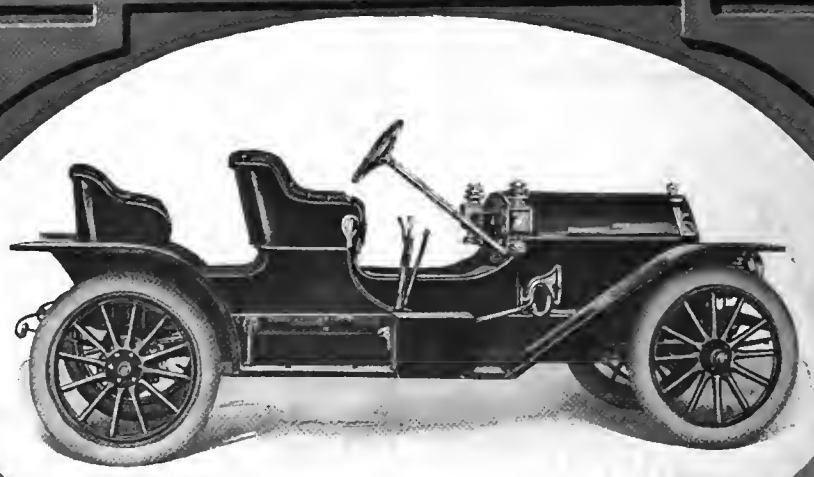
Springs—Half-elliptic; 44-inch front, under frame; 56 inch rear, outside frame; 39-inch cross on rear.

Equipment — Two 9-inch Rushmore searchlights, with generator; side and tail lamps. Storm aprons, horn and tools.

Price—$5,000.00. P. O. B. Indianapolis.

NATIONAL MOTOR VEHICLE COMPANY, 1000 East 22d Street, INDIANAPOLIS, IND.

Standard Manufacturers A. M. C. M. A.



The Inter-State, Model 28
$1,750.00

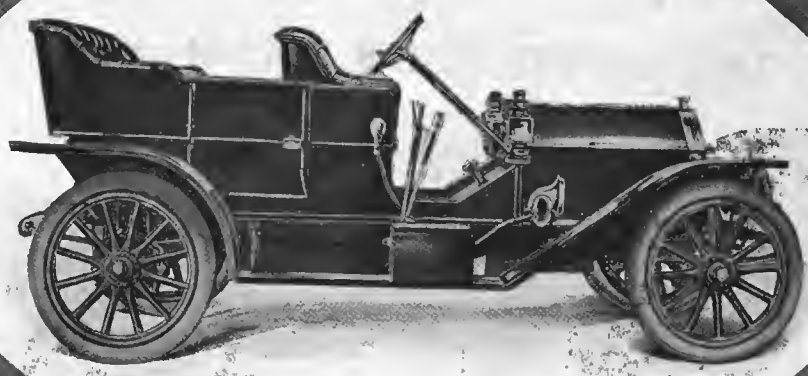
The Inter-State

THE INTER-STATE AUTOMOBILE is built for the intelligent purchaser who wants the high quality which heretofore has been found **only** in **high-priced** cars, but who does not want to pay from twenty-five hundred to five thousand dollars.

The Inter-State makes it unnecessary for such purchasers to pay such prices. It is a **permanent** car, embracing every essential factor of worth in automobile design, style, comfort, speed, endurance, dependable materials and workmanship. And it is sold at a price—$1750 complete, including Eisemann Magneto—but little higher than the cheap good-enough-until-later cars.

There is no economy and most assuredly no automobile satisfaction in buying a car that you will want to discard the second season for a **real** car. Especially since you can buy the **real** car, the **satisfying, permanent** car **this** season for just a little more money than a temporary car.

In justice to your own best interests, let us urge you not to **think** of spending your money for a "cheap" car, or even a higher-priced good car, until you have seen the Inter-State. We are glad to let you be the sole judge as to its worth at $1750.



The Inter-State Touring Car, Model 25
$1,750 00

DEALERS AND AGENTS will appreciate the opportunities opened to them by the Inter-State. Write for our attractive proposition.

At the Shows

The full line of Inter-State automobiles, including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster and Tourabout, will be exhibited at Grand Central Palace, New York, December 31-January 7, and at the Coliseum, Chicago February 6-13.

INTER-STATE AUTOMOBILE CO.

127 Willard Street, MUNCIE, INDIANA

SPECIFICATIONS:

Frame—Pressed from cold rolled steel, special stock.

Front Axle—"I" beam, drop forged in one piece—not welded—and double heat treated.

Rear Axle—The reliable semi-floating type with large axle shafts and Hyatt Roller Bearings.

Wheels—Artillery type, 12 spokes, 1¾-in., 34-in. diameter.

Tires—Standard Goodyear Quick Detachable, Continental or Diamond, 34x4 inches.

Brakes—Four 12-in. brakes all acting on rear hubs, external and internal.

Transmission—Three speed selective type and reverse, with vanadium steel gears. The selective mechanism built inside transmission case, thoroughly lubricated at all times.

Gear Ratio—3½ to 1, giving from 5 to 60 miles on high gear.

Horsepower—35 to 40

Motor—Four-cylinder, 4¼x5, water-cooled, cylinders cast in pairs.

Crank Shaft—Special drop forging 35 to 40 carbon steel, double heat treated.

Ignition—Double system Eisemann Magneto, commutator, battery and quadruple coil.

Body Styles—Touring Car, Double Rumble Roadster, Single Rumble Roadster, Tourabout and Demi-Tonneau.

Wheel Base—112 inches.

Tread—56½ inches.

Color—Standard Inter-State red.

Price—With best of equipments, head lights and generator, side oil lamps, tail lamp, tube horn, tire repair kit and tools—Eisemann Magneto—F.O.B. Muncie, $1,750

Automobile and Service. Make sure that you pay for nothing else but this. Check over every car offered you point by point.

You can pay $2500 for a four-cylinder 40-horsepower car, if you want to, but it isn't necessary. You can even go higher, but every dollar you add over the $1600 you pay for Oakland four-cylinder Forty is just so much money wasted. You get not one cent extra value in either service or appearance.

Consider the matter from the common-sense standpoint.

There are five items you want to be sure of in the car you own. Here they are:

1. Ample power—that's for speed and hill-climbing.

2. Ease of handling and operation. You want a car that you can enjoy riding in.

3. Low cost of maintenance. What it costs to run a car is just as important as what it costs to buy one.

4. Style and finish—a car that will be a credit to you when you drive in it—a car for you and your best friends.

5. Simplicity of construction—so that you can master and understand every detail.

The Oakland "Forty"

40 H.P. Touring Car.....$1600
40 H.P. Runabout..... 1600

When you see this big car, and ride in it, it will be hard for you to understand why we do not add at least $500 to its price.

The Oakland "Forty" has a 112-inch wheel base, weight, 2100 lbs., shaft drive, four-cylinder motor, cylinders cast in pairs, 1-2-inch bore by 5-inch stroke, making a power plant that we could rate higher than 40 h.p. if we were inclined to follow the practice obtaining with many makers. It is sufficient to say that no matter how much you "let her out" you will always find the Oakland "Forty" has just a little more reserve power ready for emergency. 34 x 4 tires, front and rear. Cooling is by centrifugal pump and vertical tube radiator. Brake external and internal, acting direct on rear wheels. Transmission is of the selective sliding gear type, three speeds forward and reverse. Steel I-beam front axle. Price includes three oil lamps, two large headlights, horn and complete tool kit.

Its flexibility of control, its quiet, steady transmission, and its remarkable roadability make it the one biggest $1600 worth of automobile you can buy to-day.

Now the Oakland cars (this is true of both the "Twenty" and the "Forty") were not built to meet a preconceived price.

We have other ideals beyond producing the cheapest car on the market.

We designed and built the Oakland car up to a standard that would not admit of the slightest compromise—and then set the price.

The fact that we were able to produce a car that in every respect met the demand of a high-grade family car at a sensationally low price, is just an incident—but a mighty satisfactory one—to the man who wants to get the best car in the country for his money.

So we say again, check over these points before you select your car.

The Oakland "Twenty"

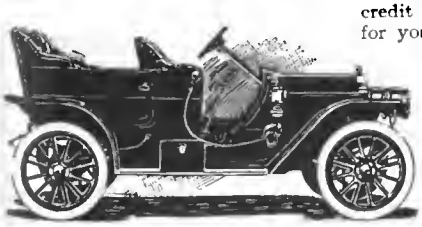
20 H.P. Touring Car or Roadster.....$1250
20 H.P. Runabout..... 1200

A comfortable, roomy family car, equipped with the unique Oakland two-cylinder vertical motor, 1-2-inch bore by 5-inch stroke. Don't confuse this with motors of the double opposed type. It is entirely different and altogether superior, and as they are equipped with an extremely ingenious counter-balancing device, they run with all the smoothness and absence of vibration formerly thought possible only with the four-cylinder motor.

In fact, anyone taking their first ride in an Oakland "Twenty" finds it hard to believe that it is not a four-cylinder motor under the hood, so noiselessly and smoothly does it run.

The "Twenty" has 100-inch wheel base. Weight, 1700 pounds. Shaft drive, 32 x 3 1-2 front and rear tires. Thermo-syphon system of cooling with fan in fly-wheel, vertical tube radiator. Brakes external and internal, operating on drums of rear wheels. Transmission of a superior planetary type, two speeds forward and reverse without a single adjustment ever necessary or possible. Price includes three oil lamps, two headlights, horn and complete tool kit.

You must see an Oakland and ride in it to appreciate the perfect result of Oakland design and Oakland skill in construction. Write for the name of our nearest dealer who will, by actual demonstration, make its superiority clear to you.



Oakland "Twenty" 2 cylinders vertical 20 horsepower, $1250.

Oakland Motor Car Co.

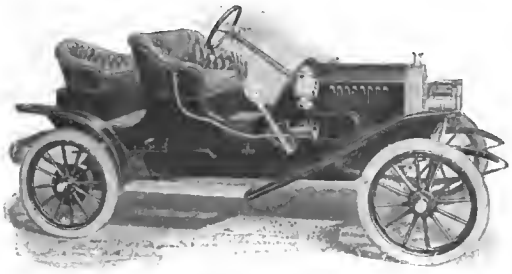
We exhibit in New York only at Grand Central Palace Auto Show, opening Dec. 31, and at Chicago Feb. 6 to 13



Model A-1. $800

Specifications

Model A-1.—Will accommodate three passengers; rumble seat; 30"x3" tires; 18 H. P.; speed, 1-35 miles; single chain drive, enclosed; weight, 1350 lbs.; 2 gas lamps and generator; 2 oil lamps; tail lamp; 40" flexible tube. Horn and full tool equipment.

Model A-3.—($875.00). Carries the same specifications as Model A-1, with the exception that it is equipped with a surrey seat in rear instead of a rumble seat.

LAMBERT FRICTION DRIVE CARS

Each Model a Leader in Its Class

The Lambert Car is a **good** automobile at a low price—not for one moment to be confused with **cheap** gear-driven cars.

The lower cost of the **more** efficient, simple Lambert friction transmission is what enables us to make a far better car than **any** manufacturer of gear-transmission cars can make for the same money.

In the Lambert Car there's a full dollar's worth of automobile value for every dollar of the price—and more, too, if judged by the ordinary standards.

We say the Lambert friction drive is more efficient than gear transmission. It is. It transmits under all conditions a higher percentage of the power generated than any type of gear transmission. It is the simplest form of transmission. It eliminates gear troubles and gear expense. It gives to the Lambert Car a smooth-running quality found in few cars.

Each Lambert model is distinguished by **other** simplicity, big-value features. Each is a leader in its class.

Buckeye Mfg. Co., Anderson, Ind.

Model 19. $1750

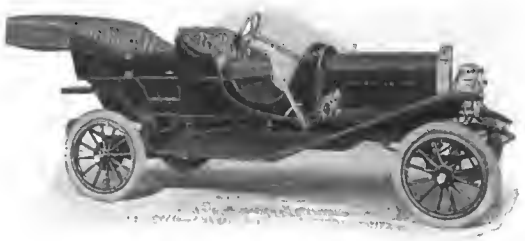
Specifications

Model 19.—Carries 5 passengers; 117" wheel base; 32"x3½" tires; 4 cylinder Rutenber motor with adjustable fan; 35-40 H. P.; speed, 1-50 miles per hour; single silent chain drive, enclosed; painted Lambert green, striped with light green. Special colo on proper notice. Weight, 1900 lbs.; 2 large gas lamps with generator; 2 oil lamps; horn; tool box on running board; full tool equipment.

Specifications

LAMBERT "30"—Capacity, 5 passengers; 28 H. P.; 4-cylinder Rutenber motor, with fan attached; speed, 1-45 miles; wheel base, 110½ inches; single silent chain drive, enclosed in dust-tight metal case; tires, 30"x3½" quick detachable pneumatics; detachable tonneau; weight, 1,600 lbs.; body painted deep red, light red stripe on panel, black moulding, running gear light red, striped with English vermillion; special color on proper notice; equipment, 2 gas lamps and generator, tail lamp, 2 oil side lamps, 40-in. flexible tube horn and full tool equipment. Price, $1250, f.o.b. factory.

The $1250 Model 27 carries the same specifications as the Lambert 30, except that it is equipped with two bucket seats instead of tonneau.



Lambert "30." $1250

LAMBERT FRICTION DRIVE CARS

We Want Lambert Representatives

The demand for automobiles at a low price is unmistakable.

The agent who represents a **good** low-priced car—the Lambert—will get the cream of the business.

Lambert cars, friction driven, have the power, the speed, the endurance, the snappy style, the finish of cars that cost half again as much.

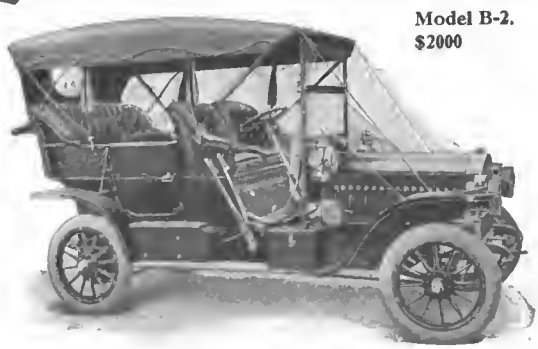
In all territory now unoccupied we want representatives for the Lambert Car. We have an unusually attractive offer to make to the right kind of men who will take up our proposition and look after our interests. We want men who appreciate and will **talk** the Lambert friction drive. Men who know enough about automobiles to recognize the fact that the Lambert Car—each of our six models—is the biggest value on the market at the price.

If you would be interested in taking up the agency question with us, write at once for full details of our proposition. In writing, you will please state what cars you are now handling and your facilities for representing the Lambert. Address BUCKEYE MANUFACTURING COMPANY, Anderson, Ind.

Lambert Cars will be exhibited at the Grand Central Palace Show, December 31 to January

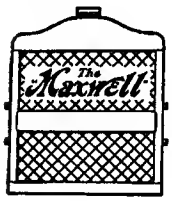
Buckeye Mfg. Co., Anderson, Ind.

Model B-2.
$2000



Specifications

Model B-2.—Carries 7 passengers; wheel base, 106"; 32"x4" quick detachable tires; 4-cylinder Rutenber motor with adjustable fan attached; 35-40 H. P.; speed, 1-45 miles per hour; direct chain drive to each rear wheel; body imperial green, striped with carmine; cape extension; top, with full set storm curtains; glass wind-shield; 2 large gas lamps with generator; oil lamps; tail lamp; horn foot rail; tool boxes on running board and in rear; full tool equipment.



A Personal Invitation to Every Dealer and Prospective Motorist at the Grand Central Palace Show to Visit the Exhibit of

Simply Perfect

The "Maxwell"

Perfectly Simple

"The Aristocrat of Moderate Priced Cars"

I want you to see the Maxwell at the Grand Central Palace show.

In the making of the Maxwell it has been my belief that we could not afford to use anything but the best materials, because a moderate-priced car, to be as successful as the Maxwell is known to be, must be more durable than the highest-priced cars—because in the very nature of things they receive harder service and less expert attention.

I consider Mr. J. D. Maxwell the foremost automobile designer of the world. Practical to the extreme, Maxwell cars are simple, and because of their simplicity—reliable.

You know the Maxwell principles—principles which have been built in these cars since 1904.

We have issued a magazine; like the foundation of Maxwell success, it is the result of mutual effort. So we call it "The Cooperator." Ask for a copy at the Maxwell booth.

Benj. Briscoe President.

MAXWELL-BRISCOE MOTOR CO.

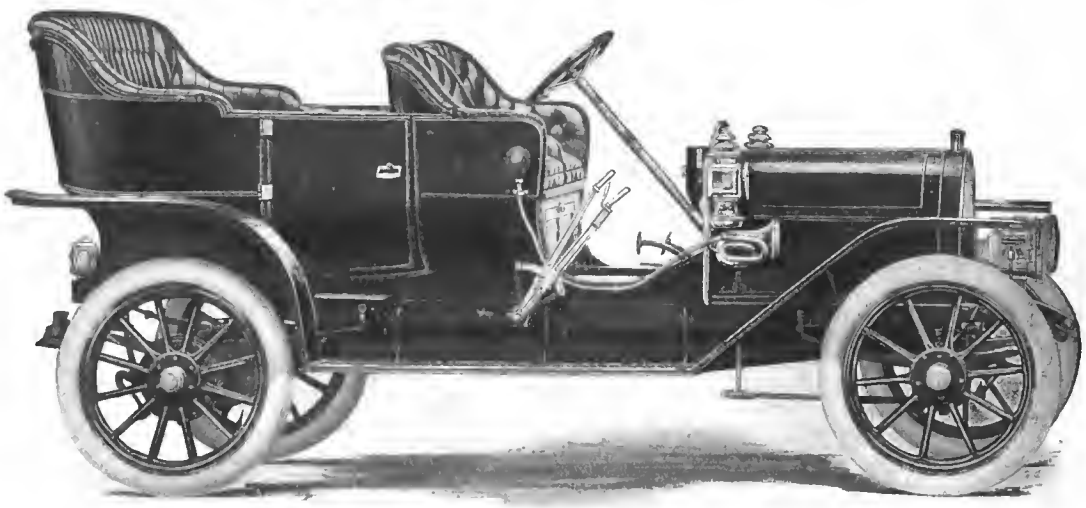
Some conditions which make possible the splendid

Cadillac

"Thirty"

at $1400.00



FOUR CYLINDER—30 H. P.—SHAFT DRIVE—SELECTIVE TYPE SLIDING GEAR TRANSMISSION, 106" WHEELBASE.

Ninety-five per cent. of all parts which enter into the construction of the Cadillac Thirty are manufactured in the Cadillac plant.

The Cadillac Company maintains its own brass and iron foundries; its own pattern shops; sheet metal shops; machine shops; gear cutting plants; painting, finishing and upholstering departments.

It makes the magnificent motor and it makes even the little bolts, nuts and cap screws which go into that motor and the car.

It manufactures its own transmissions, its own radiators, its own hoods and its own fenders.

The Cadillac Company operates its own tool making department, in which are made all the special jigs, tools and dies used in the manufacture of the Cadillac Thirty.

Every one of the millions of pieces made each year passes through the hands of a corps of trained inspectors whose watchword is—precision and perfection.

The expenditure for tool maintenance alone in the Cadillac plant in a single year is $60,000.

So accurately is every part finished that thousands of pieces of a kind with thousands of pieces of other kinds, are sent to the various assembling departments and there united without so much as the use of the finest file or emery cloth.

There is no occasion for special "fitting." The limits of measurements in many parts of the Cadillac motor, transmission, etc., are specified to the one-thousandth part of an inch.

More than 500 specially designed automatic labor-saving machines which enable one man to do with greater accuracy the work of four or five, or maybe ten, cut a tremendous figure in reducing cost on an output of ten thousand cars.

Two complete and separate mechanical organizations consisting of 3,200 men are working continually night and day on this same output of ten thousand cars.

It has always been admitted that the Cadillac was the most perfectly standardized car in the world—that its interchangeability of parts was practically absolute.

Now the plant that achieves perfect standardization likewise produces the most perfect running car, provided, of course, the motor and other vital parts are competent.

The Cadillac motor bears a reputation without flaw or tarnish. Twenty thousand Cadillac motors are and have been for four, five and six years operating all over the world, and so far as we know, not one has ever gone out of commission.

The Cadillac Thirty motor is direct heir to all the virtues of the 20,000 other Cadillac motors which have gone before—the most perfect motor the Cadillac plant has ever produced.

Bearing in mind the output of 10,000 cars and the continuous force of 3,200 men and 500 automatic labor-saving machines employed in making them, and the perfect standardization produced by manufacturing all the parts, you will begin to understand why the Cadillac Company is able to build a high grade car to sell at $1,400—a car which in all probability no other plant in the world could build and sell for less than $2,500.

The next step is to see the car (it will exceed your highest expectations in dignity, proportion and richness); to ride in it at any reasonable speed up to 50 miles per hour; to examine carefully the engine and the mechanism and then to put it into active road competition with any higher priced car you may choose.

If you will do this our car is installed.

In New York Cadillacs will be exhibited only at Madison Square Garden, Jan. 16-23, and in Chicago at the Coliseum, Feb. 6-13.

THE MARMON

"A Mechanical Masterpiece"

Marmon "Thirty-two", $2400

An Automobile Classic—A Conspicuous Value

The Marmon "Thirty-two" is neither a cheaply built car at a low price nor a "good enough" car at a high price.

It is a high grade car in every sense of the word, built as carefully as a fine watch. The parts are interchangeable, all of them manufactured by us, rigidly tested and carefully assembled into a harmonious whole.

Weighing not over 2,100 pounds, with 32-40 H. P., this "Thirty-two" has a world of speed and ability. In performance, as in appearance, it is a car that needs no apologies—occasions no regrets—a car you will be proud to own.

The "Thirty-two" sustains the Marmon reputation for mechanical excellence. It can be depended upon to stand up under the most severe usage year after year.

To the man who looks ahead and buys with his eyes wide open, this car is an emphatic bargain. No other car on the market at $3000 or less offers so much actual value.

Get the specifications, notice the character of design and equipment, and make a few careful comparisons.

Genuine Krupp and Chrome Nickel Steels are used for important parts. Bosch magneto and battery—dual system. Three point motor support. Straight line shaft drive. Rear axle and transmission in one unit. Marmon oiling system. Large brakes. Hess-Bright imported ball bearings. Big tires (34 x 4 all around). Complete equipment. Furnished as Touring Car, Roadster, Suburban, Coupe, or Limousine Town Car.

The Marmon "Fifty," $3750

A superb car, of most distinguished appearance. In hard, practical cash value, it is the superior of the most famous foreign cars selling at two or three times the price. Furnished with seven-passenger body. 50-60 H. P. Completely equipped.

Marmon "Forty-five" Roadster, a special model, $3500

The 1909 Marmon models are being exhibited at the Grand Central Palace Show, New York

Pullman '09

ANNOUNCEMENT

WE are ready for 1909 business. As hitherto in years past, the "PULLMAN" cars will maintain leadership as positively the very best automobile value obtainable.

If it is possible to attain perfection, we have reached that state in the 1909 "PULLMAN" cars.

Viewed from any standpoint—as a prospective purchaser or a dealer in motor cars—you can't match the "PULLMAN" quality, the "PULLMAN" prices or the wonderful "PULLMAN" efficiency, design, simplicity of construction, ease of operation, economy of up-keep, durability; in fact, "PULLMANS" are in every feature incomparably superior to any cars yet designed.

Model "K" 30 H.P. Touring Car. 4½ inch bore, 4½ inch stroke.
Price, $2000.00, including Bosch Magneto.

Every step from the raw material to the finished car in the progress of the making of a "PULLMAN" Automobile is under the eye of an expert in OUR OWN FACTORY and we stand back of the quality, which is the highest standard that can be produced.

In your own interest, don't buy a car, don't accept an agency, until you have full particulars about 1909 "PULLMAN" CARS.

A Model to meet every requirement at the right price. WRITE TO-DAY

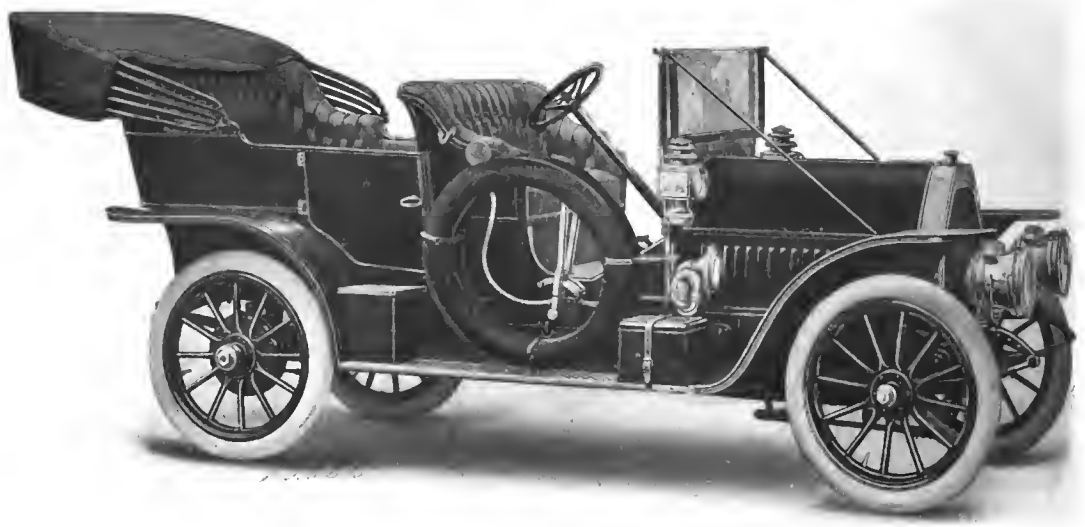
The Jewel "40" Touring Car

Price $3,000 Complete



A Suggestion of Its Completeness

Rutenber Motor, Bosch Magneto, Connecticut Coil and Exide Battery; selective transmission; platform rear suspension; Truffault-Hartford Shock Absorbers; Timken Roller Bearings; 36-inch wheels; Diamond or Goodyear Tires, 4-inch front, 4½-inch rear; full extension top and folding glass wind shield; complete lamp equipment with large Prest-O-Lite Gas tank; trunk rack, extra tire holders, etc.

Sounds a lot for the money and it is a lot for the money. We have pride in our product, which is limited, and practically no overhead expense. We have gotten right down to earth and put together the best car that we know how, with every part of the best material that can be purchased anywhere.

There Isn't Any Guesswork in the Jewel Car

There wouldn't be any guesswork in the mind of any honest agent who aims to give his customers the most he can for the money.

There's a lot of honest agents, too, whose business we can't handle—for, as stated, our output is limited. To the few who speak quick enough, we'll offer an attractive proposition and we'll make good on everything we say. Try us.

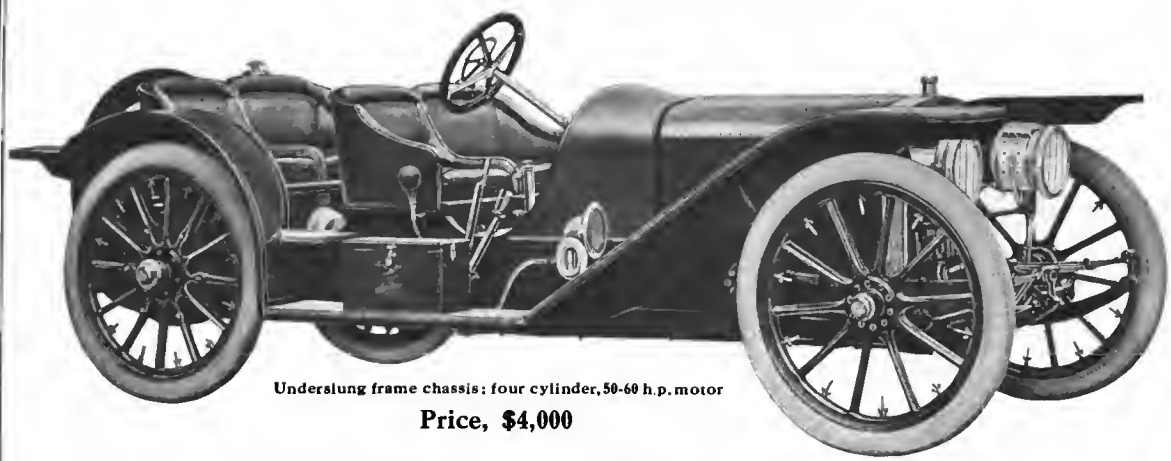
THE AMERICAN

40-inch wheel

TRAVELER



Underslung frame chassis; four cylinder, 50-60 h.p. motor

Price, $4,000

THIS CAR WILL BE THE SENSATION OF THE SHOW

From this time forward you will hear more, and more, and more of the American. . . . .

Heretofore American owners had been mostly men who had formerly driven fine imported cars.

For two years the discriminating few have understood its unique position in the motor market. But the crowd has followed the plants of huge output and conventional construction.

Only two hundred American cars will go out into the several states this season, but each will be driven by a motor connoisseur who cares little about first cost if power, service and value be there.

In your clubs, and wherever men meet to discuss the merits of motoring, you will hear its name with increasing frequency, displacing, as like as not, some other name that has hitherto been more familiar.

The philosophy of this you will better understand if you will study the smart make-up of the car; learn something of the unique underslung construction of the American Traveler and write for a descriptive account of its mechanical anatomy and performances.

SPECIFICATIONS OF THE AMERICAN TRAVELER.

Motor—Four cylinders cast in pairs; 5⅜x5½ in. 50-60 H. P. Water cooled; centrifugal circulating pump.
Ignition—Bosch high tension magneto; auxiliary coil and battery.
Carbureter—Float feed, auxiliary air supply type.
Lubrication—Four-sight-feed lubricator for cylinders and mechanism. Splash oiling crankcase. Transmission and differential run in oil.
Clutch—Leather-faced, fan-bladed cone interlocked with emergency brake.
Drive—Direct shaft to differential and floating live rear axle that bears no weight.
Wheels—40x4 in. front, 40x4 in. rear.
Wheelbase—122 inches. Tread, 56 inches.
Equipment—Two gas headlights; tail lamp; trunk rack; acetylene generator; French horn; tool kit.

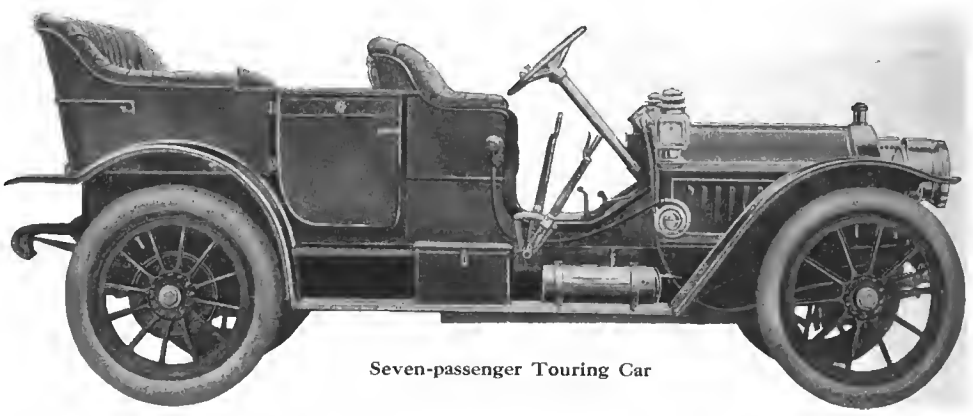
Not an Assembled Car Not an Assembled Car

The AMERICAN SIMPLEX

Fifty Horsepower Valveless Two cycle Engine Runs with the Smooth Rhythm and Applies Power with the Constancy of the Electric Motor



Seven-passenger Touring Car

50 H.P. FOUR CYLINDER, VALVELESS TWO CYCLE MOTOR

You may not live to see it, but the day is surely coming when the two cycle gas engine will be the only type used in motor cars.

It is inevitable.

We have recognized the virtues of the two cycle principle and incorporated it in the American Simplex first.

We are the pioneers among manufacturers of cars of the class in which the American Simplex stands.

Every manufacturer who puts into his car a six cylinder engine admits the vital deficiency of the four cycle principle—intermittent power—and his inability to overcome it.

Multiplicity of cylinders merely approaches—never attains—constant turning power—the continuous torque you've heard so much about.

The American Simplex two cycle engine applies power with the constancy of the electric motor.

There is not a valve, spring, roller cam or cam shaft on the American Simplex two cycle engine. They would be superfluous. They hinder the four cycle from generating its power in a steady, unceasing rush—yet the four cycle engine cannot be built without them.

The American Simplex is a manufactured car.

It is manufactured in our own plant in its entirety—motor, transmission, differential, gears, frame—every part where strength or harmonious action is vital to the long life of the car and the smoothness with which its motor runs.

That is the reason the American Simplex is a motor car symphony—there is complete harmonization of parts which no assembled car can have.

Our 1909 literature tells of the flexible three point motor suspension and radiator attachment; the rear axle transmission; the interlocking device on the gears; the improved torsion tube; the everlasting brake adjustment—every one a feature exclusive in the American Simplex—together with a comprehensive explanation of the differences in operation and results between the American Simplex valveless two cycle motor and all four cycle motors. Write for it.

The Haynes for 1909—40 H P., $3,000

A Talk to Agents

People are wary of the good-looking car that a chauffeur or an expert is unwilling to commend.

Possibly there are some agents who think that the merits of the Haynes universal joints, for instance, are too technical a matter to interest the average business man that comes in to look at the car. Maybe. But next day that man's friend, who knows an automobile when he sees it, steps in.

He gets into the chassis instead of into the tonneau.

He finds the universal joints with the floating cube of solid steel that can't ever break, and the big wearing faces that never wear out.

He finds other things, too—a unique and simple roller-pinion-and-sprocket direct drive that solves certain old problems at the rear axle, obviating wear, strains, noise and friction at a place that is a danger point in most cars. He finds a better clutch than any other car ever had. He finds a ratchet gear system that prevents gear stripping. He finds a double flywheel on the motor that makes it run like a six-cylinder without a six-cylinder's cost and complication. And he finds tremendous strength, almost needless strength, everywhere.

And the man that sent him may not hear about those technical points, but he does hear something that makes him 'phone the agent to reserve that car till cheque arrives in the morning.

Certain Haynes territory is open this year, and we are ready to talk business if you are just the right man.

Regal Motor Car Co.

Trombley Ave., Detroit, Mich.

14 Entries. Only one perfect score—The Franklin.

Against thirteen competitors, the 1909 Model D Franklin touring car won the only perfect score in the Worcester, Mass., reliability contest, December 12. Eight of the contestants went through the road run without penalization. But the Franklin was the only one to withstand the rigid examination after the run by a technical committee from the faculty of the Worcester Polytechnic Institute.

All except the Franklin suffered penalization due to broken, strained bent or loosened parts leaks, etc.

It was necessary for the committee to go over the Franklin six times in order to satisfy the other competitors.

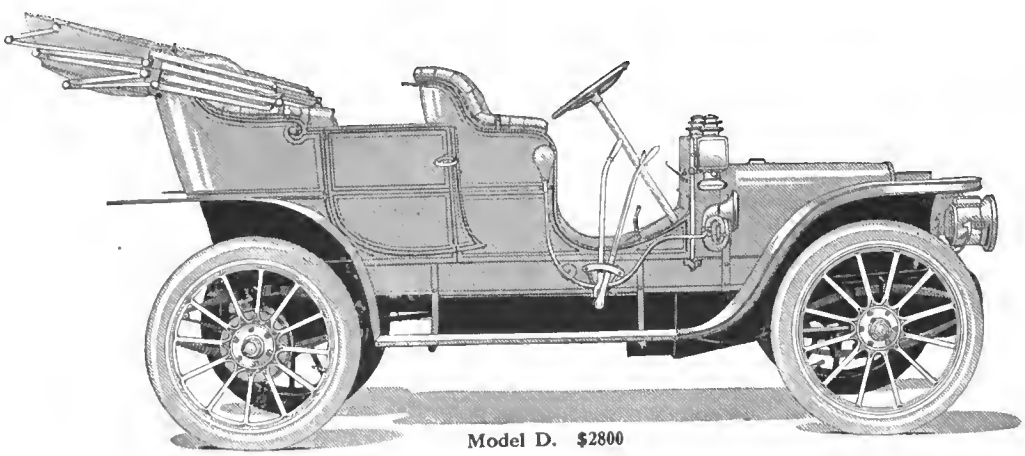
Was this luck? No!

This is the fifth severe contest in which a 1909 Franklin stock model has carried off the honors. Franklins won perfect scores in the Glidden Tour. The only Franklin entered in the Bretton Woods endurance run won a perfect score. Another Franklin won a perfect score in the 1000-mile Chicago reliability contest and also had the lowest gasoline consumption in its class. Still another Franklin won a perfect score in the Cleveland sealed bonnet run and had the lowest gasoline consumption of all contestants.

These five consecutive perfect scores in five consecutive contests, each with a stock model and —except in the Glidden Tour—only one in each contest, are most significant. How significant is of interest to every buyer of an automobile. No other automobile has such a record.

Most any automobile can make a hard road run without stops, but to go through without troubles of any kind and without any derangement or strains resulting is what tells the story.

The light-weight air-cooled Franklin does not strain or rack itself. It stands up. It rides comfortably.



Model D. $2800

A high-grade powerful automobile. Refined, reliable and safe. Abler for touring on American roads than any automobile but a Franklin. Beautiful to look at, comfortable to ride in and doing its work at the lowest operating cost.

H. H. FRANKLIN MFG. CO., Syracuse, N. Y.

ACME SEXTUPLET
6 Cylinder, 50 H. P. $4,500

THE ACME MOTOR CAR CO.
READING, PA.

At the Grand Central Palace Show, December 31 to January 7, we will exhibit the following 1909 models:

THE SPECIAL "QUAD"
(Type XXVII.)
Four cylinders, 5" x 5", 5 or 7 seats
$3,750.

THE STANDARD "QUAD"
(Type XXVI.)
Four cylinders, 4¾" x 5", 5 or 7 seats
$3,500.

THE ACME SEXTUPLET
(Type XX.)
Six cylinders, 4¾" x 5", 5 or 7 seats
$4,500.

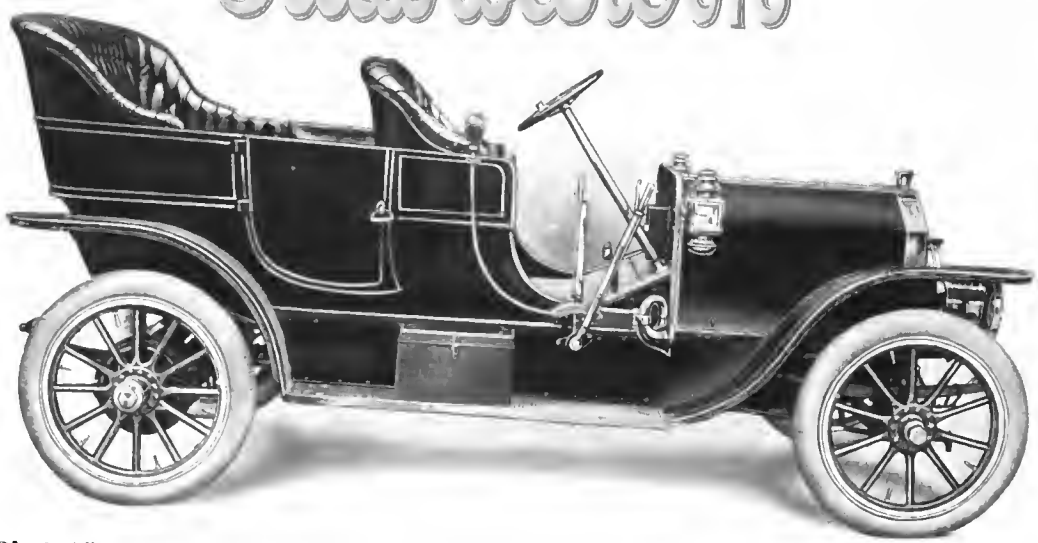
THE "FAIRMOUNT" SEXTUPLET
(Type XXI.)
Six cylinders, 4¾" x 5", Roadster or Tourabout
$4,500.

THE ACME "MIDGET"
(Type XIX.)
Four cylinders, 4½" x 5", 2 passengers, shaft-drive
$2,500.

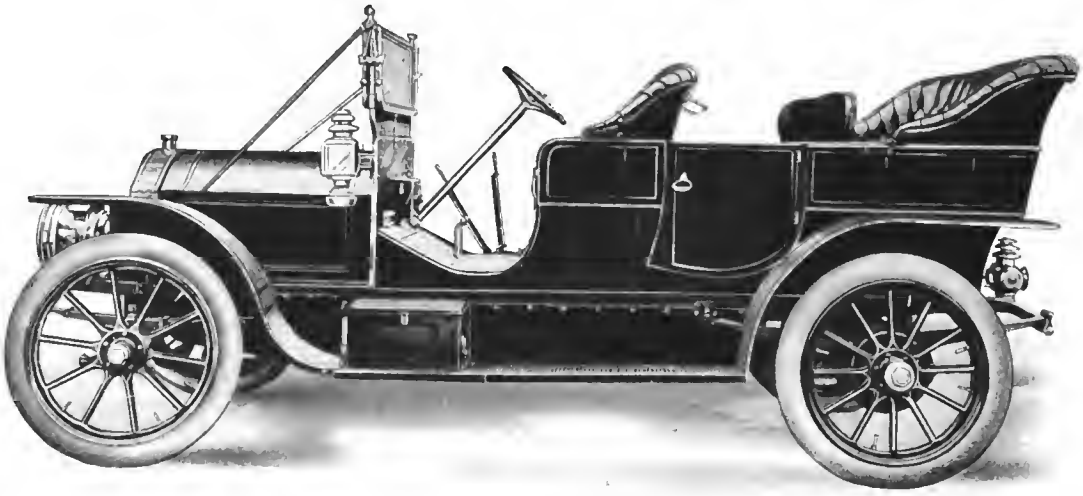
THE "VANDERBILT" ACME
(Type XXV.)
Six cylinders, 5" x 5", 5 or 7 seats
$6,000.

We have a limited amount of unoccupied agency territory which we will close at the Show.

Great Western



No. 21—62½ lbs. per H.P. 40 H.P., 4-Cylinder Motor, 4 1-2″ bore, 5½″ stroke. Weight, with complete equipment, 2500 lbs.
Price, $2500



No. 22—58⅓ lbs. per H.P. 50 H.P., 4-Cylinder Motor, 5″ bore, 6″ stroke. Weight, with full equipment, 2940 lbs.
Price, $4000

—OF COURSE

IF YOU'VE DECIDED TO BUY AN AUTOMOBILE

AN AD—FULL OF ADJECTIVES—a page of pretty platitudes will not suffice to appease your craving for facts and figures—if you've made up your mind you will buy a car and it's now only a matter of deciding which car will best suit your particular needs.

YOU WANT INFORMATION—some facts you can tie to—some points you can compare—and the more the better—with similar points in other cars.

SO WE WON'T WASTE WORDS in this ad—we'll give you facts boiled down in the form of complete specifications showing just how the E-M-F "30" is made, of what, and why.

YOU'LL FIND BY COMPARISON that this car is a full-sized, 5-passenger automobile. Same dimensions as other cars selling for twice as much, and larger—much larger—than any other car selling for the same price.

IF YOU ARE VERSED in the mechanical lore of motor car construction you will find all you desire here. If you dont know, then you know someone who does know—and the more he knows about points that spell superiority in a car the stronger will be his verdict in favor of the E-M-F "30."

AFTER YOU HAVE DIGESTED THIS thoroughly look up the nearest E-M-F "30" dealer —there are 500 of them—and arrange for a demonstration—that will settle the question.

SPECIFICATIONS:

MOTOR—HORSEPOWER—30.

TYPE. 4 cylinder, Vertical, 4 cycle. Cylinders cast in pairs with water jackets integral. *Water space between cylinders* ensuring uniform expansion and contraction. Valves all one side. Mechanically operated. Interchangeable.

CYLINDERS. Bore 4". Stroke 4½". Compression—moderate. All experience bas proven tbese cylinder dimensions to be nearly ideal for all kinds of service. Tbey give a motor of moderate speed—wbich means long life. Cooling, lubricating and all otber troubles wbich arise from short stroke, excessive bore, small exbaust valves and sbort bearings are entirely eliminated in tbe E-M-F. "30."

CRANK CASE. Cast from bigbest grade aluminum. Hand hole covers, stamped steel. Instead of the usual cast aluminum arms for supporting motor in frame tbe E-M-F. motor is carried on pressed steel members in "U" section—no beavier—three times as strong.

VALVES. Are extra large—2⅛"—made from special steel, drop forged. Stems and seats ground. Valve guides macbined and pressed into place instead of being cast integral witb cylinders—easily replaced wben worn.

All engineers agree tbat large valves not only make for efficiency, but also for economy. A four cylinder motor of 4" x 4½" may, by scientific design, accurate workmanship and large valves be made to develop 30 to 35 borsepower at 1,000 revolutions per minute, or it may develop 16—if valves are under size or tbe design faulty in other ways.

VALVE PORTS. Inlet and exhaust passages very large and unobstructed—eliminating all cbance of eddy-currents, ensuring maximum power efficiency and perfect cooling qualities.

VALVE OPERATION. Single cam-sbaft made from higb grade steel, drop forged with *all cams integral.* After milling, cam-sbaft is case bardened, and all cam surfaces as well as bearings are ground to micrometrical accuracy—guarantees silent running and consistent performance at all times.

CRANK SHAFT. *Is off-set* ¾" from centre line of cylinders—still another increase in power efficiency with minimum ot wear on cylinder walls and pistons. Crank sbaft, drop forged from special steel. Three main bearings—all large and extra long. *All bearing surfaces ground.* Flange, forged integral on cranksbaft carries fly-wheel—ground to ensure perfcct centre. Fly-wheel is also given a *running balance* at maximum motor speed to ensure accuracy and absence of vibration.

CRANK SHAFT BEARINGS. Special habbit ("White metal" alloy) in accordance with best modern practice. Cam,sbaft bearings, pbosphor-bronze.

CONNECTING RODS. Drop forged steel. I-beam cross section. Crank-pin bearing equal lengtb eacb side of centre—not off-set. Piston pin bearings, phosphor-bronze. Wrist pin bearings, marine type—not hinged. Lined with die-cast babbit. Shims provided for adjustment, wbich is easily made through large band holes in bottom of crank case.

PISTONS. Extra long—5"—ensuring good compression and long life. Each piston ground, fitted with four rings, and *each set is weighed* to ensure perfect balance of reciprocating parts—a talking-point witb some makers—a matter of course witb us.

PISTON RINGS. Eccentric type; ground on periphery-face to conform to exact bore of cylinder; also on both sides.

PISTON PIN. Special case-bardened steel ground; drilled hollow to ensure perfect lubrication. Piatons, connecting rods, crank-shafts and *oll reciprocating ports ore mechanicolly balonced* to eliminate vibration.

LUBRICATION. Splasb—automatic, vacuum feed—reliable and economical. Oil reservoir cast integral witb aluminum crank case. After having tried countless mechanical "positive feed" oiling devices and found tbem all wanting in some particular, foremost engineers have decided that tbe only really positive feed is by gravity; and experience proves that no amount of piping to cylinders and bearings will ensure the same liberal oiling to all moving parts as the old, original splasb system, by wbich tbe entire mechanism is kept constantly batbed in oil. Tbe one shortcoming of tbe gravity feed syatem was tbe necessity for throttling the feed to prevent flooding, and tbe tuhes frequently became clogged at tbe valves.

By our system of vacuum regulation—the utilization of one of tbe simplest principles in nature—we are ahle to use large tubes, ⅜". Tbis absolutely inaures free flow of oil from the reservoir, and a constant level in the crank case. Radius: on one filling of oil reservoir, 300 to 500 miles, according to road conditions.

COTTER PINS, lock-nuts, keys and taper pins are used at every point to guard against any part getting loose.

OIL CUPS. Are orovided for every joint tbat may at any time require lubrication—steering knuckles, spring connections, operating shafts, etc., etc.

IGNITION. Double system, consisting of (a) magneto, (b) battery. Tbe magneto is not an extra or "special equipment." It is as much a part of the E-M-F. motor as the valves, and is included in the list price of tbe car. Gears and all moving parts enclosed in oil tight, dust and water proof case. In this regard the E-M-F. car sets a pace for tbe world, higb priced cars included.

ENGINE GEARS. Cam-shaft and Magneto gears all enclosed and separated from crank cbamber. Gears lubricated by non-fluid grease—not cylinder oil.

COOLING. Is by large centrifugal pump—higb efficiency at slow engine speeds ensuring cooling in bill climbing and bard pulling over muddy roads. Belt driven, stamped steel fan mounted on engine—not attacbed to radiator. Eccentric belt adjustment.

CARBURETOR. Improved simple float, single jet—our own design. Very flexible and economical. Carburetor is located on driver's side of motor, away from hot exbaust pipes and otber parts—readily accesaible.

CLUTCH. Improved expanding-ring type. Leather faced. Contained in fly-wbeel. Oil groove in fly-wbeel witb boles drilled for escape of oil obviates all liability of clutcb slipping from this cause. Takes hold gently—and bolds when engaged. Adjuatment, accessible and easy.

TRANSMISSION. Type—Selective aliding gear. Gear case integral with differential bousing in rear axle—"the unit power transmission system" so generally approved by engineers of late. Gears made from E-M-F. formula special steel. Accurately cut and oil treated. Instead of aquared shaft for sliding gears, round shaft with four keys integral bas been adopted—key-ways milled and *ground*. *Geor centers olso ground* to ensure perfect alignment on shaft and silent running—details of construction heretofore known only to the higbest priced cars.

SPEEDS. Tbree forward and reverse—direct on third.

GEAR RATIO. Standard, 3¼ to 1. Speed of car, 50 miles an hour, down to 2, (you won't belicve it till we show you) on high.

DRIVE. Direct tbrougb universal jointed propeller sbaft to bevel gear on differential. Two universal joints. Pressed steel torque shaft. Gears extra large, accurately cut and made from special alloy steel.

DIFFERENTIAL. Bevel gear type—four pinions—another feature beretofore considered too expensive for any but bigh priced cars.

REAR AXLE. E-M-F. exclusive design. Right and left bousing sections drawn from sheet steel and heat treated, giving extra strength. Fitted with trusa rods. Hyatt Roller Bearings in hardened and ground removable sleeves carry load. Differential thrust bearings, babbit between ground steel washers. No balls to split—no adjustment to get out of order. Made right to stay right. Thrust of drive pinion supported by Timken Roller Bearing.

Auto-genous welding—acetylene-oxygen process—discussed so mucb in engineering circles and trade journals of late is used in this axle as well as in several other parts of the car.

Tbanks to drawn steel, auto-genous welding and "clean" deaign, this axle is lighter than any other live or floating axle on cars of similar weight and power—notwithstanding the entire transmission mecbanism is incorporated in it.

All gears—transmission and differential—as well as all shifting mechanism, are immersed in an oil batb. And the transmission-axle case as well as motor crank-case are absolutely oil tight—no mucking of floor boards or dripping on pavements. Provision is made to prevent the oil working out at the axle ends when the car is left standing on an incline. Liberal road clearance.

FRONT AXLE. I-beam type. Drop forged in one piece—not welded in centre. Heat treated. Spring percbes forged integral. Liberal safety factor. Spindles off-set back of yoke-posts—scientifically correct—affords easy steering, witb tendency to go in straight line. Steering knuckles and all connections drop forged from steel—no castings. Two-point ball bearings, bubs and all joints bronze bushed.

STEERING GEAR. Irreversible, worm and sector made from special steel case hardened. All bearing surface-ground. Connection from steering arm, at right, to left knuckle arm, obviates all tendency to "crankiness" on rougb roads.

CONTROL. Gear-sbift lever at rigbt of driver. Throttle and spark levers on left side of steering post, below wbeel—operated by fingers of left hand without releasing grasp on wheel. Rigbt hand free for emergency brake and gear shifting—the ideal control, rapidly superseding tbe fad for levers on top of wheel. Auxiliary foot accelerator. Clutch operated hy left foot, aervice brake by right foot. Emergency brake hy hand lever on right—ratcbet lock.

WHEELS. Artillery type. Large spokes—12. Spokes and felloes first grade second growth hickory.

TIRES. 32" x 3½" on all wbeels. Morgan & Wright. Universal quick-detachable rims.

BRAKES. Four—all acting on rear hubs—none on transmission. Service hrake, contracting steel bands, camel-hair lined, acting on pressed steel drums integral with rear hubs. Emergency brakes, internal expanding rings in same drum—metal-to-metal. Both sets double acting. Grip on drum is intensified by motion of car after brakes have been applied. Service brakes being on outside rendera adjustment easy. Pressed steel disc closes drum, making it dust proof.

SPRINGS. Front, semi-elliptic. Rear, full elliptic. Extra wide for tbis weigbt of car—2". Driving tbrusts and braking straina taken hy two radius rods—not hy springs.

FRAME. Pressed steel—U-section. Side members straight—weakened neither by off-setting nor dropping.

MUFFLER. E-M-F. design, silent. Silencea by radiation—not by obstruction. Absolutely no back-pressure.

FENDERS. Enameled steel in the newest style, most approved enclosed-full-lengtb-of-tbe-car type.

MATERIALS. Cylinders made from special formula higbest grade, fine grain, gray iron. Intake pipe, brass. Exhaust pipe, gray iron. Crank case, aluminum. Frame, gears, aprings, axles and driving shafts all made from special steels—each from an alloy best suited to its peculiar service, and all from E-M-F. formula. Operating levers, spring supports, spring clips, sbackles, brackets, rod-ends, etc., ateel, heat treated. All smaller parts, not drop forged, are pressed or stamped steel—*no malleoble castings* enter into the construction of the car—maximum atrengtb witb minimum weight, and *absolute assuronce of* the aafety factor desired.

BODY TYPES

TOURING CAR. 5 passenger, roomy tonneau with liberal leg-room. Latest atyle, most approved, straight-line type. Handsomely finished.

The "TOURABOUT"—an E-M-F. innovation. A classy 4-passenger car. Rear seats detacbable, leaving room for trunks and baggage. A rumble seat is included in regular equipment; when attached makes a natty 3-passenger roadster.

WHEEL BASE. 106". TREAD. Standard—56½". Special for Southern Roads 61".

WEIGHT. Touring Car slightly under 1,800 pounds.

GASOLINE CAPACITY. 15 gallons. OIL, 1 gallon.

COLOR. E-M-F. Red.

PRICE. Witb standard equipment, pair acetylene beadlights, and generator; side oil lamps, tail lamp, lamp brackets, tuhe born, tire repair kit and tools—magneto included of course—$1,250 F. O. B., Detroit, Micb.

WE WILL EXHIBIT AT THE MADISON SQUARE GARDEN SHOW, JANUARY 16th TO 23rd, 1909

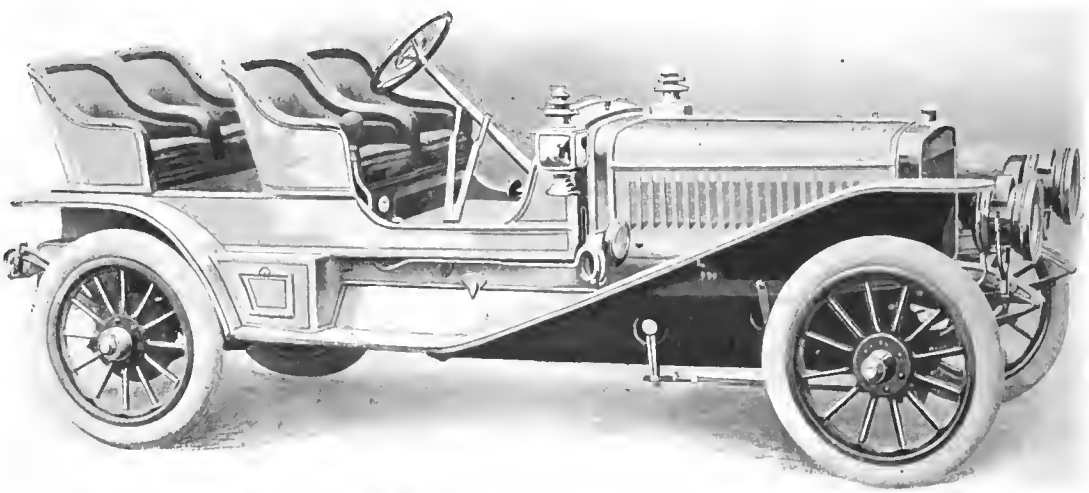
We Make Sixes Exclusively

There are many sixes on the market. And every one of them but ours (so far as we know) is made by a manufacturer who also makes fours. These makers just add two cylinders to a four and call it a six.

Most of them don't care whether you buy a four or a six, because they expect to get you "coming or going." And if you seem to prefer a four, the chance is that they will NOT tell you what a mistake you are making.

We do not ask you to purchase a



WINTON SIX

because we make sixes exclusively. Instead we are making sixes exclusively because sixes are superior to all other types. And we can prove it to you just as we have done to hundreds of others.

The Winton Six isn't a four with two added cylinders. It is a Six from the drafting room to the shipping department, from the radiator to the tail lamp. And because it is a real Six (not a makeshift) the Winton Six proves in its work all the points of superiority we claim for it.

The Winton Six starts without cranking.

Runs as sweetly and as quietly as a watch.

Makes hill climbing simple and easy.

Minimizes gear-shifting, eliminates motor vibration, and goes the route like coasting down hill.

This car holds the world's upkeep record of 4343 miles on One Dollar expense. We send the sworn records upon request.

We shall be pleased to send descriptive literature which fully presents the advantages enjoyed by the Winton Six owner. Our book, "Twelve Rules to Help Buyers," applies to all cars and will aid you in making a safe purchase. Write for literature to-day.

THE WINTON MOTOR CARRIAGE CO.

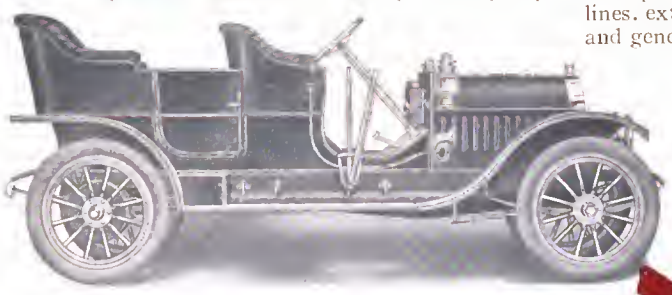
Atlas

TWO CYCLE MOTOR CARS

The Atlas 3-cylinder Touring Car is equipped with the Atlas two cycle simple, flexible, efficient, indestructible engine. The 3-cylinder two cycle Atlas engine has the light multiple impulses of the six cylinder, four cycle type without any of its complications or rapid deterioration. The numerous poppet valves, valve-shafts, adjustable bearings, cams, springs and dozens of other small breakable, wearable parts are completely eliminated in the Atlas.

THE ENGINE IS PRACTICALLY INDESTRUCTIBLE

The 1909 Touring Car has pressed steel frame, 110" wheel base geared pump, geared oiler and geared fan, Atwater Kent ignition, ¾ elliptic rear springs, 34x4" tires, aluminum body, handsome lines, extreme ease of riding, full equipment of lamps and generator or tank; price $2,000.



The 1909 line;

2-Cylinder Runabouts	Town Car
3-Cylinder Runabouts	Taxicab
3-Cylinder Touring Car	Delivery Wagon

WILL EXHIBIT AT GRAND CENTRAL PALACE DECEMBER 31st to JANUARY 7th, SPACE 9, SECTION N.

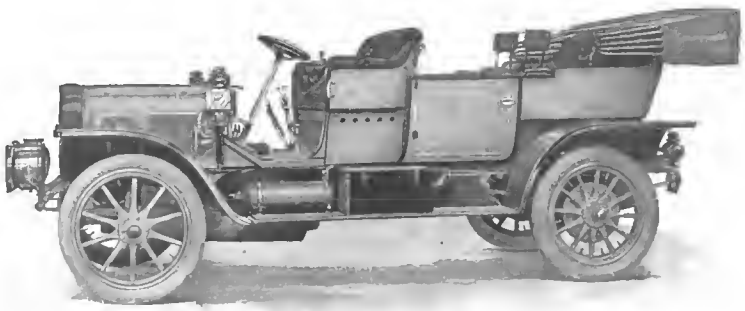
THE MODEL "M" WHITE STEAMER is the Most Luxurious Car on the Market



The luxury of the White Steamer is unequalled by any other machine. There is no car, however expensive, which has better upholstery, better springs or better finish. Owing to the compactness of the mechanism, the body is much more commodious than in any car of similar wheel-base (122 inches). Few other makes have such a liberal tire equipment (36x4 on the front wheels and 36x5 on the rear wheels).

The luxury of any car, however, depends largely upon its riding qualities, and here the White is "in a class by itself." It is the only car where starting and changes of speed can be effected without jerks or jolts. It is the only car which runs noiselessly under all conditions. It is the only car which is free from vibration, because it is the only car where the power is applied evenly and continuously, and not spasmodically.

Just as our Model "M," priced at $4,000, is the most desirable of the higher priced cars, so our Model "O," at $2,000, predominates among moderate priced machines.

Write for descriptive matter.
